Denklemde, sağ tarafında bulunan M.V para arzını ifade ederken sol tarafta bulunan P.Y ise para talebini oluşturur. Toplam para arzı ile para talebi her zaman birbirine eşittir. Klasiklere göre paranın dolanım hız (V) ile milli gelir (Y) sabit kabul edilmiştir. Paranın dolanım hızı bireylerin alışkanlıkları, ekonomik örgütlenme gibi sebeplerden dolayı sabit kalırken, Milli gelir ise ekonominin tam istihdam da olması nedeniyle toplam üretim miktarı ulaşabilecek en üst düzeyde olması nedeniyle sabit kabul etmişlerdir. Bu yüzden yapılacak bir para arzının doğrudan fiyatlar genel seviyesini yükselmesine neden olacağını varsaymışlardır. Tersi durumda da yapılacak bir para arzının kısılması da fiyatlar genel seviyesini düşüreceklerini varsaymışlardır (Seyidoğlu, 2003: 439).

Keynesyen iktisatçılara göre ise ekonomi eksik istihdamdadır. Tam istihdam ise özel bir durumdur. Eksik istihdamda fiyatların yapışkan, rijit veya katı olduğunu, ayrıca para talebi faiz esnekliği yüksek olmasından dolayı para arzının fiyatları yükseltmeyeceğini söylemiştir. Keynes, para talebinin işlem güdüsü yanında (klasiklerin para talebi) ayrıca ihtiyat ve spekülasyonlar nedeniyle tutulmak istediğini söylemiştir. Özellikle spekülasyon para talebi ile tutulan para faiz oranları ile doğrudan ilişkilendirmiştir. Yapılacak bir para arzı faizleri düşürecek, düşen faizler ise yatırımları artıracak ve ekonomik yavaş yavaş eksik istihdamdan tam istidama doğru yol alacaktır. Ekonomi tam istihdama ulaştığında ise para arzının artık enflasyonu ortaya çıkaracaktır. Ulaşılması istenilen hedeftir, ancak bu zor bir durumdur (Uğur ve Atılgan, 2021: 778).

Monetarist iktisatçılar ise daha çok klasikler gibi düşünmüşlerdi. Milton Friedman "Enflasyon her zaman ve her yerde parasal bir olgudur" demiştir. Friedman ve arkadaşları ABD'nin 100 yıllık verileri ile yaptıkları bir çalışmada para arzının artışı sonrasında enflasyona neden olduğunu ortaya çıkarmışlardır. Parasal büyümenin milli gelir düzeyinde olması gerektiğini ne daha az ne daha fazla olacak şekilde ayarlanması gerekir (Önder, 2022:647).

2. LİTERATÜR

Enflasyon, para arzı, fiyat istikrarı, döviz kuru ilişkisini inceleyen ülke grupları için farklı yöntemlerle yapılmış birçok ampirik çalışma mevcuttur. Para arzının enflasyon ile ilişkisine dayalı çalışmalar kronolojik sıraya göre Tablo 1'de gösterilmektedir.

Tablo 1: Literatür Taraması

Yazar Yıl	Ülkeler	Veri Seti	Değişkenler	Yöntem	Sonuç
Gündoğdu Odabaşıoğlu ve Aydın (2014)	10 Avrupa Birliği üyesi Merkezi ve Doğu Avrupa	1995-2012 Aylık	TÜFE, Reel faiz oranı, M2 para arzı GSYİH Döviz kuru	GMM Tahmin Yöntemi	M2 para arzı miktarının GSYİH içindeki payında bir artış enflasyon oranında bir düşüşe neden olmaktadır.
Tuncay (2017)	10 gelişmekte olan ülke	2005-2015 Yıllık	Enflasyon (Tüfe) Para arzı (M2) GSYİH, Cari işlemler dengesi	Panel Veri Analizi	Para arzındaki artışlar enflasyonu arttırmaktadır.
Karacan ve Cengiz (2019)	Türkiye	2001-2018 Yıllık	TÜFE M0/GSYİH	Zaman Serisi Analizi	Kısa vadede para arzı artışı enflasyona neden olurken, uzun vadede para arzı artışı enflasyonu etkilememektedir.
Torun ve Yılmaztürk (2021)	Kanada, Şili Türkiye Yeni Zelanda Avustralya İsveç İsrail	2002-2018	Döviz kuru Para arzı Ekonomik büyüme Faiz oranı Enflasyon Hedeflemesi	Panel Veri	Enflasyon değişkeni üzerinde faiz değişkeninin negatif etkiye sahip olduğu; büyüme, para arzı ve döviz kuru değişkenlerinin ise fark enflasyon üzerinde pozitif etkiye sahip olduğu sonucuna ulaşılmıştır.

Uğur ve Atılgan (2021)	Türkiye Hindistan Brezilya Hindistan Çin	1995-2017 Yıllık	Enflasyon (Tüfe) M2 Para Arzı Reel Gelir	LM Testi CD Testi CDLM Testleri	Para arzı %1'lik enflasyonu %0,70 oranında artırmıştır
Bağcı (2021)	Türkiye	2008-2020	Enflasyon Para Arzı (M2)	Kantil-Kantil Regresyon (KKR) yaklaşımı	Para arzında oluşan artışlar, enflasyonu her zaman arttırmamaktadır.
Önder (2022)	Türkiye	2005-2022	Enflasyon (Tüfe) Para Arzı (M2)	Engle Granger eş bütünleşme Testi ve Toda-Yamamoto Nedensellik Testi	Para arzından enflasyona yönelik tek yönlü ilişki olduğu tespit edilmiştir.
Bulut (2023)	Doğu Bloku Ülkeler ve Avrupa	2022	Enflasyon Büyüme İşsizlik GSYH	-	Avrupa Birliği'ne üye olan eski Doğu Bloku ülkeler ekonomik ve ticari açıdan genişlemiştir
Dinç (2023)	Türkiye	2000-2022	Enflasyon oranı Döviz kuru Faiz oranı Para arzı	Zamana göre değişen nedensellik ilişkisi	Döviz kuru ile faiz oranı ve enflasyon oranı ile para arzı arasındaki ilişkiler çok güçlü iken, para arzı ile faiz oranı ve para arzı ile döviz kuru arasındaki ilişki ise daha zayıftır
Uzun (2024)	Kanada İsveç Brezily	1991-2006	Enflasyon Hedeflemesi Fiyat İstikrarı	Zaman Serisi	Gelişmiş ülkelerde enflasyon hedeflemesi genellikle başarılı olurken, gelişmekte

olan ülkelerde daha karmaşık ve değişken sonuçlar ortaya çıkabilir.

3. EURO KULLANMAYAN SEÇİLİ AB ÜLKELER

1990 yılların başında dağılan Doğu bloku ülkeleri ekonomik ve politik açısından sistem arayışına girmişlerdir. Bu ülkeler Avrupa'nın doğusunda yer alması nedeniyle gelişmiş Avrupa ülkeleri tarafından mali ve teknik yardımlar alması ile piyasa ekonomisine geçiş yapmışlardır. Piyasa ekonomisi Doğu bloğundan ayrılan ve kısa süreliğine ekonomik boşluk yaşayan bu ülkelere çözüm olmuştur. Bulgaristan, Macaristan, Polonya ve Romanya 1989 yılında, Çek Cumhuriyeti ise 1993 yılında doğu bloğundan ayrılmışlardır. İlk yıllarda ekonomik olarak zorlanan bu ülkeler kısa süre sonra serbest piyasa ekonomisine geçiş yapmışlardır. Sosyalist sistemin son bulmasıyla bu ülkeler yurt dışı pazarlarını kaybetmiş, halkın refah düzeyi düşmüş ve ulusal paraları değer kaybetmişlerdir (Bulut, 2023:359-360).

Serbestleşme devletin ekonomiye artık müdahale etmemesi ve piyasa dinamikleri daha çok özel sektör eliyle yapılmasıdır. Keynesyen görüşlerden sonra özellikle 1980 yıllarından sonra başta gelişmiş ülkeler serbest piyasa ekonomisine geçiş yapmışlardır. 1989'da Sovyetlerin yıkılmasıyla bu bloktan ayrılan ve gelişmekte olan ülkelerde piyasa ekonomisine hızlı bir şekilde geçiş yaptılar. Kürselleşmenin etkisiyle liberal politikalar hayata geçmiş ve finansal serbestleşmede hem iç hem de dış finansal şeklinde olmuştur. Finansal sermayenin ülkelere uğrayıp çıkması gibi sorunlar finansal krizlerin yaşanmasına neden olmuştur. En çok finansal krizler gelişmekte olan ülkelerde etkisini göstermektedir (Tuncay ve Demir, 217:1152). 1990'lı yıllarından sonra planlı ekonomiden piyasa ekonomisine geçiş yapan bu ülkeler, başlarda planlı ekonominin izlerini taşımışlardır. Bütçe açıkları, yüksek seviyelerde oluşan enflasyon oranları, eksik istihdam ve üretim, üretim miktarını aşan para arzları gibi sorunlarla karşılaşmışlardır. 1992-97 yılları arasında yapılan makroekonomik istikrar politikaları ile bu sorunlara çözüm aramışlardır (Gündoğdu ve Aydın, 2014:294).

Yapılan ekonomik istikrar paketleri çözüm olmaya başlamış ve ilk enflasyon oranlarını düşürmeye çalışmışlardır. Tablolarda da görüleceği üzere ilk yıllarda yüksek olan enflasyon ve para arzları sonraki yıllarda düşme eğilimine girmiştir. Gelişmiş AB ülkelerinin yardımı ile bu sorunların üstesinden gelinmeye çalışılmıştır. Bu ülkelerin enflasyon ve parasal genişleme verileri aşağıdaki tablolarda gösterilmiştir.

Tablo 2: Ülkelerin 2000-2025 Enflasyon Verisi

Dönem	Bulgaristan	Polonya	Romanya	Macaristan	Çek Cumhuriyeti
Enflasyon (Yıllık ortalama %)					

2000–2004	6.38	5.34	25.94	7.32	2.54
2005–2009	7.16	2.66	6.72	5.10	2.20
2010–2014	1.98	2.30	4.06	3.20	1.76
2015–2019	1.38	0.88	1.30	1.94	1.70
2020–2024	4.86	7.40	7.26	8.90	6.82
2025 (tahmini)	4.00	3.50	7.00	3.80	2.50

Kaynak: Dünya Bankası ve IMF (2000-2025 verileri)

Enflasyon tablosunu yorumlamak gerekirse 2000-2004 yıllarında Romanya hiperenflasyon (%26) görülmüştür, Çekya ise en düşük %2,5 enflasyona sahip ülke olmuştur. 2005-2019 yılları arasında ise tüm ülkeler %0–4 bandına indi. En iyi 15 yıl olmuştur. Ancak 2020-2024 yıllarında ise Pandemi ve savaş şokuyla enflasyon çift hanelere çıkmıştır. En kötü performans Macaristan %8,9 ortalama ile görülmüştür. 2025 ise normalleşme başlamış ama Romanya hâlâ yüksek %7 düzeylerde seyretmiştir, Çekya tekrar en düşük (%2,5) enflasyonun görüldüğü ülke olmuştur. Son 25 yıllık süre içinde Çek Cumhuriyeti en düşük ve en istikrarlı ülke konumundadır. En büyük dönüşüm ise Romanya'da olmuştur

Tablo 3: Ülkelerin 2000-2025 Parasal Genişleme Verisi

Dönem	Bulgaristan	Polonya	Romanya	Macaristan	Çek Cumhuriyeti
M2 Para Arzı Büyüme Oranı (Yıllık ortalama %)					
2000–2004	14.90	10.60	24.76	12.38	8.92
2005–2009	14.26	10.46	14.30	12.14	9.76
2010–2014	7.22	5.88	8.64	6.88	6.08
2015–2019	6.84	7.66	8.66	7.46	6.86
2020–2024	7.88	8.12	8.78	8.50	7.56
2025 (tahmini)	4.20	4.80	5.70	5.00	4.50

Kaynak: Dünya Bankası ve IMF (2000-2025 verileri)

Parasal genişlemeye bakıldığında, en hızlı para arzı büyümesi 2000-2004 yılları arasında %24.8 ortalama ile Romanya'da olmuştur. Parasal genişlemenin en yavaş olduğu 2010-2014 döneminde tüm ülkeler %6-8 bandında olmuştur. Enflasyon verilerinde olduğu gibi parasal genişlemede de en istikrarlı ülke Çek Cumhuriyeti ve hiçbir zaman %10'u aşmadı. 2025'te ise bütün ülkeler %5 civarı veya altına inmiştir. Çünkü pandemi sonrası hızla artan enflasyon oranlarına karşı uygulanan sıkı para politikasıdır. Sonuç olarak para arzı büyümesi 2000'lerin başında yüksek seviyelerden 2025'te oldukça ılımlı seviyelere geriledi.

Tablo 4: Ülkelerin Para Birimi ve Euro Döviz Kurları

Ülke	Para Birimi	1 Euro =	Enflasyon Oranı

Bulgaristan	Bulgar Levası (BGN)	1,96 BGN	%5,3
Çek Cumhuriyeti	Çek Kronu (CZK)	24,24 CZK	%2,5
Macaristan	Macar Forinti (HUF)	384,52 HUF	%4,3
Polonya	Polonya Zlotisi (PLN)	4,23 PLN	%2,8
Romanya	Romen Leyi (RON)	5,08 RON	%9,9

Kur değerleri 23 Kasım 2025 itibarıyla piyasa ortalamasıdır (küçük dalgalanmalar olabilir). Enflasyon oranları Ekim/Kasım 2025 verilerine dayanmaktadır.

Hem enflasyon oranı hem de para arzı verilerine bakıldığında en güçlü para birimi ve en düşük enflasyon Çek Cumhuriyeti ilk sırada yer almaktadır. Romanya ise hem enflasyon yüksek düzeyde hem de para arzı yüksek olduğundan güçsüz para birimine sahip olduğu görülmektedir. Verilere göre şu an ekonomik sorunlar yaşanmaktadır. Diğer ülkeler ise enflasyon oranları normal düzeyde seyretmektedir.

4. EKONOMETRİK MODEL VE BULGULAR

27 AB üyesi bulunmaktadır. Bunlardan Euro birliği içinde olmayan Bulgaristan, Macaristan, Polonya, Romanya, Çek Cumhuriyeti, Danimarka, İsveç ülkeleridir. Bu ülkeler arasından gelişmekte olan piyasalar tercih edilmiştir. Ayrıca Yöntemsel birliği sağlamak amacıyla analize dört ülke ile devam edilmiştir: Bulgaristan, Macaristan, Polonya ve Romanya.

Çalışmanın amacı, bu ülkelerde para arzı ve enflasyon arasında bir ilişki olup olmadığının tespit edilmesidir. Bu çalışmada Fourier temelli yapısal kırılmaları dikkate alan testler tercih edilmiştir. Çünkü ülkelerin verileri ayrı ayrı incelendiğinde, özellikle 1990'lı yıllarda yüksek enflasyon sorunu yaşandığı, ancak AB üyeliklerini takiben önemli ölçüde enflasyonda düşüş olduğu gözlenmiştir. Benzer şekilde par arzındaki değişimlere bakıldığında da analize tabi dönem içinde trendi etkileyebilecek önemli değişimler yaşandığı gözlenmektedir. Bu nedenle kırılmanın sayısı ve türünde esneklik imkanı veren Fourier tabanlı testlerin uygulanmasının daha doğru olacağı görülmüştür. Çünkü Fourier yaklaşımı, kırılmaların ve yakalamaların sayısı, tarihleri ve biçimi hakkında önceden bilgi gerektirmez ve yapısal kaymaları az sayıda düşük frekanslı bileşen kullanarak kademeli/pürüzsüz bir süreç olarak yakalar.

Nedensellik testi içerisinde serilerin birim kök içerip içermediklerinin bilinmesi gerekmektedir. Bu amaçla Enders & Lee, 2012 - Fourier ADF Birim Kök Testi her bir ülke için ayrı ayrı uygulanmıştır.

Tablo 5: Fourier ADF Birim Kök Testi (Enflasyon)

	BULGARISTAN	**MACARISTAN**	**POLONYA**	**ROMANYA**
SABITLI	-4.261	-3.672	-4.491	-0.612
SABITLI VE TRENDLI	-4.666	-2.369	-3.204	1.112

FREKANS	1	3	3	1
	1	1	2	2

Tablo 6: Fourier ADF Birim Kök Testi (Para Arzı)

	BULGARISTAN	**MACARISTAN**	**POLONYA**	**ROMANYA**
SABITLI	-2.231	-2.30	-3.306	-2.705
SABITLI VE TRENDLI	-4.222	-1.854	-2.301	-0.428
FREKANS	1	2	3	3
	1	2	3	3

Maksimum Fouirer frekansı 3, maksimum gecikme sayısı 3, Bilgi kriteri olarak Akaike yöntemi tercih edilmiştir. Varyans tahmin metodu olarak Kurozumi with Bartlett kullanılmıştır. %10, %5 ve %1 anlamlılık düzeyinde Sabitli modelde Fourier 1 frekansı için kritik değerler -3.49, -3.81 ve -4.42; Fourier 2 frekansı için kritik değerler -2.91, -3.27 ve -3.97; Fourier 3 frekansı için -2.71, -3.07 ve -3.77 olarak hesaplanmıştır. Sabitli ve trendli modelde Fouirer 1 frekansı için -4.05, -4.35 ve -4.95; Fourier 2 frekansı için -3.71, -4.05 ve -4.69; Fouirer 3 frekansı için -3.44, -3.78, -4.45 olarak hesaplanmıştır.

Yapılan testler göstermektedir ki, Polonya hariç 3 ülke için de hem sabitli hem de sabitli ve trensli modelde %1 anlamlılık düzeyinde seriler durağan bir yapı göstermemektedir. Polonya ise sabitli ve trendli modelde birim kök içermektedir. Ancak dört ülke farklı anlamlılık seviyelerine göre bakıldığında ise sonuçlar değişmektedir. Bu nedenle tüm serilerin durağan olmasını gerektiren Granger nedensellik testi yerine, serileri düzeyinde nedensellik testine tabi tutmayı mümkün kılan Nazlioglu, et al (2016) tarafından geliştirilen Toda Yamamato temelli Fourier nedensellik testi bu çalışmada tercih edilmiştir.

Tabloda iki yönlü test var:

1. “Enf → Para Arzı” : Enflasyon para arzını nedeni midir?
2. “Para Arzı → Enf” : Para arzı enflasyonu nedeni midir?

Sayılardaki [köşeli parantez] içindeki değerler p-değerleridir (genellikle %5 anlamlılık düzeyinde $p < 0.05$ ise nedensellik kabul edilir).

Tablo 7: Toda Yamamato temelli Fourier nedensellik testi

Ülke	Enflasyon → Para Arzı	Para Arzı → Enflasyon	Sonuç (tek yönlü / çift yönlü nedensellik)
Bulgaristan	8.427 [p = 0.013]	16.562 [p = 0.000]	Çift yönlü güçlü nedensellik

Macaristan	7.629 [p = 0.072]	34.418 [p = 0.000]	Sadece Para Arzı → Enflasyon (çok güçlü)
Polonya	3.719 [p = 0.082]	2.366 [p = 0.146]	İki yönde de nedensellik yok (%10'da bile sınırda)
Romanya	0.374 [p = 0.934]	1.007 [p = 0.817]	İki yönde de hiç nedensellik yok

(Olasılık değerleri 1000 tekrarlı bootstrap ile hesaplanmıştır. Akaike bilgi kriteri kullanılmıştır)

Tablodan elde edilen sonuçlara göre Bulgaristan için %5 seviyesinde, Macaristan için ise %10 seviyesinde temel hipotez reddedilmiş ve değişkenler arasında karşılıklı nedensellik ilişkisi olduğu sonucuna varılmıştır. Polonya için %10 anlamlılık seviyesinde yalnızca Enflasyondan para arzına doğru anlamlı bir nedensellik ilişkisi olduğu görülmüştür. Romanya için ise iki yönde de anlamlı bir nedensellik ilişkisi tespit edilememiştir.

5. SONUÇ

Sovyetlerin 1989 yılında dağılmasıyla Doğu blokundan ayrılan ülkeler yeni bir politik ve ekonomik sistem arayışına girdiler. Bu ülkeler daha önce planlı ekonomi sistemi ile yönetilmişken bundan vazgeçip serbest piyasa ekonomisini tercih etmişlerder. Avrupa'nın doğusunda yer alan ülkeler Avrupa Birliğine girdiler. Ancak bazı sorunlardan dolayı daha Euro birliğine geçiş yapmadılar. Bu çalışmada, Euro kullanmayan özellikle eski doğu blokunda yer almış şuan Avrupa Birliği (AB)'de yer alan Bulgaristan, Macaristan, Polonya, Romanya ve Çek Cumhuriyeti'nin enflasyon verisi Tüketici Fiyat Endeksi (TÜFE) ve Para Arzı (M2) arasındaki ilişki 2000-2025 yılllarına ait aylık zaman serisi ile analiz edilmiştir. Parasal genişleme ile enflasyon arasında bir ilişkinin olup olmayacağı incelenmesi amaçlanmıştır. Bu amaçla, para arzının enflasyon oranı üzerindeki etkiler zaman serisi analiz yöntemlerinden Toda Yamamato temelli Fourier nedensellik testi bu çalışmada tercih edilmiştir. Analiz sonuçları özetle şöyledir:

- Bulgaristan'da para politikası ile enflasyon arasında çok güçlü ve çift yönlü bir ilişki var. Para arzı enflasyonu artırıyor, enflasyon da merkez bankasının para arzını artırmasına yol açıyor.
- Macaristan'da klasik monetarist görüşü geçerli görülüyor. Para arzındaki artışlar güçlü bir şekilde enflasyonu tetikliyor, ama ters yön (enflasyon → para arzı) anlamlı değil.
- Polonya ve Romanya'da ise para arzı ile enflasyon arasında istatistiksel olarak anlamlı bir nedensellik ilişkisi bulunmamış.

Sonuç olarak, Macaristan'da para arzının enflasyona neden olduğu hipotezinin en güçlü desteklendiği ülke olmuştur. Bulgaristan ise karşılıklı nedensellik ilişkisinin olduğu ülke, Polonya ve Romanya'da ise para arzı değişimleri enflasyonun kısa-orta vadeli hareketlerini nedensellik ilişkisi tespit edilmemiştir.

MULTIVEKTÖR DIŞ POLITIKA MODELI: AZERBAYCAN ÖRNEĞI

s.e.f.d. G.M. Quliyeva
Bakü Devlet Üniversitesi, Diplomasi ve Modern Entegrasyon Süreçleri Bölümü
ORCID: 0009-0003-9754-3588
E-posta: gulgun2004@mail.

Xülasə

Bu makale, çok vektörlü dış politika modelini teorik ve pratik açılardan incelemekte ve Azerbaycan Cumhuriyeti'nin bu model kapsamında izlediği dış politika seyrini incelemektedir. Azerbaycan'ın coğrafi konumu, enerji kaynakları ve tarihsel ve politik koşulları, çeşitli güç merkezleriyle aynı anda dengeli ve pragmatik ilişkiler kurmasına olanak sağlamaktadır. Makale, Azerbaycan'ın Rusya, Batı, Türkiye, İran ve Çin ile ilişkileri çerçevesinde çok vektörlü politikanın ana hatlarını ve sonuçlarını analiz etmektedir. Bu makalede, Azerbaycan Cumhuriyeti'nin çok vektörlü dış politika modeli ayrıntılı olarak incelenmektedir. Çok vektörlülük kavramı, küçük ve orta ölçekli devletlerin modern uluslararası ilişkiler sistemindeki konumlarını korumak ve güçlendirmek amacıyla çeşitli güç merkezleriyle paralel ilişkiler kurması olarak açıklanmaktadır. Makale, çok vektörlü politikanın teorik temellerini - realizm ve neo-realizm çerçevesinde - ve küçük devletlerin bu modele yönelmelerinin nedenlerini " balancing " ve "bandwagoning" yaklaşımları bağlamında incelemektedir. Azerbaycan'ın bağımsızlık döneminden bu yana, özellikle Haydar Aliyev ve İlham Aliyev dönemlerindeki dış politika stratejisinin oluşumu analiz edilmektedir. Haydar Aliyev'in denge yaklaşımı ve İlham Aliyev döneminde çok vektörlü politikanın sistemleştirilmesi, diplomatik pragmatizm ve stratejik tarafsızlık gibi özellikler vurgulanmaktadır. Makale, Azerbaycan'ın çok vektörlü politikasının bölgesel ve küresel yönlerini - Rusya, Türkiye, İran, Çin ve Batı (ABD ve Avrupa Birliği) ile ilişkileri - analiz etmektedir. Her bir ortakla işbirliğinin niteliği, özellikle enerji güvenliği, askeri-teknik iş birliği, bölgesel güvenlik ve stratejik çıkarların uyumu ayrıntılı olarak ele alınmaktadır. Özellikle Karabağ çatışması ve Rusya-Ukrayna savaşının Azerbaycan'ın denge politikası üzerindeki etkileri analiz edilmektedir. Jeopolitik esneklik, diplomatik manevra kabiliyeti ve ulusal çıkarların korunması, çok vektörlü politikanın avantajları olarak belirtilmektedir. Aynı zamanda, bölgesel çatışmalar, enerji güvenliğindeki riskler ve dengeleme politikasının karmaşıklığı gibi zorluklar da vurgulanmaktadır. Sonuç olarak, Azerbaycan örneği, çok vektörlü dış politika modelinin egemenliği korumak ve bölgesel ve uluslararası baskılar arasında esnek bir pozisyon almak için etkili bir araç olduğunu göstermektedir. Ancak, bu politikanın başarılı bir şekilde uygulanması yüksek diplomatik beceri ve stratejik analiz gerektirmektedir.

Açar sözlər: Çok vektörlü dış politika, Azerbaycan dış politikası, bölgesel dengeleme, enerji diplomasisi, stratejik ortaklık, Karabağ sorunu, jeopolitik esneklik, diplomatik manevra, bölgesel güvenlik

MULTIVEKTOR XARICI SIYASƏT MODELI: AZƏRBAYCAN NÜMUNƏSI

Xülasə

Bu məqalədə multivektor xarici siyasət modeli nəzəri və praktik aspektlərdə təhlil olunur və Azərbaycan Respublikasının bu model çərçivəsində apardığı xarici siyasət kursu araşdırılır. Azərbaycanın coğrafi mövqeyi, enerji resursları və tarixi-siyasi şəraiti onun müxtəlif güc mərkəzləri ilə eyni vaxtda balanslaşdırılmış və praqmatik əlaqələr qurmasına imkan verir. Məqalədə Azərbaycanın Rusiya, Qərb, Türkiyə, İran və Çinlə münasibətləri çərçivəsində multivektor siyasətin konturları və nəticələri təhlil edilir.Bu məqalədə Azərbaycan Respublikasının multivektor xarici siyasət modeli geniş təhlil olunur. Multivektorluq anlayışı, kiçik və orta dövlətlərin müasir beynəlxalq münasibətlər sistemində öz mövqelərini qorumaq və gücləndirmək üçün müxtəlif güc mərkəzləri ilə paralel əlaqələr qurması kimi izah edilir. Məqalədə multivektor siyasətin nəzəri əsasları – realizm və neorealizm çərçivəsində, həmçinin kiçik dövlətlərin bu modelə yönəlməsinin səbəbləri "balancing" və "bandwagoning" yanaşmaları kontekstində araşdırılır. Azərbaycanın müstəqillik dövründən başlayaraq, xüsusilə Heydər Əliyev və İlham Əliyev dövrlərində xarici siyasət strategiyasının formalaşması təhlil edilir. Heydər Əliyevin balanslaşdırıcı yanaşması və İlham Əliyev dövründə multivektor siyasətin sistemləşdirilməsi, diplomatik praqmatizm və strateji neytrallıq kimi xüsusiyyətlər vurğulanır. Məqalədə Azərbaycanın multivektor siyasətinin regional və qlobal istiqamətləri – Rusiya, Türkiyə, İran, Çin və Qərb (ABŞ və Avropa İttifaqı) ilə münasibətləri analiz edilir. Hər bir tərəfdaşla əməkdaşlığın xarakteri, xüsusilə enerji təhlükəsizliyi, hərbi-texniki əməkdaşlıq, regional təhlükəsizlik və strateji maraqların uyğunlaşdırılması aspektləri ətraflı müzakirə olunur. Xüsusi olaraq, Qarabağ münaqişəsinin və Rusiya–Ukrayna müharibəsinin Azərbaycanın balanslaşdırıcı siyasətinə təsirləri təhlil edilir. Multivektor siyasətin üstünlükləri kimi geosiyasi çeviklik, diplomatik manevr imkanları və milli maraqların qorunması qeyd edilir. Bununla yanaşı, regional qarşıdurmalar, enerji təhlükəsizliyində risklər və balans siyasətinin mürəkkəbliyi kimi çağırışlar da vurğulanır. Nəticədə, Azərbaycan nümunəsi göstərir ki, multivektor xarici siyasət modeli suverenliyi qorumaq, regional və beynəlxalq təzyiqlər arasında çevik mövqe tutmaq üçün effektiv vasitədir. Lakin bu siyasətin uğurla həyata keçirilməsi yüksək diplomatik bacarıq və strateji analiz tələb edir.

Açar sözlər Multivektor xarici siyasət, Azərbaycanın xarici siyasəti, regional balanslaşdırma, enerji diplomatiyası, strateji tərəfdaşlıq, Qarabağ münaqişəsi, geosiyasi çeviklik, diplomatik manevr, regional təhlükəsizlik

MULTIVECTOR FOREIGN POLICY MODEL: THE EXAMPLE OF AZERBAIJAN

Summary

This article provides a comprehensive analysis of Azerbaijan's multivector foreign policy model. The concept of multivectority is explained as the approach adopted by small and medium-sized states to maintain and strengthen their positions in the modern international system by establishing parallel relations with multiple centers of power. The theoretical foundations of multivector policy are examined

within the frameworks of realism and neorealism, alongside the reasons why smaller states adopt this model through the lenses of balancing and bandwagoning strategies. The formation of Azerbaijan's foreign policy strategy since independence is analyzed, with particular focus on the balancing approach under Heydar Aliyev and the systematization of multivector policy, diplomatic pragmatism, and strategic neutrality during Ilham Aliyev's presidency. The article further explores Azerbaijan's multivector policy in regional and global dimensions, analyzing its relations with Russia, Turkey, Iran, China, and the West (the USA and the European Union). The nature of cooperation with each partner is discussed in detail, highlighting aspects such as energy security, military-technical cooperation, regional security, and the alignment of strategic interests. The impacts of the Nagorno-Karabakh conflict and the Russia–Ukraine war on Azerbaijan's balancing strategy are also assessed. Advantages of the multivector policy include geopolitical flexibility, diplomatic maneuvering capabilities, and protection of national interests. At the same time, challenges such as regional conflicts, energy security risks, and the complexity of maintaining balance are emphasized. In conclusion, the Azerbaijani case demonstrates that the multivector foreign policy model is an effective tool for preserving sovereignty and maintaining a flexible position amid regional and international pressures. However, successful implementation of this policy requires high diplomatic skill and strategic analysis.

Keywords: Multivector foreign policy, Azerbaijan foreign policy, regional balancing, energy diplomacy, strategic partnership, Nagorno-Karabakh conflict, geopolitical flexibility, diplomatic maneuvering, regional security

GİRİŞ

Çok vektorlu dış politika modeli, modern uluslararası ilişkilerde orta güç devletlerinin çıkarlarını korumak için uyguladıkları stratejik yaklaşımlardan biridir. Bu model sayesinde devletler yalnızca çatışmalardan kaçınmakla kalmaz, aynı zamanda çeşitli uluslararası aktörlerle iş birliği yapma fırsatlarını da korurlar. Azerbaycan, Sovyet sonrası alanda bu politikayı başarıyla uygulayan devletlerden biridir.

METOD VƏ MATERİLLAR.

Modern uluslararası ilişkiler sisteminde artan jeopolitik belirsizlikler, derinleşen bölgesel çatışmalar ve küresel güç dengesindeki değişimler ışığında, orta ve küçük devletlerin dış politika tercihleri daha da önemli hale gelmiştir. Özellikle Sovyet sonrası alanda yer alan ve stratejik kaynaklara sahip ülkeler için güvenlik, bağımsızlık ve bölgesel istikrar arasında bir denge sağlamak hayati önem taşımaktadır. Bu gibi durumlarda, çok vektorlu dış politika modeli, devletlerin aynı anda birden fazla büyük güçle iş birliği kurmak ve ulusal çıkarlarını en üst düzeyde korumak için kullandıkları esnek bir yaklaşımdır. Rusya, İran, Türkiye ve Batı arasında jeopolitik bir "geçiş bölgesi"nde yer alan Azerbaycan Cumhuriyeti, bu modeli uygulayarak bağımsız politika çizgisini oluşturmayı ve sürdürmeyi başarmıştır. Enerji kaynaklarının ihracatı, ulaştırma ve lojistik kabiliyetlerinin genişletilmesi ve güvenlik zorluklarının dengelenmesi gibi konular, Azerbaycan'ın çok yönlü ve pragmatik bir dış politika çizgisini zorunlu kılmıştır. Son yıllarda Güney Kafkasya'da meydana gelen değişimler - özellikle 2020'deki İkinci Karabağ Savaşı ve bunun sonucunda oluşan yeni bölgesel güvenlik mimarisi ve Azerbaycan'ın Rusya-Ukrayna savaşı bağlamında bir pozisyon alma ihtiyacı - çok vektörlü politika kavramının önemini daha da artırmıştır. Bu bağlamda, Azerbaycan'ın Rusya, Türkiye ve Batı ile paralel iş birliği ve İran ve Çin ile ilişkilerinde temkinli ve stratejik yaklaşımı, bu modelin analiz edilmesini gerekli kılmaktadır. Dolayısıyla, bu konu yalnızca teorik olarak değil, aynı zamanda pratik açıdan da güncelliğini

korumaktadır. Azerbaycan'ın çok vektörlü dış politika çizgisinin analizi, bölgesel güçleri dengeleme politikasının fırsat ve sınırlamalarını anlamaya yardımcı olmakla kalmayıp, aynı zamanda diğer benzer ülkeler için de model teşkil edebilecek bir deneyim sunmaktadır.

Çok Vektörlülük Kavramı: Kökenleri ve Uygulama Alanları Çok vetorlü dış politika kavramı, modern uluslararası ilişkiler teorisinde özellikle küçük ve orta ölçekli devletlerin dış politika davranışlarını açıklayan kavramlardan biri olarak ortaya çıkmıştır. Bu kavram, esas olarak Soğuk Savaş sonrası dönemde, yani iki kutupluluk sonrası dönemde, küresel güç merkezlerinin büyümesi ve çok taraflı ilişkilerin genişlemesiyle bağlantılı olarak oluşmuştur. Çok vektörlü **çok vektörlülük**, bir devletin ulusal çıkarlarını en üst düzeyde korumayı amaçlayan, bazen rekabet eden birkaç farklı uluslararası aktörle aynı anda ilişki kuran esnek ve dengeli bir dış politika stratejisidir [2].

Çok vektörlü dış politika modelinin teorik temelleri neorealizm, karmaşık karşılıklı bağımlılık, yumuşak güç ve rasyonalist tercih yaklaşımlarıyla açıklanmaktadır. Neorealist yaklaşıma göre devletler, anarşik bir uluslararası sistemde güvenliklerini sağlamak için dengeleme ve ittifaklara yönelirler. Çok vektörlü yaklaşımı ise bu dengelemenin, müttefik veya ortak olarak kabul edilebilecek birden fazla güç merkezi arasında paralel olarak gerçekleştirilmesini öngörmektedir. Bu politika, teori ve pratikte ilk olarak Orta Asya ve Kafkasya bölgelerinde, özellikle Kazakistan, Azerbaycan ve Özbekistan gibi devletlerin dış politikalarında sistematik olarak kendini göstermiştir. Örneğin, 1990'ların sonlarında, Kazakistan Cumhurbaşkanı Nursultan Nazarbayev, çok vektörlü politikasını ülke dış politikasının temel ilkesi olarak ilan etmiştir. Bağımsızlığını kazandıktan sonra Azerbaycan, özellikle 1994'ten itibaren dengeli ve pragmatik bir yaklaşıma öncelik vermiştir [4].

Çok vektörizmin temel uygulama alanları aşağıdaki gibidir:

Güvenlik: Farklı güç merkezleriyle eş zamanlı olarak iş birliği yaparak bölgesel istikrarı sağlamak.

Enerji ve ekonomi: Enerji kaynaklarının taşınmasında rotaların çeşitlendirilmesi ve çeşitli aktörlerle paralel iş birliği yapmak.

Diplomatik denge: Küresel aktörler (örneğin Rusya ve Batı veya Çin ve Amerika Birleşik Devletleri) arasında tarafsız veya esnek bir konum sağlamak.

Bölgesel entegrasyon: Çeşitli entegrasyon platformlarına katılarak daha geniş bir uluslararası bağlamda ulusal çıkarların güvence altına alınması.

Bu modelin önemli bir özelliği, devletin yalnızca tek bir güç merkezine bağlı olmaması, aksine stratejik özerkliğini korumaya çalışmasıdır. Dolayısıyla, çok vektörlü dış politika modeli, özellikle jeopolitik açıdan hassas bölgelerde bulunan devletler için esneklik, diplomatik manevra olanakları ve güvenlik garantileri açısından avantajlar sunmaktadır.

Realizm ve neorealizm çerçevesinde açıklama. Çok vektörlü dış politika modeli, uluslararası ilişkiler teorisindeki realist ve neorealist yaklaşımlar ışığında daha derinlemesine anlaşılabilir. Realist teorinin temel fikri, uluslararası ilişkilerin anarşik bir ortamda gerçekleştiği ve devletlerin bu sistemde ulusal çıkarlarını –başta güvenlik ve hayatta kalma olmak üzere– sağlama mücadelesi verdikleridir (Morgenthau, 1948). Neorealizm (Waltz, 1979), uluslararası sistemin yapısının, yani güç dengesinin, devletlerin davranışlarını şekillendiren temel etken olduğunu vurgular. Bu teorik yaklaşımlara göre devletler, güç merkezleri arasında denge politikası izleyerek güvenliklerini sağlamaya çalışırlar. Bu bağlamda çok vektörlü dış politika, realizm ve neorealizmdeki dengeleme və bandvagoninq kavramları arasında esnek bir geçişe olanak tanıyan bir araç işlevi görür. Çok vektörlü dış politika izleyen devletler, bir yandan belirli güç merkezlerine yakınlaşmaya ve onların desteğinden yararlanmaya çalışırlar (bandwagoning), diğer yandan da rakip aktörlerle ilişkilerini sürdürerek güç dengesini korurlar (balancing). Neorealist yaklaşımda, çok kutuplu bir güç yapısında (örneğin ABD, Rusya, Çin ve AB gibi aktörlerin varlığı), küçük ve orta ölçekli devletler için en uygun yol stratejik

tarafsızlık veya paralel ortaklıklardır. Bu yaklaşım Azerbaycan örneğinde açıkça görülmektedir. Azerbaycan ne NATO ne de Kolektif Güvenlik Antlaşması Örgütü üyesidir, ancak her iki yapının da ana güçleriyle iş birliği yapmaktadır. Bu, realist yaklaşımda devletlerin çıkarları doğrultusunda uyarlanabilir politikalar yürütme yeteneğini göstermektedir. Realizmin bir diğer önemli unsuru olan kendini koruma içgüdüsü de çok vektörlü politikanın temelini oluşturur. Azerbaycan'ın hem Rusya hem de Batı ile paralel iş birliği, İran ve Çin ile temkinli denge politikası ve bölgesel çatışmalara karışmaktan kaçınma konusundaki diplomatik esnekliği bunun açık örnekleridir. Aynı zamanda, realizmin "çıkar temelli davranış" yaklaşımı çok vektörlü politikaya da yansır: devletler ilkeli bir tutumdan ziyade pragmatik bir tutumla hareket eder, yani ideolojik bir politikadan ziyade daha çok çıkar temelli bir politika izlerler. Azerbaycan da ulusal güvenlik, ekonomik kalkınma ve uluslararası prestij gibi çıkarlarını korumak için farklı aktörlerle eş zamanlı olarak iş birliği yapma politikasını tercih etmektedir. Dolayısıyla, çok vektörlü dış politika modeli, realizm ve neorealizm temel ilkelerine uygun olarak açıklanabilir. Bu model, devletlerin anarşik bir uluslararası sistemde hayatta kalma, denge kurma ve çıkarlarını en üst düzeye çıkarma çabalarının bir tezahürüdür.

Küçük ve orta ölçekli devletlerin bu modele yönelmesinin nedenleri. Uluslararası sistemde güç dağılımının eşitsizliği ve büyük güçler arasındaki derinleşen rekabet, küçük ve orta ölçekli devletlerin dış politika stratejilerini daha esnek ve dengeli bir şekilde oluşturma ihtiyacını doğurmaktadır.

Çok vektörlü dış politika modeli, bu tür devletlerin çıkarlarına en uygun yaklaşımlardan biridir. Küçük ve orta ölçekli devletler için bu model, bir yandan güvenlik garantileri elde etmeye, diğer yandan ekonomik ve diplomatik olanaklarını genişletmeye hizmet eder. Çok vektörlü politikaya yönelmenin temel nedenleri şunlardır: Jeopolitik ve jeoekonomik hassasiyet. Küçük ve orta ölçekli devletler genellikle büyük güç merkezleri arasında yer alır ve bu da onları doğrudan çatışmaların etkisi altına sokar. Böyle bir coğrafyada bulunan bir devlet için yalnızca tek bir güç merkezine bağlı olmak tehlikeli ve kısıtlayıcı olabilir. Çok vektörlü politika, bu devlete farklı yönlerde diplomatik ve ekonomik manevra olanakları sağlar. Azerbaycan bunun klasik bir örneğidir - Rusya, İran, Türkiye ve Batı arasında yer alan bu devlet, aynı anda çeşitli güç merkezleriyle iş birliği yapmaktadır. Güvenlik Teminatına İhtiyaç: Küçük devletler askeri güce sahip olmadıkları için güvenliklerini uluslararası ortaklıklar aracılığıyla sağlamaya çalışırlar. Çok vektörlü politikası bu açıdan en uygun seçimdir, çünkü bu model devlet için alternatif güvenlik kanalları oluşturarak herhangi bir güç merkezine bağımlılığı en aza indirir. Böylece, bir aktörle ilişkilerde yaşanan bir bozulma, bir başkasıyla telafi edilebilir.

Ekonomik Bağımlılığın Çeşitlendirilmesi: Küçük devletler genellikle kaynaklar ve pazarlar açısından daha sınırlı fırsatlara sahiptir. Çok vektörlü politika bu devletlerin birden fazla ekonomik ortakla iş birliği yapmalarına, ticaret ve yatırım akışlarını çeşitlendirmelerine olanak tanır. Örneğin, Azerbaycan'ın Avrupa, Çin ve Türkiye pazarlarına eş zamanlı erişimi, bu politikanın ekonomik avantajını göstermektedir.

Diplomatik Tanınma ve Uluslararası Meşruiyet Yeni veya az bilinen devletlerin, uluslararası tanınma ve meşruiyet kazanmak için çeşitli aktörlerle ilişkiler kurmaları gerekmektedir. Çok vektörlü yaklaşım burada hem küresel örgütlerle (BM, AB, NATO) iş birliği hem de bölgesel güçlerle ikili ilişkilerin geliştirilmesi yoluyla kullanılmaktadır. Azerbaycan'ın hem İslam İşbirliği Teşkilatı, Bağlantısızlar Hareketi hem de Avrupa Birliği ile iş birliği platformundaki faaliyetleri bunun kanıtıdır.

Büyük Güç Rekabetinden Yararlanma Çok vektörlü politika, küçük devletlerin büyük güçler arasındaki rekabetten jeopolitik kazanç elde etmelerini sağlar. Büyük güçler, o devletin sadakatini kazanmak için onlara daha fazla ekonomik ve politik ayrıcalık sunabilir. Bu, o devletin çıkarlarını daha kârlı bir şekilde gerçekleştirmesi için koşullar yaratır. Bu unsur, Rusya, Avrupa ve Çin pazarlarıyla paralel iş birliğinin kullanıldığı Azerbaycan'ın enerji politikasında açıkça görülmektedir. Dolayısıyla, küçük ve orta ölçekli devletler için çok vektörlü dış politika modeli, stratejik esneklik, risk azaltma ve ulusal çıkarların daha geniş ölçekte güvence altına alınması açısından vazgeçilmez bir araçtır. Bu model,

hem jeopolitik hem de ekonomik bağımsızlığı korumak için en uygun seçenek olmaya devam etmektedir.

"**Bandwagoning" ve "Balancing" yaklaşımları**. Uluslararası ilişkiler teorisinde, özellikle realizm ve neorealizm çerçevesinde, devletlerin güç merkezlerine yönelik davranışlarını açıklayan iki temel kavramsal yaklaşım vardır: "dengeleme" ve "bandwagoning" (**eklemlenme)**. Bu iki yaklaşım, devletlerin güvenliklerini sağlamak ve çıkarlarını korumak için uluslararası sistemde kendilerini nasıl konumlandırdıklarını anlamaya yardımcı olur. Çok vektörlü dış politika modeli ise aslında bu iki yaklaşımın esnek bir birleşimi olarak işlev görür. **Dengeleme yaklaşımı** Dengeleme yaklaşımına göre devletler, uluslararası sistemde hegemonya veya tehdit oluşturan güçlere karşı karşıt güç merkezleriyle ittifaklar kurarak denge oluşturmaya çalışırlar (Waltz, 1979). Bu strateji, devletler bağımsızlıklarını ve egemenliklerini korumak istediklerinde özellikle önem kazanır. Böyle bir yaklaşım, devletlerin baskın güce karşı çıkarak kendilerini daha güvende hissettiklerini gösterir. Azerbaycan örneğinde, dengeleme yaklaşımı, Rusya ile yakın ilişkiler kurulmasına paralel olarak Batılı kurumlar (Avrupa Birliği, NATO ile iş birliği) ve Türkiye ile stratejik ortaklıkların geliştirilmesinde kendini göstermektedir. Bu yaklaşım, Azerbaycan'ın bölgesel ve küresel güçler arasında güç dengesini korumaya çalıştığını göstermektedir. Bandwagoning Güçlü bir aktöre katılma yaklaşımı. Bandwagoning kavramına göre devletler, güçlü veya baskın bir aktörle iş birliği yaparak ve onun himayesine girerek daha az risk ve daha fazla fayda elde etmeye çalışırlar (Walt, 1987). Bu model genellikle zayıf devletler tarafından tercih edilir, çünkü bu durumda baskın gücün baskısından kaçınma veya ekonomik ve politik kazanç elde etme fırsatına sahip olurlar. Azerbaycan'ın enerji politikasında Batı ile iş birliği yapması ve "Güney Gaz Koridoru" projesi kapsamında Avrupa ile bütünleşmesi, bir anlamda bandwagoning yaklaşımının unsurlarını içermektedir. Ayrıca, Çin ile "Tek Kuşak, Tek Yol" girişimine katılımı, gelecekteki ekonomik çıkarları göz önünde bulundurarak bu güç merkeziyle ilişkileri derinleştirme girişimi olarak görülebilir. Çoklu vektörlülük bu iki yaklaşım arasında nasıl işliyor? Çoklu vektörlü dış politika modeli, özünde dengeleme ve taraf değiştirme stratejilerini bağlamsal ve paralel olarak uygulayan hibrit bir yaklaşımdır. Bu modelde, devlet aynı anda bazı alanlarda baskın güce yakınlık gösterir (taraf değiştirme), diğer alanlarda ise diğer güç merkezleriyle denge kurarak karşı tarafın etkisini sınırlamaya çalışır (dengeleme). Bu yaklaşım, Azerbaycan'ın dış politikasında dinamik bir şekilde uygulanmaktadır.

Rusya ile dengeli iş birliği; Türkiye ile askeri ve stratejik yakınlık (dengeleme); enerji ve insan sermayesi alanında Avrupa ile derin entegrasyon (bandwagoning); İran ve Çin ile temkinli açık diplomatik kanallar (dengeleme ve fırsatları değerlendirme). Dolayısıyla, "dengeleme" ve "bandwagoning" yaklaşımlarının birleşimi, çok vektörlü politikanın temel itici mekanizmalarından biridir. Azerbaycan, bu iki yaklaşımı bağlamsal ve çıkar temelli bir şekilde kullanarak uluslararası sistemde esnek, pragmatik ve dengeli bir konum sürdürmeye çalışmaktadır.

1990'lar: Devlet İnşası ve Dış Politikanın Ana Hatlarının Belirlenmesi Azerbaycan, 1991'de bağımsızlığını yeniden kazandıktan sonra dış politika alanında ciddi zorluklarla karşı karşıya kaldı. Sovyetler Birliği'nin çöküşü yalnızca siyasi özgürlük getirmekle kalmadı, aynı zamanda ekonomik çöküş, bölgesel çatışmalar ve güvenlik boşluğu gibi bir dizi yapısal sorunun mirasını da bıraktı. Böyle bir bağlamda, Azerbaycan'ın dış politika stratejisinin hem devlet inşası hem de uluslararası konumlarının oluşumuyla paralel olarak geliştirilmesi gerekiyordu. 1990'larınbaşlarında, Azerbaycan Cumhuriyeti'nin dış politikası esas olarak tepkisel (tepkisel) bir yapıya sahipti. Bu dönem, özellikle Dağlık Karabağ sorununun şiddetlenmesi, Ermenistan ile askeri çatışmalar ve uluslararası izolasyon durumunun varlığıyla karakterize edildi. İlk yıllarda dış politikada öncelik, diplomatik tanınma, toprak bütünlüğünün uluslararası alanda korunması ve bağımsızlığın korunması gibi temel konulara odaklanmıştı.

Temel özellikler ve öncelikler: Uluslararası tanınma ve örgütlere üyelik: Azerbaycan'ın 1992'de BM'ye kabulü, ülkenin uluslararası öznelliğinin tanınması açısından önemli bir aşamaydı. Daha sonra, AGİT, İİT, BDT ve diğer bölgesel örgütlere üyelikle uluslararası hukuki konumu güçlendirildi.

Toprak bütünlüğünün korunması: Dağlık Karabağ sorununun tırmanması ortamında, Azerbaycan dış politikasının temel amacı, Ermenistan'ın saldırgan politikasına karşı uluslararası destek kazanmak ve BM kararlarının kabul edilmesini sağlamaktı. 1993 yılında kabul edilen 822, 853, 874 ve 884 sayılı kararlar bunun bir sonucuydu.

Enerji kaynaklarının jeopolitik bir araca dönüşmesi: 1994 yılında imzalanan ve "Əsrin Anlaşması" olarak adlandırılan petrol anlaşması, Azerbaycan'ın dış politikasında yeni bir dönemin başlangıcını işaret ediyordu. Bu anlaşma sayesinde Azerbaycan, Batılı şirketlerle iş birliği yaparak enerji kaynaklarını uluslararası pazarlara ihraç edebildi. Böylece enerji diplomasisi ilk kez çok yönlü bir dış politikanın temel direklerinden biri haline geldi.

Türkiye ile ilişkilerin gelişimi: Bağımsızlığını kazandıktan sonra Azerbaycan, kardeşlik ve stratejik ortaklık üzerine kurulu Türkiye ile ilişkilere önem verdi. Bu ilişkiler yalnızca siyasi değil, aynı zamanda ekonomik, askeri ve kültürel alanları da kapsıyordu. Türkiye, Azerbaycan'ın bölgedeki ana destekçisi haline geldi.

Rusya ile ilişkilerin düzenlenmesi: Azerbaycan'ın bağımsız politikası, Rusya'nın Sovyet sonrası alanda nüfuzunu sürdürmeye çalışması nedeniyle Moskova ile gerginlik yaratsa da, 1990'ların sonlarına doğru, özellikle Haydar Aliyev'in liderliği sırasında, bu ilişkilerde gerçekçiliğe dayalı pragmatik bir çizgi şekillenmeye başladı.

Haydar Aliyev'in rolü ve kavramsal değişim. Ulusal lider Haydar Aliyev'in 1993 yılında iktidara geri dönmesiyle birlikte dış politikada istikrar, denge ve stratejik düşünce ön plana çıktı. Onun liderliğinde Azerbaycan, dış politikada temel ilke olarak güvenliğe odaklanan pragmatik, çok vektörlü bir yaklaşım benimsedi. Bu, devletin iç ve dış politikalarının senkronize edilmesi ve uluslararası sistemde güçlendirilmesi açısından bir dönüm noktasıydı. Dolayısıyla 1990'lar, Azerbaycan dış politikasının ilk hatlarının belirlendiği ve devlet yapısının korunmasıyla birlikte uluslararası ilişkiler sistemine entegrasyon sürecinin başladığı bir dönem olarak nitelendirilir. Bu dönemde atılan temel adımlar, daha sonra geliştirilen çok yönlü dış politikanın temelini oluşturmuştur.

Azerbaycan Dış Politika Stratejisinin Oluşturulması. 1990'lar: Devlet İnşası ve Dış Politikanın Hatlarının Belirlenmesi Sovyetler Birliği'nin dağılmasının ardından, 1991 yılında bağımsızlığını yeniden kazanan Azerbaycan, yeni jeopolitik gerçeklerle karşı karşıya kalmıştır. Bu dönemde ülkenin dış politikasının temel önceliği, uluslararası meşruiyetin tanınması, BM ve diğer uluslararası kuruluşlara üyelik, toprak bütünlüğünün desteklenmesi ve Ermenistan ile savaşın ağır sonuçlarıyla mücadele olmuştur. 1992-1993 yıllarındaki siyasi istikrarsızlık ve deneyimsizlik ortamında, dış politika net bir doğrultuda yürütülememiştir. Ancak 1993 yılında Haydar Aliyev'in iktidara gelmesiyle birlikte, dış politikada tutarlı ve esnek bir çizginin temelleri atıldı.

Haydar Aliyev'in dengeleyici yaklaşımı. Haydar Aliyev liderliğinde, dengeli bir yaklaşım Azerbaycan dış politikasında baskın çizgi haline geldi. Bu strateji, hem Batılı devletlerle (ABD, Avrupa Birliği) hem de Rusya, İran ve Türkiye ile paralel ve birbiriyle çelişen ilişkiler kurmayı amaçlıyordu. 1994 yılında imzalanan "Asrın Anlaşması" gibi büyük enerji projeleri sayesinde Azerbaycan, Batı sermayesi için stratejik önem kazanırken, aynı zamanda Rusya ile ilişkilerde temkinli bir politika benimsendi. Bu dönem, Azerbaycan'ın çok vektörlü politikasının ilk hatlarının oluşması açısından kilit bir aşama olarak kabul edilmektedir.

İlham Aliyev döneminde çok vektörlülüğün sistemleştirilmesi. İlham Aliyev'in cumhurbaşkanlığı döneminde, 2003 yılından bu yana Azerbaycan, çok vektörlü dış politika modelini daha da geliştirmiştir. Enerji diplomasisi, ulaştırma ve lojistik projeleri (TANAP, TAP, Bakü-Tiflis-Kars vb.), Bağlantısızlar Hareketi'ndeki faaliyetler, Avrupa Birliği ile ortaklık programları ve aynı zamanda Rusya ve Çin ile ikili ilişkilerin genişlemesi, Azerbaycan'ın aynı anda birden fazla güç merkeziyle iş birliği yaptığını göstermektedir. Bu durum, Azerbaycan'ın köprü işlevini yalnızca coğrafi olarak değil, diplomatik olarak da güçlendirmiştir.

Diplomatik pragmatizm ve stratejik tarafsızlık. İlham Aliyev döneminin karakteristik özelliklerinden biri diplomatik pragmatizmdir. Azerbaycan, ideolojik eğilimlerden uzak, ulusal çıkarlara daha fazla dayanan, riskleri analiz eden ve fırsatları en iyi şekilde değerlendiren bir politika izlemektedir. Rusya-Batı ve İran-Batı gerginliğinin arttığı koşullarda, Azerbaycan stratejik tarafsızlık ilkesine bağlı kalarak dengeyi korumaya çalışmaktadır. Özellikle Rusya-Ukrayna savaşı ortamında, Bakü ne Batı yaptırımlarına katılıyor ne de Moskova ile çatışmaya giriyor. Bu, Azerbaycan'ın çok yönlü dış politikasında bağımsız ve esnek bir aktör olduğunu göstermektedir. Azerbaycan-Rusya İlişkileri. Azerbaycan-Rusya ilişkileri, çok yönlü dış politikanın önemli ayaklarından birini oluşturmaktadır. İki ülke arasındaki tarihi, coğrafi ve stratejik bağlar, Azerbaycan'ı Sovyet sonrası alanda Rusya ile yakın bağları sürdüren ana aktörlerden biri haline getirmiştir. 1990'ların sonlarından itibaren, özellikle Haydar Aliyev döneminde Azerbaycan, Rusya ile ilişkilerini pragmatik bir temelde inşa etmeye başlamıştır. Bu yaklaşım "stratejik iş birliği" formülüne dayansa da, tam bir bağımlılıktan uzak, dengeli bir çizgideydi [6]. İlham Aliyev döneminde bu ilişkiler daha kurumsal bir nitelik kazandı. Enerji, güvenlik ve ulaştırma gibi alanlarda karşılıklı yarar sağlayan iş birliği formatları geliştirildi. Örneğin, silah alımları ve sınır güvenliği konularında koordinasyon da dahil olmak üzere Rusya ile askeri-teknik iş birliği, Azerbaycan için bölgesel istikrarın korunmasında önemli bir rol oynadı. Aynı zamanda Azerbaycan, Ermenistan ile yaşanan anlaşmazlığın çözümü için Rusya ile ikili ve çok taraflı formatlarda müzakerelere devam etmekte ve Kremlin'in Güney Kafkasya'daki nüfuzunu dikkate alan bir politika izlemektedir [1]. Çok vektörlü politika çerçevesinde Azerbaycan, Rusya ile ilişkilerini Batı ve diğer bölgesel güçlerle ilişkileriyle çelişmeyecek şekilde yönetmektedir. Bu yaklaşım, Azerbaycan'ın egemenlik ilkesine bağlılığını korurken, Rusya'nın bölgede istikrar adına yapıcı bir ortak olarak kalmasını amaçlamaktadır. Bu ilişkilerin bir diğer önemli boyutu da enerji diplomasisi çerçevesinde ortaya çıkmaktadır. Azerbaycan enerji kaynaklarının Avrupa'ya taşınması, Rusya ile rekabeti, bazen de iş birliğini gerektirmektedir. Dolayısıyla Azerbaycan, Hazar Denizi ötesi iş birliği olasılığını tamamen göz ardı etmeden, enerji politikasını Rusya'nın çıkarlarını dikkate alarak yönlendirmektedir [9]. Dolayısıyla Azerbaycan-Rusya ilişkileri, çok vektörlü dış politikanın "dengeleme" mekanizmasının pratik bir örneğidir: Ne Moskova ile bir çatışma ne de onun bölgesel hakimiyetine tam bir boyun eğme söz konusudur. Bu, Azerbaycan'ın stratejik bağımsızlığını korumaya ve bölgesel ve uluslararası güç merkezleri arasında esnek manevra kabiliyetlerini sürdürmeye hizmet etmektedir.

Azerbaycan-Rusya İlişkileri. Azerbaycan ve Rusya arasındaki iş birliği, güvenlik konularında önemli bir yer tutmaktadır. Bölgede lider bir güç olan Rusya, Azerbaycan'ın toprak bütünlüğü ve güvenlik stratejilerinde ana aktörlerden biridir. İki ülke, sınır koruma, terörle mücadele ve barışı koruma operasyonları gibi alanlarda iş birliği yapmaktadır. 2010'lardan bu yana Azerbaycan, Rusya ile askeri iş birliğinde giderek artan bir pragmatizm sergilemektedir. Bu iş birliği, Azerbaycan için bölgesel istikrarın korunması ve çatışma bölgelerindeki nüfuz alanının dengelenmesi açısından önemlidir [5].

Enerji, askeri-teknik ilişkiler. Azerbaycan ve Rusya arasındaki enerji sektöründeki ilişkiler hem rekabet hem de iş birliği unsurları içermektedir. Azerbaycan, petrol ve doğalgaz ihracatını Batı pazarlarına çeşitlendirmeye çalışsa da, Trans-Hazar doğalgaz boru hattı gibi enerji projeleri konusunda Rusya ile diyalog halindedir. Askeri-teknik sektörde Azerbaycan, Rus yapımı askeri teçhizat kullanmakta ve Rusya'dan askeri teçhizat satın almakta, ayrıca askeri eğitim ve deneyim alışverişinde bulunmaktadır. Bu alandaki iş birliği, Azerbaycan'ın savunma kabiliyetlerini güçlendirmek için önemli bir bileşendir [14].

Azerbaycan-Türkiye Stratejik Ortaklığı. Askeri, siyasi ve kültürel entegrasyon. Azerbaycan ve Türkiye arasındaki ilişkiler, bağımsızlıktan bu yana hızla gelişmiş ve ittifak düzeyine yükselmiştir. Bu iş birliği, hem askeri, hem siyasi hem de kültürel alanlarda derin bir entegrasyonu kapsamaktadır. Askeri alanda, ortak tatbikatlar, savunma sanayi iş birliği ve istihbarat paylaşımı, karşılıklı güvenliğin güçlendirilmesinde önemli bir rol oynamaktadır. Siyasi alanda ise iki ülke, özellikle Dağlık Karabağ sorunu ve bölgesel meseleler olmak üzere uluslararası platformlarda karşılıklı destek sağlamaktadır.

Kültürel ve dilsel birlik, uzun vadeli dostluğun ve stratejik ortaklığın temel direğini oluşturmaktadır [11].

Zangezur Koridoru, Şuşa Deklarasyonu. 2021 yılında imzalanan Şuşa Deklarasyonu, Azerbaycan ve Türkiye arasındaki ilişkilerin stratejik niteliğini daha da güçlendirmiştir. Deklarasyon, iki ülke arasında askeri iş birliği ve güvenlik alanında yeni bir aşamanın başlangıcını işaret etmiştir. Aynı zamanda, Zangezur Koridoru gibi bölgesel ulaşım ve ekonomik iş birliği projeleri, iki ülkenin küresel ve bölgesel entegrasyon stratejilerinde karşılıklı çıkarlarının bir göstergesidir. Bu koridor aracılığıyla Azerbaycan ve Türkiye, ekonomik ve ticari ilişkilerini güçlendirmenin yanı sıra Güney Kafkasya'da ulaşım altyapısının yeniden şekillenmesine de ivme kazandırıyor.

Azerbaycan ve Türkiye arasında Türk Devletleri Teşkilatı (TDT) bünyesinde iş birliği özellikle önemlidir. TUT'un amacı, Türk devletleri arasındaki siyasi, ekonomik ve kültürel entegrasyonu güçlendirmektir. Azerbaycan ve Türkiye, TUT'ta liderlik rolünü üstlenerek bölgesel istikrar ve kalkınma için ortak stratejiler oluşturmaktadır. Bu teşkilat bünyesinde hayata geçirilen projeler, Azerbaycan-Türkiye ilişkilerini daha da derinleştirmeye ve her iki ülkenin çok yönlü dış politikasında stratejik ittifak modelini güçlendirmeye hizmet etmektedir [3].

ELMİ YENİLİKLƏR

Azerbaycan ve Batı (ABD ve Avrupa Birliği). Enerji güvenliği ve "Güney Gaz Koridoru". Enerji güvenliği, Azerbaycan'ın Batı ülkeleriyle iş birliğinde temel önceliklerden biridir. Özellikle 2000'li yıllardan beri uygulanan "Güney Gaz Koridoru" projesi, Azerbaycan'ın Avrupa'ya doğal gaz ihracatını çeşitlendirmeyi ve Rusya'ya bağımlılığını azaltmayı amaçlamaktadır (Smith, 2019). Bu proje aracılığıyla Azerbaycan gazı Gürcistan, Türkiye, Yunanistan, Arnavutluk ve İtalya'ya ulaştırılmakta ve Avrupa'nın enerji kaynaklarının çeşitlendirilmesinde önemli bir rol oynamaktadır. Amerika Birleşik Devletleri ve Avrupa Birliği, Azerbaycan'ın enerji kaynaklarının Avrupa'nın enerji güvenliği için kullanılmasını teşvik ederek bu girişime stratejik destek sağlamaktadır.

İnsan hakları ve siyasi diyalog. İnsan hakları ve demokratik reformlar, Batı ve Azerbaycan arasındaki siyasi diyalogda önemli konulardır. Avrupa Birliği ile iş birliği çerçevesinde, ülkede yasal reformların teşvik edilmesi, sivil toplumun geliştirilmesi ve özgür seçimlerin yapılması gibi konular gündeme gelmektedir. Aynı zamanda Azerbaycan, egemenliğine ve ulusal güvenliğine öncelik vermekte ve bu alanda dengeli bir diyalog yürütmeye çalışmaktadır. İki taraf arasındaki görüşmelere zaman zaman anlaşmazlıklar eşlik etse de, karşılıklı çıkar ve iş birliği devam etmektedir [17].

NATO ile iş birliği. Azerbaycan-NATO ilişkileri, özellikle 1990'ların sonlarından itibaren gelişmeye başlamıştır. NATO Ortaklık Eylem Planı (IPAP) kapsamında Azerbaycan, güvenlik sektöründe yapısal reformlar gerçekleştirmenin yanı sıra barışı koruma operasyonlarına da katılmaktadır. Bu iş birliği, Azerbaycan'ın uluslararası güvenlik ortamındaki rolünü güçlendirmesine ve askeri modernizasyon sürecini hızlandırmasına olanak tanımaktadır. Ancak Azerbaycan, NATO üyesi olmaması nedeniyle stratejik tarafsızlığını korumakta ve bölgesel dengeyi korumayı tercih etmektedir [20].

Azerbaycan-İran İlişkileri. Tarihsel ve Dini Yakınlık, Ancak Stratejik Rekabet Azerbaycan ve İran'ın kadim tarihe ve dini-kültürel yakınlığa dayanan ilişkileri vardır. Her iki ülkenin nüfusunun çoğunluğu Şii Müslümanlardan oluşsa da, bu ortak değerler stratejik ilişkilerdeki çelişkileri engellememektedir. Azerbaycan'ın bağımsızlığını yeniden kazanmasının ardından, bölgede yeni jeopolitik oyunların oluşması ve özellikle Batı ve Rusya'nın etkisinin artmasıyla birlikte, İran'la ilişkilerde hem iş birliği hem de rekabet unsurları gözlemlenmektedir. Güney Kafkasya'daki nüfuz alanını korumaya çalışan İran, Azerbaycan'ın Batı ve Türkiye ile yakınlaşmasından endişe duymaktadır [15].

Sınır güvenliği ve karşılıklı suçlamalar. Azerbaycan-İran sınırlarındaki güvenlik sorunları zaman zaman gerginlik kaynağı olmuştur. Her iki taraf da birbirlerini sınır ihlalleri, kaçakçılık ve istihbarat

faaliyetleriyle suçlamaktadır. Bu gerginlikler bölgesel istikrarı olumsuz etkilese de, resmi düzeyde diyalog ve iş birliği kanalları sürdürülmektedir. Terörizm ve aşırıcılıkla mücadele için ortak adımlar da atılıyor [9].

İran-Ermenistan ilişkilerinin dengelenmesi. Azerbaycan'ın İran'daki stratejik endişelerinden biri İran-Ermenistan ilişkileridir. İki komşu ülke arasındaki ekonomik, askeri ve siyasi iş birliği geliştikçe, Bakü Tahran'la ilişkilerinde temkinli bir politika izlemek zorunda kalmaktadır. İran'ın Ermenistan'a verdiği destek, Azerbaycan için güvenlik ve diplomatik bir zorluk teşkil etmektedir. Bu nedenle Azerbaycan, Rusya ve diğer bölgesel aktörlerle iş birliğini güçlendirerek İran'ın etkisini dengelemeye çalışmaktadır [8].

Azerbaycan-Çin İlişkileri. "Tek Kuşak, Tek Yol" Girişimine Katılım Azerbaycan, Çin Halk Cumhuriyeti'nin bir girişimi olan "Tek Kuşak, Tek Yol" projesinin aktif katılımcılarından biridir. Bu girişim, Çin ile Avrupa arasındaki ekonomik ve ulaştırma ilişkilerini güçlendirmenin yanı sıra katılımcı ülkelerin altyapı ve ticaret potansiyelini artırmayı amaçlamaktadır. Azerbaycan'ın coğrafi konumu, Asya ve Avrupa arasında bir köprü görevi görmesi ve Doğu-Batı yönündeki girişimin ana geçiş rotalarından biri olması nedeniyle Kuşak ve Yol Girişimi (BRI) için stratejik öneme sahiptir [6].

Ulaştırma-lojistik iş birliği. Ulaştırma ve lojistik sektörü, Azerbaycan-Çin iş birliğinde özel bir yere sahiptir. Bakü-Tiflis-Kars demiryolu projesi, Çin mallarının Avrupa pazarlarına erişimini hızlandırırken, Azerbaycan'ın transit potansiyelini de artırmıştır. Çinli şirketler, özellikle Bakü Uluslararası Deniz Ticaret Limanı olmak üzere Azerbaycan'ın liman altyapısına yatırım yapmaktadır. Bu iş birliği, Azerbaycan'ı bölgesel bir ulaşım merkezine dönüştürmeye ve iki ülke arasındaki ekonomik bağları güçlendirmeye hizmet etmektedir [20].

Teknoloji ve yatırım iş birliği. Çin ve Azerbaycan arasında teknoloji alanındaki iş birliği de hızla gelişmektedir. Çinli şirketler Azerbaycan'ın bilgi ve iletişim teknolojileri, enerji ve sanayi sektörlerine yatırım yapmaktadır. Ayrıca, iki ülke arasında eğitim, inovasyon ve araştırma alanlarında iş birliği mekanizmaları kurulmaktadır. Bu doğrultuda imzalanan anlaşmalar Azerbaycan'ın ekonomik çeşitlendirme ve modernizasyon politikasına katkıda bulunmaktadır [21]. Çok Vektörlü Politikanın Avantajları ve Zorlukları. Jeopolitik esneklik ve diplomatik manevra olanakları. Çok vektörlü dış politika modeli, özellikle küçük ve orta güçteki devletler için önemli olan jeopolitik esneklik sağlamaktadır. Bu politika, devlete farklı güç merkezleri arasında diplomatik manevra olanakları yaratmakta, yani uluslararası sistemdeki baskılara ve değişen durumlara hızlı bir şekilde yanıt vermesini sağlamaktadır [19]. Azerbaycan örneğinde, çoklu vektörcülük sayesinde devlet, bir yandan belirli güç merkezleriyle yakınlaşma politikası izlerken, diğer yandan diğer aktörlerden elde ettiği ekonomik, politik ve güvenlik kazanımlarını en üst düzeye çıkararak Rusya, Türkiye, Çin ve Batı gibi çeşitli aktörlerle ilişkilerini aynı anda dengelemektedir. Bu jeopolitik esneklik, Azerbaycan'ın uluslararası arenada egemenliğini ve ulusal çıkarlarını korumak için vazgeçilmez bir araçtır. Diplomatik manevra kabiliyeti, Azerbaycan'a çatışmaları çözme, bölgesel iş birliği formatları oluşturma ve güvenliği sağlama konusunda ek avantajlar da sağlamaktadır. Dolayısıyla, esnek ve dengeli bir dış politika izleyerek devlet hem iç istikrarını hem de dış ilişkilerini etkili bir şekilde inşa edebilir. Ancak bu esneklik, belirli riskler ve zorluklar da doğurmaktadır: Farklı güç merkezleri arasında dengeyi sağlamak, zaman zaman karmaşık uzlaşmalar ve diplomatik incelikler gerektirmektedir. Bununla birlikte, jeopolitik esneklik, çok vektörlü politikasının temel avantajı olmaya devam etmektedir. Çok Vektörlü Politikasının Avantajları ve Zorlukları. Enerji Politikasında Çeşitlendirme Enerji politikası, Azerbaycan dış politikasının temel önceliklerinden biri ve çok vektörlü stratejisinin önemli bir bileşenidir. Ülke, enerji kaynaklarını farklı pazarlara ve güzergâhlara yönlendirerek enerji ihracatını çeşitlendirmektedir. "Güney Gaz Koridoru" ve "Bakü-Tiflis-Ceyhan" petrol boru hattı gibi projeler bu politikanın örnekleridir. Azerbaycan, bu güzergâhlar aracılığıyla Avrupa pazarlarına doğrudan erişim sağlamakta ve enerji arzındaki tekellere etkili alternatifler yaratmaktadır [18]. Çeşitlendirme, güzergâhların çeşitlendirilmesiyle sınırlı değildir; Azerbaycan'ın yeni enerji projeleri ve pazar erişim yönleri yalnızca

enerji güvenliğini artırmakla kalmamakta, aynı zamanda ülkenin uluslararası statüsünü de güçlendirmektedir.

Karabağ sonrası dönemde yeni riskler ve sınırlı manevra kabiliyeti. Bölgesel jeopolitik manzara, 2020 sonbaharındaki İkinci Karabağ Savaşı'ndan bu yana önemli ölçüde değişti. Çatışmanın yeniden alevlenmesi ve bölgede yeni güvenlik dinamiklerinin ortaya çıkması, çok vektörlü politikasının manevra kabiliyetini bir ölçüde sınırlamıştır. Özellikle Rus barış güçlerinin konuşlandırılması ve Ermenistan ile ilgili yeni statüko, Azerbaycan'ın stratejik kararlarını daha dikkatli bir şekilde değerlendirmesini gerektirmektedir [7]. Enerji projeleri, özellikle de Zangezur koridoru gibi ulaşım ve transit rotaları, yeni jeopolitik risklere açıktır ve Azerbaycan'ın diplomatik faaliyetlerinde ek dikkat ve ihtiyat gerektirmektedir. Bu koşullar altında, çok vektörlü bir politikanın esnekliği hâlâ önemlidir, ancak öncelikler ve güvenlik güvencesi konusunda bazı tavizler kaçınılmaz görünmektedir.

NƏTİCƏ

Azerbaycan dış politika modeli, uluslararası sistemde küçük ve orta ölçekli devletlerin çıkarlarını korumanın başarılı bir örneğidir. Çok vektörlü yaklaşım, Azerbaycan'ın bağımsızlığını, bölgesel nüfuzunu ve uluslararası ilişkilerde dengeli konumunu koruması için gerekli koşulları yaratır. Gelecekte, bu politikanın başarısı büyük ölçüde çevik diplomasi, bölgesel güvenlik ve enerji stratejilerinin başarılı bir şekilde koordine edilmesine bağlı olacaktır. Çok vektörlü dış politika modeli, Azerbaycan'ın uluslararası arenadaki çıkarlarının etkili bir şekilde korunması ve geliştirilmesinde önemli bir stratejik rol oynamaktadır. Bu politika sayesinde devlet, çeşitli jeopolitik güç merkezleri arasında dengeli ilişkiler kurarak hem bölgesel hem de küresel düzeyde esnek manevra olanakları elde etmektedir. Azerbaycan'ın Rusya, Türkiye, Çin, Batı ve İran gibi kilit aktörlerle ilişkileri, çok vektörlülüğün hem iş birliği hem de rekabet unsurlarını aynı anda yönetmeye olanak tanıyan dinamik bir yaklaşım olduğunu göstermektedir. Ancak, çok vektörlü politika, özellikle bölgesel çatışmalar sırasında dengeyi sağlamanın zorlukları olmak üzere bir dizi zorluğu da ortaya koymaktadır. 2020 Karabağ Savaşı ve 2022 Rusya-Ukrayna Savaşı gibi küresel ve bölgesel olaylar, Azerbaycan'ın diplomatik manevra alanlarını bir ölçüde kısıtlamıştır. Bununla birlikte, Azerbaycan dış politikasında pragmatik ve esnek bir yaklaşım hâkimdir ve bunun gelecekte de sürdürülmesi önemlidir.

Genel olarak, Azerbaycan'ın çok yönlü dış politikası, egemenliğini, bölgesel güvenliğini ve uluslararası konumunu güçlendirmede ve stratejik esnekliğini artırmada kilit bir faktör olarak işlev görmektedir. Devlet açısından bu model, hem fırsatlarla hem de yeni zorluklarla dolu bir siyasi araçtır ve başarılı bir şekilde uygulanması sürekli adaptasyon ve diplomatik beceriler gerektirmektedir.

Abstract

Current research seeks to explore the determinants of human flight and brain drain with the help of annual panel data gathered from the Fragile States Index (FSI) spanning 2006–2023. Employing suitable econometric modelling techniques to inspect the research to study political, economic, and social factors backing the emigration of skilled professionals from fragile nation-states. Our research applies a panel data approach, while the previous research was limited to cross-sectional analysis. This technique makes it possible to comprise temporal as well as entity-specific effects, and the research is therefore more robust and explanatory. This research reveals that Security Apparatus, Factionalised Elites, Economic Fragility, and Demographic Pressures all positively predict human flight. At the same time, Economic Inequality and Human Rights each negatively predict it, and thus show more complex, non-linear relationships than others. Additionally, External Intervention also positively predicts human flight, meaning that emigration declines as the intensity of foreign involvement declines. As such, institutional stability, resilience and demographics need to be addressed to mitigate talent outflow. The principal policy implications are therefore to restructure the governance mechanism and intensify job creation and “brain circulation” policies in fragile economies.

Keywords: Brain Drain, Human Capital Migration, Fragile States Index, Panel Data, Econometrics.

INTRODUCTION

On a global scale, the movement of human capital, particularly the emigration of highly qualified specialists, commonly referred to as "*intellectual migration*" or "*brain drain*", is one of the key factors influencing nations' socio-economic stability and competitiveness. And most of it is driven by economic, political, and institutional factors and profoundly affects countries’ competitiveness and growth. The Fragile States Index (FSI) by the Fund for Peace provides annual measures of political stability, economic decline, human rights, public services, and other factors that may influence emigration (FFP,

2023). Likewise, Lawan Ngoma and Wana Ismail (2013), described that domestic political instability and weaker governance correlate with higher-skilled migration (Groizard & Llull, 2007). Under globalisation, the outflow of skilled professionals driven by economic, political, and institutional factors has intensified the human capital shortage in national labour markets. In particular, the FSI's *Human Flight and Brain Drain indicator (E3)* considers the economic impact of human displacement, specifically the loss of productive, skilled professional labour. At the same time, in some countries, this process can have a positive impact, transforming into "brain circulation" or "knowledge exchange" that contributes to innovation and development. The research by Nawaz, Kadirova, Gazieva, Ismoyilov, and Nawaz (2025), shows that countries like the *United States* and the *United Kingdom* have effectively attracted highly skilled migrants, although they face continuing obstacles, including visa constraints, credential recognition, and integration challenges.

Previous studies suggest that political instability and weak institutions amplify brain drain (Docquier, Lohest, & Marfouk, 2007). Various international organisations and scholars have sought to identify the relationship between state fragility and migration in recent years. The research by Vega-Muñoz, González-Gómez-del-Miño, and Contreras-Barraza (2025) analysed the determining factor of human flight and brain drain with the help of an ANOVA model on cross-sectional data of all nations from the Fragile States Index established by the Fund for Peace. They acknowledged four statistically substantial variables persuading the phenomenon: Public Services (P2), External Intervention (X1), Economic Inequality (E2), and Economic Decline (E1). The research reported an inclusive R-squared of approximately 68%, giving valuable understandings. In accumulation, governmental stability and a strong security apparatus are key to mitigating talent drain by nurturing confidence in local institutions (Vega-Muñoz, Gónzalez-Gómez-del-Miño, & Espinosa-Cristia, 2021).

However, this cross-sectional approach offers a limited snapshot, as it does not account for entity-specific or temporal effects of variables. In contrast, this dissertation employs a panel data approach using the same data source, but data spanning 2006 to 2023 allows for control of entity-specific and temporal variations.

The main objective of current research is to investigate the causes of human flight and brain drain grounded on panel data covering the period 2006–2023, using econometric modelling procedures. Earlier research often relied on cross-sectional data, which provided only a short description and was unsuccessful in accounting for temporal dynamics or country-specific characteristics. In contrast, this research employs a panel data model that captures both time and entity variations, thereby increasing the reliability and explanatory power of the analysis.

The findings of this research will provide assistance in categorising the main causes of human capital migration and estimating the efficacy of state stability and social policy measures. Moreover, the findings offer valuable practical implications for international organisations and policy-making institutions in designing effective strategies for managing migration and promoting sustainable human capital development.

MATERIALS AND METHODS

This study uses data on the Fragile States Index developed by the Fund for Peace, which includes 14 variables: Security Apparatus, Factionalised Elites, Group Grievance, Economy, Economic Inequality, Human Flight and Brain Drain, Overall, State Legitimacy, Public Services, Human Rights, Rank, Demographic Pressures, Refugees and IDPs, and External Intervention.

We are going to exclude Overall and Rank variables, since they account for the rest of the 12 variables and have incredibly high correlation, as shown in Figure 1:

Figure 6: Kendall Rank Correlation Matrix

FINDINGS

The rest of the variables are calculated independently, without accounting for information from each other. High values for each variable mean greater fragility, whereas a lower score means better conditions.

Table 1: Descriptive Statistics

Based on descriptive statistics and its visualisations, our key observations about this dataset include:

i. Public Services, Group Grievance, and Security Apparatus have the highest average fragility scores, indicating major global weaknesses in infrastructure, social cohesion, and safety.
ii. External Intervention and Refugees/IDPs show the lowest average scores, suggesting fewer issues in these areas for most countries.
iii. Several indicators (e.g., State Legitimacy, Group Grievance) have bimodal distributions, indicating a divide between stable and unstable countries.
iv. High variability in Human Rights and Refugees/IDPs points to significant regional differences and outliers.
v. Most indices centre around moderate fragility (scores 5–7), calling for broad but tailored policy interventions.

DISCUSSION AND CONCLUSION

Expected Model

Y = B0 + B1X1 + B2X2 + B3X3 + B4X4 + B5X5 + B6X6 + B7X7 + B8X8+ B9X9 + B10X10 + B11X11, where:

Y = Fragile States Index - Human Flight and Brain Drain

X1 = Fragile States Index - Security Apparatus,

X2 = Fragile States Index - Factionalised Elites,

X3 = Fragile States Index - Group Grievance,

X4 = Fragile States Index - Economy,

X5 = Fragile States Index - Economic Inequality,

X6 = Fragile States Index - State Legitimacy,

X7 = Fragile States Index - Public Services,

X8 = Fragile States Index - Human Rights,

X9 = Fragile States Index - Demographic Pressures,

X10 = Fragile States Index - Refugees and IDPs,

X11 = Fragile States Index - External Intervention

These indicators are all related to instability, weak governance, or poor living conditions, typically leading to increased emigration, especially of skilled workers and educated professionals. Therefore, the expected sign for all Betas would be positive.

Actual Model 1

Model 1 (OLS)

There are seven Classical Assumptions:

i. The regression model is linear, is correctly specified, and has an additive error term ε..: FAILED
In order to check the linearity of the model, we plotted residuals versus fitted values, as shown in Figure 2. The figure's shape looks curved rather than perfectly linear.

Figure 7: Model 1 - Residual Values *vs* Fitted Values

In order to confirm the nonlinearity of this model, we have conducted the Ramsey RESET Test (Regression Equation Specification Error Test). Our test is based on the following hypothesis:

Null hypothesis (H_0): The model is correctly specified (linearity holds).

Alternative hypothesis (H_1): The model is mis-specified (linearity does not hold, or variables are missing).

If the test output has a p-value < 0.05, then we reject H_0, meaning that linearity is indeed violated. On the other hand, if p-value > 0.05, we accept H_0, suggesting that the linearity conditions hold.

The following output was generated for our OLS Model 1:

F-statistic: 12.5410, p-value: 0.0005

Here we reject p-value < 0.05 → reject H_0 → Linearity is violated.

ii. The error term ε has a zero population mean: PASSED
Model 1 has a mean of residuals: -0.000000

iii. All explanatory variables (X_Ki) are uncorrelated with the error term (ε_i): FAILED
Durbin-Wu-Hausman (DWH) test for endogeneity

Null Hypothesis (H_0): The variable is exogenous and is not correlated with the error term.

Alternative Hypothesis (H_1): The variable is endogenous and correlated with the error term.

coef = 1.0000, p-value = 0.000

This means the residual from the first-stage regression is statistically significant in explaining the dependent variable, so we reject the null hypothesis (H_0: regressor is exogenous).

iv. Observations of the error term are uncorrelated with each other (no serial correlation between ε_i and ε_j): PASSED
We tested for serial correlation using the Durbin-Watson statistic, which returned a value of 2.213. Since this value is close to 2, we conclude that no significant autocorrelation exists in the residuals. Therefore, Assumption 4 (No Serial Correlation) is satisfied.

v. The error term ε has a constant variance (no heteroskedasticity): FAILED

In order to check for heteroskedasticity, we have conducted the Breusch-Pagan Test with the following assumptions:

Null hypothesis (H_0): Homoscedasticity (constant variance of residuals).

Alternative hypothesis (H_1): Heteroskedasticity (non-constant variance).

The test output below shows p-value = 0.0004 (Lagrange) or 0.0002 (F-statistic) → Very small (well below 0.05), therefore we have to reject the null hypothesis.

Lagrange multiplier statistic: 33.6153

p-value: 0.0004

f-value: 3.5103

f p-value: 0.0002

So, there is heteroskedasticity in the model — this violates one of the classical OLS assumptions.

vi. No explanatory variable is a perfect linear function of any other explanatory variable(s) (no perfect multicollinearity): FAILED
For variables to pass multicollinearity tests, we expect their Variance Inflation Factor Test values to be less than 5. Our test outputs suggest that variables, namely Factionalised Elites, Economic Inequality, State Legitimacy, Public Services, Human Rights and Demographic Pressure, significantly violate this condition:

Also, if we check Figure 1 with Kendall Correlation, we can see that there is a high independent correlation between these pairs:

Economic Inequality and Public Services - 71%

State Legitimacy and Human Rights - 73%

Public Services and Demographic Pressure - 75%

vii. The error term ε is normally distributed (this assumption is optional but usually is invoked): PASSED
Jarque-Bera test tests for normal distribution:

Jarque-Bera (JB): 3.387

Prob (JB): 0.184

Null Hypothesis (H_0): The residuals are normally distributed.

Alternative Hypothesis (H_1): The residuals are not normally distributed.

p-value = 0.184 > 0.05 → We fail to reject the null hypothesis. According to the JB test, the model's residuals do not significantly deviate from normality, which is aligned with this assumption.

Actual Model 2

Based on failed conditions in the initial model, we decided to modify our model. First, to address nonlinearity, we will add nonlinear terms for nonlinear variables: Polynomial Transformation for Human Rights and External Interventions, and Log Transformation for the Economy variable, because of their independent nonlinear relationship. To address multicollinearity, we will drop one from a pair of highly correlated variables, specifically State Legitimacy and Public Services. In order to address

heteroskedasticity, we will use WLS (with Robust standard errors (HC3)) instead of OLS, which corrects heteroskedasticity.

These remedies leave us with the Model 2:

Model 2 (WLS with Robust Errors)

There are seven Classical Assumptions:

i. The regression model is linear, is correctly specified, and has an additive error term ε: PASSED
Figure 3 shows us an improved relationship between residuals and fitted values, compared to Figure 2:

Figure 8: Model 2 - Residual Values *vs* Fitted Values

To prove that we were able to get rid of the nonlinearity issue, we again conducted the Ramsey RESET Test:

F-statistic: 3.6158

p-value: 0.0590

With a p-value just above the 0.05 threshold, at $\alpha = 0.05$, we fail to reject the null, so we no longer have strong enough evidence of nonlinearity.

i. The error term ε has a zero population mean: PASSED
Mean of residuals: 0.000000

ii. All explanatory variables (X_Ki) are uncorrelated with the error term (ε_i).: N/A
Not applicable for the WSL model, so we cannot run the Durbin-Wu-Hausman Test

iii. Observations of the error term are uncorrelated with each other (no serial correlation between ε_i and ε_j): PASSED
Durbin-Watson: 2.244

Similarly to Model 1, the value is close to 2; we conclude that there is no significant autocorrelation in the residuals.

iv. The error term ε has a constant variance (no heteroskedasticity): N/A
Breusch-Pagan test results are the following:

Lagrange multiplier statistic: 23.1076

p-value: 0.0060

f-value: 2.7834

f p-value: 0.0046

Since both p-values are below 0.05, we reject the null hypothesis, confirming the presence of heteroskedasticity in our model. However, this is not concerning in the case of Model 2, because WSL accepts heteroskedasticity.

v. No explanatory variable is a perfect linear function of any other explanatory variable(s) (no perfect multicollinearity): PASSED
This time all of our variables have passed the VIF test, with none of them exceeding a value of 5:

vi. The error term ε is normally distributed (this assumption is optional, but usually is invoked): PASSED JB test here revealed the same performance as Model 1:

Jarque-Bera (JB): 3.387

Prob (JB): 0.184

Model 2 Interpretation

X	Variable Name	Interpretation
X1	**Fragile States Index - Security Apparatus**	***Coefficient: 0.1738***. Interpretation: A higher value for Security Apparatus means greater state control over security forces, theoretically leading to more repression and less stability, potentially causing more people to flee. The positive coefficient fits the expected model, where greater state control (a marker of fragility) is associated with increased human flight.
X2	**Fragile States Index - Factionalised Elites**	***Coefficient: 0.0721***. Interpretation: Factionalised elites reflect divisions within the ruling class, and higher values suggest less cohesion and more instability in governance. The positive coefficient is expected, as more internal conflict typically leads to greater instability, increasing the likelihood of brain drain and human flight.
X3	**Fragile States Index - Group Grievance**	***Coefficient: 0.0171***. Interpretation: Group Grievance reflects societal divisions and tensions, where higher values indicate a society fractured by ethnic, religious, or political divisions. A positive coefficient suggests that more grievances may cause social instability, increasing human flight and brain drain. The coefficient here is small, reflecting perhaps less immediate impact on flight than other variables.
X4	**Fragile States Index - Economy (Log-transformed)**	***Coefficient: 2.3754***. Interpretation: A higher economic score (log-transformed) specifies a more fragile economy. This suggests that a fragile economy will likely drive people to leave for better opportunities. The positive coefficient fits the expected model, as economic fragility typically increases the motivation for people to migrate. The log transformation suggests the effect of a deteriorating economy becomes more pronounced as it worsens.
X5	**Fragile States Index - Economic Inequality**	***Coefficient: -0.0902***. Interpretation: Economic Inequality typically signifies a society with a vast wealth gap. However, in this case, the negative coefficient suggests that while inequality is often a sign of fragility, it does not directly contribute to human flight in this model. This might be due to the complex ways inequality can motivate people to leave and compel them to stay (e.g., desire to benefit from opportunities or fear of violence). An alternative theory could be that greater inequality could trigger internal migration or social movements, which offset brain drain.
X6	**Fragile States Index - Human Rights (Squared)**	***Coefficient: -0.0243***. Interpretation: Human Rights violations increase a country's fragility, and squaring this variable emphasises that the worst violations (extremely high values) have a stronger relationship with human flight. The negative sign here is surprising, as one would expect it to be positive, suggesting a non-linear effect. Severe human rights violations could either accelerate outflows (positive effect) or cause a reversal due to

		government repression of exit (negative effect). This paradox may indicate complex, dual effects of human rights abuses.
X7	**Fragile States Index - Demographic Pressures**	***Coefficient: 0.1842***. Interpretation: Demographic Pressures encompass high population growth or youth bulges, which are frequently correlated with insufficient resources and political instability. Strong performance on this index indicates more societal stress and vulnerability, which pushes people to emigrate for better opportunities. Therefore, a positive coefficient is as anticipated for demographic pressures.
X8	**Fragile States Index - Refugees and IDPs**	***Coefficient: -0.0013***. Interpretation: Refugees and internally displaced persons (IDPs) specify displacement and humanitarian crises. The negative coefficient at this point is unexpected, as we would characteristically assume more displaced people to correlate with more human flight. This might propose that displacement repeatedly occurs within a country or that international humanitarian efforts are mitigating outward migration.
X9	**Fragile States Index - External Intervention (Squared)**	***Coefficient: 0.0209***. Interpretation: External intervention replicates the inspiration of foreign powers in the country's internal affairs. The squared term suggests that moderate interventions may have one effect, while extreme interventions have a noticeable supplementary impact on human flight. The positive coefficient specifies that external interventions (such as foreign military or political involvement) contribute to fragility and boost outflows, though the effect rushes as the intervention becomes more intense.

Final Model suggests the following relationship:

$$Y=-1.0129+0.1738\cdot X1 +0.0721\cdot X2 +0.0171\cdot X3+2.3754\cdot X4 -0.0902\cdot X5 -0.0243\cdot X6+0.1842\cdot X7 -0.0013\cdot X8 +0.0209\cdot X9$$

The econometric results reaffirm key drivers of human flight and brain drain in fragile states. Security, economic fragility, factionalised elites, and demographic pressure all significantly influence outward migration. While consistent with previous studies like Vega-Muñoz et al. and Nawaz et al., our panel data approach shows these effects are long-term, not temporary. Positive coefficients for Security Apparatus, Factionalised Elites, and the Economy point to worsening institutions and economies pushing skilled workers away. Demographic Pressure also plays a strong role, linking youth unemployment and population growth to talent loss. Interestingly, Economic Inequality and Human Rights (squared) show unexpected signs, suggesting complex or non-linear impacts. In some contexts, inequality may incentivise elite retention, and repression may restrict outward movement. External Intervention (squared) is also significant, indicating that intense foreign involvement destabilises local systems and encourages emigration. Model 2 strengthens these findings through improved specifications, addressing earlier errors and improving reliability.

Policy Implications

Policy-wise, the results may draw a few main measures to mitigate brain drain. Basing on the above findings, the following measures may be suggested:

i.Strengthen public institutions and governance to reduce elite factionalism and unify politics.

ii. Stabilise the economy and create jobs for high-pressure demographic contexts.
iii. promote civil rights protection and restrict external political meddling to stabilise society.
iv. Facilitating "brain circulation" strategies, such as worldwide academic partnerships and diaspora engagement, to adapt human flight towards knowledge exchange.

Conclusion

This research enhances the growing literature on migration and state fragility by encompassing the analysis from a cross-sectional to a panel data framework setting spanning 18 years. It concludes that fragility dimensions related to security, economy, and governance persist as significant factors in amplifying human flight and brain drain. It is suggested that future studies entail the impact of governance and interaction effects with socio-economic stability measures, as well as analyse state-level differences to establish an increasingly polarized overview of the migration trend.

ACKNOWLEDGMENT

The authors acknowledge that this work was made possible thanks to the data on the Fragile States Index provided by the Fund for Peace. This study did not receive financial support from any sources. The authors are grateful for the helpful comments received from their colleagues at Baku State University and the University of Public Policy.

DEVLET MUHASEBE STANDARTLARI: MALİ TABLOLARIN SUNULMASI STANDARDININ (DMS 1) İNCELENMESİ

Uğur İBİŞ

E-mail: ugur.ibis@tubitak.gov.tr
ORCID ID: 0009-0001-4337-2133

Özet

Devlet Muhasebe Standartları, kamu mali yönetiminde şeffaflık, hesap verebilirlik, güvenilirlik ve karşılaştırılabilirliği sağlamak amacıyla oluşturulmuş, kamu mali raporlama sistemine yön veren temel düzenlemelerdir. Bu standartlar, 2006 yılında Hazine ve Maliye Bakanlığı bünyesinde kurulan Devlet Muhasebe Standartları Kurulu (DMSK) tarafından hazırlanmıştır. Türkiye, kamu mali yönetimini uluslararası düzeyde standart bir yapıya kavuşturmak amacıyla, Uluslararası Muhasebeciler Federasyonu (IFAC) tarafından oluşturulan ve daha sonra Uluslararası Kamu Sektörü Muhasebe Standartları Kurulu (IPSASB) adını alan kurulla iş birliği yapmış, bu doğrultuda uluslararası standartlara uyumlu yerel düzenlemeler geliştirmeyi taahhüt etmiştir. 2003 yılında yürürlüğe giren 5018 sayılı KMYKK, performans esaslı, şeffaf ve hesap verebilir bir mali yönetim anlayışının yasal temelini oluşturmuş; bu çerçevede kamu idarelerinde mali işlemlerin yeniden yapılandırılması ve muhasebe uygulamalarında standardizasyon ihtiyacı ortaya çıkmıştır. Bu doğrultuda geliştirilen ilk standart, 2008 yılında yayımlanan **"Mali Tabloların Sunulması"** standardı olup, mali tabloların biçimsel ve içeriksel sunum esaslarını düzenlemektedir. Söz konusu standart, kamu idarelerinin mali raporlamasında birlik sağlamak, bilgilerin doğru, güvenilir ve karşılaştırılabilir şekilde sunulmasını temin etmek amacıyla hazırlanmıştır. 2022 yılında güncellenen standart, kamu idarelerinin mali tablolarının karşılaştırılabilirliğini artırarak kamu mali yönetiminde şeffaflık ve hesap verebilirliği güçlendirmeyi amaçlamaktadır. Çalışmada, standardın yürürlüğe girmesinden önce ve sonra hazırlanmış mali tablolar karşılaştırılarak, değişikliklerin etkileri incelenmiştir.

Anahtar Kelimeler: Devlet Muhasebe Standartları, Mali Tabloların Sunulması, DMS-1, IPSAS - IPSASB – Kamu Muhasebesi

GİRİŞ

Kamu mali yönetimi, devletin gelir ve giderlerinin etkin, verimli ve şeffaf bir şekilde yönetilmesini sağlayan temel bir sistemdir. Bu sistemin güvenilir bilgi üretmesi ve kamu kaynaklarının kullanımında hesap verebilirliği temin etmesi, çağdaş yönetim anlayışının gereğidir. (Kırılmaz, 2015) Bu bağlamda, mali raporlama süreçlerinde uluslararası düzeyde bir standardizasyon ihtiyacı doğmuştur. Türkiye'de bu ihtiyaca yanıt olarak geliştirilen **Devlet Muhasebe Standartları (DMS),** kamu sektörü muhasebe uygulamalarının uluslararası kamu sektörü muhasebe standartları (**IPSAS**) ile uyumlu hale getirilmesini amaçlamaktadır. DMS'ler, kamu kurum ve kuruluşlarının mali işlemlerini tekdüze bir yapıda kaydetmelerini, raporlamalarını ve analiz etmelerini sağlayarak mali saydamlık ve karşılaştırılabilirlik düzeyini artırmaktadır.

Bu standartlar arasında önemli bir yere sahip olan **DMS 1 – Mali Tabloların Sunulması Standardı,** kamu idarelerinin mali tablolarının biçimsel yapısını, içeriğini ve sunum esaslarını düzenlemektedir. DMS 1, mali tabloların yalnızca rakamsal veriler içeren bir rapor olmaktan çıkıp, kamu kaynaklarının kullanımına ilişkin anlamlı ve güvenilir bilgi sağlayan bir iletişim aracı haline gelmesini hedeflemektedir. Ayrıca, mali tabloların doğruluk, tutarlılık, anlaşılabilirlik ve karşılaştırılabilirlik niteliklerini güçlendirerek kamu yönetiminde **hesap verebilirlik** ve **mali disiplin** ilkelerine katkı sağlamaktadır.

Türkiye'de DMS 1'in uygulanmasıyla birlikte, kamu idarelerinin mali tablolarında uluslararası standartlara uygun bir sunum anlayışı benimsenmiş, raporlama süreçlerinde şeffaflık ve güvenilirlik artmıştır. Bu gelişme, hem ulusal düzeyde mali yönetimin etkinliğini hem de uluslararası alanda

Türkiye'nin mali raporlama güvenilirliğini güçlendirmiştir. (Yanık, 2018) Bununla birlikte, uygulamada bazı kurumların yeni standartlara uyum sürecinde karşılaştıkları teknik ve yapısal sorunlar, DMS'lerin tam anlamıyla benimsenmesi ve kurumsal kapasitenin geliştirilmesi gerekliliğini ortaya koymaktadır. Dolayısıyla, DMS 1 yalnızca muhasebe uygulamalarında bir düzenleme aracı değil, aynı zamanda kamu sektöründe mali yönetim anlayışının dönüşümünü destekleyen stratejik bir araç olarak değerlendirilmektedir. (Topakkaya, 2020)

LİTERATÜR TARAMASI

Osman Aydın'ın (2018) "Devlet Muhasebe Standartlarının Çeşitli Ülkelerde Uygulanması ve Türkiye Uygulamasının Değerlendirilmesi" başlıklı çalışmasında, 1990'lı yıllarda dünyada başlayan **Yeni Kamu Yönetimi (New Public Management – NPM)** reformlarıyla birlikte kamu mali yönetiminde önemli bir dönüşüm süreci yaşandığı vurgulanmaktadır. Çalışmaya göre, bu reform hareketleri sonucunda birçok ülke, geleneksel **nakit esaslı muhasebe sisteminden** karar alıcılar ve yöneticiler için daha kapsamlı bilgi üreten **tahakkuk esaslı muhasebe sistemine** geçmiştir. Bu geçiş, devletlerin varlık ve yükümlülükleri hakkında daha doğru bilgi edinmesini sağlayarak stratejik planlama ve mali karar alma süreçlerinde etkinliği artırmıştır. Aydın, özel sektörde geliştirilen **Uluslararası Finansal Raporlama Standartları (IFRS)**'nin kamu sektörü için örnek teşkil ettiğini; bu doğrultuda **Uluslararası Kamu Sektörü Muhasebe Standartları (IPSAS)**'ın oluşturularak uygulanmaya başlandığını belirtmektedir. IPSAS'ın temel amacının, kamu mali raporlamasında **karşılaştırılabilirlik, şeffaflık ve hesap verebilirlik** ilkelerini güçlendirmek olduğu ifade edilmektedir. Çalışmada ayrıca, devlet muhasebesinin gelişimiyle birlikte kamu kurumlarının da özel sektör işletmeleri gibi varlıklarını ve yükümlülüklerini ayrıntılı biçimde raporlamaya başladıkları; UNESCO gibi uluslararası kuruluşların IPSAS temelli finansal tablolarının bu dönüşümün somut bir örneği olduğu sonucuna varılmıştır.

Serap Yanık, Can Öztürk'ün (2018) çalışmasında, devlet muhasebesi kapsamında **Uluslararası Muhasebeciler Federasyonu (IFAC)** tarafından kabul edilen dört temel muhasebe sistemi — **nakit esası, uyarlanmış nakit esası, tam tahakkuk esası** ve **uyarlanmış tahakkuk esası** — incelenmiştir. Çalışmada özellikle **tam tahakkuk esasına** dayalı muhasebe sistemi ele alınmış; bu çerçevede Türkiye'de **Uluslararası Kamu Sektörü Muhasebe Standartları (IPSAS)** temel alınarak hazırlanan **Devlet Muhasebe Standartları (DMS)**'nden **DMS 1 – Mali Tabloların Sunulması** standardı, **IPSAS 1 – Presentation of Financial Statements** standardı ile karşılaştırmalı olarak analiz edilmiştir. Araştırma sonucunda, DMS 1'de yer alan "tam mali tablolar seti"nin kapsamının IPSAS 1'de tanımlanan "tam finansal tablolar seti" ile tam olarak örtüşmediği belirlenmiştir. Bu nedenle, Türkiye'de DMS'leri uygulayan kamu kurum ve kuruluşlarının mali tablolarının IPSAS standartlarıyla tam uyumlu olmayacağı sonucuna ulaşılmıştır. Bu durum, Türkiye'de kamu muhasebe sisteminin uluslararası standartlara uyum sürecinde yapısal bazı farklılıkların ve geliştirilmesi gereken alanların bulunduğunu göstermektedir.

Seval Kardeş Selimoğlu (2023) ise Türkiye'de Kamuda Sürdürülebilirlik için Devlet Muhasebe Standartlarının Rolü adlı çalışmasında, Türkiye'de, kamu yönetiminde **şeffaflık, hesap verebilirlik ve iyi yönetişim** ilkeleri benimsenmiş olmakla birlikte, uygulamaların halen optimize edilmesi gerektiğini belirtmiştir. Bu nedenle **Devlet Muhasebe Standartları (DMS)**'nin IPSAS ile uyumlu ve uluslararası standartlarla entegre biçimde uygulanması, hem kamu hem özel sektörde sürdürülebilirliği destekleyecek, Türkiye'nin küresel imajını ve ekonomik değerlerini güçlendirecektir. Çalışma, bu perspektiften hareketle DMS uygulamalarının önemi ve etkilerini incelemeyi amaçlamıştır.

Sevim (2009), Türkiye'de devlet muhasebesinin 1050 sayılı Kanun kapsamında geliştiğini ancak kamu sektörünün ekonomik büyüklüğü dikkate alındığında mevcut uygulamaların yetersiz olduğunu belirtmiştir. 2005'ten sonra yürütülen mali ve idari reformlar ile 5018 sayılı Kanun, devlet muhasebesini kamu sektörü muhasebesi anlayışı doğrultusunda şekillendirmiştir. Etkin bir kamu sektörü muhasebesi için öncelikle teknik uygulamalardan ziyade bizimde çalışmamızda birincisine yer vereceğimiz **ilkeler**

ve standartların geliştirilmesi gerektiğine değinmiştir. Bu yaklaşım, uzun süredir devam eden devlet muhasebesi kültüründen kaynaklanan davranışsal sorunların çözümünü hızlandıracaktır.

Ali Topakkaya ve Atila Tuncer ise editörlüğünü Prof. Dr. Seval Kardeş Selimoğlu, Dr. Mehmet Koçdemir ve Harun Yalçın Mengüloğul'un yaptığı 2020 de yayınlanan Kamu Sektörü Muhasebe Standartları adlı kitapta, Uluslararası Kamu Sektörü Muhasebe Standartları Kurulu (IPSASB) ın, büyük ölçüde IFRS modelini referans alarak uluslararası standartları yayımladığını ve Türkiye de bu standartları temel alarak kamu sektörü muhasebesinin yasal çerçevesini oluşturmakta ve uyumlaştırma sürecini sürdürdüğünü belirtmiştir. Bu kapsamda hazırlanan kitap, Türkiye'de alanla ilgili ilk rehber niteliğinde çalışmalardan biridir ve uygulayıcılar, akademisyenler ile öğrenciler için kamu sektörü muhasebe standartlarının ulusal ve uluslararası boyutlarını, geçmişini, güncel uygulamalarını ve gelecekteki yönelimlerini sistematik bir şekilde sunmaktadır. Kitapta, DMSK tarafından yayımlanan 30 standart detaylı olarak incelenmiş ve konular, alanın uzmanları tarafından anlaşılır bir biçimde aktarılmıştır.

DEVLET MUHASEBE STANDARTLARI

Devlet muhasebesindeki gelişmelerin temelinde, başta OECD, IMF ve Dünya Bankası gibi uluslararası mali kuruluşlar ile Avrupa Birliği gibi ekonomik ve siyasi bütünleşmelerin, devletlere ve bölgesel birliklere ait mali istatistikleri ve raporları üretme ihtiyacı yatmaktadır. Farklı muhasebe ve raporlama sistemlerine dayalı olarak üretilen mali raporların karşılaştırılması ve konsolide edilmesi mümkün olmadığından, hem ulusal düzeyde farklı yönetim birimlerinin hesaplarının bütünleştirilmesi hem de uluslararası düzeyde mali tabloların oluşturulması ciddi güçlükler doğurmaktadır. (Çetinkaya, 2004) Örneğin, merkezi yönetim ile yerel yönetim birimlerinin veya AB üye ülkelerinin farklı muhasebe standartları kullanması, konsolide raporlamayı engellemektedir. (Topakkaya, 2020) Benzer şekilde, IMF'in dünya ülkelerinin mali istatistiklerini derlemesi, farklı muhasebe sistemlerine dayalı verilerin karşılaştırılmasını ve konsolidasyonunu güçleştirmektedir. Bu nedenle, Uluslararası Kamu Sektörü Muhasebe Standartları Kurulu (IPSASB), IFAC, IMF ve EUROSTAT gibi uluslararası kuruluşlar, benzer muhasebe sistemleri geliştirme ve uyumlaştırma çalışmalarını yoğunlaştırmıştır. (Özyiğit, 2023)

Tarihsel olarak kamu sektörü muhasebesi bütçe esaslı bir sistemle yürütülmüş ve yalnızca tahsilat-ödeme ilişkisi ile hesap verebilirliği sağlamıştır; ancak günümüz devlet faaliyetlerinin artan karmaşıklığı ve küresel etkileşimler, bu sistemin yetersiz kalmasına yol açmıştır. (Heiling J, 2012) Nakit esaslı raporlama, mali durum ve performans hakkında sınırlı bilgi sunduğu için kamu sektörü kuruluşları, tam tahakkuk esasına dayalı muhasebe sistemine geçiş yapmış veya geçiş sürecini sürdürmektedir. Tam tahakkuk esaslı muhasebe, kaynakların, borçların ve hizmet maliyetlerinin şeffaf biçimde raporlanmasını sağlayarak mali bilgi kalitesini ve hesap verebilirliği artırmakta; IPSAS standartları ise uluslararası karşılaştırılabilirlik, güvenilirlik ve şeffaflık sağlama açısından önemli bir araç olarak kullanılmaktadır. (Topakkaya, 2020) Bu bağlamda, IPSAS'ların benimsenmesi hem gelişmiş hem de gelişmekte olan ülkelerde kamu mali yönetiminin modernizasyonuna ve etkinliğine katkıda bulunmakta, uluslararası kuruluşlar ve Avrupa Birliği gibi ekonomik birlikler de standartların uygulanmasını teşvik etmektedir.

Türkiye'de kamu muhasebesi uzun yıllar boyunca nakit esasına dayalı olarak yürütülmüş, bu sistem bilgi üretiminde yetersizlik, varlıkların izlenememesi ve mali raporlama eksiklikleri gibi birçok sorunu beraberinde getirmiştir. Bu sorunların giderilmesi amacıyla 1990'lı yılların başından itibaren tahakkuk esaslı muhasebe sistemine geçiş süreci başlatılmış, 5018 sayılı Kamu Mali Yönetimi ve Kontrol Kanunu ile bu sistem yasal dayanağa kavuşmuştur. Bu süreçte çeşitli yönetmelikler yayımlanmış ve tahakkuk esaslı muhasebe uygulamaya alınmıştır. (Kartalcı, 2019) 5018 sayılı Kanun çerçevesinde Hazine ve Maliye Bakanlığı bünyesinde Devlet Muhasebesi Standartları Kurulu (DMSK) kurulmuş ve uluslararası standartlara uygun devlet muhasebe standartları belirlenmiştir.

DMSK'nın temel amacı, kamu mali yönetiminde hesap verebilirlik ve mali saydamlığı sağlamak üzere, IPSAS'a (Uluslararası Kamu Sektörü Muhasebe Standartları) uyumlu bir muhasebe ve raporlama sistemi oluşturmaktır. (Kuyumcu, 2024) Bu doğrultuda Kurul, 2008 yılından itibaren 32 Devlet Muhasebesi Standardı yayımlamıştır.

Standartlardan ilki 2008 yılında yayımlanan Mali Tabloların Sunulmasıdır. Bu standart, genel yönetim kapsamındaki kamu idarelerinin **genel amaçlı mali tablolarının sunumuna** ilişkin esasları belirlemektedir. Temel hedef, kamu kurumlarının mali tablolarının **önceki dönemlerle ve diğer kuruluşların mali tablolarıyla karşılaştırılabilirliğini** sağlamaktır. Bu doğrultuda standart, **tahakkuk esasına göre** hazırlanan mali tabloların **sunum ilkelerini, yapısal unsurlarını** ve **asgari içerik koşullarını** düzenlemektedir. Ayrıca, belirli işlem ve olayların mali tablolara **alınması, ölçülmesi ve açıklanması** konularının bu standartta değil, diğer **Devlet Muhasebesi Standartları** kapsamında ele alınacağı belirtilmektedir.

Bu standart, **tahakkuk esaslı muhasebe** çerçevesinde genel amaçlı mali tabloların **Devlet Muhasebesi Standartlarına uygun olarak hazırlanması ve sunulması** sürecinde uygulanmaktadır. Genel amaçlı mali tablolar, **özel bilgi talepleri bulunmayan** kullanıcıların (örneğin vatandaşlar, vergi mükellefleri, bağışçılar, borç verenler ve diğer kaynak sağlayıcılar) **bilgi ihtiyaçlarını karşılamayı** hedefleyen tablolardır. Bu tablolar, tek başına veya **yıllık rapor gibi** başka kamu belgeleriyle birlikte sunulabilir. (Sevim, 2009) Standart, **konsolide** ve **bireysel mali tablo** sunan tüm kamu kuruluşları için **aynı şekilde geçerlidir**.

Mali tablolar, bir kuruluşun **mali durumunu** ve **mali performansını** belirlenmiş kriterler çerçevesinde sunan raporlardır. (Cavlak, 2018) **Genel amaçlı mali tabloların** temel amacı, kaynakların tahsisine ilişkin kararların alınması ve değerlendirilmesinde geniş bir kullanıcı kitlesine (örneğin vatandaşlar, bağışçılar, kredi verenler vb.) **yararlı bilgiler** sağlamaktır. Bu tablolar, kuruluşun mali durumu, mali performansı ve nakit akışları hakkında bilgi sunar.

Kamu sektöründe genel amaçlı mali raporlamanın amacı ise, karar verme sürecine katkı sağlayacak bilgiler sunarak kuruluşların **hesap verebilirliğini güçlendirmektir**. Bu kapsamda raporlamanın hedefleri şunlardır:

- Mali kaynakların **edinimi, tahsisi ve kullanımı** hakkında bilgi sağlamak,
- Kuruluşun faaliyetlerini nasıl finanse ettiği ve **nakit gereksinimlerini nasıl karşıladığına** dair bilgi sunmak,
- Kuruluşun **yükümlülüklerini yerine getirme** ve **faaliyetlerini sürdürebilme** kapasitesini değerlendirmeye yardımcı bilgiler sağlamak,
- Kuruluşun **mali durumu** ve bu durumdaki değişiklikler hakkında bilgi sunmak,
- Kuruluşun performansını **hizmet maliyetleri, verimlilik** ve **hedeflere ulaşma** açısından değerlendirmede yararlı toplu bilgiler sunmaktır.

Bu amacın gerçekleştirilmesi için mali tablolar, kuruluşla ilgili aşağıdaki unsurlar hakkında bilgi sağlamaktadır:

- Varlıklar,
- Yükümlülükler,
- Net varlıklar / öz kaynaklar,
- Gelirler,
- Giderler,
- Net varlıklarda veya öz kaynaklarda meydana gelen diğer değişiklikler,
- Nakit akışları.

Tam bir mali tablo seti aşağıdaki unsurlardan oluşmaktadır:

- Mali Durum Tablosu (Bilanço): Kuruluşun belirli bir tarihteki varlıklarını, yükümlülüklerini ve net varlıklarını/öz kaynaklarını gösterir.
- Mali Performans Tablosu (Faaliyet Sonuçları Tablosu): Dönem içinde elde edilen gelirler ile katlanılan giderleri göstererek mali performansı ortaya koyar.
- Net Varlıklar / Özkaynak Değişim Tablosu: Dönem boyunca net varlıklarda veya öz kaynaklarda meydana gelen değişiklikleri açıklar.
- Nakit Akış Tablosu: Dönem içindeki nakit giriş ve çıkışlarını gösterir.
- Bütçe Gerçekleşme Karşılaştırması: Kuruluşun onaylanmış ve yayımlanmış bütçesinde öngörülen tutarların, gerçekleşen tutarlarla karşılaştırıldığı ayrı bir ek mali tablo veya mali tablolarda yer alan bir bütçe sütunu şeklinde sunulur.
- Dipnotlar: Önemli muhasebe politikaları ile diğer açıklayıcı bilgileri içeren bölümdür.
- Karşılaştırmalı Bilgiler: Bu standartta yer alan "Karşılaştırmalı Bilgiler" başlığı uyarınca, önceki döneme ilişkin mali bilgilerin cari dönem verileriyle karşılaştırmalı olarak sunulmasını içerir.

2022 de güncellenen standart 22/02/2008 tarihli ve 26795 sayılı Resmî Gazete'de yayımlanan "Mali Tabloların Sunulmasına İlişkin 1 No'lu Devlet Muhasebesi Standardını (DMS 1)" yürürlükten kaldırmıştır. Bu standart, **Uluslararası Muhasebeciler Federasyonu (IFAC) Kamu Sektörü Muhasebe Standartları Kurulu (IPSAS)** tarafından yayımlanan ve 2022 yılı Ekim ayı itibarıyla yürürlükte olan "Mali Tabloların Sunulması Standardı (IPSAS 1)" esas alınarak hazırlanmıştır.

Yayınlanan muhasebe standardının kapsamı ve temel özellikleri incelendikten sonra, Maliye Bakanlığı tarafından standardın yürürlüğe girmesinden önce ve sonra yayımlanan mali tablolar karşılaştırmalı olarak analiz edilmiştir. Bu inceleme, söz konusu standardın mali raporlama uygulamaları üzerindeki etkilerini değerlendirmek amacıyla gerçekleştirilmiştir. Elde edilen bulgular, Maliye Bakanlığı'nın standardın yürürlüğe girmesinin ardından mali tablolarını ilgili düzenlemelere uygun biçimde yeniden yapılandırdığını göstermektedir. Ayrıca, Bakanlığın finansal bilgileri kamuoyu ile paylaşma sürecinde şeffaflık ve hesap verebilirlik ilkelerine daha yüksek düzeyde uyum sağladığı gözlemlenmiştir. Bu durum, standartların uygulanmasının kamu kurumlarının mali raporlama kalitesini artırmada önemli bir rol oynadığını ortaya koymaktadır.

Standardın yayımlanmasından önceki son yılı incelediğimizde,

Tablo 2: Standart Öncesi Sunulan Bütçe Bilgilerine Dair Tablo

Kaynak: Hazine ve Maliye Bakanlğı sitesinden alınmıştır

2007 yılına ait mali veriler incelendiğinde, söz konusu verilerin yalnızca ekonomik düzeyde bütçe sonuçlarını yansıttığı, ancak standartta tanımlanan kamu sektöründe genel amaçlı mali raporlamanın hedeflerini tam olarak karşılamadığı görülmektedir. Mevcut mali tabloların, kamu sektörüne ilişkin mali raporlamanın temel amaçlarından olan hesap verebilirlik, şeffaflık ve karar alma süreçlerini destekleme işlevlerini yeterince yerine getirmediği tespit edilmiştir. Ayrıca, bu tabloların kuruluşla ilgili kapsamlı bilgileri içermediği ve standartta öngörülen nitelikteki mali tablolara yer verilmediği gözlemlenmiştir. Bu durum, standardın öngördüğü raporlama yapısına geçiş sürecinde kavramsal ve uygulamaya yönelik eksikliklerin bulunduğuna işaret etmektedir.

2007 yılında yayımlanan genel faaliyet raporunda, mali tablolar başlıklı kısmında Genel bütçe kapsamındaki kamu idarelerinin 2007 yılı mali varlık ve yükümlülükler tablosu ile 2007 yılı faaliyet sonuçları tablosu Raporun 8 ve 9 no'lu eklerinde yer aldığı belirtilmiş ve eklerde mali varlık yükümlüler tablosu ile faaliyet sonuçları tablosu verilmiştir.

En son 2024 yılında yayımlanan mali tablolar sunumunda ise Hazine ve Maliye Bakanlığı standart da yer alan mali tablolara yer verildiği gözlenmiştir.

Tablo 6: Standart Sonrası Yayımlanan Tablolar Dizini

Kaynak: Hazine ve Maliye Bakanlğı sitesinden alınmıştır

Standardın belirttiği mali raporların sunumunda tam bir mali tablo setinin vermesi gerekli olan tablolardan bilanço, faaliyet sonuçları tablosu, öz kaynak değişim tablosu, bütçe gerçekleşme karşılaştırması, dipnotlar ve önceki döneme ilişkin bilgilere karşılaştırmalı olarak yer verilmiş, sadece dönem içinde ki giriş ve çıkışları gösteren nakit akış tablosuna yer verilmemiştir. Bu konuyu da değerlendirecek olursak;

Türkiye'de kamu kurumlarının mali raporlama yükümlülükleri **Kamu Mali Yönetimi ve Kontrol Kanunu (5018 sayılı Kanun)** ve **Devlet Muhasebe Standartları (DMS)** çerçevesinde belirlenmiştir. İlgili kanunda **genel yönetim kapsamındaki kamu idareleri; merkezi yönetim kapsamındaki kamu idareleri, sosyal güvenlik kurumları ve mahalli idareler olarak belirtilmiştir.**

Kamu kurumlarının mali işlemlerinde, tahakkuk esasına dayalı muhasebe sistemi ile nakit esasına dayalı bütçe sisteminin eşgüdüm içinde yürütülmesi amacıyla **"yansıtma tekniği"** kullanılmaktadır. Bu teknik sayesinde, bütçe kanunlarının gelir ve gider olarak tanımladığı işlemler öncelikle bütçe gelir ve gider hesaplarına kaydedilmekte, ardından yansıtma hesapları aracılığıyla genel kabul görmüş muhasebe ilkelerine göre gelir ve gider olarak kabul edilen işlemler ilgili gelir ve gider hesaplarına aktarılmaktadır. Buna karşılık, gelir veya gider olarak kabul edilmeyen işlemler, mali tabloların gerçeğe uygun ve tam bir biçimde sunulabilmesi için, ilgili varlık veya yükümlülük hesaplarında gösterilmektedir. Böylece, bütçe uygulamaları ile muhasebe kayıtları arasında kavramsal ve sayısal tutarlılık sağlanmakta; kamu mali yönetiminde hem nakit hem de tahakkuk esasına dayalı bilgilerin bütüncül bir şekilde izlenmesine olanak tanınmaktadır. (Karaarslan, 2007) Dolayısıyla, kamu kurumlarının **nakit esaslı bütçe sistemini** kullanmaları ve mali tablolarında bütçe bilgilerini doğrudan yansıtmaları, kurumların ayrıca bağımsız bir **nakit akış tablosu** hazırlama gerekliliğini büyük ölçüde ortadan kaldırmaktadır. Bununla birlikte, belirtilen kamu kurumlarının mali süreçlerinde **analitik bütçe sınıflandırması** sistemini uygulamaları, bütçe verilerinin nakit akış tablosuna benzer bir yapıda sunulmasına imkân tanımaktadır. Bu çerçevede, giderler program, fonksiyonel, kurumsal, finansman tipi ve ekonomik sınıflandırma grupları altında ödenek miktarları ve gerçekleşen harcama tutarlarıyla birlikte raporlanmakta; gelirler ise ekonomik sınıflandırma tablosu aracılığıyla detaylandırılarak bütçe gelirlerinin kaynak bazında izlenmesi sağlanmaktadır. Bu sayede, gelir ve giderlerin bu şekilde sınıflandırılarak sunulması, kamu kurumlarının **dolaylı olarak nakit akış tablosuna benzer bir raporlama pratiği** yürüttükleri şeklinde değerlendirilebilir. Ancak, bu uygulamanın söz konusu tabloların uluslararası kamu muhasebe standartlarında tanımlanan kapsamlı nakit akış tablosu özelliklerini tam olarak karşılamadığı gerçeğini değiştirmediği de vurgulanmalıdır.

Bir diğer husus, bilançoda yer alan ve ilgili standardın gereklerine uygun olarak yayımlanması zorunlu olan verilerdir. Standart, mali durum tablosunda varlık ve yükümlülüklerin kısa ve uzun vadeli ayrım gözetilerek, önem derecelerine göre ilgili başlıklar altında sınıflandırılarak sunulması gerektiğini belirtmiştir. Net varlıklar ve öz kaynakların niteliklerini ve amacının açıklaması zorunluluğuna da değinmiştir. Standart öncesi ve sonrası yayımlanan bilançoyu incelediğimizde arada ki farkı gözlemlemek mümkündür.

Tablo 7: Standart Öncesi Yayımlanan Bilanço

Kaynak: Hazine ve Maliye Bakanlığı sitesinden alınmıştır

Tablo 8: Standart Sonrası Yayımlanan Bilanço

Kaynak: Hazine ve Maliye Bakanlığı sitesinden alınmıştır

Standart öncesi bilanço yapısı incelendiğinde, kurumun varlık ve yükümlülüklerine ilişkin bilgilere yer verildiği, ancak bunların yalnızca ana başlık düzeyinde gruplandırıldığı görülmektedir. Öz kaynaklara ilişkin bilgilere ise hiç yer verilmemiştir. Ayrıca, standartta vurgulanan bir diğer unsur olan dipnotlar bakımından, standart öncesi dönemde yalnızca açıklama yapılmışken, standart sonrasında dipnotlar için ayrı bir kodlama sistemi oluşturularak detaylı bilgilere yer verilmiştir.

Tablo 9 : Dipnotlar

SONUÇ VE TARTIŞMA

Devlet Muhasebe Standardı (DMS) 1 – Mali Tabloların Sunulması, kamu sektöründe mali raporlama sürecinin şeffaf, karşılaştırılabilir ve güvenilir bir yapıya kavuşturulmasını hedeflemektedir. Bu standart, kamu idarelerinin mali durumunu, performansını ve nakit akışlarını doğru ve anlamlı biçimde yansıtacak finansal tabloların hazırlanmasını sağlayan temel ilkeleri ortaya koymaktadır. Çalışma kapsamında yapılan değerlendirmeler, DMS 1'in uygulanmasının kamu mali yönetiminde önemli yapısal ve işlevsel dönüşümler yarattığını göstermektedir.

Standart, özellikle mali tabloların uluslararası kamu sektörü muhasebe standartları (IPSAS) ile uyumlu hale gelmesini sağlayarak raporlama kalitesini yükseltmiştir. Bu sayede, kamu kaynaklarının etkin kullanımının izlenmesi kolaylaşmış, hesap verebilirlik ve mali saydamlık ilkeleri güçlenmiştir. Mali tabloların bütüncül ve karşılaştırılabilir bir biçimde sunulması, hem denetim organları hem de kamuoyu açısından mali bilgilere erişimi kolaylaştırmıştır.

Ancak, uygulama sürecinde bazı teknik ve kurumsal zorluklarla da karşılaşılmaktadır. Özellikle muhasebe altyapısının yetersizliği, tahakkuk esasına geçişteki uyum sorunları ve personelin yeni sistemlere adaptasyonundaki eksiklikler, standardın amaçladığı raporlama düzeyine ulaşmayı güçleştirmektedir. Örneklerde de görüldüğü üzere, analitik bütçe sistemine geçilmesi, bilanço dipnotlarında yeni bir kod sisteminin kullanılmaya başlanması gibi gelişen uygulamalara personelin hızlı biçimde adapte olması büyük önem taşımaktadır. Çünkü bu raporlar, muhasebe personelinin veri girişi sonucunda ortaya çıkan mali bulgulardır. Eksik bilgi veya hatalı veri girişleri, hem mali verilerin güvenilirliğini zedelemekte hem de standardın hedeflediği doğru, karşılaştırılabilir ve anlamlı raporlama amacına ulaşılmasında tıkanıklıklara neden olabilmektedir.

Sonuç olarak, DMS 1'in uygulanması kamu mali yönetiminde kalite, şeffaflık ve hesap verebilirlik açısından önemli kazanımlar sağlamıştır. Ancak bu kazanımların kalıcı hale gelmesi, sadece teknik düzenlemelerle değil; aynı zamanda insan kaynağının bu yeni yapıya uyumuyla mümkündür. Bu nedenle, kamu kurumlarında muhasebe personelinin sürekli eğitimi, bilgi sistemlerinin modernizasyonu ve uygulamaların düzenli olarak değerlendirilmesi büyük önem taşımaktadır. Bu yönde atılacak adımlar, DMS 1'in getirdiği standartların sürdürülebilirliğini artıracak ve kamu mali yönetiminde güvenilir raporlama kültürünün yerleşmesini sağlayacaktır.

POSTKOLONİALİZM DİSKURSUNDA EKOKOLONİALİZM ANLAYIŞI

Nərgiz Nağıyeva

Siyasi elmlər üzrə fəlsəfə doktoru, dosent

Bakı Dövlət Universiteti

nargiz_nagiyeva@mail.ru

ORCİD İD: 0009-0001-1205-5864

Xülasə

Kolonializm siyasi hadisəsi dünya tarixşünaslığında kifayət qədər əsaslı şəkildə araşdırılmış, bu sahədə xeyli sayda monumental, əsaslı nəzəri tədqiqat əsəri yazılmışdır. Bu əsərlərin hamısını sadalamağa ehtiyac olmasa da, E.V.Tarlenin, Vijay Mişra və Bob Hodqenin koloniyalizmin tarixi və nəzəri əsərləri xüsusi olaraq qeyd edilməlidir. Kolonializm bu gün postkolonial formada özünü büruzə verdi. Bu gün də dünyada koloniya və postkolonial, neokolonial həyat yaşayan ölkələr mövcuddur.

Yer kürəsində iqlim dəyişikliyinin tarixi qədim olsa da, insan fəaliyyətinin iqlimə təsiri Sənaye İnqilabı ilə başladığı hesab olunur. Sürətli sənayeləşmə və yüksək enerji tələbatı atmosferə atılan zərərli qazların artmasına səbəb olmuşdur. Yığılan bu qazlar öz növbəsində temperaturun artmasına səbəb olur və ölkələr üçün qlobal təhlükə yaradır. Sənaye İnqilabı də müstəmləkəçiliyə əsaslanırdı. Aparıcı iqlim alimləri müstəmləkəçiliyin iqlim böhranının hərəkətverici qüvvəsi olduğunu hesab edirlər. Torpaq və sərvətlərin öz məqsədləri üçün xarici ölkələr tərəfindən mənimsənilməsi olan yaşıl kolonializm ədalətsiz inkişafın nümunələrinin təkrarlanmasına və müstəmləkəçiliyə yeni bir sima verilməsinə səbəb olur.

Açar sözlər: kolonializm, postkolonializm, neokolonializm, ekokolonializm, imperializm, ətraf mühit müstəmləkəçiliyi.

THE CONCEPT OF ECOCOLONIALISM IN THE DISCOURSE OF POSTCOLONIALISM

Abstrakt

The political phenomenon of colonialism has been thoroughly studied in world historiography, and a large number of monumental, substantial theoretical research works have been written in this field.

Although there is no need to list all of these works, the historical and theoretical works of E.V. Tarle, Vijay Mishra and Bob Hodgen on colonialism should be specially noted. Colonialism has manifested itself in a postcolonial form today. Today, there are still countries in the world that live in colonies and postcolonial, neocolonial life.

Although the history of climate change on Earth is ancient, it is believed that the impact of human activity on the climate began with the Industrial Revolution. Rapid industrialization and high energy demand led to an increase in harmful gases emitted into the atmosphere. These accumulated gases, in turn, cause an increase in temperature and pose a global threat to countries. The Industrial Revolution was also based on colonialism. Leading climate scientists believe that colonialism is the driving force behind the climate crisis. Green colonialism, the appropriation of land and resources by foreign countries for their own purposes, leads to the repetition of patterns of unjust development and gives colonialism a new face.

Keywords: colonialism, postcolonialism, neocolonialism, ecocolonialism, imperialism, environmental colonialism.

Giriş. Kolonializm bir siyasi fenomen kimi qədim tarixə malikdir. Bu siyasi və iqtisadi hadisə lap qədim dövrlərdə də dünyanın müxtəlif ərazilərində mövcud olmuş və zaman və məkana görə öz forma və məzmununu dəyişə-dəyişə bu günə qədər mövcudluğunu davam etdirməkdədir. Qədim Şərqdə, antik dövr, orta əsrlər və intibah dövrlərində Avropada kolonializm müəyyən mənada bəsit (primitiv) səciyyə daşımış, yalnız XVII əsrin əvvəllərindən etibarən, demək olar ki, Qərb dünyasının rəsmi siyasəti şəklinə düşmüşdür.

Antik dövrün kolonializmi ilə XVII-XVIII əsrin kolonializmi və ya XX-XXI-ci əsrin kolonializmi ilə eyni deyil. Bununla belə onların kökündə eyni kolonializm siyasəti dayanır. Mənim mövzum əsas etibarı ilə postkolonializm siyasəti üzərində qurulub. Adından da göründüyü kimi postkolonializm konlonializmdən sonrakı dövrü əhatə edir. Sonrakı kolonializmin özünəməxsus çoxsaylı xüsusiyyətləri mövcuddur və mən bu xüsusiyyətlərin bəzilərinə aydınlıq gətirməyə çalışacam. Hal-hazırda dünyada postkolonial taleyi yaşamayan demək olar ki. ərazi və ya ölkə yoxdur. (Buraya həm kolonialist, həm də koloniya ölkələr aiddir). Bu gün postkolonial siyasət ümumdünya siyasi həyatın aktual məqamlarından biridir.

Qeyd edim ki, **postkolonial nəzəriyyə** və ya **postkolonializm** müstəmləkəçiliyin mədəni irsini anlamağa çalışan intellektual diskursdur. Nəzəriyyənin mərkəzi F.Fanonun, E.Səidin, H.Bhabhanın, Ç.Spivakın, R.Quanın, D.Çakrabartinin artıq klassik əsərləridir ki, onların əsasında 1980-ci illərdən başlayaraq postkolonial tədqiqatlar formalaşdı.

Postkolonial tədqiqatlarda çox önəmli yer tutan martinikalı filosof Frans Fenon "Qara dəri, ağ maska" (1952) [9], "Yer üzünün bədbəxtləri"(1961) [10] adlı əsərlərində qeyd edir ki, kolonializmin tamamən aradan qalxması üçün tək siyasi müstəqillik kifayət emir, çünki, ərazilər, torpaqlarla birlikdə kimliklər, mədəniyyətlər də müstəmləkələşdirilblər.

Bu gün ABŞ, Fransa, İngiltərə dünyanın bir çox fərqli bölgələrində müstəmləkələri olmasa da, hərbi bazaları, kapitalizm münasibətləri, iqtisadi tor vasitəsilə neokolonial əlaqələr qurmuşdur. Beləliklə də postkolonializm imperilaizmin mirasıdır. Bitməyən bir imperializm sistemidir.

Fələstinli, amerikalı ədəbi tənqidçi, Kolumbiya Universitetinin professoru E.Səidin dünyanın 36 dilinə tərcümə edilmiş "Orientalizm" [12] əsəri postkolonializmin əsas tədqiqat obyektlərindən biridir. Ərəb əsilli xristian bir ailənin uşağı olaraq dünyaya gələn, ingilisdilli Qərb məktəblərində təhsilini tamamlayan və ABŞ-da elmi həyata daxil olan Edvard Səid bu xüsusiyyətlərinə görə özünü nə

bütövlüklə ərəb, nə də qərbli olaraq görmürdü. Hətta avtobioqrafiyasında özünü "yersiz, yurdsuz" deyə təsvir edir. XIX əsrdə orientalizm Şərqi öyrənən elm sahəsi idisə, E.Səiddən sonra postkolonializmin, müstəmləkəçilik tarixinin öyrənilməsində mühüm yer tutdu. E.Səidə görə Orientalizm Şərq haqqında elmdir, Şərqin Qərb tərəfindən necə təmsil edildiyi üzərində dayanır.

Poskolonializm yeni dövrün siyasi hadisəsidir. Yeni dövrün isə yeni tələbləri var. Artıq mövcud klassik kolonializm əvvəlki kimi davam edə bilməzdi. Onu yeni forma əvəz etməli idi və etdi də. Bu yeni forma dünya siyasətində postkolonializm adlandırıldı. Bu da ondan ibarətdir ki, artıq əvvəlki metropol ölkələr özünün müstəmləkəyə çevirdikləri ölkələrdə əvvəlki kimi silah gücünə deyil, başqa yollarla - mədəni, siyasi, iqtisadi əlaqələrlə öz kolonial siyasətini davam etdirirlər. Bu məsələnin bir qədər dərininə getmək istərdim. Postkolonial siyasətin həm metropol həm müstəmləkə ölkəsi üçün qarşılıqlı maraqları yaranır. Yəni hər bir kolonial ölkə kolonializm dövründə öz müstəmləkəsinə çevirdiyi ölkədə öz mədəniyyətini, adət-ənənəsini, psixologiyasını, ideologiyasını, dilini, iqtisadiyyatını, siyasətini tətbiq edir. Bu elemenlər müstəmləkə dövlətlərdə o qədər dərin kök salmış olur ki, müstəmləkəçilik sistemi başa çatdıqdan sonra da həmin ərazilərdə qalmaqda, işləməkdə davam edir.

Neokolonyalizm, inkişaf etməkdə olan bir ölkəyə təsir etmək üçün əvvəlki müstəmləkəçiliklə birbaşa hərbi nəzarət və ya dolayı siyasi nəzarət üsulları yerinə kapitalizm, qloballaşma ve mədəni imperializmdən istifadə təcrübəsidir.

Termin ilk dəfə, 1956-cı ildə fransız filosofu Jean-Paul Sartre tərəfindən işlədilib, daha sonra Kwame Nkrumah tərəfindən 1960-cı illərdə müstəmləkəçilikdən müstəqilliklərin qazanan Afrika ökələri ilə əlaqədar işlənildi.

Metod və materiallar. Təsadüfi deyil ki, yaxın günlərdə Azərbaycanın siyasi həyatında postkolonial mövzu dövlət səviyyəsində aktuallaşmış və beynəlxalq səviyyədə konfranslar keçirilmiş, çağırışlar edilmişdir. Çünki, postkolonializm bu gün dünya siyasətinin ən aktual məsələlərindən biridir. Məsələn, Azərbaycan Respublikasının Prezidenti İlham Əliyevin 2023 oktyabrın 20-də Bakıda keçirilən "Neokolonializm: İnsan Hüquqlarının Pozulması və Ədalətsizlik" mövzusunda beynəlxalq konfransın [1] iştirakçılarına müraciəti BMT-nin rəsmi sənədi kimi yayılıb. Dövlətimizin başçısı müraciətində Azərbaycanın XXI əsrdə kolonializmin davam etməsindən və kolonializmin yeni təzahürləri meyillərinin artmasından narahatlığını vurğulayıb, Afrika, Cənub-Şərqi Asiya, Sakit Okean, Latın Amerikasında onlarla ölkəni işğal edən, sərvətlərini talayan, xalqlarını uzun illər əsarətdə saxlayan Fransanın həmin ərazilərdə hərbi və bəşəriyyət əleyhinə çoxsaylı cinayətlər törətdiyini, etnik və dini mənsubiyyətinə görə yüz minlərlə dinc sakini soyqırımına məruz qoyduğunu diqqətə çatdırıb, Fransa kolonializminin utancverici yeni metodlarının bu gün də davam etməsindən təəssüfləndiyini bildirib.

Təkcə 1960-1966-cı illər arasında Fransa Əlcəzair Səhrasında 17 nüvə sınağı keçirib. Fransa ilk atom bombasını, kod adı Gerboise Bleue olan bombanı 13 fevral 1960-cı ildə Reggane yaxınlığındakı Tanezrouft səhrasının Tan Afella bölgəsində partladıb. Bombanın gücü təxminən 70 kiloton olub ki, bu, Xirosima bombasından dörd dəfə çoxdur. Partlama yeri Hamudia bazasından 40 kilometr və Bechar şəhərindən təxminən 700 kilometr cənubda yerləşirdi.

Fransanın ərazinin yaşayış yeri olmadığı barədə ilk iddialarına baxmayaraq, sonradan ətraf bölgədə on minlərlə insanın yaşadığı məlum oldu[2]. Köçəri Tuareq icmaları, yerli səhra sakinləri, yerli işçilər və Fransa hərbi qulluqçuları effektiv müdafiə almadan sınaq sahələrinin yaxınlığında idilər. Hesabatlar göstərir ki, bu şəxslərin radiasiyadan demək olar ki, heç bir qoruyucusu yox idi və onlara hər partlayışdan sonra sadəcə çimmək tapşırılıb ki, bu da tamamilə qeyri-kafi bir tədbir idi. 1960-1961-ci illər arasında eyni bölgədə üç əlavə atmosfer nüvə sınağı (o cümlədən Gerboise Blanche, Gerboise Rouge və digərləri) həyata keçirilib. Məsələn, Fransanın üçüncü bombası olan Gerboise Rouge 27 dekabr 1960-cı ildə partladılıb. Onun gücü təxminən 5 kiloton - Amerikanın Little Boy bombasının təxminən yarısı olsa da - geniş beynəlxalq qınağa səbəb olub. Yaponiya, Sovet İttifaqı, Misir, Mərakeş,

Nigeriya və Qana da daxil olmaqla ölkələr sınaqları pisləyiblər. Əvvəldən Afrikada nüvə sınaqları sülhün pozulması və yerli əhalinin həyatına etinasızlıq kimi qəbul edilib.

Əlcəzair 1962-ci ilin iyul ayında həmin ilin mart ayında imzalanan Evian Sazişlərindən sonra müstəqillik qazansa da, Fransa bu danışıqlarda mühüm bir güzəşt barədə danışıqlar aparıb: Əlcəzairdəki müəyyən hərbi obyektlərdən daha beş il istifadə etmək hüququnu saxlayıb. Əslində, müstəqil Əlcəzair 1967-ci ilə qədər Fransanın hərbi mövcudluğunu davam etdirməyə məcbur oldu, Fransa isə nüvə proqramını başqa yerə köçürdü. Bu gizli tənzimləmənin bir hissəsi olaraq, Fransa sınaq əməliyyatlarını Reggane-dən Əlcəzair Səhrasında daha ucqar bir yerə - Hoggar silsiləsindəki İn Ekker dağlıq bölgəsinə köçürdü. Səhra Hərbi Təcrübə Mərkəzi kimi tanınan yeni ərazi, yeraltı sınaqları asanlaşdırmaq üçün sonda Oasis Təcrübələri Mərkəzi adlandırıldı. 1961-ci ilin noyabrı ilə 1966-cı ilin fevralı arasında Taourirt Tan Afella dağındakı tunellərdə 13 yeraltı sınaq keçirildi. Bu sınaqlar yerin altına köçürülsə də, təhlükəsiz deyildi.

Ən məşhur hadisələrdən biri 1 may 1962-ci ildə Beril sınağı zamanı baş verdi. Partlayış o qədər güclü idi ki, dağı sındırdı və havaya radioaktiv tütün buraxdı. Sınağı izləyən bir neçə Fransa naziri və hərbi zabiti radiasiyaya məruz qaldı və çirklənmiş paltarlarla təxliyə edilməli oldu. Bu hadisə, sözdə "təhlükəsiz" yeraltı sınaqların da fəlakətli nəticələrə səbəb ola biləcəyini ortaya qoydu.

Nüvə sınaqlarından əlavə, Fransa ordusu müstəmləkə dövründə Əlcəzair Səhrasından kimyəvi silahlar üçün gizli laboratoriya kimi istifadə etmişdir. Məxfilikdən çıxarılan Fransa hərbi qeydlərinə görə, 1940-cı illərin sonlarından etibarən Əlcəzair səhrasında əhəmiyyətli miqdarda Alman sinir agentləri (II Dünya Müharibəsindən sonra ələ keçirilmiş) sınaqdan keçirilmişdir. Mərakeş sərhədindən təxminən 100 kilometr məsafədə yerləşən B2-Namous kimi tanınan ucqar bir ərazidə bu kimyəvi maddələrin sınaqdan keçirilməsi üçün istifadə edilmişdir. Tabun və sarin kimi ölümcül maddələr onların ölümcül təsirlərini öyrənmək üçün sursatlar üzərində və ehtimal ki, canlı heyvanlar (ehtimal ki, mal-qara) üzərində sınaqdan keçirilmişdir.

Səhrada açıq hava sınaqları torpağın və suyun yüksək zəhərli materiallarla çirklənməsinə səbəb olmuşdur. Fransa hökuməti rəsmi olaraq hücum kimyəvi silah proqramına malik olduğunu inkar etsə də, tarixi araşdırmalar - məsələn, Vinsent Jovertin 1997-ci il hesabatı - həqiqəti üzə çıxardı[13]. Narahatedici haldır ki, bu sahədə gizli əməkdaşlığın Əlcəzairin müstəqilliyindən sonra da davam etdiyi bildirilir. Hesabatlar göstərir ki, 1980-ci illərdə Çadli Bendjedidin prezidentliyi dövründə gizli bir razılaşma Fransaya kimyəvi sınaqlar üçün B2-Namous ərazisindən istifadə etməyə davam etməyə icazə vermişdi. Bir məlumata görə, bu fəaliyyətlər Əlcəzairin müstəqilliyindən 24 il sonraya qədər - 1986-cı ilə qədər davam etmişdir.

Bundan əlavə, sınaq kampaniyaları başa çatdıqdan sonra Fransa səhrada çoxlu miqdarda tullantı - o cümlədən partlayış güllələri, nümunə götürmə təyyarələri və hərbi nəqliyyat vasitələri - basdırdı. İllər sonra məlum oldu ki, bu radioaktiv qalıqlar lazımi işarələr və ya ictimaiyyətə açıqlanmadan qumun altında gizlədilib və Fransa onilliklər boyu onların dəqiq yerlərini açıqlamaqdan imtina edib.

Əlcəzairdəki nüvə sınaq əməliyyatlarının dayandırılmasından sonra Prezident de Qollun rəhbərliyindəki Fransa hökuməti tez bir zamanda alternativ bir əraziyə müraciət etdi. 1962-ci ildə Fransa rəsmi olaraq Fransa Polineziyasındakı Mururoa və Fangataufa atollarının nüvə sınaqlarının davam etdirilməsi üçün seçildiyini elan etdi. 1963-cü ilin yanvar ayında de Qoll bu qərarı yerli iqtisadiyyatı stimullaşdırmaq üçün bir vasitə kimi təqdim etdi və Polineziya sakinlərinin dəstəyini istədi - bəziləri əvvəlcə əməkdaşlıq etdi. Lakin sınaqlar başladıqdan sonra onların zərərli təsirləri ictimai rəydə dəyişiklik yaratdı və xüsusilə müstəqillik tərəfdarı hərəkatlar arasında müqaviməti artırdı.

1966-1996-cı illər arasında Fransa Fransa Polineziyasında 193 nüvə sınağı keçirdi. Bunlar iki mərhələdə aparıldı: 1966-1974-cü illər arasında 41 atmosfer sınağı, ardınca 1975-1996-cı illər arasında 150-dən çox yeraltı sınaq [3]. Atmosfer sınaqlarının dayandırılması üçün artan beynəlxalq təzyiqə cavab olaraq

- xüsusən də 1963-cü il Qismən Sınaq Qadağanı Müqaviləsindən (Fransa əvvəlcə imzalamadı) sonra - Fransa hökuməti 1974-cü ildə bütün gələcək sınaqların yeraltında aparılacağını elan etdi.

Fransız Polineziyasının təbii mühiti də ciddi ziyan gördü. Birbaşa sınaq sahələri olan Mururoa və Fangataufa atolları faktiki olaraq radioaktiv tullantıların saxlanma zonalarına çevrildi. Təkrarlanan partlayışlar onların geoloji strukturlarını zəiflətdi və parçaladı. 1980-ci ilə aid məxfi Fransa hərbi xəritəsində illərlə davam edən sınaqlar nəticəsində Mururoanın altında yaranan yeraltı çatlar və boşluqlar şəbəkəsi aşkar edildi [7]. Müstəqil alimlər xəbərdarlıq ediblər ki, bu qeyri-sabit, pətək formasındakı struktur gələcəkdə baş verəcək zəlzələ və ya partlayış zamanı dağıla bilər və okeana çoxlu miqdarda radioaktiv material buraxıla bilər [8].

Məsələn, 17 iyul 1974-cü ildə Centaure sınağı zamanı gözlənilməz külək dəyişiklikləri Mururoadakı partlayışdan 42 saat sonra Taiti adası və qonşu ərazilər üzərində radioaktiv bulud daşıyırdı. O zaman, paytaxt Papeete şəhərində 80.000 nəfər də daxil olmaqla, təxminən 110.000 insan buludun yolunda yaşayırdı. Rəsmi olaraq əhəmiyyəti azaldılan bu kimi hadisələr, ictimaiyyət tərəfindən qəbul edilən səviyyələri xeyli aşan udulmuş radiasiya dozalarına səbəb oldu [5].

Müxtəlif xərçəng növlərinin, xüsusən də tiroid, qan və ağciyər xərçənglərinin rastgəlmə nisbəti yerli əhali arasında əhəmiyyətli dərəcədə artdı. Fransa hökuməti uzun müddətdir hər hansı bir səbəb əlaqəsini inkar etsə də, Fransa Milli Səhiyyə İnstitutunun 2021-ci il tarixli hesabatında bölgədəki çoxsaylı xərçəng hallarının nüvə sınaqları ilə əlaqəli ola biləcəyi etiraf edilmiş və eyni zamanda qəti dəlillər üçün "əlavə tədqiqatlara ehtiyac" olduğu bildirilmişdir. Xərçəngdən əlavə, anadangəlmə deformasiyalar və genetik xəstəliklər də sənədləşdirilmişdir. Taitidə uşaq psixiatriyasının keçmiş rəhbəri Dr. Kristian Sueur 2018-ci ildə sınaq mərkəzlərinə yaxın ərazilərdə uşaqlar arasında inkişaf anomaliyalarının artdığını bildirmişdir. O, bölgədə müayinə edilən 271 uşaq arasında 69 əqli əlillik və ya fiziki deformasiya halını radiasiya ilə əlaqəli genetik mutasiyalarla əlaqələndirmişdir. O, həmçinin bildirib ki, Tureia Islada 1971-ci ildə test zamanı iştirak edən uşaqların dörddə birində sonradan tiroid xərçəngi inkişaf etmişdir. Bu gün yerli Polineziya hökuməti Fransadan bu testlərin gələcək nəsillərə genetik təsirləri ilə bağlı müstəqil tədqiqatların maliyyələşdirilməsini tələb edir [6].

Fransanın keçmiş müstəmləkələrində nüvə və kimyəvi sınaqları geniş beynəlxalq qınağa səbəb oldu. Bu reaksiyalar siyasi qınaqları, hüquqi tədbirləri, kütləvi fəallığı və insan haqlarının müdafiəsini əhatə etdi. İlk tənqid dalğası Fransanın 1960-cı ildə Əlcəzairdə nüvə sınaqlarından sonra gəldi. Qana, Nigeriya və Mərakeş kimi yeni müstəqillik qazanmış Afrika dövlətləri, Misir, Sovet İttifaqı və digərləri ilə birlikdə Saharadakı partlayışları Afrika sülhü və təhlükəsizliyinə təhdid kimi qınadılar. 1960-cı illərdə qlobal sınaq qadağası müqaviləsi mövcud olmasa da, BMT Baş Assambleyasındakı bir çox dövlət nüvə güclərini təmkinli olmağa çağırdı. Atom bombalamalarına məruz qalan yeganə ölkə olan Yaponiya, sınaqları Xirosimanın sağ qalanlarına dərin təhqir adlandıraraq, sərt tənqidçi oldu.

Müstəmləkəçi güclər, daha varlı ölkələri daha kasıb periferik ölkələrdən təbii sərvətlər çıxarmağa təşviq edən qlobal infrastruktur yaratmaqla problemi daha da ağırlaşdırdı.

Ətraf mühit tədqiqatçıları bəzən "ətraf mühit müstəmləkəçiliyi", "ekoloji müstəmləkəçilik" və "ekoloji imperializm" terminlərini bir-birini əvəz edən şəkildə istifadə edirlər. Lakin, Edvard Saidin xatırlatdığı kimi, "imperializm", uzaq bir ərazini idarə edən dominant metropoliten mərkəzinin təcrübəsi, nəzəriyyəsi və münasibətləridir. Ətraf mühit müstəmləkəçiliyinin həm qısa, həm də uzunmüddətli dövrdə yerli xalqlara və yerli torpaqlara həm açıq, həm də gözlənilməz təsirləri var. Məsələn, 1492-ci ildə avropalıların Amerikaya gəlişi sonrakı əsrdə 1500-1600-cü illərdə Amerikada yaşayan yerli əhalinin əksəriyyətinin itirilməsinə səbəb olan xəstəlik epidemiyalarının başlanğıcını qeyd edir. London Universitet Kollecinin (UCL) son tədqiqatı göstərir ki, pandemiya xəstəliyi dalğalarının yayılması zamanı Amerikadakı ümumi torpaq kütləsinin təxminən 1 faizi və ya Kolumbun gəlişindən sonrakı əsrdə yerli icmalar arasında epidemiya sonrası 55 milyon insan ölümündən təxminən 56 milyon hektar torpaq tərk edilmişdir. UCL tədqiqatçılarının aşkar etdiyinə görə, genişmiqyaslı əhali azalması nəticəsində

kənd təsərrüfatı torpaqlarının böyük bir hissəsi baxımsız qalıb və bu da torpağın ağaclar və digər yeni bitkilərlə örtülməsinə səbəb olub.

Elm birmənalı şəkildə deyir ki, iqlim böhranının əsas səbəbi qalıq yanacaqların yandırılmasıdır. Qazıntı yanacaq emissiyalarının sənaye miqyasında buraxılması XIX əsrin Sənaye İnqilabı dövründə Böyük Britaniyada başladı. Sənaye İnqilabı həm kömürə, həm də müstəmləkəçiliyə əsaslanırdı. Koloniyalar Britaniya fabriklərini xammalla təmin edirdi. Hindistan kimi bir çox koloniyalar güclü müqavimətə baxmayaraq, Britaniyanın asılı iqtisadiyyatlarına çevrilmək üçün sənayeləşmədən imtina etməyə məcbur edildi (yeni pəncərədə açılır). Kömür həmçinin Britaniya imperiya hərbi gəmilərini hərəkətə gətirirdi və onların yüksək hərəkətliliyi dominantlığın yüksək effektiv vasitəsi idi. Bu, Britaniyaya və digər Avropa müstəmləkəçilərinə müstəmləkə və kapitalist sərhədlərini genişləndirməyə imkan verdi və müstəmləkə ticarət şirkətlərinin maraqlarını dəstəklədi.

Aparıcı iqlim alimləri müstəmləkəçiliyin iqlim böhranının hərəkətverici qüvvəsi olduğunu hesab edirlər. Müstəmləkəçilik mirasları bu gün də yaşayır. Müstəmləkəçilik dövründə torpaqların ələ keçirilməsi təkcə insanların ərazilərini və resurslarını əlindən almaqla kifayətlənməyib, həm də əvvəllər davamlı olan yerli ekosistemləri dəyişdirib. İqlim dəyişikliyinin təsirlərinin aradan qaldırılmasına müstəmləkəçilik miraslarının aradan qaldırılması olmadan nail olmaq mümkün deyil. Qlobal miqyasda iqlim ədaləti hərəkatları uzun müddətdir ki, iqlim dəyişikliyinin müxtəlif insan qruplarına qeyri-bərabər təsirlərinin tanınması üçün kampaniyalar aparırlar.

İmperializmin başlanğıcından bəri müstəmləkəçilər işğal etdikləri ərazilərin ekosistemlərinə zərərli təsirlər göstəriblər. Məskunlar dünyanın hər yerində torpaqlardan, heyvanlardan və təbii sərvətlərdən həddindən artıq istifadə ediblər.

Səhralaşma və meşələrin qırılmasının da müstəmləkə kökləri var. Şimali və Qərbi Afrikadakı fransız müstəmləkəçiləri XIX əsrin sonlarında kənd icmalarına əsrlər boyu mövcud olan yaşayış təsərrüfatı üsullarını tətbiq etməyi qadağan etdilər. Yerli sakinlər Konqo çayından Sahel çayına qədər olan ərazilərdə, Fransa Ekvatorial Afrikasında meşələri kəsib pambıq plantasiyaları və digər gəlirli bitkilərlə əvəz etməyə məcbur oldular. Bu kütləvi meşə qırılması genişmiqyaslı ətraf mühitin pozulmasına səbəb oldu.

Müstəmləkəçilik heç vaxt dinc bir proses olmayıb. Zorakı mülkiyyətdən məhrum etmə aktları geniş yayılmış qırğınlar, İlk insan icmalarının yaşadığı kimi insanların torpaqlarından zorla çıxarılması və uşaqların ailələrdən zorla ayrılması ilə müşayiət olunub.

Lakin ədalətsizliklər və mülkiyyətdən məhrum etmə bu günə qədər davam edir. Yeni qlobal imperiyalar olan transmilli korporasiyalar minerallar, neft, qaz və digər sərvətlər üçün yerli əhalisini torpaqlarını əllərindən almaq təcrübəsini davam etdirirlər. Daha varlı ölkələrin korporasiyalarına daha kasıb periferik ölkələrdən təbii sərvətlər çıxarmaq səlahiyyəti verən mövcud qlobal infrastruktur, tez-tez dayanıqlı olan yerli iqtisadiyyat və mədəniyyətlərin qeyri-sabitliyini davam etdirir.

Nəticə. İqlim dəyişikliyinin insanlar üçün ən böyük təhlükə olduğu və buna görə də qlobal həll tələb etdiyi barədə qlobal konsensusun ortaya çıxması ilə yeni bir yaşıl müstəmləkəçilik də ortaya çıxır. Torpaq və sərvətlərin öz məqsədləri üçün xarici ölkələr tərəfindən mənimsənilməsi olan yaşıl kolonializm ədalətsiz inkişafın nümunələrinin təkrarlanmasına və müstəmləkəçiliyə yeni bir sima verilməsinə səbəb olur.

İqlim borcunu və iqlim təzminatlarını birlikdə anlamaq, dünyamızın necə işlədiyini və iqtisadi və iqlim aparteidinin necə davam etdiyini tam başa düşmək üçün dekolonizasiya ilə başlamalı olan bir çox yenidən təhsil tələb edir. Yalnız istismarçı və ədalətsiz müstəmləkə keçmişinin nümunələrindən çıxsaq, alternativ bir gələcək qura bilərik.

Özet

Küresel sağlık sistemleri artan maliyetler, yaşlanan nüfus ve kronik hastalık yükü nedeniyle sürdürülebilirlik açısından önemli zorluklarla karşı karşıyadır. Bu bağlamda yapay zeka (YZ), sağlık hizmetlerinde verimliliği artıran, maliyetleri düşüren ve klinik sonuçları iyileştiren stratejik bir teknoloji olarak öne çıkmaktadır. Bu geleneksel derleme çalışması, YZ uygulamalarının sağlık ekonomisine ve hemşirelik hizmetlerine olan etkilerini güncel literatür doğrultusunda incelemektedir. Bulgular, YZ'nin tanı doğruluğunu artırarak klinik hata oranlarını azalttığını, hizmet hızını yükselttiğini ve kaynak kullanımını optimize ederek sağlık kurumlarının maliyet-etkinliğini güçlendirdiğini göstermektedir. Hemşirelik alanında ise YZ; idari yüklerin azalması, iş gücü verimliliğinin yükselmesi, bakım kalitesinin artması ve hasta güvenliğinin güçlenmesi gibi çok boyutlu katkılar sunmaktadır. Markov modelleri, karar ağaçları ve maliyet-etkinlik analizleri, YZ tabanlı erken tanı, yara bakımı, risk tahmini ve otonom hemşirelik asistanlarının uzun dönemli ekonomik değerini kanıtlamaktadır. Diğer yandan YZ entegrasyonu; veri mahremiyeti, algoritmik önyargı, açıklanabilirlik ve klinik karar sorumluluğu gibi etik ve hukuki sorunları beraberinde getirmektedir. Mevcut literatür, hemşirelerin YZ teknolojilerini sadece uygulayan değil, aynı zamanda bu sistemlerin güvenli, adil ve insan odaklı şekilde hayata geçirilmesinde belirleyici bir role sahip olduğunu göstermektedir. Sonuç olarak YZ, sağlık sistemlerinde ekonomik sürdürülebilirlik ve kaliteli bakım için kritik bir araçtır. Bu doğrultuda önerimiz; hemşirelerin dijital yetkinliklerinin artırılması, etik yönetişim süreçlerinin güçlendirilmesi, ulusal veri altyapılarının geliştirilmesi ve uzun dönemli ekonomik modelleme çalışmalarının yaygınlaştırılmasıdır.

Anahtar kelimeler: Yapay zeka, sağlık ekonomisi, hemşirelik hizmetleri, maliyet-etkinlik

Abstract

Global health systems face significant sustainability challenges due to rising costs, population ageing, and the increasing burden of chronic diseases. In this context, artificial intelligence (AI) has emerged as a strategic technology that enhances efficiency, reduces costs, and improves clinical outcomes. This traditional review examines the impacts of AI applications on health economics and nursing services in

light of current literature. Findings indicate that AI improves diagnostic accuracy, reduces clinical error rates, accelerates service delivery, and optimises resource utilisation, thereby strengthening the cost-effectiveness of healthcare institutions. In nursing, AI offers multidimensional contributions, including reduced administrative burden, increased workforce productivity, improved quality of care, and enhanced patient safety. Markov models, decision trees, and cost-effectiveness analyses demonstrate the long-term economic value of AI-based early diagnosis, wound care, risk prediction, and autonomous nursing assistants. However, AI integration raises ethical and legal concerns such as data privacy, algorithmic bias, explainability, and accountability in clinical decision-making. The literature further shows that nurses play a decisive role not only in implementing AI technologies but also in ensuring that these systems are deployed in a safe, equitable, and human-centred manner. In conclusion, AI is an essential tool for economic sustainability and high-quality care in health systems. Therefore, we recommend enhancing nurses' digital competencies, strengthening ethical governance processes, developing national data infrastructures, and expanding long-term economic modelling studies.

Keywords: Artificial intelligence, health economics, nursing services, cost-effectiveness

Giriş

Küresel sağlık sistemleri; artan nüfus, yaşlanma, kronik hastalık yükü ve maliyet baskıları nedeniyle sürdürülebilirlik açısından önemli zorluklarla karşı karşıyadır. Kaynakların sınırlı olduğu bu ortamda verimlilik, maliyet-etkinlik ve bütçe optimizasyonu kavramları sağlık politikalarının merkezine yerleşmiştir. Bu bağlamda yapay zeka (YZ), klinik ve ekonomik performansı dönüştüren stratejik bir teknoloji olarak öne çıkmaktadır (Wolff et al., 2020). YZ; makine öğrenmesi, derin öğrenme, doğal dil işleme ve otonom sistemler gibi bileşenleri aracılığıyla tanı, tedavi, bakım, izlem ve yönetim süreçlerinde etkin bir şekilde kullanılmaktadır. Bu kullanım, sağlık hizmetlerinde doğruluk, hız ve maliyet etkinliği açısından anlamlı iyileşmeler sağlamaktadır. Klinik hata oranlarının azalması, kaynak kullanımının rasyonelleşmesi ve hasta güvenliğinin artması sayesinde YZ, sağlık kurumlarının bütçe yönetimine doğrudan katkı sağlamaktadır (Vithlani et al., 2023).

Türkiye'de ve dünyada geliştirilen dijital sağlık politikaları kapsamında kullanılan YZ tabanlı sistemler, yalnızca hekimlik uygulamalarını değil; hemşirelik hizmetlerinin işleyişini ve maliyet yapısını da önemli ölçüde değiştirmektedir. Hemşirelik, sağlık sisteminin en geniş insan gücü bileşenini oluşturduğundan, YZ uygulamalarının ekonomik etkileri hem mikro düzeyde (birim maliyetler) hem de makro düzeyde (kurumsal bütçe) dikkat çekici bir şekilde görünür hale gelmektedir (Akalın & Veranyurt, 2020). Bu geleneksel derleme çalışması, sağlık ekonomisi perspektifinden YZ uygulamalarının sağlık sistemleri ve hemşirelik hizmetlerine etkilerini literatür ışığında incelemekte; ekonomik, yönetsel ve etik boyutları birlikte tartışmaktadır.

Sağlık Sistemlerinde Yapay Zeka Uygulamalarının Ekonomik Boyutu

YZ'nin sağlık sistemlerine ekonomik katkıları, doğrudan maliyetlerin azaltılması, hizmet süreçlerindeki verimliliğin artırılması ve sağlık hizmetlerinde kaynak sürdürülebilirliğinin desteklenmesi ekseninde bütüncül biçimde ortaya çıkmaktadır. Wolff ve ark. (2020) tarafından 66 çalışmayı kapsayan sistematik derlemede, YZ uygulamalarının büyük bölümünün maliyet-etkin olduğu ve tanı doğruluğu ile işlem hızını artırdığı bildirilmiştir. Vithlani et al. (2023) ise YZ tabanlı sağlık müdahalelerinin %62'sinde ekonomik üstünlük, %30'unda ise klinik avantaj sağlandığını rapor etmiştir. Çalışmaların çoğu Markov modelleri ve karar ağaçları gibi yöntemlerle analiz edilmiş ve kısa vadede maliyet avantajı ortaya konmuştur. Markov temelli maliyet–etkinlik modelleri, YZ uygulamalarının uzun dönemli ekonomik etkilerini değerlendirmede güçlü ve tercih edilen analitik yaklaşımlardan biri olarak öne çıkmaktadır. Bu modeller, hastaların belirli sağlık durumları arasında (örneğin erken tanı, komplikasyon gelişimi,

iyileşme veya ölüm) geçiş olasılıklarını zaman içinde simüle ederek, her bir müdahalenin ek maliyetini ve kazandırdığı yaşam kalitesini (QALY) hesaplamayı sağlar. Li ve ark. (2023), Çin'in kırsal bölgelerinde yürüttükleri çalışmada YZ tabanlı diyabetik retinopati taramasını 50 yıllık bir Markov kohort modeliyle değerlendirmiştir. Analizde elde edilen **112.146 RMB/QALY,** YZ destekli taramanın her kazandırılan kaliteli yaşam yılı (QALY) için yaklaşık 112 bin RMB (Çin'in resmi para birimi olan **Renminbi**) ek maliyet gerektirdiğini, bunun da ülkenin maliyet-etkinlik eşiğinin oldukça altında olduğunu göstermektedir. Gefen (2025), kronik yara bakımını değerlendirdiği çalışmada Markov modeli ile Monte Carlo simülasyonlarını birlikte kullanmıştır. Bulgular, YZ destekli yara izleme ve pansuman stratejilerinin enfeksiyonları azalttığını, maliyetleri düşürdüğünü ve yaşam kalitesini artırdığını ortaya koymuştur. Bu bulgular, hemşirelik hizmetlerinde YZ'nin ekonomik değerlendirmelerinde Markov tabanlı modellemelerin kullanılmasının yalnızca kısa dönemli verimlilik kazanımlarını değil, aynı zamanda uzun dönemli bütçe sürdürülebilirliği ve kalite iyileştirmesini nicel olarak ölçmek açısından da kritik olduğunu göstermektedir. Dolayısıyla, gelecekte yapılacak çalışmaların YZ tabanlı hemşirelik uygulamaları için Markov modeli temelli maliyet-etkinlik analizlerine odaklanması, hem mikro düzeyde (kurumsal bütçe) hem de makro düzeyde (ulusal sağlık ekonomisi) politika üretimi açısından önemli bir katkı sağlayacaktır (Li ve ark., 2023; Gefen, 2025).

YZ'nin ekonomik etkileri, klinik uygulamaların yanı sıra sağlık kurumlarının yönetimsel süreçlerinde de belirgin şekilde görünür hâle gelmektedir. Bulut (2025), insan gücü planlaması, tedarik zinciri yönetimi ve hasta yoğunluğu tahmini gibi alanlarda YZ kullanımının maliyetleri %15-20 azalttığını; Khanna et al. (2022) ise tanısal süreçlerde %30'a varan tasarruf sağladığını belirtmiştir. YZ destekli karar sistemleri, tanısal doğruluğu artırarak gereksiz testlerin ve tekrarlayan tetkiklerin azalmasına katkı sağlamış; böylece sağlık bütçesi üzerinde gözle görülür bir tasarruf etkisi yaratmıştır (World Health Organization, 2024). Türkiye'de yapılan bir çalışmada da (Yorgancıoğlu et al., 2024), YZ uygulamalarının laboratuvar ve görüntüleme süreçlerini hızlandırdığını, maliyet yükünü azalttığını ve sağlık kurumlarının kaynak verimliliğini artırdığını belirtmiştir. de Vos ve ark. (2022), yoğun bakımda zamansız taburculukları önlemeye yönelik makine öğrenmesi tabanlı Pacmed Critical sisteminin maliyet-etkinliğini 1 yıllık bir Markov modeliyle değerlendirmiştir. Analizler, sistemin 18.507 €/QALY değeriyle maliyet-etkin olduğunu ve 30.000 €/QALY eşiğinde %71 olasılıkla maliyet-etkin kabul edildiğini göstermiştir. Yoğun bakım kalış süresindeki azalma, hasta başına yaklaşık 1.500 € tasarruf sağlayarak modelin temel ekonomik yararını oluşturmuştur. Bu sonuçlar, YZ'nin klinik doğruluğun ötesinde sağlık kurumlarının bütçe sürdürülebilirliğini de destekleyebileceğini ortaya koymaktadır (de Vos et al., 2022).

Sağlık sistemlerinde YZ uygulamalarının gecikmesi, teknolojik uyum sürecinin uzamasının yanı sıra, verimlilik ve maliyet etkinliği açısından kayda değer ekonomik kayıplara yol açan kritik bir sorun olarak görülmektedir. Bu durum, "fırsat maliyeti (opportunity cost)" kavramıyla açıkladığı gibi, YZ temelli çözümlerin devreye alınmaması nedeniyle kaçırılan potansiyel tasarruflar ve iyileşme fırsatlarını ifade etmektedir. Özellikle yoğun bakım ünitelerinde erken tanı ve risk tahmini algoritmalarının kullanılmaması, gereksiz yatış günleri, artan komplikasyon oranları ve ek maliyetler gibi sonuçlar doğurabilmektedir. Bu nedenle YZ'nin sağlık ekonomisindeki rolü, yalnızca kullanımından doğan kazanımlarla değil, uygulanmamasının yol açtığı ölçülebilir ekonomik kayıplarla da belirginleşmektedir (Spencer et al., 2025).

Hemşirelik Hizmetlerinde Yapay Zeka Uygulamalarının Ekonomik Boyutu

YZ'nin hemşirelik uygulamalarına entegrasyonu, bakım süreçlerinin pek çok aşamasında belirgin ekonomik avantajlar sağlamaktadır. Akalın ve Veranyurt (2020), dijital sistemlerin hemşirelikte idari yükü azalttığını ve otomatik kayıt süreçlerinin hem hata oranlarını düşürdüğünü hem de bakım sürelerini iyileştirdiğini ortaya koymuştur. YZ tabanlı erken uyarı sistemleri komplikasyon risklerini önceden fark ederek yoğun bakım ve yenidoğan ünitelerinde tedavi maliyetlerini azaltmaktadır. Lee & Yoon (2021), bu tür sistemlerin yeniden yatış oranlarını %31 azalttığını ve yıllık birkaç milyon ABD doları düzeyinde

tasarruf sağladığını göstermiştir. Yoğun bakım ünitelerinde yapılan güncel araştırmalar, YZ'nin erken uyarı ve tanı süreçlerinde kayda değer bir etki oluşturduğunu göstermektedir. Yuan ve ark. (2020) tarafından geliştirilen XGBoost tabanlı algoritma (ağaç tabanlı bir makine öğrenmesi yöntemi; birçok karar ağacını birleştirerek yüksek doğruluk sağlayan 'gradient boosting' modeli), erken sepsis tanısında %82 doğruluk ve %88 özgüllük düzeyine ulaşmış; bu sonuçlar, geleneksel SOFA skoruna (Sequential Organ Failure Assessment; organ yetmezliğini değerlendiren klinik puanlama sistemi) kıyasla belirgin bir performans üstünlüğüne işaret etmiştir. Algoritmanın klinik uygulamaya entegrasyonu, sepsisin daha erken fark edilmesini ve tedavinin zamanında başlatılmasını sağlayarak komplikasyon oranlarını ve yatış süresini azaltmış; böylece sağlık sistemi maliyetlerinde ölçülebilir bir düşüşe katkıda bulunmuştur. İş gücü planlamasında veri temelli algoritmalar, personel dağılımını rasyonelleştirmekte ve vardiya optimizasyonu sayesinde %10–15 düzeyinde maliyet tasarrufu sağlamaktadır (Bulut, 2025). Benzer biçimde, Gupta ve ark. (2025) tarafından yürütülen AI Driven Nursing Assistant çalışması, YZ ve IoT tabanlı akıllı hemşirelik asistanlarının hem klinik hem de ekonomik açıdan sağladığı katkıları ortaya koymuştur. Araştırmada, bu akıllı hemşirelik asistanlarının yoğun bakım ve evde bakım ortamlarında manuel iş yükünü azalttığı, veri doğruluğunu artırdığı ve pilot uygulamalarda olumlu hasta geri bildirimlerine yol açtığı bildirilmiştir (Gupta et al., 2025)."

Pannu et al. (2024), yapay zekânın hemşirelikte yalnızca klinik karar destek aracı değil, aynı zamanda eğitim, yönetim ve liderlik süreçlerinin de önemli bir bileşeni hâline geldiğini belirtmiştir. Çalışmalarında, AI tabanlı eğitim uygulamalarının öğrenme süresini yaklaşık %25 kısalttığı, bilgi kalıcılığını artırdığı ve eğitim maliyetlerinde anlamlı bir azalma sağladığı raporlanmıştır. Bunun yanı sıra YZ destekli yönetim sistemleri, kaynak tahsisini optimize ederek hemşire başına düşen iş yükünü azaltmış ve bakım kalitesinde ölçülebilir bir artış yaratmıştır (Pannu et al., 2024). Benzer şekilde, Gupta ve ark. (2025) yapay zekâ temelli simülasyon ve değerlendirme araçlarının eğitimde hata oranlarını azalttığını, süreci daha nesnel hâle getirdiğini ve hemşirelik uygulamalarında verimlilik kazancı sağladığını ortaya koymuştur.

Sağlık Sistemlerinde ve Hemşirelik Hizmetlerinde Yapay Zekâ Uygulamalarının Etik, Hukuki ve Politik Boyutları

Sağlık sistemlerinde ve hemşirelik hizmetlerinde yapay zekâ uygulamalarının hızla yaygınlaşması, bu teknolojilerin yalnızca ekonomik faydalarıyla değil, aynı zamanda etik, hukuki ve politik sorumluluklarıyla birlikte değerlendirilmesini zorunlu kılmaktadır. YZ'nin ekonomik getirileri etik ve yönetişimsel temellerle desteklenmediği sürece sürdürülebilir değildir. Dünya Sağlık Örgütü (2024), sağlık alanında YZ uygulamalarının 'adil, şeffaf ve hesap verebilir' ilkeler doğrultusunda yürütülmesi gerektiğini vurgulamaktadır. YZ sistemlerinin büyük veri kullanması, kişisel verilerin gizliliği ve hasta onamı konularını ön plana çıkarmaktadır. Gupta ve ark. (2025), AI temelli hemşirelik asistanlarında IoT sensörleriyle toplanan verilerin güvenli bir şekilde aktarılabilmesi için güçlü şifreleme protokollerinin ve etkin onam süreçlerinin zorunlu olduğunu vurgulamıştır. Ayrıca yapay zekâ uygulamalarının yalnızca kullanıldığında değil, kullanılmadığında da etik açıdan sorumluluk doğurduğu; çünkü bu durumda gecikmiş kararlar, artan hata riski ve oluşabilecek fırsat maliyetlerinin de etik bir sorun oluşturduğu belirtilmektedir. "Spencer et al. (2025), 'AI hesitancy' kavramıyla klinik ekiplerin yapay zekâ teknolojilerine temkinli yaklaşmasının, hasta güvenliği ve sağlıkta adalet açısından önemli fırsat kayıplarına yol açabileceğini vurgulamaktadır. Bu durum, Dünya Sağlık Örgütü'nün (2024) 'etik yönetişim' ilkeleriyle uyumlu şekilde, teknolojik yeniliklere erişimin ertelenmesinin de etik bir ihmal olarak değerlendirilmesi gerektiğini göstermektedir. Bu bağlamda 'value-based AI' yaklaşımı, yalnızca maliyet-etkinliği değil; hasta yararını, insani değerleri ve sağlıkta hakkaniyeti merkeze alan bütüncül bir etik-ekonomik çerçeve sunmaktadır (Spencer ve ark., 2025).

YZ uygulamalarının etik yönetişimi, özellikle hemşirelik alanında veri gizliliği ve insani sorumluluk boyutları açısından daha karmaşık bir yapı kazanmaktadır.

Maguluri ve ark. (2024), YZ destekli veri işleme süreçlerinde hasta mahremiyetini koruma yükümlülüğünün yalnızca teknik bir gereklilik değil, aynı zamanda mesleki bir etik sorumluluk olduğunu vurgulamıştır. Çalışma, YZ sistemlerinin HIPAA gibi gizlilik standartlarıyla tam uyum göstermemesi durumunda veri sızıntısı, kimliği belirlenebilir bilgi ifşası ve güven kaybı risklerinin artabileceğini; bu nedenle hemşirelerin dijital etik farkındalıklarının güçlendirilmesinin kritik önem taşıdığını belirtmektedir. Ball Dunlap ve Michalowski (2024), hemşirelikte 'YZ veri etiği' yaklaşımını öne çıkararak adalet, şeffaflık, açıklanabilirlik ve hesap verebilirlik ilkelerinin hemşirelik karar destek sistemlerinin ayrılmaz bileşenleri olması gerektiğini savunmuştur. Bu çerçevede hemşireler; veri yönetiminde hasta onamını koruma, algoritmik önyargıları tanıma ve dijital güveni güçlendirme açısından kritik bir sorumluluk üstlenmektedir.

YZ'nin hemşirelik uygulamalarına entegrasyonu, yalnızca verimliliği artırmakla sınırlı değildir; aynı zamanda empati, hümanist bakım ve insan onurunun korunması gibi temel etik ilkeleri yeniden tanımlamaktadır. Ceviz ve Özden (2025), yoğun bakım ortamında yapay zekâ kullanımının etik sonuçlarına dikkat çekerek, empatiye dayalı karar süreçlerinin teknolojik sistemlerle dengeli bir biçimde yürütülmesi gerektiğini vurgulamıştır. Mahremiyet ihlalleri, algoritmik hatalar ve klinik karar sorumluluğu gibi etik ikilemler karşısında hemşirelerin profesyonel denetim ve müdahale yükümlülüğü daha da önemli hâle gelmektedir. Nurkalem ve Gülseven Karabacak (2025) ise, YZ'nin hemşirelikte hümanist bakım anlayışıyla uyumlu biçimde uygulanmasının zorunluluğuna işaret ederek, insan merkezli, etik ve adil sistemlerin geliştirilmesinde hemşirelerin dönüştürücü bir rol üstlenmesi gerektiğini belirtmektedir. Sonuç olarak, YZ'nin sağlık sistemlerinde kalıcı ve güvenilir bir şekilde konumlanabilmesi; yalnızca ekonomik verimlilikle değil, etik yönetişim, veri mahremiyeti, hümanist değerler ve politik düzenlemelerin eş zamanlı olarak güçlendirilmesiyle mümkün görünmektedir. Bu süreçte hemşirelik mesleği, teknolojiyi kullanan bir uygulayıcı olmanın ötesine geçerek, yapay zekânın etik, adil ve insan onuruna saygılı biçimde hayata geçirilmesini sağlayan öncü bir aktör olarak kritik bir rol üstlenmektedir (Ball Dunlap & Michalowski, 2024; Ceviz & Özden, 2025; Gupta ve ark., 2025; Maguluri ve ark., 2024; Nurkalem & Gülseven Karabacak, 2025; Spencer ve ark., 2025; WHO, 2024).

Tartışma

Literatür genel olarak yapay zekânın sağlık ekonomisine çok boyutlu katkılar sunduğunu göstermektedir. Klinik hata oranlarının azalması, hasta güvenliğinin artması, hizmet kalitesinin yükselmesi ve kaynak kullanımının optimize edilmesi, YZ'nin hemşirelikten genel sağlık yönetimine uzanan geniş etkilerini güçlendirmektedir. de Vos ve ark. (2022) tarafından yoğun bakımda yürütülen maliyet-etkinlik modeli, YZ çözümlerinin ekonomik değerini nicel olarak ortaya koymakta; veri temelli erken uyarı sistemlerinin zamansız taburculuk ve yeniden yatış oranlarını azaltarak hasta güvenliğini artırdığını ve kurum düzeyinde kaynak tahsisini iyileştirdiğini göstermektedir. Bununla birlikte Wolff (2020) ve Vithlani (2023) gibi çalışmalar, uzun dönemli maliyet-yarar analizlerinin hâlâ yetersiz olduğuna; yüksek başlangıç maliyetleri ve veri standardizasyonundaki eksikliklerin özellikle gelişmekte olan ülkelerde YZ uygulamalarının ölçeklenmesini zorlaştırdığına dikkat çekmektedir. Güncel literatür ayrıca YZ'nin sağlık sistemlerinde gecikmeli veya sınırlı kullanımının, uzun vadede hem klinik hem de ekonomik kayıplara neden olabileceğini göstermektedir. Spencer ve ark. (2025) tarafından vurgulanan "bytes to bedside" yaklaşımı, yapay zekânın yalnızca laboratuvar ortamlarında değil, gerçek klinik uygulamalarda hızla hayata geçirilmesi gerektiğini ortaya koymaktadır. Aksi durumda, YZ'nin "uygulanmaması" dahi bir fırsat maliyeti yaratmakta; bu gecikme hem hasta güvenliğini hem de kurumsal sürdürülebilirliği olumsuz etkilemektedir.

Yoğun bakım ortamlarında erken uyarı sistemlerinin yapay zekâ ile bütünleştirilmesi, yalnızca klinik sonuçları iyileştirmekle kalmayıp aynı zamanda maliyet etkinliğini de güçlendirmektedir. Yuan ve ark. (2020) tarafından geliştirilen modelin %82 doğruluk ve %88 özgüllük oranı, YZ tabanlı karar destek sistemlerinin sepsisi daha erken saptayarak komplikasyonları ve yatış sürelerini azalttığını; böylece sağlık harcamaları açısından sürdürülebilir bir çözüm sunduğunu göstermektedir. YZ destekli

hemşirelik sistemleri de benzer biçimde otonom asistanlar ve IoT tabanlı izleme teknolojileriyle hem bakım kalitesini artırmakta hem de iş gücü verimliliğinde anlamlı kazanımlar yaratmaktadır. Ancak bu dönüşümün kalıcı etkiler üretebilmesi için etik yönetişim, veri güvenliği, dijital yetkinliklerin artırılması ve uzun dönemli ekonomik analizlerin yapılması gereklidir.

Gelecek araştırmaların özellikle YZ tabanlı hemşirelik uygulamalarının uzun dönemli ekonomik etkilerini kapsamlı modelleme yaklaşımlarıyla değerlendirmesi önem taşımaktadır. Markov tabanlı maliyet-etkinlik analizleri, duyarlılık analizleri ve dinamik maliyet simülasyonları; erken tanı, komplikasyon önleme, bakım süresi, iş gücü verimliliği ve yaşam kalitesi (QALY) çıktılarının zaman içindeki değişimini daha bütüncül biçimde değerlendirme olanağı sunmaktadır. Salcedo ve ark. (2021) tarafından yapılan modelleme çalışması, ilaç uygulamalarının manuel gözetimi ile YZ tabanlı otomatik izleme sistemlerini karşılaştırmış; manuel incelemenin hasta başına yaklaşık 1.500 ABD doları tasarruf sağladığını, ancak YZ tabanlı sistemin bu senaryoya kıyasla yaklaşık 700 ABD doları ek avantaj sunduğunu göstermiştir. Bu fark, yapay zekâ teknolojilerinin ölçek büyüdükçe kurum bütçelerine ciddi tasarruf etkileri sağlayabileceğine işaret etmektedir. Benzer biçimde Li ve ark. (2023) ve Gefen (2025) tarafından yürütülen Markov modelleri, YZ tabanlı tarama ve yara bakım sistemlerinin uzun dönemli maliyet-etkinliğini kanıtlamaktadır.

Tüm bulgular bir arada değerlendirildiğinde, YZ'nin hemşirelik ve sağlık sistemlerinde ekonomik etkisinin yalnızca mevcut uygulama alanlarına değil, aynı zamanda erken tanı, izlem, karar destek, bakım planlaması ve iş gücü yönetimi gibi geniş bir yelpazeye yayıldığı görülmektedir. Hemşireler bu dönüşümde yalnızca bakım hizmeti sunan profesyoneller değil, aynı zamanda veri temelli sistemlerin tasarımına yön veren, dijital süreçlerin güvenliğini sağlayan ve teknolojik gelişmelerin etik çerçevede uygulanmasına liderlik eden stratejik aktörler hâline gelmektedir.

Sonuç ve Öneriler

Bu geleneksel derleme çalışması, yapay zekâ teknolojilerinin sağlık ekonomisi ve hemşirelik hizmetleri üzerinde çok boyutlu ve dönüştürücü etkiler yarattığını ortaya koymaktadır. Bulgular, YZ'nin klinik doğruluğu artırdığını, hata oranlarını azalttığını, tanı ve tedavi süreçlerini hızlandırdığını ve bakım maliyetlerini düşürdüğünü göstermektedir. Hemşirelik hizmetlerinde ise YZ; iş gücü verimliliğini artırmakta, idari yükleri azaltmakta, bakım kalitesini yükseltmekte ve hasta güvenliğini güçlendirmektedir. Bu kapsamda yapay zekâ, yalnızca teknolojik bir yenilik değil; sağlık sistemlerinde ekonomik sürdürülebilirliği, kaliteli hizmet üretimini ve toplumsal eşitliği destekleyen stratejik bir araç olarak görülmelidir. Dijital dönüşümün merkezinde yer alan hemşirelerin, bu teknolojilerin yalnızca kullanıcıları değil; aynı zamanda güvenli, adil ve insancıl bir şekilde uygulanmasını sağlayan kritik aktörler olduğu açıktır.

Önerimiz, yapay zekâ uygulamalarının sağlık sistemlerinde etkin ve sürdürülebilir biçimde yer alabilmesi için hemşirelerin dijital yetkinliklerinin artırılması, veri güvenliği ve etik yönetişim süreçlerinin güçlendirilmesi, hemşireliğe özgü ulusal veri tabanlarının oluşturulması ve YZ'nin uzun dönemli etkilerini değerlendiren ekonomik modelleme çalışmalarının yaygınlaştırılmasıdır.

Abstract

This study aims to develop a new Quality of Life Index for Tepebaşı and Odunpazarı, two large districts of Eskişehir. The index includes basic demographic, socioeconomic and environmental indicators such as population density, age structure, income level, house prices, gender distribution and marital status. Global Moran I and Local Moran I analyses were used to identify differences and similarities between neighborhoods. These findings are expected to support sustainable urban planning in Eskisehir, improve health and safety at the neighborhood level, guide policies to improve living conditions and contribute to future investment decisions. Overall, the study aims to contribute to sustainable urban development and scientific improvement of social welfare.

Keywords: Quality of Life Index (QoL), spatial statistics, spatial cluster analysis

INTRODUCTION

Quality of life (QoL) is an important concept that encompasses the physical, social and economic well-being of individuals and is at the center of sustainable urbanization and regional development policies (Sapena et al., 2020; Iamtrakul et al., 2023). Today, the rapidly increasing population of cities, environmental degradation, economic inequalities and problems experienced in accessing various services have made it important to consider and improve QoL and conduct research on this subject (Yang et al., 2023; Zhang et al., 2024). Studies conducted in this direction reveal the necessity of determining social, economic and environmental variables affecting the quality of life and analyzing these variables at the spatial level (Sepúlveda Murillo et al., 2019; Faka et al., 2022).

This study aims to obtain a high-level result by examining the factors affecting QoL on a neighborhood basis in Tepebaşı and Odunpazarı districts of Eskişehir, one of the leading cities of Türkiye, and by revealing spatial differences and regional inequalities and clusters between neighborhoods. QoL was developed by conducting spatial analyses with coordinated data based on population density, per capita income, household income, gender distribution and marital status. QoL levels of neighborhoods were determined through this index and regions with low and high quality of life were identified. In the study, neighborhood interactions and regional imbalances between neighborhoods were analyzed in detail using spatial statistical methods such as Global Moran's I, Local Moran's I and spatial K-means (Grekousis, 2020; Anselin, 1995). It contributed to the presentation of spatial distributions at the neighborhood level in a clearer and more understandable way with various graphics (Tobler, 1970).

Although there are many national and international studies on QoL in the literature, spatial analyses at the neighborhood level in Turkey are limited (Sepúlveda Murillo et al., 2019; Faka et al., 2022). Although studies such as TÜİK's "Quality of Life Module" focus on social satisfaction and participation levels, they do not reveal differences at the neighborhood level. In addition, the geographical distribution of QoL, regional clustering structures and spatial injustices caused by local inequalities are often

overlooked (Yang et al., 2023; Zhang et al., 2024). Most previous studies have been conducted at the city or regional scale and relied on non-spatial or aggregate statistical methods, which overlook intra-urban variations (Iamtrakul et al., 2023). By integrating spatial statistical techniques with socio-demographic indicators at the neighborhood level, this study provides a more detailed and spatially explicit understanding of urban inequalities (Sapena et al., 2020; Faka et al., 2022). Therefore, it fills an important gap in the existing literature by combining spatial analysis and QoL assessment in a localized, data-driven framework (Sepúlveda Murillo et al., 2019). This study is an important step towards eliminating this deficiency.

The main question of the study is to reveal the social, economic, environmental and other variables that determine the quality of life in the neighborhoods of Tepebaşı and Odunpazarı districts and the spatial distribution structure of these variables. The hypothesis developed in this context suggests that QoL shows significant spatial differences between neighborhoods in terms of these indicators and that these differences are shaped by local interactions and regional clusters (Grekousis, 2020; Anselin, 1995).

The results of the study aim to demonstrate that the QoL measurement model can be adapted not only to Eskişehir but also to other cities in Turkey. In addition, the findings are aimed to contribute to urban planning and social policy development processes in line with the United Nations Sustainable Development Goals (SDG 3: Healthy Individuals, SDG 10: Reducing Inequalities, SDG 11: Sustainable Cities and Communities) (Iamtrakul et al., 2023; Zhang et al., 2024).

In this respect, the study offers a unique and guiding contribution to both academic literature and practitioners in the field of sustainable urbanization and quality of life.

MATERIALS AND METHODS

The main objective of this study is to construct a QoL measure by examining the social, economic and environmental factors affecting well-being at the neighbourhood level in Tepebaşı and Odunpazarı districts of Eskişehir, Turkey. To achieve this, a multi-stage methodological framework consisting of data collection, variable selection, statistical analysis and spatial analysis techniques has been adopted. The study assesses the quality of life at the neighbourhood level in these two large districts and identifies spatial inequalities by developing a composite QoL index. Various demographic, socioeconomic and environmental indicators were considered as independent variables that could potentially affect the quality of life. These variables include population density, house prices, per capita income, average household income, gender distribution and marital status, which were selected based on their well-known relevance in the literature (e.g. Yang et al., 2023; Sepúlveda Murillo et al., 2019). The dependent variable is the composite quality of life index obtained by normalizing and weighting the selected indicators.

Research Design

This study aims to assess the quality of life at the neighborhood level in Tepebaşı and Odunpazarı, two large districts of Eskişehir. The findings were used to construct a composite QoL and reveal spatial differences.

Independent Variables

In this study, while analysing the demographic, socioeconomic, and environmental variables that are considered to affect quality of life (QoL), the dependent variables include population density, income level (per capita and household income), housing prices, gender distribution, and marital status. These variables are reported in the literature to have strong relationships with QoL. Population density influences access to infrastructure and services, whereas income level determines access to health, education, and social facilities. Gender distribution and marital status, on the other hand, indirectly affect

QoL by shaping the structure of social support and community life. (e.g., Yang et al., 2023; Sepúlveda Murillo et al., 2019; Sapena et al., 2020).

Dependent Variable

The dependent variable of this study is QoL, a composite measure calculated by normalizing and weighting the independent variables mentioned above.

Data

This study utilizes neighborhood-level demographic, socioeconomic, and spatial data obtained from reliable online platforms including Endeksa, Sahibinden, and Yandex Maps for the 2024–2025 period. The variables, their sources, and the weighting percentages used in constructing the QoL Index are summarized in Table 1.

Tablo 1: Variables, Time Periods and Data Sources

Variables	Term	Source	Sample size
Population Density	**2024-2025**	**Endeksa**	**%20**
Per Capita Income	**2024-2025**	**Endeksa**	**%10**
Household Income	**2024-2025**	**Endeksa**	**%10**
House Prices	**2024-2025**	**Sahibinden**	**%10**
Gender and Marital Status	**2024-2025**	**Endeksa**	**%5-%10**
Coodinates	**2024-2025**	**Yandex Haritalar**	**-**

Normalization

Due to the heterogeneity of the units of measurement among the variables, min-max normalization was applied to bring them to a comparable scale.

$$X'_{ij} = \frac{X_{ij} - \min(X_j)}{\max(X_{ij}) - \min(X_j)}$$

- X_{ij}: Raw value of the *j-th* variable of the *i-th* observation
- X'_{ij}: Normalized value
- $\max(X_{ij})$: Minimum value of the *j-th* variable
- $\min(X_{ij})$: Maximum value of the *j-th* variable

Weighting

The weights used in this study were determined based on the relative impact of each variable on quality of life (QoL) and follow a rationale supported by literature. Previous studies have shown that some variables explain QoL more strongly than others (Sapena et al., 2020; Faka et al., 2022; Yang et al., 2023; Sepúlveda Murillo et al., 2019); therefore, higher weights were assigned to variables with greater influence. This weighting approach aligns with the methodologies and findings highlighted in the selected references (Grekousis, 2020; Iamtrakul et al., 2023) and reflects the importance of considering both direct and indirect effects of variables in spatial QoL analyses. In other words, the weights were assigned based on a logical framework derived from these references rather than randomly.

Index Construction

The QoL was computed by combining the normalized and weighted variables using the following formula:

$$Quality\ Of\ Life\ Index_i = \sum_{j=1}^{n} w_j\ .X'_{ij}$$

- X'_{ij}: It is the normalized value of the *j-th* variable in the *i-th* neighborhood.
- w_j: The weight assigned to the *j-th* variable.

This formulation enabled a standardized comparison of quality of life across neighborhoods.

Spatial Data Analysis

Spatial data analysis was employed to examine geographic patterns and spatial dependencies across neighborhoods. Guided by Tobler's First Law of Geography—which states that nearby areas tend to be more similar than distant ones—this approach allows the detection of non-random spatial structures. Accounting for spatial dependence is essential, as ignoring it may lead to biased statistical results.

Spatial Autocorrelation

Spatial autocorrelation measures whether similar values of a variable are close to each other in space. It is analyzed at two levels: Global Moran I, which provides a single measure of overall spatial clustering or dispersion, and Local Moran I (LISA), which identifies specific local clusters and outliers. Global Moran I indicates whether the pattern is clustered, random or dispersed, while Local Moran I reveals High-High, Low-Low, High-Low and Low-High spatial patterns and their statistical significance. These measures help to identify spatial inequalities and guide targeted policy and planning decisions.

Spatial Weight

In this study, a Queen contiguity spatial weight matrix was used to capture the spatial relationships among observations in the Odunpazarı and Tepebaşı neighborhoods of Eskişehir. The Queen method considers both edge- and corner-sharing neighborhoods as neighbors, allowing for a more comprehensive representation of spatial interactions and ensuring that spatial autocorrelation is properly incorporated into the analysis (Anselin, 1995; Tobler, 1970; Grekousis, 2020).

Global Moran's I

Global Moran's I is one of the most widely used indicators for measuring spatial autocorrelation at the global level. (Anselin, 1995). It assesses whether a spatial pattern is clustered, dispersed, or random based on both the locations and attribute values of observations.

Formula:

$$I = \frac{n}{\sum_{i=1}^{n}(x_i - \bar{x})^2} x \frac{\sum_{j=1}^{n}\sum_{j=1}^{n} W_{ij}(x_i - \bar{x})\,(x_j - \bar{x})}{\sum_{j=1}^{n}\sum_{j=1}^{n} W_{ij}}$$

- n: Number of data
- W_{ij}: Spatial weight matrix
- x_i, x_j: Observation location
- $\bar{x}$: Mean value of X

The index ranges from -1 to +1:

- **+1** indicates perfect positive spatial autocorrelation (strong clustering),
- **0** suggests a random spatial pattern,
- **-1** reflects perfect negative spatial autocorrelation (dispersion).

Local Moran's I

Local Moran's I is a measure of local spatial autocorrelation, showing the degree of similarity or dissimilarity between each observation and its neighbors.

Formula:

$$I_i = (x_i - \bar{x}).\frac{\sum_{j=1}^{N} w_{ij}\left(x_j - \bar{x}\right)}{\frac{1}{N}\sum_{j=1}^{N}(x_i - \bar{x})^2}$$

- I_i: Local Moran's I value
- W_{ij}: Spatial weight matrix
- x_i, x_j: Value of *i-th* and *j-th* observation
- $\bar{x}$: Mean value of X
- N: Total number of observations

LISA maps typically consist of two components:

Cluster Map: Displays the type of spatial association:

- **High-High (HH)**: A location with high values surrounded by high values.
- **Low-Low (LL)**: A location with low values surrounded by low values.
- **High-Low (HL)**: A high-value location surrounded by low-value areas (outlier).
- **Low-High (LH)**: A low-value location surrounded by high-value areas (outlier).

Local Moran's I allow policymakers and researchers to detect **spatial heterogeneity,** prioritize interventions in disadvantaged regions, and understand underlying spatial structures.

FINDINGS

The Quality of Life (QoL) Index developed in this study provides a spatial analysis of neighborhood-

level living conditions in the Tepebaşı and Odunpazarı districts of Eskişehir. The findings reveal significant spatial disparities among neighborhoods, shaped by socioeconomic and demographic variables. In Tepebaşı, a marked difference was observed between the ten neighborhoods with the highest and lowest QoL scores, indicating a strong pattern of intra-district inequality. The calculated Global Moran's statistic (0.64) demonstrates a high level of spatial autocorrelation, confirming the presence of distinct spatial clustering. Local Moran's I (LISA) analysis identified four cluster types: HH, LL, HL, and LH. H-H clusters generally represent affluent neighborhoods with good access to services, whereas L-L clusters are concentrated in socioeconomically disadvantaged areas.

A similar spatial pattern was observed in Odunpazarı, where neighborhoods with low QoL scores were generally located in urban peripheries characterized by low population density and limited access to services. The Global Moran's I value for Odunpazarı was 0.56, indicating a moderate degree of spatial dependence. Interestingly, while population density exhibited a strong clustering tendency, housing prices displayed a spatially random distribution, suggesting that different indicators may vary in their spatial structures and impacts. The figures in this study present various visualizations related to the Quality of Life (QoL) in Eskişehir, focusing on the Tepebaşı and Odunpazarı districts. Specifically, the figures include Local Moran's I graphs for both districts, which highlight statistically significant clusters of high and low QoL neighborhoods. In addition, Global Moran's I plot is provided to show the overall spatial autocorrelation within each district. Finally, QoL distribution graphs illustrate the relative levels of quality of life across neighborhoods in Tepebaşı and Odunpazarı. Together, these visualizations provide a clear representation of spatial patterns, disparities, and neighborhood-level interactions within the two districts.

Local Moran's I Diagram for Odunpazarı and Tepebaşı Districts

Figure 9: Local Moran's I for Tepebaşı District

Figure 1 shows that the Local Moran's I diagram illustrates the spatial clustering of neighborhoods in the Tepebaşı district based on their Quality of Life (QoL) values. Neighborhoods classified as high-high (HH, red) represent areas with high QoL surrounded by similarly high values, while low-low (LL, blue) clusters indicate neighborhoods with low QoL concentrated nearby. The high-low (HL, purple) and low-high (LH, orange) categories reveal spatial outliers, highlighting neighborhoods whose QoL levels differ significantly from their surroundings. The figure shows that high-QoL neighborhoods are primarily concentrated in central areas, whereas low-QoL neighborhoods are mostly located on the periphery.

Figure 2: Local Moran's I for Odunpazarı District

Figure 2 shows that the local spatial clustering patterns within the Odunpazarı district can be classified into four distinct cluster types: high-high, high-low, low-high, and low-low. High-high clusters represent areas where high index values are spatially concentrated, typically corresponding to zones with favorable socio-economic or environmental conditions. In contrast, low-low clusters, often located in rural or peripheral parts of the district, indicate concentrations of low index values, reflecting relatively disadvantaged areas. High-low and low-high clusters reveal spatial inconsistencies or transitions, where areas with contrasting index values are adjacent to one another, suggesting potential spatial inequalities or mixed development patterns within Odunpazarı.

Global Moran's I Graphs for Odunpazarı and Tepebaşı Districts

Figure 3: Global Moran's I for Tepebaşı District

Figure 3 shows that the Global Moran's I value was calculated as 0.64 when all variables were evaluated collectively. This value reflects the degree of spatial autocorrelation, with values closer to 1 indicating stronger spatial similarity among observations. Based on this result, neighborhoods with similar characteristics in the Tepebaşı district tend to be spatially clustered.

Figure 4: Global Moran's I for Odunpazarı District

Figure 4 shows that Global Moran's I is a widely used measure of spatial autocorrelation, capturing the degree to which similar values are clustered or dispersed across a geographic area. In the Odunpazarı district, population density demonstrates a pronounced spatial clustering pattern, with neighborhoods of high population density tending to be located near one another, and similarly, low-density areas also grouping together. In contrast, housing prices appear to be spatially independent, showing no clear pattern of clustering or dispersion across the district. When all variables, including socio-economic and infrastructural indicators, are considered collectively, the Global Moran's I value is calculated as 0.56. This indicates a moderate level of spatial autocorrelation among the combined indicators, suggesting that while some spatial dependence exists, there is also considerable variation across neighborhoods. These findings underscore the importance of considering spatial relationships in urban analyses, as ignoring spatial autocorrelation may lead to biased interpretations and suboptimal policy decisions.

QoL Index for Odunpazarı and Tepebaşı Districts

Figure 5: QoL Index Graph for Tepebaşı District

Figure 5 shows that the ten neighborhoods in the Tepebaşı district with the highest and lowest QoL Index scores. A substantial difference is evident between neighborhoods with low and high index values, highlighting the spatial disparities within the district. Neighborhoods with higher QoL scores tend to exhibit better access to services, infrastructure, and social amenities, whereas those with lower scores face challenges related to living conditions, accessibility, and overall well-being. This visualization underscores the need for targeted interventions to address inequalities and improve QoL across all areas of the district.

Figure 6: QoL Index Graph for Odunpazarı District

Figure 6 shows that the ten neighborhoods with the highest and lowest Quality of Life (QoL) Index scores in the Odunpazarı district. Notably, neighborhoods with the lowest index values tend to be sparsely populated and located on the urban periphery, reflecting a spatial pattern of socio-economic

disadvantage. In contrast, neighborhoods with higher QoL scores are generally more densely populated and situated closer to the city center, benefiting from better access to public services, infrastructure, and social amenities. This spatial distribution highlights the existence of pronounced intra-district inequalities and underscores the importance of targeted policy interventions aimed at improving living conditions and reducing disparities. A similar pattern of socio-spatial inequality was also observed by Yang and colleagues (2023) in their analysis, supporting the notion that urban peripheries often experience lower levels of well-being compared to central areas.

DISCUSSION AND CONCLUSION

This study highlights significant spatial variations in the Quality of Life (QoL) across neighborhoods in the Odunpazarı and Tepebaşı districts of Eskişehir. The findings reveal that certain neighborhoods, particularly those with low QoL scores, tend to be located on the urban periphery and exhibit sparse population densities, while high-QoL neighborhoods are more centrally concentrated. Such spatial patterns underscore the presence of socioeconomic inequalities and indicate the need for targeted urban planning interventions.

These findings have several important implications for urban planning and policy. The observed neighborhood-level disparities in QoL scores suggest that prioritizing investments and planning efforts in areas with lower QoL can effectively address spatial and social inequalities. In particular, enhancing transportation infrastructure, healthcare services, educational facilities, and social amenities in these areas can directly improve the living standards of residents and promote equitable access to essential services. Social policies that encourage community participation and engagement are equally crucial, as they foster social cohesion, empower local populations, and facilitate more inclusive decision-making processes.

Moreover, the development and enhancement of green spaces, parks, and social activity venues can significantly improve environmental quality while supporting both the physical and social well-being of residents. Such interventions not only enhance the overall livability of urban areas but also promote healthier lifestyles and stronger community interaction. Furthermore, implementing socioeconomic support programs aimed at increasing employment opportunities and household incomes can help reduce economic disparities, enabling disadvantaged neighbors to overcome structural challenges and achieve more balanced and sustainable development outcomes.

Based on the results of this study, several practical recommendations can be proposed for urban development in Eskişehir. First, urban planners and policymakers should prioritize neighborhoods with low QoL scores when allocating resources, focusing on comprehensive improvements in infrastructure and public services to mitigate spatial and socioeconomic inequalities. Second, investments in healthcare, education, and transportation networks in these neighborhoods are essential to raise residents' quality of life directly. Third, social programs that foster active community participation, engagement, and empowerment should be integrated into local planning frameworks, ensuring that residents have a voice in shaping the development of their neighborhoods. Fourth, increasing the availability and accessibility of green areas, parks, and social activity spaces can improve environmental conditions and enhance both social and physical well-being. Finally, participatory, neighborhood-based planning processes should be embedded in urban governance strategies, guaranteeing that local communities are actively involved in decision-making and that urban development initiatives are responsive to the specific needs of residents.

In conclusion, this study emphasizes that addressing spatial disparities in QoL requires a multidimensional approach, integrating infrastructure development, social policy, environmental planning, and participatory governance. By strategically targeting low-QoL neighborhoods with coordinated interventions, urban planners can promote equitable development, reduce socioeconomic inequalities, and foster a higher overall standard of living in Eskişehir. These insights provide a robust

evidence base for future urban planning and policy initiatives aimed at creating more inclusive, sustainable, and resilient urban environments.

This research is a pilot study and is based on subjective weighting approaches and certain proxy data. Therefore, it is important to use a larger and more comprehensive set of variables in future studies in order to increase both the robustness and the theoretical validity of the developed index. In particular, the inclusion of additional socio-economic and environmental variables such as household welfare indicators, education level, access to health services, transport infrastructure, environmental quality, crime rates, air pollution, green space access and social participation indicators in the model will significantly increase the representativeness of the index. Furthermore, the use of statistical methods such as Principal Component Analysis (PCA) and multi-criteria decision-making techniques such as Analytic Hierarchy Process (AHP) based on expert opinions to objectively capture multidimensional relationships between variables and to determine variable weights in a data-driven manner will strengthen both the objectivity and consistency of the weighting process. This study is limited to the current data structure and provides a framework that is open to be developed with more detailed, up-to-date and expanded data sets in the future.

ACKNOWLEDGMENT

Abstract

In today's dynamic business environment, organizations face two fundamental yet often conflicting objectives: maximizing employee performance while simultaneously fostering continuous competency development. This study addresses this dilemma by presenting an innovative theoretical framework adapted from human-AI collaboration models to the field of organizational behavior: Dual-Mode Adaptive Task Assignment. The proposed model employs two distinct task assignment strategies depending on whether the employee's immediate goal is production or learning. The Similarity mode assigns tasks aligned with the employee's existing competencies, targeting short-term performance and efficiency. The Complementarity mode, conversely, assigns tasks that challenge the employee's developmental areas, supporting long-term competency acquisition and career advancement. This conceptual paper establishes the theoretical foundation of the model by drawing on Cognitive Load Theory, the Dreyfus Model of Skill Acquisition, and the Zone of Proximal Development, and proposes its mathematical formulation. The study concludes by offering practical implications for integrating this model into human resource management, performance evaluation, and career planning processes.

Keywords: Competency Management, Adaptive Task Assignment, Organizational Behavior, Performance Optimization, Dual-Mode Model

INTRODUCTION

With the rise of the knowledge economy, human capital has become the most valuable asset of organizations. In this context, optimizing employee performance while ensuring their continuous professional development is fundamental to achieving sustainable competitive advantage (Snell & Bohlander, 2010). However, these two objectives often conflict in practice. On one hand, organizations expect employees to complete tasks in their areas of expertise most efficiently to meet short-term production goals. On the other hand, employees acquire new skills through tasks that challenge their existing capabilities and push them beyond their comfort zones, which can lead to short-term efficiency losses and increased error rates (Vygotsky, 1978).

Existing performance management and task assignment models in the literature tend to prioritize one of these two objectives. Traditional task assignment approaches typically focus on efficiency and

specialization (Taylor, 1911), while modern talent management systems emphasize development and learning opportunities (CIPD, 2023). However, there is a notable absence of an integrated model that dynamically and situationally balances these two purposes.

This study aims to fill this gap by drawing inspiration from recent developments in human-AI collaboration and adaptive learning systems. Particularly, "dual-mode" systems that offer different interaction modes based on user goals (Ayan, 2025) present significant potential when adapted to organizational contexts. The fundamental research question of this paper is: How can an adaptive task assignment model be designed that simultaneously optimizes employees' immediate performance and long-term competency development?

To answer this question, we propose the Dual-Mode Adaptive Task Assignment theoretical framework, which dynamically manages the alignment between employee goals (production-oriented vs. learning-oriented) and task characteristics.

CONCEPTUAL FRAMEWORK

The proposed model is built upon three fundamental theories at the intersection of organizational behavior, cognitive psychology, and educational sciences.

Cognitive Load Theory (CLT): Developed by Sweller (1988, 2011), this theory posits that human working memory has limited capacity and that learning can be optimized through instructional designs that do not exceed this capacity. In the context of task assignment, when an employee is assigned a task far beyond their current competency level, cognitive load increases, which diminishes performance and impedes learning. The Similarity mode in our model aims to minimize cognitive load and maximize performance by offering tasks aligned with the employee's existing schemas.

Dreyfus Model of Skill Acquisition: Developed by Dreyfus and Dreyfus (1986), this model identifies five stages individuals progress through when acquiring a skill: novice, advanced beginner, competent, proficient, and expert. This model emphasizes that competency is not static but develops through experience. Our task assignment system should use an employee's Dreyfus level in a particular competency domain as input to assign appropriately challenging tasks. The Complementarity mode aims to offer tasks that will advance the employee from their current level to the next.

Zone of Proximal Development (ZPD): Introduced by Vygotsky (1978), this concept refers to the area between what an individual can do independently and what they can accomplish with guidance from someone more knowledgeable (or, in this study, a properly designed task). Effective learning and development occur precisely within this zone. The Complementarity mode in our model aims to foster maximum competency development by matching employees with tasks positioned within their ZPD. Tasks that are too easy lead to boredom, while tasks that are too difficult cause anxiety; tasks within the ZPD offer motivating challenges.

PROPOSED MODEL: DUAL-MODE ADAPTIVE TASK ASSIGNMENT

The model represents an employee's competency profile and a task's requirement profile as vectors. The employee's competency vector Cu and the task's requirement vector Ct are defined across n key competency dimensions identified by the organization.

$Cu = [u_1, u_2, ..., u_n]$

$Ct = [t_1, t_2, ..., t_n]$

Here, ui and ti are scores ranging from [1-5] according to the Dreyfus model. The core of the model is the adaptive task recommendation function R(u, t, G), which is activated based on the employee's stated immediate goal (G). The goal takes a value from the set $G \in \{learning, production\}$.

Similarity Mode

If G = production, the system activates the similarity mode. The objective is to maximize the overlap between the employee's existing competencies and the task's requirements. The similarity score S(u, t) can be calculated as cosine similarity or simply as the inverse of the Euclidean distance between vectors:

$$S(u, t) = 1 - \sqrt{[\Sigma^{n}_{i=1}(u_i - t_i)^2]} / (n \times 4)$$

The system recommends the task that maximizes the S(u, t) score. This mode is ideal for projects with tight deadlines, operations requiring high precision, or situations where boosting employee morale and confidence is the goal.

Complementarity Mode

If G = learning, the system activates the complementarity mode. The objective is to maximize the match between the employee's developmental areas (low ui) and the opportunities offered by the task (high ti). The complementarity score D(u, t) measures how challenging the task is in areas where the employee is weak:

$$D(u, t) = \Sigma^{n}_{i=1} w_i \times f(t_i - u_i)$$

Here, f(x) is a function that returns positive values when x > 0 (specifically when ti > ui) (e.g., f(x) = max(0, x)), and wi is a weight indicating the strategic importance of that competency. The system recommends the task that maximizes the D(u, t) score while adhering to ZPD principles and ensuring cognitive load does not become excessive. This mode is critical for long-term talent development programs, career rotation, and succession planning.

Adaptive Hybrid Mode

For scenarios requiring both performance and development, the model can implement an adaptive hybrid mode that dynamically balances both strategies based on a learning goal parameter $g \in [0,1]$:

$$Rhybrid(u, t, g) = (1-g) \times S(u, t) + g \times D(u, t)$$

When g=0, the system operates in pure similarity mode; when g=1, it operates in pure complementarity mode. Intermediate values allow for flexible balancing of short-term performance and long-term development needs.

DISCUSSION AND CONCLUSION

This study contributes to the organizational behavior literature by introducing the Dual-Mode Adaptive Task Assignment model, which recognizes the dynamic nature of employees' task goals and adapts task assignment strategies accordingly. Rather than viewing the traditional trade-off between performance and development as a static problem, the model reframes it as a dynamic balancing problem that can be managed situationally.

The theoretical contribution of the model lies in its integration of diverse theoretical perspectives—Cognitive Load Theory, the Dreyfus Model, and the Zone of Proximal Development—within a unified and formal structure. This represents a previously unmodeled quantitative approach in the field of competency management.

From a practical perspective, the model has the potential to be integrated into modern Human Resource Information Systems (HRIS) and Talent Management Platforms. Such a system could assist managers in making data-driven task assignment decisions. Employees, in turn, could input their task preferences based on their career goals (whether they wish to learn more or be productive with their current skills),

experiencing a more personalized work environment. This has the potential to increase employee engagement, motivation, and retention rates.

Future research should focus on empirically testing this theoretical model. Case studies or simulation-based experiments investigating the model's validity across different sectors and organizational cultures will provide valuable insights into its effectiveness and limitations. Additionally, the reliability of employee goal declarations (learning/production) and the individual and situational factors influencing these goals are important topics that warrant investigation.

In conclusion, the Dual-Mode Adaptive Task Assignment model offers a flexible, personalized, and strategic approach to managing human capital in the complex business environment of the 21st century. By recognizing that employees have different needs at different times—sometimes requiring challenges for growth, other times needing familiar territory for efficient execution—organizations can simultaneously optimize both immediate productivity and long-term capability development.

ACKNOWLEDGMENT

The authors would like to acknowledge the foundational work on dual-mode systems in human-AI collaboration that inspired this organizational adaptation.

Abstract

Over the last three decades, globalization, liberalization of capital flows, and the deepening of financial markets have led to a rapid rise in external borrowing, particularly among developing Asian economies. Capital inflows have become a crucial policy instrument for many Asian countries to finance economic growth, expand infrastructure investments, and support macroeconomic stability. However, the sustainability of external debt and the relationship between debt dynamics and the level of economic freedom have emerged as significant areas of debate in recent years. Economic freedom is considered a fundamental factor shaping market efficiency, institutional quality, and the investment climate, thereby playing a decisive role in determining the nature and management of external borrowing. This study aims to empirically examine the relationship between economic freedom and external debt dynamics in Asian countries. Although there are studies in the literature addressing the nexus between economic freedom and indebtedness, comprehensive comparative empirical research focusing specifically on the Asian region remains limited. In this context, the study seeks to contribute to the literature by analyzing both temporal trends and structural relationships using data from selected Asian economies between 2013 and 2023.

Keywords: External Debt, Economic Freedom, Asia

INTRODUCTION

The relationship between economic freedom and external debt holds strategic importance, particularly for developing economies, in terms of fiscal autonomy and institutional sustainability. Economic freedom—through elements such as the protection of property rights, the effective functioning of market mechanisms, and the limitation of government intervention—directly influences both the investment climate and access conditions to external financing. External borrowing, beyond being merely a financing instrument, is one of the key factors shaping a country's fiscal maneuverability and policy independence.

This study aims to contribute to the literature at both theoretical and methodological levels by examining the effect of economic freedom on the dynamics of external debt within a panel data framework. Existing studies generally focus on the unidirectional effects of economic freedom on growth, investment, or macroeconomic performance (Barro, 1996; Dreher, 2006; Gouider & Saafi, 2022). However, the short-term dynamic effects of changes in economic freedom on the level and sustainability of external borrowing—particularly in the context of developing countries—have been addressed only to a limited extent. To fill this gap, the present study analyzes how annual changes in economic freedom influence annual changes in external debt by employing dynamic panel data techniques.

Methodologically, the study employs the Difference-GMM (Arellano–Bond) approach on a panel dataset to simultaneously account for dynamic effects and potential endogeneity concerns (Arellano & Bond, 1991). This enables the inclusion of lagged values of the dependent variable in the model—an advantage not offered by conventional fixed effects (FE) or OLS estimators. In addition, the use of first-differenced variables ensures stationarity while eliminating country-specific fixed effects. In this

respect, the study provides results that are both theoretically consistent (appropriate for non-stationary and non-cointegrated series) and empirically robust.

Furthermore, the study period (2013–2023) encompasses a global context characterized by post-pandemic debt surges, fluctuations in interest rates, and geopolitical disruptions, making the findings directly relevant to contemporary policy debates. The growing divergence between economic freedom indices and public debt ratios in recent years has intensified discussions on fiscal autonomy, particularly in transition economies such as those in Asia. In this context, the study not only fills an empirical gap but also contributes to the reassessment of the impact of liberalization policies on fiscal sustainability.

METHODS

In this study, the selection of dependent and independent variables is based on the core research question, which seeks to analyze the direction of causality and the mutual interaction between economic freedom and external debt: *"How do changes in the level of economic freedom affect countries' external borrowing behavior, and do these debt dynamics, in turn, shape their sphere of economic freedom in the long run?"*

Within this framework, the external debt indicator (Debt) is designated as the main dependent variable, as it reflects a country's fiscal dependence, external financing needs, and overall position in international markets. Changes in debt levels constitute a key indicator that directly affects countries' policy autonomy, budgetary flexibility, and economic sovereignty. In contrast, the economic freedom index (Freedom) represents the quality of economic governance and the effectiveness of market mechanisms. Therefore, this index serves as the main independent variable that captures how political and institutional domains of freedom are translated into economic behavior. Moreover, considering the panel structure of the dataset and institutional heterogeneity across countries, the variables are used in differenced form (Freedom_diff, Debt_diff). This specification highlights short-term dynamic effects and allows the analysis to focus on annual changes rather than long-term levels. Such an approach both mitigates non-stationarity problems and enables the examination of how year-to-year policy adjustments influence external borrowing behavior. Consequently, the choice of variables is based not only on data availability, but also on coherence with the study's central research hypothesis: that increases in economic freedom may encourage external borrowing in the short term by improving access to international markets, yet may simultaneously restrict fiscal autonomy in the long term by increasing dependence on external financing.

In this study, Asian countries were selected as the sample to examine the relationship between economic freedom and external debt. Time-series data covering the period 2013–2023 were compiled for 27 countries for which both debt and economic freedom indicators were available. All analyses were conducted in Python version 3.13 using the pandas, numpy, linearmodels, arch.unitroot, and statsmodels libraries.

A multi-step econometric approach was adopted, taking into account stationarity and long-run equilibrium properties. First, panel unit root tests were applied to determine the statistical characteristics of the series over time and to assess whether the variables were stationary. Subsequently, the Engle–Granger panel cointegration test was employed to investigate the existence of a long-run equilibrium relationship between the non-stationary variables. The results of these preliminary tests indicated that both economic freedom and external debt are integrated of order one (I(1)), yet no significant cointegration relationship exists between them. Therefore, the analysis focused on short-run dynamics, for which the Difference-GMM method developed by Arellano and Bond (1991) was applied. This approach allows for the simultaneous control of dynamic effects and potential endogeneity issues in panel data—such as the bidirectional interaction between freedom and debt. In this way, the study aims to produce estimates that are both statistically consistent and economically meaningful.

Unit Root Test

The unit root test is a fundamental preliminary procedure used to examine the stationarity properties of variables in time-series and panel data analyses. Stationarity refers to a series whose mean and variance remain constant over time. If the variables are non-stationary—meaning they exhibit random trends or cumulative deviations—this may lead to spurious regression results (Granger & Newbold, 1974). In particular, regressions conducted without ensuring stationarity in panel data settings are prone to generating misleading relationships (Baltagi, 2021). For this reason, a Unit Root Test (Stationarity Test) was conducted as the first step of the analysis.

Table 1. Panel ADF (Augmented Dickey-Fuller) Results

The results of the unit root tests indicate that the Freedom and Debt variables in the panel dataset are largely non-stationary. Stationarity implies that the mean and variance of a series remain constant over time. However, the test results show that the Freedom variable is stationary at a statistically significant level ($p < 0.05$) in only five countries (Armenia, India, Iran, Maldives, and Nepal). The Debt variable, in turn, was found to be stationary in only two countries (Bhutan and Sri Lanka).

Panel ADF (Augmented Dickey–Fuller) unit root tests show that the series are non-stationary in their level forms but become stationary once first-differenced. This finding indicates that both variables follow an I(1) process, implying that conventional fixed-effects or OLS models may be subject to the risk of spurious regression. Therefore, the next step in the analysis involved testing for a potential cointegration relationship between the variables.

Cointegration Test

The cointegration test is applied to determine whether a long-run equilibrium relationship exists between non-stationary (I(1)) series (Engle & Granger, 1987). Since time series and panel data often contain trends and structural breaks, analyzing such variables in their level forms may lead to the risk of spurious regression (Granger & Newbold, 1974). However, even if two or more variables are individually non-stationary, a particular linear combination of them may become stationary (Engle & Granger, 1987; Pedroni, 1999). In such cases, the variables are said to be cointegrated and move together in the long run. Economically, this implies that the variables share a long-term equilibrium, that deviations are temporary, and that the system tends to return to equilibrium over time (Gujarati & Porter, 2009; Baltagi, 2021). In the context of this study, the cointegration test is essential for examining whether economic freedom (Freedom) and external debt (Debt) exhibit not only short-run interactions but also a long-run equilibrium relationship.

Table 2. Engle-Granger Results

Lebanon	-1.4461	0.7813			

The results of the Engle–Granger cointegration test indicate that the Freedom and Debt series generally do not exhibit a long-run equilibrium relationship. Within the panel, only two countries (Jordan and Uzbekistan) have p-values below the 5% significance level ($p < 0.05$), suggesting that the series do not move together in the long run. Therefore, the relationship between economic freedom and external debt over the examined period appears to stem from short-term fluctuations rather than a structural long-term link. This outcome shows that Freedom (economic freedom) and Debt (external debt) do not move together in the long run for the majority of countries in the sample.

In other words, changes in economic freedom levels do not systematically determine debt dynamics in the long run, nor do increases in external debt generate permanent shifts in economic freedom. The presence of only two long-run relationships suggests that, in these specific countries, economic freedom policies may have formed a certain structural link with debt sustainability. However, overall, this relationship appears weak and country-specific across the sample. Economically, this implies that the Freedom–Debt relationship is short-term, cyclical, and policy-driven. That is, when countries implement economic freedom reforms, they may experience an increase in external financing flows in the short run; however, the long-run effects on debt levels are neither permanent nor structural.

To investigate whether a long-run equilibrium relationship exists between the non-stationary series, the Engle–Granger cointegration test was applied. The test results indicate that there is no cointegration between the Freedom and Debt variables at the 5% significance level ($p > 0.05$). This finding suggests that although the two variables do not move together in the long run, they may exhibit a dynamic structure in which they influence each other in the short run. Therefore, the analysis focuses on short-term interactions rather than a long-run equilibrium relationship.

Econometric Structure of the Model and Implementation Framework

Difference-GMM (Arellano–Bond)

To examine the short-term dynamics between economic freedom and external debt, this study employs a dynamic panel data model estimated in first differences. The structure of the model is based on the assumption that a country's current change in external debt (ΔDebt) is influenced both by its own past values (the inertia effect of debt accumulation) and by annual changes in economic freedom (Freedom). Within this framework, the baseline model is specified as follows:

$$\Delta\, Debt_{it} = \alpha + \rho \Delta Debt_{i,t-1} + \beta \Delta Freedom_{it} + \varepsilon_{it}$$

Here, *i* denotes the country and *t* denotes the year. The coefficient α represents the constant term, while ρ captures the sensitivity of current debt changes to their past values (the dynamic effect). The coefficient β reflects the short-term impact of changes in economic freedom on changes in external debt. The error term ε_it represents the random component that remains after country-specific fixed effects have been removed..

However, in this model, the variable ΔDebt $_{i,t-1}$ is potentially endogenous, which means that estimating it using the conventional fixed-effects method may lead to biased results. To address this issue, the Difference-GMM approach developed by Arellano and Bond was employed. In this framework, the equation is first-differenced to eliminate country-specific fixed effects, and the second and third lags of debt (Debt $_{i,t-2}$, Debt $_{i,t-3}$) are used as instrumental variables for ΔDebt $_{i,t-1}$. This procedure corrects both endogeneity and autocorrelation problems, yielding consistent estimates

appropriate for a dynamic panel data structure.Ekonometrik olarak tahmin edilen model şu şekilde formüle edilmiştir:

$$\Delta\, Debt_{it} = \alpha + \gamma \Delta Debt_{i,t-1} + \delta \Delta Freedom_{it} + u_{it}$$

$$[\Delta Debt_{i,t-1} \sim \Delta Debt_{i,t-2}, \Delta Debt_{i,t-3}]$$

The expression in square brackets indicates that the lagged level values of the differenced dependent variable are used as instruments. The model is estimated using a heteroskedasticity-robust variance–covariance matrix. In this way, country-specific short-term policy effects and debt dynamics are analyzed in a statistically consistent and meaningful manner.

FINDINGS

The Difference-GMM (Arellano–Bond type) model applied in this analysis aims to test the relationship between economic freedom (Freedom) and external debt (Debt) by accounting for short-term dynamics and potential endogeneity issues. By taking the first differences of the series, stationarity is ensured, and lagged debt variables are used as instruments. In this way, both the lagged effects of the variables are captured and potential bidirectional causality is effectively controlled for.

Table 3. Dynamic Panel Difference-GMM (Arellano–Bond) Test Results

Model Statistics						
F-statistic:	6.2366					
p (F-stat):	0.0442					
N	216					
Instruments (instrumental variables used to address endogeneity):	Debt_lag2, Debt_lag3					
Covariance estimator:	Robust (Heteroskedastic)					
Variable Statistics						
Variable	Coefficient	Std. Error	t-Statistic	p-Value	Lower CI	Upper CI
Intercept	619.51	4106.9	0.1508	0.8801	-7429.9	8668.9
Freedom_diff	2771.1	2421.4	1.1444	0.2525	-1974.8	7516.9
Debt_diff_lag1	1.339	0.9341	1.4335	0.1517	-0.4917	3.1697

Since the model is subject to potential heteroskedasticity and autocorrelation, standard errors were computed using a robust (heteroskedasticity-consistent) covariance estimator. This estimator corrects for heteroskedasticity in the error terms and allows for the consistent estimation of coefficient standard errors (Arellano & Bond, 1991; Blundell & Bond, 1998). As a result, the significance tests of the model become more reliable.

According to the estimation results of the model, the coefficient of the *Freedom_diff* variable is approximately 2771.1, with a p-value of 0.2525. This indicates that a one-unit increase in economic freedom has a positive but statistically insignificant short-run effect on the annual change in external debt. Meanwhile, the coefficient of *Debt_diff_lag1* is 1.339 with a p-value of 0.156, which likewise renders the coefficient statistically insignificant. This suggests that debt increases tend to exhibit

persistence (i.e., some inertia from previous-period debt changes), although this effect is not statistically significant. The overall significance of the model is confirmed by the F-statistic (6.23, p = 0.044), indicating that the model as a whole is statistically significant.

The results indicate a positive yet statistically insignificant relationship between the annual change in economic freedom scores and the annual change in external debt. This finding suggests that short-term reforms in economic freedom may have weak or heterogeneous effects on debt dynamics. Moreover, the insignificance of the *Debt_diff_lag1* coefficient, together with the earlier cointegration tests showing no general long-run equilibrium relationship, implies that the interaction between economic freedom and external debt is temporary and short-lived in nature.

DISCUSSION AND CONCLUSION

The primary objective of this study is to analyze the nature of the relationship between economic freedom and external debt in a sample of developing economies by employing dynamic panel data methods. The results of the Panel ADF unit root tests and the Engle–Granger cointegration test indicate that the series are non-stationary and do not exhibit a long-run cointegration relationship. Consequently, the analysis focuses on the short-term dynamics between the variables, and the Difference-GMM approach in the style of Arellano and Bond is applied. The model results reveal that short-run increases in economic freedom positively influence external debt levels, although this effect is statistically insignificant.

The findings indicate that annual changes in economic freedom have a positive but statistically insignificant effect on short-term fluctuations in external debt. Similarly, the one-period lag of debt change is also positive, as theoretically expected, but statistically insignificant. These results suggest that external debt dynamics largely evolve independently of freedom-related reforms and that short-term policy adjustments do not produce a marked impact on debt levels.

The overall statistical significance of the model (F-statistic, $p < 0.05$) indicates that the instrumental variables used and the model specification are appropriate. However, the insignificance of the individual coefficients suggests that the relationship between the variables is weak and temporary in nature. This outcome is also consistent with the earlier tests, which showed no general long-run cointegration relationship. Therefore, in this sample, the relationship between economic freedom and external debt appears to manifest as cyclical and short-term fluctuations rather than as a structural long-term linkage.

Overall, the study demonstrates that short-term reforms in economic freedom do not exert a decisive influence on external debt, and that debt dynamics are shaped predominantly by macroeconomic conditions, financial depth, exchange rate movements, and country-specific fiscal policies. In this respect, the impact of improvements in economic freedom on debt sustainability should be evaluated over a longer time horizon and within broader institutional frameworks. Furthermore, the results indicate that developing more comprehensive models focusing on the structural determinants of external borrowing would provide valuable contributions to the literature.

This study is based on a panel dataset covering 27 countries for the period 2013–2023 and conducts its analysis using two key variables—economic freedom (Freedom) and external debt (Debt). While this scope preserves methodological consistency, it also entails certain limitations. First, the analysis focuses exclusively on these two core variables and does not incorporate potential control variables such as economic growth, inflation, interest rates, or institutional quality. This omission may result in disregarding indirect factors that influence the relationship. Second, although the Difference-GMM method is effective in capturing short-term effects, it cannot model long-run equilibrium dynamics. Future research could benefit from employing methods such as Panel ARDL or FMOLS, which would provide deeper insights into the temporal dimension of the freedom–debt relationship. Lastly, although the dataset includes the period affected by the COVID-19 pandemic and regional geopolitical shocks, these events were not incorporated into the model as structural break variables. Including such break

indicators could yield a more accurate explanation of debt dynamics, particularly for the post-2020 period.

Abstract

The Bangladeshi banking industry is simultaneously navigating traditional profitability pressures and growing demands for environmental, social and governance (ESG)–aligned finance. Recent evidence shows that bank performance in emerging economies is increasingly shaped by both internal balance-sheet structures and macro-financial conditions, while sustainability metrics become more central for regulators, investors and depositors. This paper examines how macroeconomic factors (economic growth and inflation) and bank-specific characteristics (loan–deposit ratio, loan–asset ratio, capital-to-risk-weighted-assets ratio, financial assets, firm size and leverage) jointly influence two complementary measures of sustainability for Bangladeshi banks: accounting-based sustainability (return on assets, ROA) and market-based sustainability (Tobin's Q). Using an unbalanced panel of scheduled commercial banks and applying a dynamic System Generalized Method of Moments (System GMM) estimator, we address profit persistence, endogeneity and unobserved heterogeneity. The results show that sound capitalization, prudent leverage and a moderate loan–deposit ratio are associated with higher and more sustainable bank performance, whereas excess loan concentration and high inflation weaken sustainability. These findings carry clear implications for bank management and regulators seeking to align profitability, resilience and sustainability in Bangladesh's banking system.

Keywords: Banks' sustainability, banking sector, profitability, financial performance, leverage, panel data

1. Introduction

The banking sector plays a pivotal role in the economic development of emerging economies by channeling savings into productive investments, facilitating payment systems, and supporting financial inclusion. In Bangladesh, banks dominate the financial system and are central to financing trade, industrial expansion, and infrastructure development. Ensuring the sustainability of banks—understood here as their ability to maintain stable profitability, sound asset quality, and resilience to shocks over time—is therefore critical not only for the stability of the financial system but also for the broader macroeconomic performance of the country (Bony, 2021). The recent episodes of global financial turbulence, domestic governance challenges, and rising regulatory scrutiny have highlighted the need to understand the economic and financial drivers that underpin the sustainable performance of Bangladeshi banks (Hossain & Ahamed, 2021).

Bank sustainability can be assessed from multiple perspectives. Market-based indicators, such as Tobin's Q, capture how investors perceive the value and long-term prospects of banks, while accounting-based measures such as return on assets (ROA) reflect internal efficiency in generating profits from existing resources (Đurđević & Furtula, 2023). Focusing on both dimensions allows for a more comprehensive assessment: a bank can appear profitable in the short term yet be undervalued by the market if investors anticipate heightened risks, weak governance, or unsustainable business models.

In a rapidly evolving financial landscape—characterized by digitalization, regulatory reforms, and heightened competition—understanding how macroeconomic conditions and bank-specific financial structures jointly shape these performance indicators is indispensable (Dhar et al., 2025; Karim, Dhar, et al., 2025; Karim & Kumar Dhar, 2025; Mamun et al., 2025; S. Sarker et al., 2025)

The main objective of this study is to uncover the economic and financial determinants of sustainability in Bangladeshi banks by examining the impact of macroeconomic factors and bank-level characteristics on ROA and Tobin's Q (Bhowmik et al., 2025; Gazi, Karim, et al., 2024; Jie et al., 2025; Karim, Roshid, Dhar, et al., 2024). Specifically, the study investigates how inflation (INFL), economic growth (EG), loan-to-deposit ratio (LDR), loan-to-asset ratio (LAR), capital-to-risk-weighted asset ratio (CRWAR), firm age (FA), firm size (FS), and leverage (LEV) affect both accounting-based and market-based measures of bank sustainability. By doing so, the paper aims to shed light on whether macroeconomic stability and internal balance sheet structures promote or undermine sustainable performance in the Bangladeshi banking industry (Ahmad et al., 2025; Karim, 2020; Karim et al., 2017, 2018, 2024; Karim, Kamruzzaman, et al., 2022; Karim, Khatun, et al., 2023; Karim, Mamun, et al., 2023; Karim, Roshid, et al., 2023; Miah et al., 2019).

Methodologically, the study employs an unbalanced panel dataset of 26 listed commercial banks in Bangladesh over the period 2012–2024, yielding 338 firm-year observations. Panel data techniques are used to exploit both the cross-sectional and temporal dimensions of the data. After conducting a series of diagnostic tests—including tests for cross-sectional dependence, unit roots, heteroskedasticity, and serial correlation—fixed and random effects models are initially estimated. Subsequently, the Hausman specification test indicates the presence of endogeneity and unobserved heterogeneity biases that cannot be fully addressed by static models. In response, the study adopts a dynamic panel generalized method of moments (GMM) estimator, allowing lagged dependent variables and potential endogeneity in explanatory variables to be handled in a robust manner.

This paper contributes to the literature in several ways. First, it focuses specifically on sustainability in the banking sector of an emerging economy, using both market-based (Tobin's Q) and accounting-based (ROA) performance proxies, rather than relying on a single indicator. Second, unlike much of the previous work that applies simple ordinary least squares or static panel estimators, this study applies dynamic GMM techniques that explicitly account for endogeneity, persistence in performance, and firm-specific unobserved heterogeneity. Third, it integrates macroeconomic conditions and granular bank-level financial indicators within a unified framework, thereby illustrating how external and internal forces interact to shape sustainability. Finally, the study offers policy-relevant insights for regulators, bank managers, and policymakers in Bangladesh regarding how to foster a more sustainable and resilient banking sector.

2. Literature Review

2.1 Bank Sustainability and Performance Measures

Bank sustainability is often operationalized through profitability and market valuation indicators, which reflect the ability of banks to generate returns, manage risks, and sustain investor confidence over time (Siswanti et al., 2024; Wan et al., 2023a). Accounting-based measures such as ROA capture how efficiently a bank uses its total assets to generate earnings, while market-based indicators such as Tobin's Q reflect market perceptions of the bank's future earnings potential and risk profile (Curi & Lozano-Vivas, 2020; Veríssimo et al., 2021).

Prior studies on bank performance have typically focused on either profitability or market valuation, but relatively few have simultaneously examined both as complementary dimensions of sustainability in emerging markets (Abou-El-Sood & Shahin, 2023; Azmi et al., 2021).

Many existing works also rely on static models that ignore performance persistence and potential endogeneity between bank characteristics and profitability, thereby limiting the robustness of their conclusions. This research, in contrast, applies a dynamic panel generalized method of moments approach, which accounts for the persistence of profitability over time and mitigates concerns about endogeneity by instrumenting for potentially endogenous variables (Varghese & Haque, 2021).

2.2 Macroeconomic Determinants

2.2.1 Inflation

Inflation affects banks through multiple channels, including interest margins, loan quality, and real value of assets and liabilities (Veríssimo et al., 2021b). Several studies have found that moderate inflation can be associated with higher bank margins if banks adjust lending rates faster than deposit rates, whereas high or volatile inflation tends to deteriorate asset quality and increase uncertainty, ultimately harming profitability (Sánchez Serrano, 2025a; Tsegaye et al., 2024). However, much of the existing literature treats inflation as a control variable rather than a focal determinant and often uses time-series or cross-sectional data for single countries (Bortoluzzo et al., 2024). Furthermore, many earlier studies do not account for dynamic adjustments or cross-sectional dependence across banks, which may bias estimates of the inflation–profitability relationship. The impact of inflation on bank profitability is not consistently established in the literature, with some studies indicating a positive relationship in certain contexts, such as China, while others, like those in Bangladesh, Sri Lanka, and Pakistan, find no significant effect, suggesting a nuanced and context-dependent influence(Bortoluzzo et al., 2024). The ability of banks to anticipate inflation and adjust interest rates accordingly can lead to increased profitability, as revenues may grow faster than costs (Forte et al., 2020a).

2.2.2 Economic Growth

Economic growth is generally expected to foster bank sustainability by enhancing demand for credit, reducing default risk, and improving overall financial conditions (Mehedi et al., 2023; Veríssimo et al., 2021b). Empirical studies typically find a positive relationship between GDP growth and bank profitability, as stronger economic activity leads to higher loan volumes and better asset quality. Nonetheless, many existing studies examine this relationship using short time periods or small samples and often focus on advanced economies or cross-country settings. For emerging markets like Bangladesh, the evidence remains relatively sparse, and earlier analyses rarely consider how growth simultaneously affects both ROA and Tobin's Q (Abedin et al., 2022; Khan et al., 2025).Moreover, the failure to adopt dynamic panel techniques may obscure the persistence of profitability and the feedback effects between bank performance and economic growth. Inconsistency in findings regarding the relationship between GDP growth and bank profitability, particularly in Bangladesh, suggests that a simple linear analysis may be insufficient to capture the complex dynamics at play, necessitating a conditional analysis (Apau & Sibindi, 2023).

. Indeed, some research indicates a positive relationship between economic growth and bank profitability, attributed to increased credit demand and improved solvency during economic booms (Danye, 2020). Conversely, other studies highlight that rapid economic expansion might incentivize banks to engage in excessive risk-taking, potentially eroding long-term stability and performance, especially in less regulated environments (Blattner et al., 2023).

2.3 Bank-Specific Financial Determinants

2.3.1 Loan-to-Deposit Ratio (LDR)

The loan-to-deposit ratio is a key indicator of bank intermediation and liquidity management. A higher LDR suggests more aggressive lending relative to the deposit base, which may increase interest income but also raises liquidity and credit risks (Forte et al., 2020b). Prior research has shown that moderate

levels of LDR can enhance profitability, whereas excessively high levels may lead to funding stress and asset quality problems. However, many studies treat LDR as a linear predictor, overlooking possible nonlinearities or threshold effects (Hughes et al., 2019a). In addition, earlier works often ignore the risk that LDR is endogenously determined by profitability expectations—banks expecting higher returns may deliberately expand lending—leading to biased coefficient estimates when using simple regression approaches (Blattner et al., 2023). Furthermore, the impact of LDR on bank profitability can be moderated by other bank-specific factors, such as capital adequacy and asset quality, which warrants a more comprehensive model specification to fully capture these interactions. Moreover, the relationship between LDR and profitability might vary significantly across different market conditions or bank business models, suggesting the need for more nuanced analyses that consider such heterogeneity.

2.3.2 Loan-to-Asset Ratio (LAR)

The loan-to-asset ratio captures the extent to which bank assets are concentrated in loans rather than liquid or low-risk securities (Bitar et al., 2018). A higher LAR implies greater exposure to credit risk and dependence on loan performance. Evidence from earlier studies is mixed: some find that higher LAR improves profitability by aligning assets with higher-yielding loans, while others report negative effects due to increased non-performing loans and provisioning costs (Bitar et al., 2018; Thornton & Tommaso, 2020).

Many of these studies do not explicitly examine sustainability or long-term resilience; instead, they focus on short-term profitability. Moreover, the majority of prior work fails to address cross-sectional dependence and potential simultaneity between loan growth and performance, which may lead to misleading conclusions about the true impact of LAR (Tarawneh et al., 2024). The integration of information asymmetry proxies, such as earnings forecast error and illiquidity ratios, could offer deeper insights into how the LAR influences debt financing costs and, consequently, bank sustainability(Shi et al., 2024). Similarly, the equity-to-assets ratio, which indicates the overall capital strength, offers insights into a bank's financial health, where a decline may signal increased debt financing or a reduction in total assets, posing financial risks (Durguti, 2020).

2.3.3 Capital to Risk-Weighted Asset Ratio (CRWAR)

A robust capital to risk-weighted asset ratio is fundamental for bank stability, reflecting a bank's capacity to absorb unexpected losses and maintain solvency (Apau & Sibindi, 2023). A higher Capital Adequacy Ratio is generally preferred as it signifies the bank's capability to finance operations internally, thus reducing reliance on external funding (Tsegaye et al., 2024). Well-capitalized institutions, by either decreasing risk-weighted assets or boosting portfolios of risk-weighted instruments, contribute positively to banking sector stability and profitability (Adem, 2023; Priharta & Gani, 2023).

However, studies also reveal that the relationship between capital adequacy and profitability is complex, with varying effects across different economic contexts and regulatory frameworks (Abou-El-Sood & Shahin, 2023).

Specifically, an increased capital-to-risk-weighted asset ratio can lead to higher profitability by bolstering investor confidence and enabling banks to pursue growth opportunities more aggressively, while also mitigating systemic risks (Varghese & Haque,' 2021).

Conversely, an overly conservative capital structure might constrain lending activities and reduce profitability by increasing the cost of equity (Bitar et al., 2018). Furthermore, while a greater capital adequacy ratio is associated with a stronger capital cushion to absorb losses, suggesting resilience against adverse economic conditions (Wan et al., 2023). This relationship can be complex, and some alternative estimation techniques may show contradictory results, emphasizing the need for further research to delineate optimal capital structures. Some studies suggest that beyond a certain threshold,

increased capital may not proportionately enhance profitability, potentially leading to opportunity costs by limiting profitable growth opportunities (Le, 2020).

2.3.4 Firm Age (FA)

Firm age proxies for experience, reputation, and established relationships with customers and regulators. Older banks may benefit from accumulated knowledge and customer loyalty, which can support stable earnings. However, older institutions may also suffer from inertia, outdated technologies, and rigid organizational structures, potentially hindering their adaptability to evolving market dynamics and innovation. Moreover, younger banks might leverage technological advancements and innovative business models to gain a competitive edge, though they may face higher initial operational costs and reputational challenges compared to their more established counterparts (Apau & Sibindi, 2023).

. The impact of firm age on profitability can therefore be ambiguous, requiring empirical investigation to discern the predominant effect within a specific banking sector. Conversely, younger banks may encounter higher initial operational costs and reputational hurdles while also potentially leveraging technological advancements and innovative business models to gain a competitive advantage (Ononye & Aloamaka, 2025).

This duality underscores the necessity for empirical studies to determine whether the benefits of experience or the agility of youth predominantly influence financial performance in a given banking landscape. Older banks, due to their experience, are also often better equipped to identify essential resources for survival and maintain their reputation through social actions, which can positively influence long-term sustainability(Wasiu Abiodun et al., 2023). However, some research suggests that older firms might exhibit greater rigidity and resistance to innovation, potentially limiting their adaptability to new market conditions and technological shifts, which could ultimately impede their long-term financial performance. Conversely, other studies have found that age can contribute to greater stability and risk management, allowing older institutions to navigate economic downturns more effectively due to their established practices and larger capital bases (Mehedi et al., 2023).

2.3.5 Firm Size (FS)

Firm size is one of the most extensively examined determinants of bank performance. Larger banks may benefit from economies of scale and scope, diversified portfolios, and stronger market power. However, they may also suffer from managerial complexity, coordination problems, and “too-big-to-manage” challenges (Katsiampa et al., 2022; Laeven et al., 2014). The literature thus reports both positive and negative associations between size and profitability, depending on the institutional context and time period. A key limitation of earlier work is that it often assumes a monotonic relationship between size and performance and does not account for potential endogeneity—successful banks may grow larger, making size both a cause and a consequence of performance (Hughes et al., 2019). However, many studies indicate that larger banks often benefit from economies of scale, leading to cost advantages and enhanced profitability (Katsiampa et al., 2022). Conversely, an inverted U-shaped relationship has also been observed, suggesting that while an increase in assets can positively impact profitability up to a certain point, further growth may lead to diminishing returns or even decreased profitability due to increased complexity and regulatory burdens (Mahmudova, 2023).

2.3.6 Leverage (LEV)

Leverage captures the level of debt financing relative to equity. Higher leverage can amplify returns on equity when returns exceed the cost of debt but also increases the risk of distress in downturns

(Varghese & Haque, 2021).

Traditional theories of capital structure suggest a trade-off between tax benefits of debt and bankruptcy costs. Empirical studies on banks frequently find that moderately leveraged institutions are more

profitable, although excessive leverage is associated with instability and crisis vulnerability. Nonetheless, many existing analyses focus on non-financial firms or advanced economies, and the evidence for emerging banking sectors remains limited. Furthermore, leverage is inherently endogenous to profitability and risk, which static estimation techniques often fail to address (Dell'ariccia et al., 2017). Therefore, understanding the nuanced relationship between leverage and bank performance requires dynamic models that account for these interdependencies and are tailored to specific market conditions (Bortoluzzo et al., 2024; Washington et al., 2022). However, some research indicates a positive relationship between leverage and firm profitability, particularly in banks, implying that increased financial leverage can enhance performance (Mahmudova, 2023). However, other studies suggest that an inverse relationship between leverage and bank profitability exists, possibly due to increased risk and financial fragility associated with higher debt levels (Veríssimo et al., 2021).

2.4 Gaps in the Existing Literature

Overall, previous studies have provided valuable insights into the determinants of bank performance but exhibit several limitations. First, many works consider only a subset of macroeconomic or bank-specific variables and do not jointly examine how they shape both market-based and accounting-based measures of sustainability (Menicucci & Paolucci, 2023).

Second, most studies rely on static models that cannot adequately capture persistence in performance, endogeneity in balance sheet variables, or cross-sectional dependence across banks. Third, empirical evidence specific to Bangladeshi banks—particularly using recent data and rigorous dynamic panel techniques—remains scarce (Hossain & Ahamed, 2021; Md. F. Khan et al., 2023).

By addressing these gaps through the application of GMM estimators to a comprehensive panel dataset, this paper seeks to provide more robust evidence on the sustainability drivers of Bangladeshi banks. This approach enables a more thorough analysis of how capital structure choices, encompassing various debt ratios, influence profitability and overall financial stability within this emerging market context (Ima et al., 2024; Rudiningtyas et al., 2023). Moreover, while some studies touch upon the general capital structure of firms in Bangladesh, there is a distinct lack of empirical research focusing specifically on the interplay between capital structure and bank performance (Sarker & Islam, 2021; Siddik et al., 2017).

3. Methods:

3.1 Sample firms and data

All of Bangladesh's listed banks make up the population for this study. We chose 26 commercial banks for this analysis out of the 33 listed banks on the Dhaka Stock Exchange (DSE). The financial statements of the banks, which were obtained from their individual websites and the DSE library, were used to generate the panel data. The analysis includes 338 firm-year data throughout the course of 13 fiscal years, from 2012 to 2024. These banks were chosen based on data accessibility, capitalization, and economic importance in Bangladesh. These elements guarantee the sample's representativeness and shed light on how audit committee traits impact business performance in Bangladesh's banking industry. Missing data for institutions were excluded during the study period to ensure the robustness of the analysis.

3.2 Variables

In line with prior research, several key variables were used to measure audit committee characteristics and their impact on firm performance. This study focuses on critical aspects widely associated with audit committees in emerging markets across various sectors, especially financial institutions. The variables are classified into dependent, independent, and control variables.

3.2.1 Dependent Variables

Return on Assets (ROA):

This metric, often denoted as ROA, assesses the efficiency with which a bank's assets are utilized to generate profits. It is calculated as net income divided by total assets, reflecting management's ability to convert assets into earnings, thereby serving as a robust indicator of financial performance (Mehedi et al., 2023).

Tobin's Q (TQ): This forward-looking measure reflects the market's perception of a company's future performance and is computed as the market value of a firm divided by the replacement cost of its assets (Shi et al., 2024; Zubair & Huang, 2025).

. Tobin's Q, as a market-based performance metric, offers a distinct perspective by incorporating investor expectations regarding the firm's growth opportunities and intangible assets, which accounting-based measures like ROA may not fully capture (Abedin et al., 2022).

3.2.2 Independent Variables

3.2.2.1 Inflation (INFL)

Inflation assumes that prices will increase (Tran et al., 2023). It is an increase in prices, which signifies a deterioration of purchasing power over time. The pace of decline in purchasing power can be indicated by the average price escalation of a curated basket of goods and services over time. The standard metric for inflation is the inflation rate, which represents the annual percentage change in the overall price level.

3.2.2.2 Economic Growth

Economic growth, often measured by the annual percentage change in Gross Domestic Product, reflects the expansion of a country's economy and its capacity to produce goods and services

(Thornton & Tommaso, 2020),

growth rates generally correlate with a more favorable operating environment for banks, leading to increased loan demand and improved asset quality. Conversely, sluggish economic growth or recessionary periods can adversely affect bank profitability through reduced business activity, higher loan defaults, and diminished investment opportunities.

3.2.2.3 Loan to Deposit Ratios (LDR)

The Loan to Deposit ratio is a crucial liquidity indicator for banks, calculated by dividing a bank's total loans by its total deposits. A higher ratio indicates that a bank is lending out a larger portion of its deposits, potentially increasing profitability but also exposing it to greater liquidity risk if deposit outflows occur unexpectedly

(Apau & Sibindi, 2023)

. Conversely, a lower ratio might suggest more conservative lending practices and ample liquidity, albeit possibly at the expense of maximizing interest income. This ratio is a critical component in assessing a bank's financial stability and its ability to manage both asset utilization and funding costs effectively. It is also a key determinant of a bank's capacity to generate revenue from its primary lending activities (Rolle et al., 2020).

3.2.2.4 Loan to Asset Ratio (LAR)

This metric assesses the proportion of a bank's assets allocated to loans, reflecting its core business focus and risk appetite. A higher loan-to-asset ratio often implies an aggressive lending strategy, potentially enhancing profitability but also elevating credit risk exposures, whereas a lower ratio may suggest a more conservative approach with greater liquidity (Onorato et al., 2024a). This ratio is particularly relevant in evaluating how effectively a bank deploys its assets to generate interest income, balancing the imperative for growth with prudent risk management. Thus, it directly influences a bank's net interest margin and overall financial performance (Mahmudova, 2023).Furthermore, the ratio serves as an indicator of a bank's asset structure and its reliance on interest-bearing assets to drive revenue growth (Bakoush et al., 2019).

3.2.2.5 Capital to Risk Weighted Asset Ratio

This ratio, commonly known as the Capital Adequacy Ratio, is a critical prudential metric that measures a bank's capital in relation to its risk-weighted assets, indicating its financial strength and ability to absorb potential losses. A higher ratio signifies a bank's enhanced capacity to withstand adverse economic shocks, thereby ensuring its stability and safeguarding depositor interests. This robust capital buffer enables banks to maintain operations during periods of financial distress, reducing the likelihood of systemic risk and promoting long-term sustainability within the banking sector (Mahmudova, 2023). Moreover, it directly influences a bank's lending capacity and its competitiveness in the financial market, as regulatory requirements often tie capital levels to permissible risk exposures.

3.2.3 Control Variables:

Firm Age (FA): The age of a bank can influence its operational efficiency and risk management capabilities, with older institutions potentially benefiting from established client relationships and more sophisticated internal controls. Conversely, newer banks may exhibit greater agility and innovation in their service offerings. Bank Size: Larger banks often benefit from economies of scale and diversified portfolios, which can enhance their stability and competitive advantage, though excessive size can lead to managerial inefficiencies and "too big to fail" moral hazard issues(Mahmudova, 2023). The number of years since the firm was incorporated. Older firms tend to have more established governance practices, which may influence their performance (Sánchez Serrano, 2025).

Firm Size (FS): Measured as the natural logarithm of total assets, firm size is a widely used control variable that accounts for scale-related advantages in financial performance (Karim et al., 2022). Larger firms frequently have greater access to capital markets, enabling more diversified investment opportunities and potentially lower funding costs. Conversely, smaller firms may exhibit greater flexibility and niche market specialization, potentially leading to higher growth rates in specific segments.

Firm Leverage (LEV): The debt-to-equity ratio, which is used to control the impact of a firm’s capital structure on its performance. Higher leverage can increase financial risk, potentially affecting firm performance (Onorato et al., 2024). This variable, often measured as the total debt to total assets ratio, indicates a firm's reliance on borrowed capital, which can amplify both returns and risks for shareholders. High leverage can increase financial fragility and susceptibility to economic downturns, whereas lower leverage typically implies a more conservative financial structure.

The inclusion of control variables such as firm size, age, and leverage is essential, as they account for firm-specific factors that could influence financial performance independently of audit committee characteristics. These variables are well-established in corporate governance literature and have been shown to significantly affect financial outcomes (Veríssimo et al., 2021).

3.3 Econometric Specification

To investigate the determinants of bank sustainability, the study specifies dynamic panel models for both accounting-based and market-based performance measures. For bank *i* in year *t*, the general functional form is:

$$Y_{it}= \alpha_0+\rho Y_{i,t-1}+\beta_1 INFL_{it}+\beta_2 EG_{it}+\beta_3 LDR_{it}+\beta_4 LAR_{it}+\beta_5 CRWAR_{it}+\beta_6 FA_{it}+\beta_7 FS_{it}+\beta_8 LEV_{it}+\mu_i+\varepsilon_{it}$$

Where Y_{it} denotes either ROA or Tobin's Q, $Y_{i,t-1}$ is its lagged value capturing persistence of performance, μ_i represents unobserved time-invariant bank-specific effects, and ε_{it} is the idiosyncratic error term.

Including the lagged dependent variable allows for dynamic adjustment and recognizes that current performance is influenced by past profitability and market valuation. However, this feature renders standard fixed-effects or random-effects estimators biased and inconsistent in short panels because $Y_{i,t-1}$ is correlated with the error term through the bank-specific effect μ_i. In addition, several regressors—particularly LDR, LAR, CRWAR, FS, and LEV—may be endogenously determined by bank performance, as more profitable or highly valued banks can adjust their lending, capitalization, size, and leverage in response to market conditions.

3.4 Diagnostic Tests

Before selecting the appropriate estimator, a series of diagnostic tests are conducted. First, tests for cross-sectional dependence (Pesaran's CSD, Breusch–Pagan LM, and Friedman tests) suggest significant interdependence among banks in both ROA and Tobin's Q models, reflecting common shocks and systemic linkages across institutions. Second, panel unit root tests (Levin–Lin–Chu, ADF–Fisher, and IPS) are applied to all variables. The results indicate that ROA, Tobin's Q, and all explanatory variables are stationary at levels, ensuring that the regressions do not suffer from spurious relationships.

Third, heteroskedasticity tests (White test, Breusch–Pagan/Cook–Weisberg, and modified Wald) reveal the presence of heteroskedasticity in both models, indicating that error variances differ across banks and over time. Fourth, tests for serial correlation (Breusch–Godfrey LM, Durbin–Watson, and Wooldridge test for autocorrelation in panel data) indicate no severe first-order autocorrelation in the residuals of the conventional panel models. Together, these diagnostics highlight the need for robust estimators that can accommodate cross-sectional dependence, heteroskedasticity, and potential endogeneity.

3.5 Model Selection: Fixed Effects, Random Effects, and Hausman Test

Static fixed effects (FE) and random effects (RE) models are first estimated as benchmark specifications. The FE estimator controls for unobserved bank-specific heterogeneity by allowing each bank to have its own intercept, while the RE estimator assumes that unobserved effects are uncorrelated with the regressors. To decide between FE and RE, the Hausman specification test is employed.

The Hausman test results (Table 7) report chi-square statistics of 57.836 for the ROA model and 17.369 for the Tobin's Q model, both significant at the 1% level. These findings reject the null hypothesis that the RE estimator is consistent, implying that bank-specific effects are correlated with the explanatory variables. As a result, FE is preferred over RE in the static setting. However, even the FE estimator becomes biased in the presence of the lagged dependent variable and endogenous regressors, motivating the use of dynamic GMM techniques.

3.6 Dynamic Panel GMM Estimation

To address the endogeneity of the lagged dependent variable and other potentially endogenous regressors, the study adopts the system GMM approach, which combines equations in first differences

and levels and uses appropriate lags of the variables as internal instruments. This estimator is well-suited for panels with a relatively large cross-sectional dimension (N) and a moderate time dimension (T), like the dataset used in this study.

In the first-differenced equation, lagged levels of the dependent and endogenous variables are used as instruments to remove the bank-specific effect μ_i and mitigate simultaneity bias. In the level equation, lagged differences of the variables serve as instruments under the assumption that these differences are uncorrelated with the bank-specific effect. Robust standard errors are computed to account for heteroskedasticity and cross-sectional dependence. The validity of the instruments is assessed using the Hansen J-test of overidentifying restrictions and the Sargan test, while Arellano–Bond tests for first- and second-order serial correlation in the differenced residuals (AR(1) and AR(2)) are used to verify the absence of higher-order serial correlation.

The final GMM estimations, presented in Table 8, form the basis for the discussion of the main empirical results.

4. Results

4.1 Descriptive Statistics

Table 1 presents the descriptive statistics for all variables. The mean ROA is 0.214 with a standard deviation of 0.286, indicating moderate profitability but considerable variation across banks and over time. Tobin's Q averages 4.864 with a relatively large standard deviation of 9.490, reflecting substantial dispersion in market valuations and potential episodes of over- or undervaluation. The macroeconomic variables—average inflation (6.856%) and economic growth (6.643%)—highlight a generally high-growth and moderately inflationary environment in Bangladesh over the sample period.

The bank-specific ratios also show notable variability. The mean loan-to-deposit ratio (65.564%) suggests that, on average, banks are moderately aggressive in converting deposits into loans, but the wide range (32.475% to 115.432%) indicates heterogeneity in intermediation strategies. The loan-to-asset ratio averages 59.657%, suggesting that a substantial proportion of bank assets consists of loans. The CRWAR mean of 37.576 reflects relatively high capitalization, though the range includes some negative values, likely driven by data anomalies or restructuring episodes. Firm age averages around 25 years, indicating a mix of relatively young and well-established banks, while firm size (measured by the logarithm of total assets) displays moderate dispersion. Leverage averages 11.324 with a considerable spread, pointing to diverse funding structures.

Variance inflation factors (VIFs) are all close to unity, with a mean VIF of 1.441, indicating no serious multicollinearity among regressors. This supports the reliability of the regression estimates in identifying the distinct effects of each variable.

Table 1: Descriptive Statistics

Variable	Mean	Std. Dev.	Min	Max	VIF	1/VIF
ROA	0.214	0.286	0.000	2.631		
TQ	4.864	9.490	0.881	32.077		
INFL	6.856	0.9126	5.512	7.723	1.057	0.946
EG	6.643	1.003	3.448	7.882	1.100	0.909
LDR	65.564	16.345	32.475	115.432	1.168	0.856

LAR	59.657	14.564	29.765	81.645	2.324	0.430
CRWAR	37.576	7.765	-46.645	86.456	1.856	0.538
FA	24.675	11.443	10.000	63.000	1.326	0.754
FS	25.986	0.816	23.134	28.124	1.489	0.671
LEV	11.324	6.975	-4.211	69.654	1.207	0.8285
Mean VIF					1.441	

Note: The number of observations = 338

4.2 Pairwise Correlations and Multicollinearity

The pairwise correlations in Table 2 indicate generally moderate relationships among the variables. ROA is positively associated with firm age, size, and leverage, suggesting that larger, older, and more leveraged banks tend to display higher accounting profitability. The correlation between ROA and LAR is negative and significant, indicating that higher loan concentration in assets is associated with lower profitability, possibly due to increased credit risk or non-performing loans. Tobin's Q exhibits weaker correlations with several variables but shows negative associations with LAR and some risk-related indicators, consistent with investor concern about risk exposure.

The correlation structure does not reveal any pair of regressors with excessively high correlation, and combined with the low VIF values, confirms that multicollinearity is not a major issue in the empirical models. This allows for a more precise interpretation of the individual coefficient estimates in the regression analysis.

Table 2: Pairwise Correlations and Multicollinearity

Variable	**ROA**	**TQ**	**INFL**	**EG**	**LDR**	**LAR**	**CRWAR**	**FA**	**FS**	**LEV**
ROA	1.000									
TQ	0.004	1.000								
INFL	-0.058	-0.029	1.000							
EG	0.007***	0.111**	-0.021	1.000						
LDR	-0.029	0.047	0.055	0.117*	1.000					
LAR	-0.128**	-0.143**	0.155***	0.014	0.300***	1.000				
CRWAR	-0.084	-0.030	0.048	-0.159***	-0.221***	0.285***	1.000			
FA	0.494***	-0.036	-0.148*	0.036	-0.163*	-0.112*	0.399***	1.000		

			*		**					
FS	0.543	-0.456***	0.435	0.231	0.463**	0.234	0.432**	0.143	1.000	
LEV	0.213***	0.321	-0.324***	0.397**	0.207**	0.543***	0.189	0.278*	0.378**	1.000

4.3 Cross-sectional Independence

Table 3 reports the results of cross-sectional dependence tests. For both the ROA and Tobin's Q models, the Pesaran CSD, Breusch–Pagan LM, and Friedman tests yield statistics that are highly significant, indicating the presence of cross-sectional dependence among banks. This is not surprising in a banking system where institutions are exposed to common macroeconomic shocks, regulatory changes, and market sentiments. Cross-sectional dependence underscores the importance of robust estimators and appropriate standard errors, as ignoring such dependence could lead to underestimated standard errors and overstated statistical significance.

Table 3: Cross-sectional Independence

	Pesaran CSD		**Breusch-Pagan LM**		**Friedman's test**	
	Test statistic	**p-value**	**Chi2 (66)**	**Prob > chi2**	**Test statistic**	**p-value**
Model 1 (ROA)	12.321	0.0000	175.498	0.0000	78.508	0.0000
Model 2 (Tobin's Q)	7.376	0.0000	121.231	0.0000	43.259	0.0000

4.4 Unit Root Test

Panel unit root test results, reported in Table 4, show that ROA, Tobin's Q, and all explanatory variables are stationary at levels. The Levin–Lin–Chu, ADF–Fisher, and IPS tests consistently reject the null of a unit root at conventional significance levels. These findings suggest that the variables fluctuate around stable means over the sample period and that the estimated relationships are unlikely to be spurious. Consequently, it is appropriate to estimate the models in levels without requiring differencing to ensure stationarity.

Table 4: LLC, ADF-Fisher, IPS Test

	LLC		ADF-Fisher		IPS	
	statistic	p-value	statistic	p-value	statistic	p-value
ROA	-11.738	0.000***	11.328	0.000***	-18.756	0.000***
TQ	-4.453	0.000***	13.312	0.000***	-14.675	0.000***

INFL	-2.498	0.0011***	-4.845	0.046***	-4.854	0.021**
EG	-11.540	0.000***	-6.548	0.000***	-2.756	0.000***
LDR	-8.847	0.000***	-9.478	0.000***	-9.576	0.000***
LAR	-2.604	0.000***	-5.647	0.000***	-8.476	0.000***
CRWAR	-9.923	0.000***	9.478	0.000***	-12.756	0.000***
FA	-7.834	0.000***	10.381	0.000***	-6.758	0.000***
FS	-8.432	0.000***	8.934	0.000***	-7.472	0.000***
LEV	-2.435	0.000***	3.672	0.000***	-3.653	0.000***

Notes: "The symbol *** indicates significance at the 1% level. Both the Levin–Lin–Chu and Augmented Dickey-Fuller-Fisher tests are conducted at the level".

4.5 Heteroscedasticity

As shown in Table 5, the White test and Breusch–Pagan/Cook–Weisberg test indicate the presence of heteroskedasticity in both the ROA and Tobin's Q models. The modified Wald test similarly confirms groupwise heteroskedasticity in the panel. These results imply that the variance of the error term differs across banks and over time, making classical ordinary least squares assumptions invalid. The use of robust standard errors in the GMM estimations mitigates the impact of heteroskedasticity and improves the reliability of inference.

Table 5: White, BPCW, MW Test for Heteroscedasticity

	White Test		**Breusch-Pagan/Cook-Weisberg test**		**Modified Wald test**	
	Chi2	Prob > chi2	Chi2	Prob > chi2	Chi2	Prob > chi2
Model 1 (ROA)	65.453	0.015	271.254	0.0000	10729.77	0.0000
Model 2 (Tobin's Q)	32.734	0.1089	37.843	0.000	20782.16	0.0000

4.6 Autocorrelation

Table 6 presents the results of autocorrelation tests. The Breusch–Godfrey LM test and the Wooldridge test for autocorrelation in panel data do not indicate significant first-order serial correlation in either model, and the Durbin–Watson statistics are close to 2, suggesting that residuals are not severely autocorrelated in the static specifications. In the dynamic GMM framework, the Arellano–Bond AR(1) test is expected to detect first-order serial correlation in the differenced residuals, while the AR(2) test should not indicate second-order correlation if the instruments are valid. The reported AR(1) p-values are effectively zero, while AR(2) p-values are well above conventional significance levels, confirming the appropriateness of the instrument set and the absence of higher-order serial correlation.

Table 6: BGLM, DW, and Wooldridge Test

	Breusch-Godfrey LM		**Durbin-Watson test**	**Wooldridge test**	
	Chi2	Prob > chi2	D-W Statistic	F (1, 11)	Prob > chi2
Model 1 (ROA)	6.836	0.127	1.893	3.654	0.430
Model 2 (Tobin's Q)	2.827	0.486	2.167	0.657	0.563

4.7 Model Selection and GMM Estimation Results

The Hausman test results in Table 7 reject the random effects specification in favor of fixed effects for both performance measures, indicating that bank-specific effects are correlated with the regressors. Nevertheless, given the dynamic nature of the models and potential endogeneity of key variables, the study proceeds to estimate dynamic GMM models.

Table 8 reports the GMM regression results. For ROA, the lagged dependent variable (L.DEP) has a positive and significant coefficient (0.045), indicating persistence in accounting profitability: banks with higher ROA in the previous period tend to maintain relatively high ROA in the current period. A similar pattern is observed for Tobin's Q, where the lagged dependent variable coefficient (0.074) is significantly positive, reflecting persistence in market valuation.

Inflation exerts a negative and highly significant effect on both ROA (−0.321) and Tobin's Q (−0.234). This suggests that higher inflation erodes bank profitability and diminishes investor valuations, likely by increasing costs, reducing real returns, and heightening macroeconomic uncertainty. In contrast, economic growth has a positive and significant impact on both performance measures: the coefficient on EG is 0.431 for ROA and 0.310 for Tobin's Q, indicating that stronger economic activity supports higher profitability and better market valuations by stimulating demand for credit and improving asset quality.

Among bank-specific factors, the loan-to-deposit ratio negatively and significantly affects ROA (−0.054), implying that more aggressive lending relative to deposits may undermine profitability, perhaps due to liquidity strains or higher credit risk. However, its effect on Tobin's Q is negative but statistically insignificant, suggesting that investors may not respond strongly to variations in LDR once other factors are controlled. The loan-to-asset ratio exerts a robust and negative impact on both performance measures, with coefficients of −0.432 for ROA and −0.034 for Tobin's Q (both significant). This indicates that a higher concentration of assets in loans reduces both profitability and market valuation, consistent with increased exposure to credit risk and non-performing loans.

The capital-to-risk-weighted asset ratio (CRWAR) has a negative but insignificant effect on ROA, while it significantly reduces Tobin's Q (−0.438). This pattern suggests that, in the Bangladeshi context, higher capitalization does not necessarily translate into higher accounting profitability and may even be perceived by the market as a signal of risk or regulatory pressure rather than proactive risk management. Alternatively, high capital buffers might reflect underutilized lending capacity or conservative risk-taking that suppresses returns.

Firm age negatively affects both performance measures, with a strong and significant coefficient for ROA (−0.543) and a weaker but significant effect for Tobin's Q (−0.843 at the 10% level). This implies that older banks tend to be less profitable and less valued by the market, possibly due to rigid organizational structures, legacy systems, and lower adaptability to innovation. Firm size has an insignificant positive effect on ROA but a significant negative effect on Tobin's Q (−0.723), indicating

that the market tends to discount larger banks, perhaps due to concerns about inefficiency, governance issues, or "too-big-to-manage" risks, even if their accounting profitability is not markedly different.

Finally, leverage (LEV) exerts a positive and highly significant impact on both ROA (0.043) and Tobin's Q (0.743). This suggests that, within the observed range, higher leverage enhances profitability and market valuations, likely by amplifying returns when economic conditions are favorable. However, such benefits may come at the cost of increased systemic risk, particularly during downturns, and must be interpreted with caution.

The diagnostic tests for the GMM models indicate that the instrument sets are generally acceptable. The AR(1) tests confirm expected first-order correlation, while AR(2) tests do not reject the null of no second-order correlation. The Sargan test p-values are above conventional significance levels, suggesting that overidentifying restrictions are not rejected. The Hansen test results show low p-values in some specifications, hinting at potential instrument proliferation or specification sensitivity, which is acknowledged as a limitation and addressed in the discussion.

5. Discussion and Policy Implications

The empirical results reveal a coherent picture of how macroeconomic conditions and bank-specific financial structures jointly shape the sustainability of Bangladeshi banks. The positive and significant impact of economic growth on both ROA and Tobin's Q underscores the importance of a vibrant real economy for bank sustainability. When economic activity expands, demand for loans increases, default rates decline, and overall financial conditions improve, thereby enhancing both current profitability and future growth expectations (Ahmad et al., 2024; Al Mamun et al., 2025; Gazi, Islam, et al., 2024; Islam et al., 2025; Karim, Bhowmik, et al., 2025; Karim, Chakrobortty, et al., 2022; Karim et al., 2024; Karim, Kamruzzaman, et al., 2023; Karim, Roshid, & Waaje, 2024b, 2024a; Karim, Waaje, et al., 2025; Kuri et al., 2025; Nahiduzzaman et al., 2025; Roshid, Karim, et al., 2025, 2024; Roshid, Saiyed, et al., 2025; Roshid, Waaje, et al., 2025, 2024; Roshid, Yeamin, et al., 2025; Song et al., 2025; Sultana et al., 2025; Waaje et al., 2024, 2025; Zhu et al., 2025). This aligns with the broader literature on the bank–growth nexus in emerging markets.

Conversely, the negative effects of inflation on both performance measures suggest that inflationary pressures undermine bank sustainability by eroding real returns, increasing uncertainty, and potentially encouraging speculative rather than productive borrowing. In a moderately inflationary environment like Bangladesh, banks may struggle to fully adjust their lending and deposit rates in tandem, resulting in compressed net interest margins. Moreover, high inflation can weaken borrower repayment capacity and impair asset quality, further undermining profitability and investor confidence.

Bank-specific factors reveal that balance sheet structure and risk-taking behaviors are critical determinants of sustainability. The negative effects of LDR and LAR on performance indicate that aggressive expansion of lending relative to deposits and asset base can be detrimental when not supported by sound credit risk management. High loan concentration may initially boost interest income but eventually lead to elevated non-performing loans and provisioning costs, which depress both profitability and market valuation. The finding that LDR significantly affects ROA but not Tobin's Q suggests that the market may anticipate or discount such risks ahead of their full impact on accounting figures or may weigh other factors—such as leverage and capitalization—more heavily.

The mixed evidence on capitalization is particularly noteworthy. While capital adequacy is conventionally associated with stability, the negative impact of CRWAR on Tobin's Q suggests that, in the Bangladeshi context, high capital ratios may be interpreted as a response to elevated risk or regulatory pressure rather than a sign of strength. Alternatively, banks that hold excessive capital might forgo profitable lending opportunities, resulting in lower expected returns. This underscores the need for a nuanced approach to capital regulation that balances safety with incentives for efficient intermediation.

The negative relationship between firm age and performance highlights the potential challenges faced by older banks in adapting to technological change, digital banking, and evolving customer preferences.

Legacy systems, bureaucratic structures, and entrenched practices may hinder innovation and efficiency, causing older institutions to lag behind younger or more agile competitors. The market's negative response to firm size in terms of Tobin's Q further suggests concerns about complexity, governance, and risk management in large banks, even if their accounting profitability is not dramatically different from smaller peers.

Leverage emerges as a double-edged sword. The positive effect of leverage on both ROA and Tobin's Q indicates that Bangladeshi banks have, on average, used debt financing to enhance returns and signal growth opportunities to investors. However, high leverage can magnify losses in downturns and heighten systemic risk. In the absence of strong risk management and regulatory oversight, the observed benefits of leverage could be fragile and susceptible to rapid reversal in the face of adverse shocks.

The findings of this study carry several important implications for bank managers and boards of directors in Bangladesh. First, banks should strive to align their growth strategies with macroeconomic conditions, capitalizing on periods of strong economic growth while building buffers for downturns. Prudent credit risk management is essential to ensure that loan expansion does not erode asset quality. This includes robust underwriting standards, effective monitoring of borrower performance, and timely recognition and provisioning of non-performing loans. Second, banks need to carefully manage their loan-to-deposit and loan-to-asset ratios. While lending is the core business of banking, excessive reliance on loan assets and high LDRs can undermine liquidity and increase exposure to credit risk. Banks should diversify their income sources, invest in liquid and low-risk securities where appropriate, and maintain adequate liquidity buffers. Active asset–liability management and stress testing can help banks identify vulnerabilities under different macroeconomic scenarios and adjust their balance sheets accordingly. Third, the results suggest that the benefits of high capitalization are not automatic. Banks should treat capital as a strategic resource rather than merely a regulatory requirement. Maintaining adequate capital buffers is essential for absorbing shocks, but excessively high capital ratios without corresponding improvements in risk management or lending efficiency may signal underutilization of resources. Bank management should therefore integrate capital planning with long-term business strategies, ensuring that capital is deployed to support high-quality lending and sustainable growth. Fourth, the negative effect of firm age and size on performance calls for reforms in internal governance and organizational design. Older and larger banks may need to undertake structural and digital transformation to remain competitive. This includes upgrading core banking systems, adopting fintech innovations, streamlining decision-making processes, and fostering a culture of innovation. Strengthening board oversight, enhancing transparency, and aligning executive incentives with long-term sustainability goals can also mitigate governance challenges in complex institutions. Finally, banks should pay close attention to leverage and risk-taking behavior. While moderate leverage can enhance returns, excessive reliance on debt financing can increase vulnerability to shocks. Banks should establish clear risk appetite frameworks, conduct regular stress tests, and ensure that leverage is consistent with their capital positions and risk management capacity. Transparent disclosure of leverage, risk exposures, and capital adequacy can also improve market discipline and investor confidence. Overall, a stable macroeconomic environment, prudent regulation, and strong internal governance in banks are mutually reinforcing pillars of a sustainable banking system. By jointly addressing macroeconomic and microeconomic determinants of sustainability, policymakers and bank managers can foster a more resilient and growth-supportive financial sector in Bangladesh.

Conclusion

This study examined the economic and financial drivers of sustainability in Bangladeshi banks using panel data for 26 listed banks over the period 2012–2024. Employing dynamic panel GMM estimators to address endogeneity, persistence in performance, and unobserved heterogeneity, the analysis demonstrated that macroeconomic conditions and bank-specific financial structures jointly shape both accounting-based (ROA) and market-based (Tobin's Q) measures of sustainability. Economic growth

enhances, while inflation undermines, bank performance. At the bank level, high loan concentration and aggressive intermediation are detrimental to sustainability, whereas leverage supports performance within the observed range, albeit with potential risks. Firm age and size present challenges in terms of adaptability and market perception, and capitalization must be managed strategically to balance stability and profitability.

The findings underscore the importance of aligning macroeconomic policies, regulatory frameworks, and internal bank strategies to foster a sustainable and resilient banking system. For Bangladesh, this implies maintaining macroeconomic stability, refining prudential regulation, and encouraging technological and organizational innovation in banks.

Limitations and Future Guidelines

Despite its contributions, the study has several limitations. First, the analysis is restricted to listed commercial banks, which may differ from non-listed or specialized institutions in terms of governance, risk profiles, and regulatory treatment. Future research could extend the sample to include a broader set of banks or other financial institutions. Second, the study relies on secondary data, which may be subject to measurement errors, reporting inconsistencies, or classification issues—particularly for variables such as CRWAR and non-performing loans.

Third, while dynamic GMM techniques address several econometric challenges, they are sensitive to instrument choice and may suffer from instrument proliferation. Future studies could experiment with alternative instrument reduction strategies or employ complementary estimation methods, such as bias-corrected least squares dummy variable (LSDVC) estimators. Fourth, the current analysis focuses on macroeconomic and financial ratio determinants; incorporating additional dimensions—such as corporate governance, digitalization, ESG practices, and institutional quality—could provide a more holistic picture of bank sustainability.

Finally, comparative studies across countries or regions could help identify whether the patterns observed in Bangladesh are specific to its regulatory and institutional context or representative of broader trends in emerging markets. Such work would further enrich the understanding of how economic and financial drivers shape the sustainable development of banking sectors worldwide.

DONALD TRAMPIN İKİNCİ PREZİDENTLİK DÖVRÜNDƏ ABŞ-Aİ MÜNASİBƏTLƏRİ

Cavid İBAYEV

Magistrant, Bakı Dövlət Universitet
E-mail: javid.ibayev@gmail.com

Xülasə

Donald Trampın ikinci prezidentlik dövrü ABŞ-Avropa İttifaqı münasibətlərində yeni mərhələ kimi qiymətləndirilə bilər. Bu mərhələdə transatlantik əlaqələrdə uzun illər boyu mövcud olmuş qarşılıqlı etimad böhranla əvəz olundu. Tramp administrasiyasının əsas iqtisadi siyasətlərindən biri "reciprocal tariffs" adlanan qarşılıqlı tariflər konsepsiyası oldu. ABŞ bu siyasət çərçivəsində Avropa mallarına yüksək tariflər tətbiq edərək iqtisadi təzyiq mexanizmini gücləndirdi. 2025-ci ilin yayında bağlanan "15 faiz tarif anlaşması" isə əsas problemləri həll etmədi; əksinə, tərəflər arasında asimmetriyanı qorudu. Avropa İttifaqı buna cavab olaraq 26 milyard avro dəyərində qarşı tədbirlər paketi elan etdi. Eyni zamanda NATO daxilində müdafiə məsuliyyətinin bölüşdürülməsi məsələsi də gərginlik mənbəyinə çevrildi. ABŞ-ın Avropadan müdafiə xərclərini 5 faizə qədər artırmağı tələb etməsi sosial və iqtisadi çətinliklər yaratdı, Avropa liderlərini isə "strateji müstəqillik" axtarışına yönəltdi. Tramp administrasiyasının sağçı-populist qüvvələrə dolayı dəstəyi Avropa daxilində ideoloji parçalanmanı dərinləşdirdi və liberal-mühafizəkar qarşıdurmalarını gücləndirdi. Münhen Təhlükəsizlik Konfransında vitse-prezident JD Vensin sərt bəyanatları ABŞ-ın Avropa ilə münasibətlərində ideoloji şərtləri ön plana çıxardığını göstərdi. Bütün bu proseslər göstərir ki, ABŞ və Avropa İttifaqı münasibətləri qarşılıqlı əməkdaşlıqdan daha çox rəqabət, etimadsızlıq və təzyiq mühitinə keçid edir. Bu tendensiyalar yalnız Avropa üçün deyil, qlobal siyasi və iqtisadi balanslar üçün də strateji əhəmiyyət kəsb edir.

Açar sözlər: ABŞ, Avropa İttifaqı, Donald Tramp, ticarət münasibətləri, təhlükəsizlik siyasəti

Giriş

Donald Trampın ikinci prezidentlik dövründə ABŞ-Avropa İttifaqı münasibətlərində kəskin dəyişikliklər müşahidə olunur. Ticarət müharibələri, təhlükəsizlik məsələlərində qarşılıqlı ittihamlar, ideoloji və siyasi gərginliklər transatlantik münasibətlərin əvvəlki etibar və əməkdaşlıq çərçivəsindən uzaqlaşdığını göstərir. ABŞ-ın proteksionist iqtisadi siyasəti, NATO çərçivəsində müdafiə məsuliyyətləri ilə bağlı tələbləri və Avropada populist qüvvələrə dolayı dəstəyi Avropa İttifaqının daxili sabitliyini sarsıdır. Bu, qlobal güc balansına təsir göstərməklə yanaşı, beynəlxalq münasibətlər sistemində yeni qarşıdurma xətləri yaradır. Azərbaycan Respublikası üçün ABŞ-Avropa İttifaqı münasibətlərindəki gərginlik birbaşa strateji əhəmiyyət kəsb edir. Avropa İttifaqı Azərbaycanın əsas enerji tərəfdaşlarından biri olduğu halda, ABŞ-la münasibətlərdə də təhlükəsizlik və regional sabitlik məsələləri ön plana çıxır. Transatlantik münasibətlərdəki böhran Azərbaycanın enerji ixracatına, Qafqazdakı geosiyasi balanslara və Cənubi Qaz Dəhlizi kimi beynəlxalq layihələrin gələcəyinə təsir göstərə bilər. Bundan başqa, Qərb blokunun parçalanması fonunda Azərbaycan öz xarici siyasətində balanslaşdırılmış mövqeyini daha diqqətlə formalaşdırmalı olur.

Bu baxımdan, tədqiqatımızın məqsədi Donald Trampın ikinci prezidentlik dövründə ABŞ-Avropa İttifaqı münasibətlərində iqtisadi, təhlükəsizlik və ideoloji müstəvidə baş verən dəyişikliklərin mahiyyətini təhlil etmək və onların Azərbaycan üçün mümkün nəticələrini qiymətləndirməkdir.

İqtisadi və ticarət münasibətlərində gərginliklər

Donald Trampın ikinci prezidentlik dönəmində ABŞ-ın ticarət siyasətində mərkəzi anlayışlardan biri "reciprocal tariffs", yəni qarşılıqlı tariflər konsepsiyası oldu. Tramp 2025-ci ilin aprelin 2-də böyük ticarət defisitini milli təhlükə kimi elan etdi və aprelin 5-dən etibarən ABŞ-a gətirilən bütün mallara minimum 10 faiz tarif tətbiq ediləcəyini açıqladı. Bu yanaşma ABŞ-Çin münasibətləri ilə

məhdudlaşmadı, Avropa İttifaqı da bu siyasətin əsas hədəflərindən biri oldu. Trampın arqumenti ondan ibarət idi ki, ABŞ digər ölkələrin ixracatçıları üçün açıq bazar təqdim etdiyi halda, qarşı tərəfdən eyni dərəcədə ədalətli şərtlər almır və buna görə də balansı "məcburi qarşılıqlı addımlarla" bərpa etmək lazımdır. Bu, xüsusilə Avropa mallarının ABŞ bazarında daha sərt şərtlərlə üzləşməsinə səbəb oldu. Tarif dərəcələrinin yüksəldilməsi ikinci prezidentlik müddətində ən çox diqqət çəkən hadisələrdən biri idi. ABŞ administrasiyası polad, alüminium və mis kimi əsas xammal məhsullarına tətbiq olunan tarifləri 50 faizə qədər qaldırdı. Avropa İttifaqından gətirilən maşınlar, avtomobil ehtiyat hissələri, dərman preparatları və yarımkeçiricilər üçün isə ümumi 15 faiz tarif nəzərdə tutuldu. Bu qərar Trampın özünün "15 faiz tarif razılaşması" kimi təqdim etdiyi plan çərçivəsində elan edildi. ABŞ bu yolla ticarət balansındakı mənfi göstəriciləri azaltmağa çalışırdı, amma Avropa ölkələri bu tariflərin haqsız olduğunu düşünür və mübahisəli şəkildə qəbul edirdi [3]. Avropa İttifaqının bəzi sektorları, məsələn polad və alüminium istehsalı, bu sərt tarif rejimindən heç bir istisna qazanmadı və nəticədə Avropa iqtisadiyyatının strateji sahələri birbaşa təsirləndi [4].

2025-ci ilin yayında ABŞ ilə Avropa İttifaqı arasında imzalanan razılaşma "15 faiz tarif anlaşması" kimi təqdim olundu. Bu razılaşmaya görə, Avropa İttifaqı ABŞ-a ixrac etdiyi mallar üçün 15 faiz tarif ödəməyi qəbul edir, eyni zamanda ABŞ iqtisadiyyatına 600 milyard dollarlıq sərmayə yatırmaq və ABŞ-dan enerji idxalını artırmaq öhdəliyini götürürdü. Amma bu sənəd əslində Tramp dövründə mövcud olan digər yüksək tariflərə təsir göstərmədi. Polad və alüminium idxalında tətbiq edilən 50 faizlik tariflər qüvvədə qaldı. Analitiklər hesab edirdilər ki, bu razılaşma Avropa üçün qənaətbəxş deyil, çünki ABŞ tərəfi rəqəmsal bazarlarda, mənşə qaydalarında və qeyri-tarif maneələrdə sərt tələblər qoyaraq üstün mövqeyini qoruyurdu. Avropa bu şərtlərin qlobal rəqabət mühitində öz ixracatçılarını ciddi çətinliklərə sürüklədiyini qeyd edirdi [6].

Avropa İttifaqı bu siyasətə cavab olaraq 2025-ci ildə 26 milyard avro dəyərində qarşı tədbirlər paketini elan etdi. Bu tədbirlərə ABŞ-dan gətirilən viski, geyim məhsulları, avtomobil sektoru malları və digər istehlak məhsulları daxil idi. Avropa ölkələri bununla göstərmək istəyirdilər ki, Trampın sərt addımları yalnız ABŞ üçün deyil, qlobal iqtisadi sabitlik üçün də təhlükə yaradır. Brüssel eyni zamanda bir daha vurğuladı ki, Avropa Birliyi ölkələrinin ticarət siyasəti ayrı-ayrı paytaxtların qərarı ilə deyil, Avropa Komissiyasının səlahiyyətləri çərçivəsində müəyyən edilir. Bu, həm də ABŞ-a siqnal idi ki, Avropa ilə danışıqlarda parçalanma taktikasına ümid etməməlidir [5].

Mövcud ticarət həcmləri fonunda bu gərginliklərin miqyası daha aydın görünürdü. 2024-cü ildə ABŞ və Avropa İttifaqı arasında mallar və xidmətlər üzrə ümumi ticarət dövriyyəsi 1,6 trilyon avroya çatmışdı ki, bu da təxminən gündəlik 4,2 milyard avro dəyərində mübadilə demək idi. Trampın yeni tarif rejimi bu möhtəşəm ticarət həcminə ciddi risk yaradırdı. Xüsusilə avtomobil sənayesi və nəqliyyat sektoru kimi Avropa iqtisadiyyatının əsas dayaqları 50 faizlik tariflərin təsiri ilə rəqabət gücünü itirə bilərdi. Analitiklər xəbərdarlıq edirdilər ki, belə bir vəziyyət Avropa ixracatının böyük hissəsini ABŞ bazarından sıxışdırıb çıxara bilər.

Dünya Ticarət Təşkilatının (WTO) təsiri də bu prosesdə zəifləyirdi. Tramp administrasiyası WTO-nun Apellyasiya Məhkəməsinin fəaliyyətini məhdudlaşdırmaq və öz tarif rejimini qlobal norma halına gətirmək istiqamətində addımlar atdı. Bir sıra ölkələr ABŞ-ın qərarlarını WTO mexanizmləri çərçivəsində mübahisələndirmək istəsələr də, ABŞ-ın təşkilatın fəaliyyətinə maliyyə töhfələrini dayandırması və Apellyasiya Məhkəməsinin işini bloklaması effektiv nəticələrin qarşısını aldı. Bu, qlobal ticarət rejiminə etimadı daha da azaltdı və çoxqütblü iqtisadi münasibətlərdə qeyri-müəyyənlik yaratdı. ABŞ daxilində bu siyasətin əsaslandırılması "America First" sənaye strategiyası ilə bağlı idi. Tramp istehsalın ölkəyə qaytarılması və idxaldan asılılığın azaldılması üçün tarifləri əsas vasitə kimi təqdim edirdi [1]. Amma aparılan iqtisadi təhlillər göstərirdi ki, tariflər nəticəsində yaranan əlavə xərclər birbaşa idxalçı şirkətlər və nəticə etibarilə istehlakçılar tərəfindən qarşılanır. Başqa sözlə, tariflər daxili bazarda qiymət artımına səbəb olurdu. Bu, istehsalçıları qismən qorusa da, ABŞ vətəndaşlarının gündəlik xərclərini artırdı. Beləliklə, iqtisadi siyasətin real yükü sıravi istehlakçının üzərinə düşürdü.

Gələcək perspektivlərə baxdıqda, ABŞ və Avropa İttifaqı arasındakı tarif gərginliklərinin davamlı bir xəttə çevrilməsi ehtimalı yüksək görünür. Avropa Birliyi artıq "geoiqtisadi qarşısının alınması" siyasətini gündəmə gətirərək, yeni ticarət ittifaqları yaratmaq, strateji sənaye sektorlarını qorumaq və tədarük zəncirlərini şaxələndirmək kimi addımlar atmağa məcbur olur. Analitiklər hesab edirlər ki, ABŞ-la ticarət münasibətləri etibar və əməkdaşlıqdan çox qarşılıqlı təzyiq üzərində formalaşacaq. Bu isə yalnız iqtisadi sferada deyil, Avropanın siyasi və geosiyasi strategiyalarında da dərin izlər buraxacaq.

Təhlükəsizlik, siyasi etimad və ideoloji təsirlər

Donald Trampın ikinci prezidentlik dövründə transatlantik münasibətlərdə etimadın kəskin şəkildə zəiflədiyi müşahidə olundu. ABŞ rəhbərliyi hələ ilk 100 gün ərzində həm ritorik, həm də praktik addımlarla Avropa ölkələrinə qarşı sərt yanaşma nümayiş etdirdi. Bu yanaşma uzun illər ərzində formalaşmış qarşılıqlı etibar strukturunu ciddi şəkildə sarsıtdı. Avropa ictimaiyyətində və siyasi dairələrdə ABŞ-ın Avropa üzərindəki status quo maraqlarını yenidən nəzərdən keçirdiyi barədə şübhələr geniş yayıldı. Bunun nəticəsi olaraq Avropa daxilində "müdafiə məsələsini öz üzərinə götürmək" çağırışları getdikcə gücləndi və AB-nin öz təhlükəsizlik arxitekturasını qurması zərurəti gündəmə gəldi. NATO daxilində münasibətlər də bu dövrdə ciddi gərginliklərlə yadda qaldı. Tramp administrasiyası Avropa ölkələrindən müdafiə xərclərini yalnız 2 faizlik öhdəlik səviyyəsində deyil, ən azı 5 faizə qədər artırmağı tələb etdi [2]. Bu tələb Avropa ölkələri üçün sosial və iqtisadi prioritetlərlə ziddiyyət təşkil edirdi, çünki belə böyük bir yük dövlət büdcələrinə ciddi təzyiq demək idi. Avropa liderləri bu məsələdə ABŞ-la ortaq nöqtə tapmaqda çətinlik çəkdilər və nəticədə qitə daxilində müdafiə məsuliyyətini bölüşmək, ABŞ-ın azalan dəstəyini kompensasiya etmək üçün yeni strategiyalar axtarışına çıxdılar. Bu isə Avropanın təhlükəsizlik məsələlərində daha müstəqil mövqeyə yönəlməsinə səbəb oldu.

2025-ci ilin fevralında Münhen Təhlükəsizlik Konfransında ABŞ vitse-prezidenti JD Vensin çıxışı münasibətlərə əlavə gərginlik gətirdi. O, Avropa liderlərini demokratiyanı zədələməkdə, senzura tətbiq etməkdə və seçki proseslərinə müdaxilə etməkdə ittiham etdi. Vens açıq şəkildə bildirdi ki, ABŞ-ın Avropaya dəstəyi yalnız demokratik prinsiplərin qorunması ilə şərtlənəcək [8]. Bu çıxış Avropa ictimaiyyətində güclü narazılıq doğurdu və "ideoloji savaş" ritorikasının sadəcə daxili siyasətdə deyil, həm də transatlantik diplomatiyada əsas xəttə çevrildiyini göstərdi. Avropa paytaxtlarında ABŞ-ın münasibətlərə açıq şərtlərlə yanaşması ciddi narahatlıqla qarşılandı.

Tramp administrasiyasının ən diqqətçəkən yanaşmalarından biri Avropada "mədəni savaş" strategiyasına xüsusi önəm verməsi idi. ABŞ rəhbərliyi Avropadakı sağçı-populist partiyaları özünə ideoloji müttəfiq kimi görməyə başladı. Bu partiyalara açıq və gizli dəstəyin verilməsi, Avropanın liberal seçki sistemlərinin tənqid olunması qitədə siyasi qütbləşməni daha da dərinləşdirdi [7]. Nəticədə liberal və mühafizəkar düşərgələr arasında qarşıdurmalar kəskinləşdi və Avropa daxilində siyasi parçalanma tendensiyaları gücləndi. Bu siyasət həmçinin Avropa İttifaqının institusional bütövlüyünə təhdid kimi qəbul edildi.

Trampın prezidentliyi Avropadakı radikal sağ partiyalara motivasiya verir. Bu partiyalar özlərini daha fəal şəkildə təqdim etməyə başladılar və beynəlxalq müstəvidə görünürlük qazandılar. Münhen konfransında vitse-prezident Vensin Almaniyada AfD lideri ilə görüşməsi bunun bariz nümunəsi oldu. Bu, Avropa siyasi dairələrində ABŞ-ın qitənin daxili siyasi balansına birbaşa təsir göstərməsi kimi qiymətləndirildi [10]. Bununla belə, radikal sağ hərəkatların tam siyasi hakimiyyət iddiası hələ də məhdudiyyətlərlə üzləşir, çünki onlar ideoloji tutarlılıq, daxili birləşmə və Avropa qurumlarının təsirindən kənarda müstəqil hərəkət etməkdə çətinlik çəkirlər. AB ilə ABŞ arasında ideoloji parçalanma da dərinləşməyə başlayır. Tramp administrasiyası Avropanın öz dəyərlərinə, qərar qəbuletmə səlahiyyətlərinə meydan oxuyan bir siyasət yürütməyə çalışdı. Avropa tərəfi bu siyasəti "mədəni və ideoloji manipulyasiya" kimi qiymətləndirdi. Avropa institutları özlərini artıq yalnız təhlükəsizlik tərəfdaşı deyil, həm də ABŞ-ın ideoloji nəzarət obyektinə çevrilmiş kimi hiss etməyə başladılar. Bu isə Avropanın siyasi identitetinin qorunması uğrunda mübarizəni daha da aktuallaşdırdı və qitənin liberal-demokratik institutlarını müdafiə etmə zərurətini ön plana çəkdi.

Trampın təhlükəsizlik siyasəti Avropada strateji müstəqillik çağırışlarını gücləndirir. ABŞ-ın dəstəyinin qeyri-müəyyənləşməsi Avropa liderlərini hərbi sənaye və müdafiə sahəsində öz güclərinə arxalanmağa məcbur etdi. Bu çərçivədə Avropa ölkələri birgə müdafiə layihələrinə daha çox sərmayə qoymağa, təhlükəsizlik sahəsində ABŞ-dan asılılığı azaltmağa çalışdılar. Bu proses Avropanın gələcəkdə müstəqil aktor kimi çıxış etməsinin zəruriliyini daha aydın göstərdi və "strateji avtonomiya" anlayışı əsas müzakirə mövzularından birinə çevrildi [9].

Diplomatik müstəvidə də gərginliklər artmaqda davam edir. ABŞ-ın Avropa liderlərinin seçkilərinə dolayı müdaxilə niyyətləri barədə yayılan iddialar Avropa ictimaiyyətində güclü rezonans doğurdu. Avropa dövlətləri ABŞ-ın qitə daxilində təsir imkanlarını məhdudlaşdırmaq üçün öz strateji institutlarını möhkəmləndirməyə çalışdılar. Bu tendensiyanın davamlılığı ABŞ və Avropa arasında münasibətlərin gələcəkdə daha ehtiyatlı, daha çox strateji rəqabət və ideoloji diskurs üzərində qurulacağını göstərir. Belə bir şəraitdə tərəflər arasında etimadın əvvəlki səviyyəyə qayıtması yaxın perspektivdə real görünmür.

NƏTİCƏ

Donald Trampın ikinci prezidentlik dövründə ABŞ-Avropa İttifaqı münasibətləri həm iqtisadi, həm də təhlükəsizlik və ideoloji müstəvidə dərin gərginliklərlə xarakterizə olunmuşdur. Tarif siyasəti, müdafiə məsuliyyətləri, transatlantik etimadın zəifləməsi və Avropada siyasi qütbləşmənin güclənməsi bu münasibətlərin əsas xüsusiyyətlərini müəyyənləşdirir. Bütün bunlar göstərir ki, transatlantik münasibətlərdə əvvəlki dövrdə mövcud olan əməkdaşlıq və qarşılıqlı etibar artıq davamlı şəkildə sarsılmışdır. Bu baxımdan, tədqiqatımızın nəticələrini aşağıdakı kimi ümumiləşdirmək mümkündür:

– Tramp administrasiyasının tətbiq etdiyi "reciprocal tariffs" siyasəti və yüksək tariflər Avropa İttifaqının strateji sahələrini ciddi zərbə altında qoydu, iqtisadi münasibətləri qarşıdurma müstəvisinə gətirdi.

– ABŞ və Avropa arasında bağlanan "15 faiz tarif anlaşması" əsas problemləri həll etmədi, əksinə, tərəflər arasında ticarət münasibətlərində asimmetriyanı qorudu.

– Avropa İttifaqı ABŞ-ın sərt addımlarına qarşı 26 milyard avro dəyərində cavab tədbirləri elan etməklə özünü müdafiə etmək məcburiyyətində qaldı.

– NATO daxilində ABŞ-ın müdafiə xərclərini 5 faizə qədər artırmaq tələbi Avropada həm siyasi, həm də iqtisadi narazılıq yaratdı və "strateji müstəqillik" çağırışlarını gücləndirdi.

– ABŞ administrasiyasının ideoloji yanaşmaları, o cümlədən sağçı-populist partiyalara dəstək verməsi Avropa daxilində siyasi qütbləşməni dərinləşdirdi və demokratik institutların sabitliyini şübhə altına aldı.

– Bütün bu amillər ABŞ-AB münasibətlərinin yaxın illərdə etibar və əməkdaşlıq üzərində deyil, qarşılıqlı ehtiyat və strateji rəqabət üzərində qurulacağını göstərir.

Abstract

Sustainable tourism has become a global imperative for achieving economic, environmental, and social balance, yet its adoption in emerging economies remains limited due to institutional, financial, and behavioral constraints. This study fills the gap by empirically identifying the critical success factors (CSFs) that influence the adoption of sustainable tourism practices (ASTP) in developing nations. Grounded in the Theory of Planned Behavior (TPB), the research integrates institutional, resource-based, and stakeholder perspectives to examine how Regulatory and Policy Support (RPS), Access to Green Financing (AGF), Stakeholder Awareness and Attitude (SAA), and Community Participation (CP) influence the adoption of sustainable tourism through Perceived Behavioral Control (PBC) as a mediating variable, and Economic Development Level (EDL) as a moderator. Using a quantitative cross-sectional survey of 334 tourism stakeholders across emerging economies, data were analyzed through Partial Least Squares Structural Equation Modeling (PLS-SEM). The findings reveal that RPS, AGF, SAA, and CP significantly enhance PBC, which in turn positively affects ASTP, while EDL does not moderate this relationship. Academically, the study extends TPB by incorporating contextual and institutional dimensions within the sustainable tourism framework. From a policy perspective, it

highlights the importance of coherent regulatory frameworks, accessible green financing, and active community engagement in promoting sustainable transitions. Socially, the study highlights the empowerment of local communities through participatory approaches to tourism development. The key limitation lies in the non-representative sample confined to specific emerging regions, suggesting the need for comparative cross-country analyses in future research. Future studies may also integrate cultural, technological, and environmental dynamics to develop a more holistic understanding of sustainability adoption in tourism.

Keywords: Sustainable tourism adoption, Emerging economies, Critical success factors, Theory of Planned Behavior (TPB)

INTRODUCTION

Tourism has become one of the fastest-growing industries in the world and an essential contributor to socioeconomic progress, particularly in emerging economies. It generates employment, foreign exchange earnings, and regional development opportunities (Telfer & Sharpley, 2015). However, the unregulated expansion of tourism often produces adverse impacts on the environment, culture, and social structures, including resource depletion, waste generation, and cultural erosion (Baker, 2024). Due to such repercussions, the idea of sustainable tourism has emerged as a priority in order to ensure both current and future generations can meet their own needs (Volgger et al., 2025). Sustainable tourism combines the three dimensions of development (economic, social and environmental) while securing that the growth of tourism brings benefits both to destinations' communities and to nature (Afaq et al., 2025).

The purpose of this paper is to highlight and empirically ascertain the key factors that drive sustainable tourism practice adoption in developing countries. In detail, the present study aims to investigate how Regulatory and Policy Support (RPS), Access to Green Financing (AGF), Stakeholder Awareness and Attitude (SAA) and Community Participation (CP) impact the adoption of sustainable tourism with Perceived Behavioral Control (PBC) as mediated power. In addition, it also intends to examine the role of Economic Development Level (EDL) in moderating the relationship between PBC and ASTP. Through the combination of institutional and behavioral viewpoints, this study aims to draw a holistic picture that can contribute to our understanding on how sustainable tourism adoption may be motivated as well as offering some practical implications for policy makers, tourism operators, and local communities to promote sustainability transitions within emerging economies.

Despite its significance worldwide, the adoption of sustainable tourism practices (ASTP) is limited and variable in emerging economies. However, advanced countries have mainstream sustainability guidelines; the basing of emerging destinations still poses difficulties on Click "Collaborate with our partners". including undeveloped legislation systems, lack of funds, weak institutional cooperation, and low community awareness (Karim et al., 2025b; Telfer & Sharpley, 2015). These barriers prevent the translation of sustainability policies into actionable practices. Therefore, identifying the critical success factors (CSFs) that foster sustainable tourism adoption is essential to achieving long-term development goals in these regions (Dangi & Jamal, 2016).

Regulatory and policy support serves as the foundation for sustainable tourism by providing legislative direction, environmental guidelines, and incentive mechanisms (Scott, 2011). Access to green financing ensures that tourism enterprises—especially small and medium-sized operators—have the financial capacity to invest in sustainable infrastructure and technologies (Gössling et al., 2020). Stakeholder awareness and attitude (SAA) determine how tourism operators, visitors, and local residents perceive and value sustainable practices (Luong, 2025). Finally, community involvement enhances social ownership and guarantees that tourism development aligns with local values and strengthens (Aref, 2011; Tosun, 2006). These are the ingredients together with the institutional and social environment in which sustainable tourism can thrive. This study is grounded in the theoretical framework of the TPB

(Ajzen, 1991), which suggests that intention and actual behaviors are determined by attitudes, subjective norms, and PBC—the perceived ease or difficulty with respect to performing a behavior. PBC in the context of the sustainable tourism industry includes stakeholders' beliefs regarding their capability to perform sustainably as well (Han, 2015). The four critical success factors are expected to enhance PBC, which, in turn, drives the adoption of sustainable tourism practices (ASTP). Furthermore, the model includes the Economic Development Level (EDL) as a moderating variable, as it is believed that these relationships may be conditioned by the level of development of a country (Telfer & Sharpley, 2015). More economically developed areas have better institutional capacities, more environmental literacy, and better access to finance to realize the positive effect of PBC on ASTP.

This study is important as it represents an inclusive perspective on the institutional and behavioral aspects related to the adoption of sustainable tourism in developing nations. Although sustainable tourism has been studied from policy and community perspectives before, little has integrated policies with communities to develop a comprehensive model covering the coexistence of structural drivers, individual attitudes as well as contextual boundary conditions (Afaq et al., 2025; Dangi & Jamal, 2016). This analysis will further be extended to the development of perception of control on perceived behavioral control and adoption intention, where it wears out its significance by examining different regulatory modes, financial access evenness, stakeholder attitude, and community participation. Policy implications: the results should help inform policymakers in shaping enabling regulatory and financial systems, practitioners on how to prepare the ground for stakeholder involvement, and local communities about ways in which they can contribute to transition dynamics.

Most of the current literature has examined sustainable tourism implementation in developed countries, but little attention has been directed to this topic under institutional frameworks and resource availability conditions that are different than those observed in developing economies (Gössling et al., 2020). Among developing countries, little empirical research has been conducted to examine inclusive models that include both internal (behavioral) and external (institutional) factors influencing the adoption of ST in this context. Furthermore, although the TPB has been broadly employed in individual-level environmental behavior (Han, 2015; Luong, 2025), its potential use for tourism organizations and communities in resource-limited contexts is under-researched. In addition, the moderating effect of Economic Development Level (EDL) on these relationships was rarely examined in previous empirical studies. This study fills these gaps by examining an integrated perspective, including mediating (PBC) and moderating (EDL) mechanisms.

To sum up, authors add to the stimulating debate about sustainable tourism by establishing and testing empirically a comprehensive model that incorporates institutional, behavioral, and structural views. The model expands on the Theory of Planned Behavior (TPB) and brings insights into how economic development contexts affect sustainability outcomes. Through identifying what are the key success factors in the adoption of ST in a developing country, this paper provides important policy implications for resilient, inclusive, and environmentally friendly tourism systems.

Literature Review and Hypothesis Development

Theoretical Background

Sustainable guiding has been identified as a strategic necessity in promoting long-term socio-economic and environmental sustainability, especially for developing countries depending on tourism as a major development booster (Roshid et al., 2025a; Waaje et al., 2025). This study is based on the theoretical framework of the Theory of Planned Behavior (TPB) (Ajzen, 1991), which suggests that behavior intentions and actions are driven by attitudes, subjective norms, and perceived behavioral control (PBC). In the context of sustainable tourism, TPB offers a strong structure to demonstrate how external and internal factors can impact tourism stakeholders' adoption of sustainability-oriented practices (Khatun et al., 2025; Han, 2015). Perceived behavioral cost (PBC) as a mediating construct mirrors the perceived

ease or difficulty of carrying out sustainable tourism based on available resources and opportunities (Lam & Hsu, 2004).

Although from an institutional aspect, RPS is a critical indicator for sustainable tourism implementation. According to Institutional Theory (Pathak et al., 2025), organizational activities are partly influenced by coercive pressures like policies and regulations imposed by the government. In developing countries, appropriate regulatory and policy practices act as drivers to enable the conditions for voluntary adoption of sustainability standards (Nunkoo et al., 2013; Roshid et al., 2025b). Weak governance and poor policy implementation, on the other hand, can undermine sustainable tourism initiatives (Afaq et al., 2025). Therefore, RPS can support perceived behavioral control by offering structural and legal backing to sustainability-related behavior. Sufficient access to Green Financing (AGF) also enhances the capacity of tourism companies to operate with sustainable measures. Following this, Resource-Based Theory (El Nemar et al., 2025) asserts that the availability of financial resources is a fundamental organizational capability that affects strategic behavior. Economic instruments, for example, green credit, eco-grants, and carbon funding, are used to promote and implement energy-efficient infrastructure and support sustainable business practices (Baker, 2024). In developing countries, where financial constraints are prevalent, AGF appears to influence PBC in a direct way by making resources attainable and mitigating perceived financial risks.

Another important factor is Stakeholder Awareness and Attitude (SAA). According to Pham et al. (2025), "Stakeholder Theory suggests that sustainable tourism requires the participation and favorable interaction of many sources such as local people, tourists, and decision-makers". Raising awareness and having a positive attitude toward sustainability encourages stakeholders to engage in and promote green programs (Luong, 2025). Community participation, rooted in the participatory development theory, emphasizes bottom-up involvement rather than top-down decision-making (Tosun, 2006). Active community participation can enhance sustainability by allowing community needs and values to be integrated into tourism practices and programs, thus reinforcing social legitimacy, as well as the practicality of implementation (Aref, 2011). The Economic Development Level (EDL) is suggested as a moderator that influences the dimensions of these relationships. According to Development Economics Theory, greater levels of economic development result in superior institutional capacity, infrastructure, and technological readiness for the delivery of sustainability (Hossain & Mollik, 2022; Mollik et al., 2024; Telfer & Sharpley, 2015). Thus, the effect of PBC on sustainable tourism adoption would be stronger in more mature LDCs.

Consequently, ASTP at the micro level has been depicted as: a Dependent variable encompassing how much destination participants have incorporated environmental, socio-cultural, and economic sustainability into their performance. By combining TPB, Institutional Theory, Resource-Based Theory, and Stakeholder Theory into a unified framework, the present model addresses the complexity of sustainable tourism practice adoption in developing countries.

Hypothesis Development

Regulatory and Policy Support (RPS) and Perceived Behavioral Control (PBC)

The support of regulation and policy is vital for the encouragement of sustainable tourism, particularly in developing countries where there are prevalent weak or inconsistent institutional frameworks. Clear regulatory framework, government support, and enforcement aid in reducing uncertainty for the adoption of ST (Chowdhury et al., 2025). As per the institutional theory, supportive policies lead to a facilitative environment, enhancing stakeholder confidence in their ability to take sustainable actions (Sun et al., 2025). Moreover, in the context of the Theory of Planned Behavior (TPB), when external factors such as regulatory facilitation exist, individuals' perceived behavioral control (PBC), that is, their perceived ease or difficulty of performing a behavior, tends to increase (Ajzen, 1991).

Strong policy system encourages entrepreneurs and local operators to implement sustainability initiatives (Nunkoo et al., 2013; Nguyen et al., 2024). When government agencies provide incentives such as subsidies, tax exemptions, or simplified licensing for sustainable practices, it boosts perceived behavioral control among tourism stakeholders. Therefore, it can be posited that:

H1: Regulatory and Policy Support (RPS) has a positive and significant effect on Perceived Behavioral Control (PBC).

Access to Green Financing (AGF) and Perceived Behavioral Control (PBC)

Access to financial capital is widely recognized as one of the most critical enablers for implementing sustainability initiatives. In developing regions, limited access to credit, high interest rates, and a lack of sustainability-oriented financial products often restrict the adoption of green practices (Baker, 2024). When tourism enterprises have access to green financing, including environmental funds, microloans, or sustainability-linked credit, they are more capable of investing in eco-friendly infrastructure and waste management systems.

According to the resource-based view (RBV), organizations with greater financial and resource capacity can more effectively translate intentions into sustainable actions (El Nemar et al., 2025). From a TPB perspective, financial accessibility enhances individuals' perceived control over behavior by lowering constraints and enabling the implementation of sustainable initiatives (Han & Kim, 2010). Empirical studies further support the fact that financial incentives and credit availability are positively related to the perceived capacity of stakeholders to act sustainably (Chen et al., 2025; Rahman et al., 2024).

H2: Access to Green Financing (AGF) positively influences Perceived Behavioral Control (PBC).

Stakeholder Awareness and Attitude (SAA) and Perceived Behavioral Control (PBC)

Sustainable tourism adoption heavily depends on stakeholders' level of awareness and their attitude toward sustainability. When tourism operators, employees, and community members understand the benefits of sustainable practices, they are more confident in their ability to execute them (Lee & Jan, 2019). The TPB asserts that both attitudes and perceived behavioral control are key determinants of behavioral intentions (Ajzen, 1991). A well-informed and positively inclined stakeholder group is likely to feel empowered and capable of performing sustainable actions.

Awareness campaigns, training programs, and educational initiatives improve knowledge about environmental management, reducing psychological barriers and enhancing control perceptions (Chen & Tung, 2014). For example, if stakeholders understand the propensities of energy-saving and eco-certification, their confidence in taking sustainability action would be stronger (Pham et al., 2025). Thus, influencing awareness of and attitude toward issues might significantly enhance PBC on sustainable tourism management.

H3: Stakeholder Awareness and Attitude (SAA) has a positive effect on Perceived Behavioral Control (PBC).

Community Participation (CP) and Perceived Behavioral Control (PBC)

Community-based participation is one of the basic pillars of sustainable tourism. The involvement of communities in decision-making and benefit sharing contributes to social legitimacy and empowerment (Byrd et al., 2008). Utilisation of the community in this manner consolidates sustainability measures with local knowledge and culture, reinforcing ownership and control for stakeholders.

Social support and shared participation could enhance perceived control by offering social resources and joint responsibility in TPB (Ajzen, 1991). Previous research has also proven that the closer communities are participating in tourism planning and resource management, the more control they feel

they have over tourism activities (Idziak et al., 2018; Rasoolimanesh & Jaafar, 2017), and therefore, their residents are more concerned about sustainability. Thus, community participation serves as a source of both motivation and facilitation, strengthening perceived behavioral control on the part of participants.

H4: Community Participation (CP) positively influences Perceived Behavioral Control (PBC).

Perceived Behavioral Control (PBC) and Adoption of Sustainable Tourism Practices (ASTP)

Perceived Behavioral Control (PBC) has a direct effect on the intention to adopt sustainable tourism behaviors. In Ajzen's (1991) Theory of Planned Behavior, PBC refers to people's beliefs about their capability of executing behavior under certain contingencies. They are more likely to commit such activities if they believe that they could use pro-environmental practices (which may include conservation of energy, recycling of waste, and protection of biodiversity) in the tourism industry (Singh & Bhardwaj, 2025).

The empirical evidence also indicates that PBC significantly predicts behavioral intention and actual behavior in the context of sustainability studies (Lam & Hsu, 2006; Han & Kim, 2010). In cases of tourism, those who feel greater control over their circumstances have a high propensity to carry out green certifications, eco-industry, and community-related projects (Zientara, Zamojska, 2018).

H5: Perceived Behavioral Control (PBC) positively influences the Adoption of Sustainable Tourism Practices (ASTP).

The Moderating Role of Economic Development Level (EDL)

Proposed Hypothesis: The influence of perceived behavioral control on the adoption of sustainable tourism practice may be contingent upon the economic development status of a region. In advanced economies, better infrastructure, institutions, and technological coverage facilitate stakeholders to convert perception of control into sustainable actions (Telfer & Sharpley, 2015). In contrast, in emerging or low-income contexts, despite high stakeholders' perceived control, the relationship may be weakened because of the shortage of resources and institutional constraints (Hall, 2019).

Accordingly, economic development serves as a contextual moderator further conditioning the effect of PBC on sustainable tourism adoption. PBC is more likely to generate behavior when populations are embedded in areas with a better economy.

H6: Economic Development Level (EDL) moderates the relationship between Perceived Behavioral Control (PBC) and the Adoption of Sustainable Tourism Practices (ASTP), such that the relationship is stronger in higher economic development contexts.

Figure 1: Theoretical Framework

METHODOLOGY

Research Design

The method used for the study was a Quantitative research design, which systematically investigated critical success factors influencing sustainable tourism adoption in emerging economies. The design was selected to measure the associations among variables and to test them statistically. Innovation perspective, the research model draws from technology, organization, and environment (TOE) theory (Cantisani, 2006) and the theory of planned behavior (TPB) (Ajzen, 1991), to provide an integrated view

on technological-, organizational-, and behavioral determinants of sustainability adoption. The main constructs of the study, Regulatory and Policy Support (RPS), Access to Green Financing (AGF), Stakeholder Awareness and Attitude (SAA), Community Participation (CP), Perceived Behavioral Control (PBC), and Economic Development Level (EDL), which predict the whole Adoption of Sustainable Tourism practices (ASTP).

Research Approach and Rationale

The cross-sectional survey approach was applied to one point in time data collection, aiming at the estimation of attitudes and behavioral patterns for sustainable tourism acceptance. This approach is suitable to elucidate interactions between variables and the perception by different stakeholders in a particular temporal social-economic context (Chapman et al., 2005).

Population and Sampling Technique

The study participants were actors engaged in tourism, which included tourism operators, government officials, hotel managers, travel agents, and representatives of local communities from developing countries. Due to difficulty in locating a comprehensive sampling frame, the researcher used convenience sampling, which is applicable in exploration and behavioral research (Etikan, 2016). In total, 334 valid questionnaires were retrieved from both online and offline studies by covering varied geographic areas, professional qualifications, and demographic attributes.

Research Instrument

An instrument, containing close-ended questions rated on a five-point Likert scale from strongly disagree (1) to strongly agree (5), was formulated. The constructs were derived from validated scales from extant literature of sustainable tourism and adoption in organizations (Arbolino et al., 2021; Nunkoo, 2017). A pilot study of 30 participants was carried out to maintain clarity and consistency during final data collection. Feedback from the pilot test was included to revise ambiguous or redundant items, thereby increasing content validity and internal consistency.

Data Collection Procedure

Information was obtained from online as well as field-based surveys, enabling participation from multiple quarters. Ethical issues of voluntary participation and the anonymity of respondents were followed.

Data Analysis Technique

The data obtained were processed with Partial Least Squares Structural Equation Modelling (PLS-SEM) using SmartPLS 4.0 software. This approach was selected as appropriate for complex models with several latent variables and small to medium-sized samples (Hair et al., 2019). The analysis involved two stages: 1. Measurement Model Assessment: Reliability, Convergent, and Discriminant Validity tested via Cronbach's alpha, Composite Reliability (CR), and Average Variance Extracted (AVE). 2. Structural model testing: that is, establishing the relationships postulated among the variables, and in addition, which success factors are most significant to sustainable tourism adoption. Adoption of PLS-

SEM ensured the study was sound and predictions accurate, facilitated theory development, and provided a clear direction for policy makers, tourism planners, and practitioners who seek to promote sustainable tourism in developing nations.

FINDINGS

Demographic analysis of **Table 1** is very useful for extracting key success factors for the implementation of ST in developing countries (Cambodia). The gender distribution (54.8% male and 45.2% female) also shows more balanced participation of individuals in sustainable tourism; hence, whenever planning policies or initiatives, consideration should be given to both genders as well. Higher education rates (46.1% completed a Bachelor's and 29.9% a Master's degree) mean educated people could be more knowledgeable about sustainability-related matters, and therefore more approachable in terms of adopting ST practices. The age distribution indicates that the biggest group, 36.8% of the respondents in the 26–35-year-old range, might tend to favor ST owing to a relatively high level of environmental awareness, occasionally found in younger generations. Most of the tourists belong to the 20,001–40,000 BDT and 40,001–60,000 BDT income group which indicates that middle-income groups can take the burden of eco-friendly tourism facilities. Furthermore, 35.9% of the respondents who have tourism working experience from 1 to 3 years suggest that a large proportion are newcomers in the tourism sector, and these are key stakeholders where action can take place at an early stage, allowing for their influence on adopting sustainable behaviors during their professional life. Overall, these demographic factors can inform sustainable tourism strategies targeted to meet the needs and profile of the target population in emerging economies.

Table 1: Demographic Analysis

Category	Sub-Category	Frequency (n)	Percentage
Gender	Male	183	54.8
	Female	151	45.2
Education Level	High School	47	14.1
	Bachelor	154	46.1
	Master	100	29.9
	PhD	33	9.9
Age Group	18–25 Years	89	26.6
	26–35 Years	123	36.8
	36–45 Years	75	22.5
	46–55 Years	29	8.7
	Above 56 Years	18	5.4
Monthly Income (BDT)	Below 20,000	60	18.0
	20,001–40,000	102	30.5
	40,001–60,000	78	23.4
	60,001–80,000	56	16.8

	Above 80,000	38	11.4
Tourism Experience	Less than 1 year	75	22.5
	1–3 years	120	35.9
	4–6 years	85	25.4
	7+ years	54	16.2

Table 2 presents the convergent validity and internal consistency reliability of different constructs on sustainable tourism adoption. All the constructs exhibit satisfactory convergent validity (all factor loadings > 0.7) with indicator loadings ranging between 0.722 and 0.869 across all the constructs considered as recommended by Hair et al. (2019). For example, AGF indicators (AGF1–AGF4) have the factor loadings λ values between 0.780 and 0.831, which indicates that the measurement model can effectively explain the meaning of green financing in sustainable tourism. Also, both ASTP and RPS have high factor loadings and confirm their relevant functions in relation to sustainable tourism adoption.

The reliability of the constructs is also supported by Composite Reliability (CR) and Cronbach's alpha, or internal consistency reliability. Values greater than the recommended cut-off point of 0.7 (e.g., CR for AGF =0.887, Cronbach's alpha for PBC = 0.814) indicate high internal consistency, which in turn indicates that the items measure their variables consistently (Shea & Fortna, 2011). These findings support the idea that the model is valid and reliable and provide a solid basis for evaluating critical success factors in sustainable tourism adoption.

Table 2: Convergent Validity and Internal Consistency Reliability

Construct	Indicators	Convergent Validity		Internal Consistency Reliability	
		Factor loading	AVE	Composite Reliability	Cronbach's alpha
AGF	AGF1	0.818	0.661	0.887	0.830
	AGF2	0.780			
	AGF3	0.831			
	AGF4	0.823			
ASTP	ASTP1	0.801	0.659	0.885	0.828
	ASTP2	0.826			
	ASTP3	0.838			
	ASTP4	0.782			
CP	CP1	0.837	0.653	0.882	0.827
	CP2	0.722			
	CP3	0.834			
	CP4	0.834			

	EDL1	0.806			
	EDL2	0.830			
EDL	EDL3	0.808	0.652	0.832	0.824
	EDL4	0.784

In **Figure 2,** the measurement model represents the links among different elements that influence the adoption of sustainable tourism in developing countries. Significant independent variables (RPS, AGF, and SAA) are those of key influence on PBC, with path coefficients ranging from 0.166 to 0.869. PBC has a substantial impact on the Adoption of Sustainable Tourism Practices (ASTP) (0.314), highlighting its important role in the adoption behavior. Although the direct effect of Economic Development Level (EDL) on ASTP (0.073) is weak, it indirectly impacts PBC, revealing the significance of behavioral control to break through obstacles. The model thus suggests RPS and PBC as important facilitators of the adoption of sustainable tourism.

Figure 2: Measurement Model

Table 3 shows the Heterotrait-Monotrait Ratio (HTMT) values for discriminant validity among constructs associated with sustainable tourism adoption in emerging economies. Values of HTMT less than the cut-off of 0.85 (or in some circumstances, 0.90) imply that constructs are discriminated against from each other as proposed by Henseler et al. (2015). The HTMT values for AGF, ASTP, CP, EDL, PBC, RPS, and SAA are all less than the threshold in this case, indicating good discriminant validity. For example, the HTMT value of AGF and ASTP is 0.113, and by this, we can say that Access to Green Financing (AGF) and Adoption of Sustainable Tourism Practices (ASTP) are not the same construct. The correlation of PBC and EDL × PBC is also low (0.108), indicating that the interaction factor is hardly associated with other constructs in the model. These findings validate the unique impact of RPS, CP, and EDL on implementing sustainable tourism practices, as revealed from the questionnaire survey,

which verifies the solid results for investigating CSFs in emerging markets (Fornell & Larcker, 1981; Henseler et al., 2015).

Table 3: Heterotrait-Monotrait Ratio (HTMT) Analysis

	AGF	ASTP	CP	EDL	PBC	RPS	SAA	EDL x PBC
AGF								
ASTP	**0.113**							
CP	**0.148**	**0.086**						
EDL	**0.103**	**0.217**	**0.053**					
PBC	**0.373**	**0.506**	**0.335**	**0.075**				
RPS	**0.232**	**0.155**	**0.180**	**0.045**	**0.477**			
SAA	**0.154**	**0.206**	**0.269**	**0.051**	**0.440**	**0.224**		
EDL x PBC	**0.141**	**0.032**	**0.027**	**0.060**	**0.108**	**0.040**	**0.067**	

Source: Authors' Work

The discriminant validity of the constructs is evaluated by the Fornell-Larcker Criterion, which compares the square root of average variance extracted (AVE) with other latent construct correlations as given in **Table 4**. According to Fornell and Larcker (1981), the AVE score of each construct should be greater than the correlations between them to maintain discriminant validity. For example, the AVE of AGF is 0.813, which is greater than its correlations with other variables (e.g., ASTP: 0.085 and CP: 0.131), indicating discriminant validity for this measure. Political advertising attitudes (PAA) also has an AVE of 0.801 and coefficients less than the square root of its AVE on all other constructs. This shows that PBC is discriminated from constructs such as Regulatory & Policy Support and Community Participation. The findings also indicate that SAA (0.795) is clearly separable, thus confirming the discriminant validity of each construct in measuring sustainable tourism adoption in emerging economies. These results support the construct validity of the model (Fornell & Larcker, 1981).

Table 4: Fornell Lacker Creation

	AGF	**ASTP**	**CP**	**EDL**	**PBC**	**RPS**	**SAA**
AGF	0.813						
ASTP	0.085	0.812					
CP	0.131	0.043	0.808				
EDL	-0.083	0.185	-0.019	0.807			
PBC	0.313	0.418	0.291	0.050	0.801		
RPS	0.196	0.131	0.151	0.014	0.395	0.814	
SAA	0.127	0.171	0.225	0.000	0.364	0.188	0.795

Source: Authors' Work

The structural model (**Figure 3**) has the predictors-- Regulatory and Policy Support (RPS), Access to Green Financing (AGF), Stakeholder Awareness and Attitude SAA, Community Participation (CP) explaining 31.4% variance in Perceived Behavioral Control (PBC), whereas PBC along with Economic Development Level (EDL) explains 20.6% variance in Adoption of Sustainable Tourism Practices (ASTP). But the strength of these chaining linkages (path coefficients) is not very strong or significant because, in this study, they do not have a direct impact on perceived control and sustainable practice adoption.

RPS and AGF have weak positive relationships with PBC, meaning that encouraging policies and financial availability are present, but do not significantly contribute confidence of stakeholders to adopt sustainable tourism. SAA and CP, as well, have little impact, indicating that mere knowledge of and interest in a cybersecurity career is not enough to develop perceived behavioral control. PBC's direct impact on ASTP is also low, which suggests that stakeholders may experience structural or financial obstacles to implementation even when they believe themselves able.

EDL has a larger moderating influence (β = 0.173) on the PBC–ASTP relationship, denoting that economic context only slightly bolsters the PBC effect on ASTP; stakeholders in more economically developed or MRDD regions are somewhat more likely to act sustainably given perceived control. In sum, the findings indicate that both institutional support and financial and social support are required to guide a positive climate for inducing the needed changes surrounding the acceptance of sustainable tourism practices in emerging economies.

Figure 3: Structural Model

Results: The path coefficients and statistical testing of the hypotheses associated with sustainable tourism adoption in emerging economies are provided in **Table 5**. Hypotheses are tested using the T-statistic and P-value, which provide information on the support of postulated relationships.

H1 (RPS→PBC): The effect of Regulatory & Policy Support (RPS) on Perceived Behavioral Control (PBC). The support for this hypothesis is strong, with a path coefficient value of 0.284 (T = 6.562, P = 0.000) that is statistically significant. This suggests that effective policies and regulations play a key role in empowering stakeholders to implement sustainable tourism practices, consistent with Ajzen's (1991) Theory of Planned Behavior, where external factors such as regulation influence perceived control. H2 (AGF → PBC) indicates that AGF has a positive impact on PBC. The 0.204 path coefficient (T = 4.706, P = 0.000) indeed indicates that green financing is a salient facilitator for stakeholders to pursue the implementation of sustainable tourism practices. Consistent with Kharb et al., this evidence indicated that access to financial resources can be the old power required to achieve sustainability in emerging economies (Kharb et al., 2025). H3 (SAA → PBC) emphasizes that Stakeholder Awareness & Attitude (SAA), is, in fact, significant on PBC. The results reveal that awareness and positive attitudes on sustainability contribute in a highly significant manner to improving perceived control toward adopting sustainable tourism practices (path coefficient = 0.248, T = 5.667, P = 0.000). H4 (CP → PBC) posits that CP affects HBC. Positive path coefficient of 0.165 (T = 3.440, P = 0.001) indicates that the active participation of communities in tourism decision making makes their belief in controlling sustainability practices stronger, and the latter is a crucial factor to induce sustainability. H5 (PBC → ASTP) examines the association between PBC and the Adoption of Sustainable Tourism Practices (ASTP). The strong path coefficient of 0.416 (T = 8.959, P = 0.000) confirms the prediction that when stakeholders perceive that to have more control (PBC), they are more likely to engage in sustainable tourism practices.

Finally, H6 (EDL x PBC → ASTP) investigates if Economic Development Level (EDL) moderates the relationship between PBC and ASTP. The path coefficient 0.073 (T = 1.362, P = 0.173) does not qualify

as statistically significant, which means "EDL" cannot moderate the relationship between "PBC" and "ASTP". This result seems to indicate that, contrary to what one might think, economic structures might not have as much influence as regulatory and monetary or community in influencing the implementation of measures for sustainable development.

Table 5: Path Coefficient

No	Hypothesis	Original sample	Sample mean	Standard deviation	T statistics	P values	Decision
H1	RPS -> PBC	0.284	0.287	0.043	6.562	0.000	Supported
H2	AGF -> PBC	0.204	0.205	0.043	4.706	0.000	Supported
H3	SAA -> PBC	0.248	0.249	0.044	5.667	0.000	Supported
H4	CP -> PBC	0.165	0.168	0.048	3.440	0.001	Supported
H5	PBC -> ASTP	0.416	0.419	0.046	8.959	0.000	Supported
H6	EDL x PBC -> ASTP	0.073	0.072	0.053	1.362	0.173	Not Supported

DISCUSSIONS

The present research draws attention to the determinants that may influence sustainable tourism adoption among emerging market countries, value concentrating on the Roles of Regulatory & Policy Support (RPS), Access to Green Financing (AGF), Stakeholder Awareness & Attitude (SAA), Community Participation (CP), and Perceived Behavioral Control (PBC). The findings indicate that these three variables have strong potential in promoting the adoption of sustainable tourism by stakeholders, with Economic Development Level (EDL) not moderating the relationship.

RPS has a significant impact on PBC, indicating that stakeholders can engage in sustainable tourism under regulatory conditions effectively. This is consistent with the theoretical framework of Ajzen's (1991) Theory of Planned Behavior and lends support to policy support as a critical influence on perceptions of control. It is worth noting that the role of policies in promoting sustainability was also underscored in previous research (Gössling et al., 2009; Buckley, 2012). Also, AGF has a positive influence on PBC, 17 showing that the availability of financial resources promotes ST behavior. Kharb et al. (2025), in addition to considering that green finance is key in removing financial obstacles, allow players to invest in environmentally friendly investments. The positive influence of SAA on PBC supports the argument that ST requires education and awareness. Stakeholder awareness of the advantages of sustainability is greater; their perceived levels of control increase (Mayer & Frantz, 2004; Rasoolimanesh et al., 2025). PBC is greatly influenced by community participation (CP). This result has implications for the role of community participation in CBT and is consistent with the notion that when individuals participate in decision-making, they are more likely to adopt sustainable behavior. Active involvement of local people leads to a sense of ownership and accountability, as demonstrated in the works of Talukder & Khan (2025). The association between PBC and ASTP suggests that those stakeholders who feel as if they are in control and can reliably implement and use ASTPs do so. This is consistent with Ajzen (1991), who claims that perceived control has a direct impact on behavior. Nevertheless, EDL does not attentively attain the interaction effect of PBC and ASTP either. This indicates that economic development is not an adequate determinant for engaging in sustainable tourism. Rather, it is regulation frameworks, public engagement, and financial accessibility that are determining

the development of sustainability: similar findings to Gössling et al. (2009) and Karim et al. (2025a), who support the idea that economic development alone is insufficient for sustainable tourism.

In conclusion, the research highlights that RPS, AGF, SAA, and CP play crucial roles in facilitating sustainable tourism uptake in developing nations. Such factors enable the environment franchise and stakeholders to feel empowered towards sustainable practices. Economic development has something to do with it, but it is not the only factor for sustainability. Politicians should work to build enabling conditions through regulation, finance, capacity building, and community engagement for sustainable tourism uptake.

Theoretical and Practical Implications

Theoretical Implications

This research builds on the Theory of Planned Behavior (TPB) and uses it in the context of sustainable tourism in developing countries. The results also demonstrate the influence of RPS, AGF, and SAA on PBC determining ACTP. This evinces the continuing relevance of TPB for understanding sustainable tourism practices, especially within the context of specific socio-political challenges (Ajzen, 1991; Perugini & Bagozzi, 2001). In addition, the research also contests that Economic Development Level (EDL) is a key factor of sustainability adoption. While economics is a consideration, industry development was beginner; however, the model reveals that RPS and community participation, together with financial access, are most salient to implementing sustainability practices (Gössling et al., 2009; Buckley, 2012). This enriches the literature in that economic growth alone is not sufficient to attain sustainability; conducive regulations and a slick financial system are needed (Kharb et al., 2025). In addition, the study upholds Stakeholder Theory (Pham et al., 2025) that community participation is crucial in shaping stakeholders' attitudes and behaviors toward sustainability, particularly tourism development.

Practical Implications

For public policy makers, the results suggest that regulatory & policy support (RPS) and access to green financing (AGF) are critical factors in encouraging sustainable tourism. Transparent policy and financial aid can encourage stakeholders to put investment in ecologically friendly actions (Gössling et al., 2009). Tourism authorities need to concentrate on stakeholder education and public participation, which can lead to the strengthening of PBC as well as long-term sustainability (Mayer & Frantz, 2004; Talukder & Khan, 2025). The research also demonstrates that economic growth without other means is not sustainable. Rather, financial access and community involvement are the main challenges to sustainable practice uptake (Buckley 2012). These are the ones that must be given priority by both policymakers and tourism professionals to facilitate the movement of the emerging economies towards sustainable tourism.

Limitations and Scope for Future Research

This analysis, despite its qualities, is not without limitations. An important limitation of the sample is that it may not represent the general population of emerging market economies, since it was drawn based on a specific demographic characteristic. For example, the majority are of the young age group (26-35 years) and educated (with 46.1% with a bachelor's degree) and are from mid-income strata. This may not be the case for other age groups or income levels, and these factors could affect the adoption of sustainable tourism. Subsequent studies may strive for a more representative sample to investigate the potential impact of different demographic variables, including age, education, and income, on attitudes and behavior towards sustainable tourism. Moreover, the research concentrated on a few items (RPS, AGF, SAA, CP, PBC, and EDL), ignoring other factors that might eventually affect sustainable tourism

adoption levels, for instance, cultural context or technology advances, or tourism trends of the market (Gössling et al., 2009). Future research might incorporate these variables into the model and thus provide deeper insights into sustainable tourism adoption. In addition, this research is context-related, so its findings may only be applicable to the specific region being studied. Comparative work amongst a range of emerging markets with unique cultural and economic realities could improve the transferability of the results (Buckley, 2012). Moreover, although economic development did not moderate the relationship between PBC and ASTP to a significant degree, future studies may need to explore interplays of economic, culture, and environment in building an extended sustainable tourism adoption model. Furthermore, Uddin et al. (2025), Karim et al. (2024), and Dhar et al. (2025) have found that the circular economy can be a significant factor in promoting sustainability in tourism. Other relevant factors such as policy improvement (Islam et al., 2025), financial subsidies (Karim et al., 2025c; Kuri et al., 2025), can be considered to strengthen the tourism sustainability. Hence, future research on tourism sustainability can consider them.

Conclusion

In examining the success factors of sustainable tourism adoption in emerging economies, this research adds to the understanding of the ways that factors are linked with sustainable tourism adoption. Further, they underscore the significance of Regulatory & Policy Support (RPS), Access to Green Financing (AGF), Stakeholder Awareness & Attitude (SAA), and Community Participation (CP), enhancing Perceived Behavioral Control (PBC), which subsequently promotes Adoption of Sustainable Tourism Practices (ASTP). The findings emphasize the significance of RPS as a mechanism to enable stakeholders and thus underline the importance of policy structures that guide and facilitate sustainable practices. Moreover, it was discovered that AGF also had a strong and significant impact on PBC to demonstrate the importance of financial availability for such sustainability programs implementation. The positive correlation of SAA with PBC indicated that sustainability consciousness and attitude are fundamental to the formation of control in sustainable behaviors. CP also has a positive influence on PBC, indicating the significance of community-driven sustainable tourism practices. It is interesting to observe that the variable EDL was expected to interact with the association between PBC and ASTP, although it was not found no significant interaction coefficients were found, which indicates that economic development alone cannot be enough for adopting sustainable practices. Rather, enabling policies and access to finance and the community seem to be contributing more significantly to surmounting obstacles for sustainable tourism in emerging economies.

This study adds to the small body of literature by encapsulating several elements in a model for understanding sustainable tourism adoption. The results inform policymakers, tourism authorities, and local communities to focus on creating legal frameworks, access to finance, and education programmes for the long-term sustainability of the emerging countries' tourism industry. Further investigation into other factors and differences across regions would be interesting for future studies.

Özet

Enerji tüketimi ile ekonomik büyüme arasındaki ilişki, iktisat literatüründe uzun süredir tartışılan, karmaşık ve çok boyutlu bir konudur. Enerji, üretim faktörleri arasında önemli bir yere sahiptir ve ekonomik faaliyetlerin sürdürülebilmesi için temel bir girdidir. Bu nedenle, bir ülkenin enerji tüketim düzeyi genellikle ekonomik kalkınma, sanayileşme ve teknolojik ilerleme süreçlerinin bir göstergesi olarak kabul edilmektedir. İslam İşbirliği Teşkilatı (İİT) üyesi ülkeler, enerji kaynakları, ekonomik büyüme düzeyleri ve kalkınma stratejileri bakımından önemli farklılıklar göstermektedir. İİT ülkeleri hem enerji açısından zengin üretici ekonomileri hem de enerji ithalatına bağımlı ülkeleri kapsamaktadır. Bu çeşitlilik, enerji tüketimi ile ekonomik büyüme arasındaki ilişkinin farklı ekonomik yapı ve kalkınma düzeylerine sahip ülkelerde nasıl değiştiğini analiz etmek için elverişli bir çerçeve sunmaktadır. Bu çalışma da, İİT üyesi ülkelerde 1992-2022 dönemi için toplam ve kişi başına düşen enerji tüketimi, gayri safi yurtiçi hasıla (GSYİH) ve küreselleşme verilerini ifade eden ekonomik, politik ve kültürel küreselleşme kullanılmaktadır. Çalışma sonucuna göre İran ve Kuveyt için enerji tüketiminden ekonomik büyümeye doğru nedensellik ilişkisi varken, ekonomik büyümeden enerji tüketimine doğru Suudi Arabistan, Türkmenistan ve Fas'ta olduğu görülmektedir.

Anahtar kelimeler: Enerji Tüketimi, Ekonomik Büyüme, İİT Ülkeleri

THE RELATIONSHIP BETWEEN ENERGY CONSUMPTION AND ECONOMIC GROWTH IN OIC MEMBER COUNTRIES

Abstract

The relationship between energy consumption and economic growth has long been a debated, complex, and multidimensional topic in the economics literature. Energy is a crucial production factor and a fundamental input required for sustaining economic activities. Therefore, a country's level of energy consumption is often regarded as an indicator of its economic development, industrialization, and technological progress. Member countries of the Organisation of Islamic Cooperation (OIC) exhibit significant differences in terms of energy resources, economic growth levels, and development strategies. The OIC includes both energy-rich producer economies and countries that are highly dependent on energy imports. This diversity provides a suitable framework for analyzing how the relationship between energy consumption and economic growth varies across countries with different economic structures and development levels. In this study, total and per capita energy consumption, gross domestic product (GDP), and globalization indicators economic, political, and cultural globalization are employed for OIC member countries over the period 1992-2022. According to the findings, there is a causal relationship running from energy consumption to economic growth in Iran

and Kuwait, while a causal relationship from economic growth to energy consumption is observed in Saudi Arabia, Turkmenistan, and Morocco.

Keywords: Energy Consumption, Economic Growth, OIC Countries

GİRİŞ

Sanayi Devrimi'nin başlangıcından itibaren enerji kaynakları giderek artan bir hızla kullanılmaya başlanmış ve bu süreçte enerjiye verilen önem zamanla daha da artmıştır (Pirlogea ve Cicea, 2012). Yıllar boyunca nüfus artışı ve sanayileşmenin hız kazanması, enerjiye olan talebi önemli ölçüde yükseltmiştir. Enerji, üretim, ulaşım ve hizmet sektörleri gibi ekonominin tüm alanlarında temel bir girdi olduğundan, ekonomik faaliyetlerin genişlemesi enerji talebini de beraberinde artırmaktadır. Bu bağlamda enerji kullanımı, ekonomik dengenin belirleyici unsurlarından biri olarak değerlendirilmektedir. Enerji tüketimindeki artış, üretim kapasitesinin genişlemesini ve yaşam standartlarının iyileşmesini desteklerken, aynı zamanda ekonomik büyümenin sürdürülebilirliğine de katkı sağlamaktadır.

Enerji ve ekonomik büyüme arasındaki ilişkinin yönü her zaman aynı değildir. Bazı ekonomilerde enerji tüketimi büyümeyi teşvik ederken, bazı durumlarda ekonomik büyüme enerji talebini artırmaktadır. Bu durum, ülkelerin gelişmişlik düzeyine, enerji kaynaklarının yapısına ve uygulanan politikaların niteliğine göre farklılık gösterebilir. Gelişmiş ülkelerde yüksek teknolojili üretim yapısı ve enerji verimliliği politikaları sayesinde ekonomik büyüme, enerji tüketimindeki artıştan görece daha az etkilenmektedir. Buna karşın, gelişmekte olan ülkelerde sanayileşme süreci ve hızlı kentleşme, enerji talebinin ekonomik büyümeyle birlikte artmasına yol açmaktadır. Enerji tüketimi ve ekonomik büyüme arasındaki bu dinamik ilişkiyi daha iyi anlamak için, birkaç sosyoekonomik değişken dikkate alınmalıdır. Onların önünde, kişi başına gelir, bireylerin ekonomik refahını yansıtır ve enerji tüketimini doğrudan etkiler. Gelir arttıkça, tüketim alışkanlıkları değişir ve enerji talebi artar (Chen vd., 2007). Son iki yüzyılda dünya, ekonomik, sosyal ve politik alanlarda artan entegrasyon girişimlerinin etkisiyle, uluslararası ticaretin, kültürel etkileşimlerin ve siyasal iş birliklerinin benzeri görülmemiş ölçüde yoğunlaştığı bir döneme girmiştir. Bu gelişmeler, küreselleşmenin ekonomik büyüme ve kalkınma üzerindeki etkisini literatürde önemli bir araştırma alanı haline getirmiştir. Dolayısıyla, küreselleşme çerçevesinde enerji tüketimi ile ekonomik büyüme arasındaki ilişkinin analiz edilmesi ve bu iki değişken arasındaki etkileşim kanallarının açıklığa kavuşturulması büyük önem taşımaktadır.

Bu bağlamda, gelişmekte olan ekonomiler grubunda yer alan ve enerji piyasasında stratejik bir güç oluşturan İslam İşbirliği Teşkilatı (İİT) üyesi ülkelerinde, enerji tüketimi ve ekonomik düzey arasında istikrarlı ve sürdürülebilir bir denge sağlanıp sağlanamadığı hususu belirsizliğini korumaktadır. Dünya nüfusunun yaklaşık %25–26'sını barındıran bu ülkeler, petrol ve doğalgaz gibi yenilenemeyen enerji kaynaklarının rezervlerinin büyük bir kısmına sahiptir. Ancak bu ülkeler arasında enerji kaynaklarının dağılımı homojen değildir; bazı üyeler enerji ihracatçısı konumundayken, diğerleri enerji ithalatçısı durumundadır. Bu farklılık, İİT ülkeleri içinde enerji ve büyüme ilişkisinin yönünü ve gücünü farklı biçimlerde ortaya çıkarmaktadır. Bu çalışmanın temel amacı, 1992-2022 döneminde seçilmiş İİT üyesi ülkelerde kişi başına birincil enerji tüketimi ile ekonomik büyüme arasındaki ilişkiyi araştırmaktır. Veri mevcudiyeti ve tüm üyeler arasındaki tutarlılık sınırlamaları nedeniyle analiz, çalışma dönemi boyunca güvenilir ve sürekli verilerin elde edilebildiği 16 ülkeye odaklanmaktadır. Aynı zamanda, İİT (İslam İşbirliği Teşkilatı) ülkeleri hakkında bu tür bir çalışmanın bulunmaması, bu çalışmanın özgün değerini vurgulamaktadır. Giriş bölümünün ardından, çalışma ilgili literatürü gözden geçirir ve sonraki bölümlerde metodoloji ve yöntemler tartışılır, modelle ilgili sonuçlar sunulur. Son bölümde, çalışmanın etkinliğini vurgulamayı amaçlayan bir tartışma ve sonuçlar yer almaktadır.

1.LİTERATÜR TARAMASI

Enerji ve ekonomik büyüme arasındaki ilişki üzerine yapılan araştırmalar, bu ilişkinin hem teorik hem de ampirik açıdan farklı yönlerini ortaya koymuştur. Bazı çalışmalar, enerji tüketiminin ekonomik büyümenin temel belirleyicilerinden biri olduğunu ve enerji arzındaki artışın üretim kapasitesini genişlettiğini savunmaktadır. Diğer taraftan bazı araştırmalar ise ekonomik büyümenin enerji talebini artırdığı, dolayısıyla nedenselliğin büyümeden enerjiye doğru işlediği görüşünü desteklemektedir. Ayrıca bazı ülkelerde enerji ve büyüme arasında çift yönlü bir ilişki bulunduğu, bazılarında ise herhangi bir nedensellik ilişkisinin olmadığı sonucuna ulaşılmıştır. İncelenen literatürde enerji tüketimi, küreselleşme ve ekonomik büyüme değişkenlerini içeren ve farklı modelleme yaklaşımlarına dayanan çok sayıda ampirik çalışma bulunmaktadır. Bu çalışmalar genel olarak enerji tüketimi ile ekonomik büyüme, küreselleşme ile ekonomik büyüme ve enerji tüketimi ilişkileri temelinde ele alınmakta olup, araştırmaların sonuçları kullanılan yöntem ve ülke örneklerine göre farklılık göstermektedir. Çetin ve Seker (2012) çalışmada, Johansen-Juselius ve Stock-Watson eşbütünleşme testleri ile Toda-Yamamoto nedensellik testleri kullanılarak, enerji tüketimi ile ekonomik büyüme arasındaki ilişki Türkiye ekonomisi bağlamında 1970-2009 periyodunda incelenmiştir. Toda-Yamamoto test sonuçları enerji tüketimi ile ekonomik büyüme arasında her hangi bir nedensellik ilişkisinin olmadığını göstermektedir ve enerji darlığının ekonomik büyümeyi negatif olarak etkiliyebileceğini ifade etmektedir. Gabbasa ve arkadaşları (2013) tarafından gerçekleştirilen araştırmada, İslam İşbirliği Teşkilatı (İİT) üyesi ülkelerde enerji tüketimindeki artışın ekonomik büyüme ve nüfus artışıyla doğrudan ilişkili olduğu ortaya konmuştur. Çalışma, enerji kullanımı ile gayri safi yurt içi hasıla (GSYİH) gibi ekonomik kalkınma göstergeleri arasındaki ilişkinin anlaşılmasının, söz konusu ülkelerde ulusal enerji kullanımının önemini kavramak açısından büyük önem taşıdığını vurgulamaktadır.

Bakirtaş ve Çetin (2016) tarafından yapılan çalışmada, 1992-2010 dönemi için G-20 üyesi 18 ülke kapsamında, kişi başına düşen reel GSYİH ile kişi başına düşen yenilenebilir elektrik enerjisi tüketimi arasındaki uzun dönemli ilişkinin EKC hipotezi çerçevesinde incelennmiştir. Araştırmada panel veri analiz yöntemlerinden yararlanılmıştır. Pedroni panel eşbütünleşme test sonuçları, kişi başına düşen yenilenebilir enerji tüketimi ile kişi başına düşen reel GSYİH arasında uzun dönemde anlamlı bir ilişki bulunduğunu göstermektedir. Doğan ve Diğer (2016) çalışmada, Augmented Dickey Fuller (ADF) ve PP birim kök analizi yöntemiyle Hindistan örnekleminde zaman serisi analizi yapılmıştır. Yapılan analiz sonucunda ekonomik büyümeden enerji tüketimine doğru bir nedensellik ilişkisi bulunmuşken enerji tüketiminden ekonomik büyümeye doğru bir nedensellik ilişkisi bulunamamıştır. Doğan ve Değer (2016), 2000–2012 döneminde BRIC ülkelerinde toplam enerji tüketimi, ekonomik büyüme ve küreselleşme arasındaki nedensellik ve eşbütünleşme ilişkilerini incelemiştir. Çalışmada Pedroni ve Kao eşbütünleşme testleri ile panel Granger nedensellik analizi kullanılmıştır. Sonuçlar, değişkenler arasında uzun dönemli bir eşbütünleşme ilişkisinin var olduğunu göstermiştir. Anwar, Arshed ve Kousar (2017) tarafından gerçekleştirilen çalışmada, 1990–2014 dönemi için 29 İİT ülkesine ait panel veriler kullanılarak çok değişkenli bir hata düzeltme modeli oluşturulmuş ve analizde sermaye, işgücü ile petrol fiyatları değişkenleri de dikkate alınmıştır. Pedroni panel eşbütünleşme testlerinden elde edilen bulgular, reel GSYİH, yenilenebilir enerji tüketimi, reel sabit sermaye oluşumu, işgücü ve petrol fiyatları arasında uzun dönemli bir ilişki bulunduğunu göstermektedir. Panel hata düzeltme modelinden elde edilen sonuçlar ise yenilenebilir enerji tüketiminden ekonomik büyümeye doğru tek yönlü bir nedensellik ilişkisi olduğunu ortaya koymuştur. Alper (2018), Türkiye için 1970-2015 dönemini kapsayan çalışmasında küreselleşmenin alt bileşenleri, kişi başına düşen gayrisafi yurt içi hasıla ve kent nüfusunun kişi başına enerji tüketimi üzerindeki uzun dönemli etkilerini incelemiştir. Uzun dönem katsayılarını tahmin etmek amacıyla DOLS tahmin yöntemi kullanılmıştır. Elde edilen sonuçlara göre, tüm modellerde kişi başına GSYİH'nın kişi başına enerji talebi üzerinde pozitif bir etkisinin olduğu tespit edilmiştir.

Akdağ ve İskenderoğlu (2018) çalışmada, Avrupa Birliği üyesi 14 ülkenin 2007-2016 tarihleri arasında yenilenemeyen enerji tüketimi, yenilenebilir enerji tüketimi ve nükleer enerji tüketimi ile GSYH

arasındaki ilişki, dinamik panel analiz yöntemi ile test edilmiştir. Analiz sonucunda yenilenebilir ve yenilenemeyen enerji tüketiminin GSYH üzerinde anlamlı ve pozitif etkisinin olduğu tespit edilmiştir. Bucak (2022), çalışmasında küreselleşmenin ekonomik karmaşıklık üzerindeki etkisini analiz etmek amacıyla BRICS-T ülkelerine ait 1995-2018 dönemi verilerini kullanarak bir panel veri analizi gerçekleştirmiştir. Elde edilen bulgular, seriler arasında uzun dönemli bir eşbütünleşme ilişkisinin mevcut olduğunu göstermektedir. Emek ve Polat (2022), 1990-2018 döneminde 15 yükselen piyasa ekonomisini kapsayan çalışmalarında enerji tüketimi, küreselleşme ve ekonomik büyüme arasındaki nedensellik ilişkisini analiz etmiştir. Modelde ekonomik büyüme göstergesi olarak kişi başına reel GSYH, küreselleşme düzeyini temsilen ekonomik, sosyal ve siyasal küreselleşme endeksleri ile toplam sabit sermaye ve işgücü değişkenleri kullanılmıştır. Dumitrescu ve Hurlin nedensellik testi sonuçlarına göre, yenilenebilir ve yenilenemez enerji tüketimi ile ekonomik büyüme arasında çift yönlü nedensellik ilişkisi bulunduğu belirlenmiştir. Zhang vd. (2023), 1975–2020 döneminde altı Asya yükselen ekonomisinde yenilenebilir enerji tüketimi ile ekonomik büyüme arasındaki ilişki üzerinde sosyal, ekonomik ve politik küreselleşmenin etkilerini incelemiştir. Çalışmada CS-ARDL yöntemi kullanılmış ve yenilenebilir enerji tüketiminin uzun dönemde ekonomik büyümeyi önemli ölçüde artırdığı tespit edilmiştir. Bulgulara göre, ekonomik ve politik küreselleşme büyümeyi sınırlarken, sosyal küreselleşme büyümeyi desteklemektedir. Chen vd. (2025), 1990–2022 döneminde G7 ülkelerinde yenilenebilir enerji tüketimi, Ar-Ge harcamaları, küreselleşme, enerji yoğunluğu ve GSYİH arasındaki ilişkiyi CO_2 emisyonları bağlamında incelemiştir. Moment Quantile Regression (MMQR) yöntemi kullanılarak yürütülen çalışma, yenilenebilir enerji yatırımlarının çevresel sürdürülebilirlikteki belirleyici rolünü ve küreselleşmenin çevresel etkilerinin dikkatle yönetilmesi gerektiğini ortaya koymuştur.

2.VERİ SETİ VE YÖNTEM

Bu çalışmada, 1992–2022 dönemi için 16 İslam İşbirliği Teşkilatı (İİT) üyesi ülkeye ait yıllık veriler kullanılarak, kişi başına düşen birincil enerji tüketimi ile ekonomik büyüme arasındaki ilişkinin yanı sıra küreselleşme ile olan nedensellik ilişkisi incelenmiştir. Ülkelerin seçilme nedeni ve verilerin 1992 yılından itibaren başlatılmasının sebebi, ilgili göstergelere ait verilerin bu yıldan itibaren düzenli olarak mevcut olmasıdır. Tahmin edilen modelde ekonomik büyüme bağımlı değişken olarak kullanılmıştır. Ekonomik büyüme değişkeni (lnGSYİH), Dünya Bankası verilerinden; kişi başına düşen birincil enerji tüketimi (lnET) ise gigajoule cinsinden Enerji Enstitüsü istatistiklerinden elde edilmiştir. Küreselleşme değişkenleri, ticaret, politik ve kültürel boyutları kapsayan (de facto) genel küreselleşme endeksi olarak alınmış ve veriler KOF Küreselleşme Endeksi'nden temin edilmiştir. Tablo 1, çalışmada kullanılan tüm değişkenlere ait tanımları, ölçüm birimlerini ve veri kaynaklarını kapsamaktadır.

Tablo 1: Değişkenlere Dair Bilgiler

Tahmin süreci birden fazla aşamadan oluşmaktadır. İlk olarak, elde edilen veriler tutarlılığı sağlamak ve yorumlanabilirliği artırmak amacıyla doğal logaritmik forma dönüştürülmüştür. Daha sonra, panel testlerine geçmeden önce veri setinin temel özelliklerini özetlemek ve genel bir görünüm sunmak için betimleyici istatistiklerden yararlanılmıştır. Model ise aşağıdaki yapıya göre oluşturulmuştur.

$$lnGSY\dot{I}H_{it} = \beta_0 + \beta_1 lnET_{it} + \beta_2 Ticaret_{it} + \beta_3 Politik_{it} + \beta_4 Kültürel_{it} + \varepsilon_{it} \quad (1)$$

Burada; $\beta_0 \dots \dots \beta_1$ değişkenlerin katsayılarını ve ε_{it} ise hata terimini göstermektedir.

Tablo 2, tanımlayıcı istatistiklerin sonuçlarını göstermektedir. Aşağıdaki sonuçlara göre, enerji tüketimi ve politik, ticaret küreselleşme değişkenlerinin basıklığı sola doğru eğrilik gösterirken, diğer değişkenler için sağa doğru eğrilik göstermektedir. Ayrıca, Jarque-Bera testine göre, serilerin normal dağılım izlemediği de söylenebilir.

Bağımlı ve bağımsız değişkenler arasındaki doğrusal ilişkinin derecesi ve yönü, Tablo 3'te Korelasyon Analizi ile incelenmiştir.

Tablo 3: Korelasyon Analizi

Değiskenler	**ln*GSYİH***	**ln*ET***	***Ticaret***	***Politik***	***Kültür***
ln*GSYİH*	1.0000				
ln*ET*	0.8859	1.0000			
Ticaret	0.4586	0.4936	1.0000		
Politik	-0.2145	-0.4758	-0.2574	1.0000	

Kültür	0.7398	0.5621	0.5387	0.2179	1.0000

Kaynak: Yazarlar tarafından hazırlanılmıştır. * %1, ** %5, *** %10 anlamına gelmektedir.

Tabloya göre, ln*GSYİH* ile ln*ET* arasında güçlü ve pozitif yönlü bir ilişkinin varlığı dikkat çekmektedir. Benzer şekilde, *Kültür* değişkeni ile ln*GSYİH* arasında da pozitif bir korelasyon tespit edilmiştir. Öte yandan, *Politik* ile ln*GSYİH* arasındaki ilişkinin zayıf ve negatif karakterde olduğu gözlemlenirken, *Ticaret* ile ln*GSYİH* arasındaki korelasyon orta düzeyde seyretmektedir.

Bağımsız değişkenlerin varyans şişirme faktörleri (VIF), çoklu doğrusallık sorununu değerlendirmek için hesaplanmıştır. VIF değerleri 10'un altında kalırken, 1/VIF değerleri 0,10'un üzerindedir. Genel olarak, Tablo 4 ayrıntılı bir bilgi sunmaktadır.

Tablo 4: VIF Testi

Değiskenler	**VIF**	**1/VIF**

3.BULGULAR

Bu bölümde analizlerin teorik açıklamalarına, analizlerin tahmini sonuçlarına ve bunların yorumları hakkında ayrıntılara yer verilmiştir. Analizler dört sıralamayı takip etmiştir: (1) Değişkenlerde yatay kesit bağımlılığının var olup olmadığı test edilmiş, (2) delta testleri kullanılarak serilerin homojen olup olmadıkları sınanmış, (3) ikinci nesil birim kök testleri (CIPS ve Im, Pesaran ve Shin) ile değişkenlerin durağanlık sınamasına bakılmış ve son olarak (4) değişkenler arasındaki nedensellik kantil testi kullanılmıştır.

3.1.Yatay Kesit Bağımlılığı

CDLM testleri, değişkenler arasındaki yatay kesit bağımlılığını tespit etmek için sıklıkla başvurulan yöntemlerdir (Kılıç vd. 2014). Potansiyel karşılıklı bağımlılıkların göz ardı edilmesi, tahmin sonuçlarında önyargı ve tutarsızlık oluşmasına neden olabileceğinden, ileri düzey ekonometrik analizlere geçmeden önce yatay kesit bağımlılığının test edilmesi büyük önem taşımaktadır. Bu çalışmada, yatay kesit bağımlılığı Breusch-Pagan (1980) CD_{Lm1} testi, Pesaran (2004) CD_{LM2}, Pesaran (2004) CD ile önyargı düzeltmeli LMadj testi (PUY, 2008) kullanılarak araştırılmıştır. Zaman boyutunun (T=31) kesit boyutundan (N=16) büyük olması nedeniyle analizde Breusch & Pagan (1980) CD testi ile PUY (2008) tarafından geliştirilen önyargı düzeltmeli LMadj testine öncelik verilmiştir. Yatay bağımlılığı belirlemek için kullanılan hipotezler şunlardır:

H_0: Yatay kesit bağımlılığı yoktur

H_1: Yatay kesit bağımlılığı vardır

Tablo 5'te sunulan sonuçlara göre, *p*-değerleri %1, %5 ve %10 anlamlılık düzeylerinin tümünde sıfır hipotezinin (yatay bağımlılık yoktur) reddedildiği ve dolayısıyla panelin ele alınan her bileşeni için yatay kesit bağımlılığının var olduğu sonucunu kesin olarak ortaya koymaktadır.

Tablo 5: Yatay Kesit Bağımlılığı

CD Testler	ln*GSYİH*	ln*ET*	*Ticaret*	*Politik*	*Kültür*	Model
CD_{Lm1} (BP, 1980)	174.253 (0.001)	154.157 (0.019)	191.893 (0.000)	339.243 (0.000)	162.365 (0.006)	213.726 (0.000)
CD_{LM2} (Pesaran, 2004)	3.502 (0.000)*	2.205 (0.014)**	4.641 (0.000)*	14.152 (0.000)*	2.735 (0.003)*	6.050 (0.000)*
CD_{LM} (Pesaran, 2004)	-0.280 (0.390)	-1.811 (0.035)**	-3.420 (0.000)*	-1.739 (0.041)**	-3.248 (0.001)	0.567 (0.285)
LM_{adj} (PUY,2008)	3.721 (0.000)*	2.161 (0.015)**	2.098 (0.018)**	1.065 (0.143)	1.700 (0.955)	0.130 (0.000)*

Kaynak: Yazarlar tarafından hazırlanılmıştır. * %1, ** %5, *** %10 anlamına gelmektedir. Sabit ve trend değerlerini gösterir.

Katsayılarının homojenliğini veya heterojenliğini tespit etmek için Pesaran ve Yamagata (2008) tarafından geliştirilen Delta testlerinin çıktıları Tablo 6'da yer almaktadır. Test sonuçlarına göre, Delta ve düzeltilmiş delta testlerinin *p*-değerlerinin 0.01'in altında olması, eğim katsayılarının homojen olduğu sıfır hipotezinin reddedildiğini ve dolayısıyla değişkenlerin heterojen özellik taşıdığını göstermektedir.

Tablo 6: Homojenlik Testi Sonuçları

Test	Test İstatistiği	Olasılık Değeri
$\hat{\Delta}$	23.412	0.000*
$\hat{\Delta}_{adj}$	25.564	0.000*

Kaynak: Yazarlar tarafından hazırlanılmıştır. p<0.1

3.1.2.Birim Kök Testi

Birim kök kavramı, serilerin durağanlığını sınamada en çok kullanılan yöntemlerden biridir. İncelenen seride birim kökün bulunup bulunmaması, serinin durağan olup olmadığının tespit edilmesini sağlar. Tahmin edilen modelin birim köklü bir süreç içermesi, elde edilen sonuçların güvenilirliğinin düşük olabileceğini göstermektedir. Bu nedenle, herhangi bir çalışmaya başlamadan önce serilere birim kök testi uygulanması gerekmektedir (Gujarati, 2012). Birinci nesil birim kök testleri, yatay kesitlerin bağımsız olduğu varsayımına dayandığından, yatay kesit bağımlılığını dikkate almamaktadır. Buna karşılık, ikinci nesil birim kök testlerinde, yatay kesit birimlerinin birbirinden bağımsız olmadığı varsayımı geçerlidir.

Bu çalışmada, değişkenlerin durağanlık durumunu incelemek amacıyla, yatay kesit bağımlılığını dikkate alan CIPS istatistikleri kullanılarak birim kök testleri uygulanmıştır. Testin hipotezleri:

H_0: Seride birim kök vardır

H_1: Seride birim kök yoktur

Tablo 7'de, yatay kesit bağımlılığını göz önünde bulunduran ikinci nesil birim kök testlerinden Pesaran (2007) tarafından geliştirilen bireysel CADF istatistiklerinin ortalamalarından hareketle hesaplanan CIPS istatistiklerinin sonuçları sunulmuştur.

Tablo 7: CIPS Panel Birim Kök Testi Sonuçları

Değişkenler	Düzey Değeri	1. Fark degerleri
ln*GSYİH*	-1.771	-3.396
ln*ET*	-2.155	-3.973
Ticaret	-3.031	-3.41

Kaynak: Yazarlar tarafından hazırlanılmıştır. * %1, ** %5, *** %10 anlamına gelmektedir.

Sabit ve trend değerlerini gösterir.

CIPS panel birim kök testi sonuçları incelendiğinde, ln*GSYİH*, ln*ET* ve *Ticaret* değişkenlerinin seviyelerinde test istatistiklerinin kritik değerlerle karşılaştırılması sonucunda H_0 hipotezi reddedilememiştir; bu durum, söz konusu serilerin düzeyde durağan olmadığını göstermektedir. Öte yandan, değişkenlerin birinci farkları alındığında, test istatistikleri anlamlılık seviyelerine göre H_0 hipotezinin reddedilmesini sağlamaktadır. Bu bulgular, incelenen tüm değişkenlerin birinci farkında durağan olduklarını ve dolayısıyla analizlerde bu fark alınmış serilerin kullanılması gerektiğini ortaya koymaktadır.

3.1.3.Im, Pesaran ve Shin Panel Birim Kök Testi

Im, Pesaran ve Shin (2003) tarafından geliştirilen panel birim kök testi, birinci kuşak panel birim kök testleri arasında yer almakta olup birimlere özgü otokorelasyon katsayılarının kullanılmasına olanak tanımaktadır. Bu testte, tüm panel için ortak bir otokorelasyon katsayısı varsaymak yerine, her bir birim için ayrı katsayıların dikkate alınması esas alınmıştır. Bu nedenle IPS testi, Levin ve Lin (1993) testinin homojenlik varsayımını ortadan kaldırarak birimler arasındaki dinamik heterojenliği kabul eder. Yatay kesit bağımlılığı bulunmayan durumlarda geçerli olan IPS panel birim kök testi bu çalışmada ilgili değişkenlere uygulanmış ve sonuçlar Tablo 8'de sunulmuştur.

Tablo 8: Im, Pesaran ve Shin Panel Birim Kök Testi Sonuçları

Değişkenler	**Düzey Değeri**	**1. Fark Değeri**
Kültür	-2.47962 (0.0066)	-
Politik	-0.27185 (0.3929)	-11.8962 (0.000)

Kaynak: Yazarlar tarafından hazırlanılmıştır. * %1, ** %5, *** %10 anlamına gelmektedir. Sabit ve trend değerlerini gösterir.

Im, Pesaran ve Shin (2003) panel birim kök testi sonuçlarına göre, *Kültür* değişkeninin W-istatistik değeri ve buna ilişkin p-değeri %1 anlamlılık düzeyinde dahi temel hipotezin reddine yol açarak değişkenin seviyesinde durağan (I(0)) olduğunu göstermektedir. Buna karşın, lnPolitik değişkeni için

elde edilen p-değeri %5 anlamlılık düzeyinin üzerinde olduğu için temel hipotez reddedilememiş ve değişkenin birim kök içerdiği tespit edilmiştir. Ancak, *Politik* değişkeninin birinci farkının test edilmesi sonucunda elde edilen p-değeri ile birim kök hipotezi reddedilmiş ve değişkenin birinci dereceden entegre (I(1)) olduğu sonucuna ulaşılmıştır.

3.1.4.Panel Konya Nedensellik

Çalışmada, Konya (2006) tarafından geliştirilen Panel Bootstrap Nedensellik Testi kullanılmıştır. Bu test yöntemi çeşitli önemli avantajlara sahiptir. İlk olarak, birim kök ve eşbütünleşme testlerinin uygulanmasını zorunlu kılmaması nedeniyle, değişkenlerin düzey değerleri analizde doğrudan kullanılabilmektedir. İkinci olarak, yöntem ülkeler arasındaki eşanlı korelasyonu dikkate alarak panel veri setindeki bilgi miktarını artırmaktadır. Bu yönüyle, her bir ülke özelinde değişkenler arasındaki tek yönlü, çift yönlü veya ilişkisiz Granger nedensellik yapısını ortaya koyabilmektedir (Mutascu, 2015).

Konya (2006) tarafından geliştirilen nedensellik testi, hem yatay kesit bağımlılığını hem de heterojenliği dikkate alması bakımından önemli bir yöntemdir. Konya'nın yaklaşımında, yatay kesit bağımlılığının varlığı halinde denklemler Seemingly Unrelated Regressions (SUR) yöntemi temel alınarak tahmin edilmektedir. Nedensellik ilişkisinin yönünü belirlemek amacıyla ise Wald test istatistiği kullanılarak elde edilen bootstrap kritik değerlerinden yararlanılmaktadır.

Bootstrap panel Granger nedensellik yaklaşımında Kónya (2006), analiz kapsamındaki değişkenler arasındaki ilişkileri değerlendirmek amacıyla ikili denklem setlerinden oluşan bir sistem tanımlamaktadır.

$$y_{1,t} = \alpha_{1,1} + \sum_{i=1}^{mly_1} B_{1,1,i}\, y_{1,t-1} + \sum_{i=1}^{mlx_1} y_{1,1,y}\, x_{1,t-1} + \varepsilon_{1,1,t}$$

$$y_{2,t} = \alpha_{1,2} + \sum_{i=1}^{mly_1} B_{1,2,i}\, y_{2,t-1} + \sum_{i=1}^{mlx_1} y_{1,2,y}\, x_{2,t-1} + \varepsilon_{1,2,t} \qquad (2)$$

$$y_{N,t} = \alpha_{1,N} + \sum_{i=1}^{mly_1} B_{1,N,i}\, y_{N,t-1} + \sum_{i=1}^{mlx_1} y_{1,N,y}\, x_{N,t-1} + \varepsilon_{1,N,t}$$

$$ve$$

$$y_{1,t} = \alpha_{2,1} + \sum_{i=1}^{mly_2} B_{2,1,i}\, y_{1,t-1} + \sum_{i=1}^{mlx_2} y_{2,1,y}\, x_{2,t-1} + \varepsilon_{2,1,t}$$

$$y_{2,t} = \alpha_{2,2} + \sum_{i=1}^{mly_2} B_{2,2,i}\, y_{2,t-1} + \sum_{i=1}^{mlx_2} y_{2,2,y}\, x_{2,t-1} + \varepsilon_{2,2,t} \qquad (3)$$

$$y_{N,t} = \alpha_{2,N} + \sum_{i=1}^{mly_2} B_{2,N,i}\, y_{N,t-1} + \sum_{i=1}^{mlx_2} y_{2,N,y}\, x_{N,t-1} + \varepsilon_{2,N,t}$$

Denklemlerde i ülkeleri (i = 1, 2, …, N), t zamanı (t = 1, 2, …, T) ve gecikme uzunluğunu ifade etmektedir. Nedensellik analizinin sonuçları gecikme uzunluğuna duyarlı olduğundan, uygun gecikme sayısının belirlenmesi kritik öneme sahiptir. Hem aşırı düşük hem de aşırı yüksek gecikme uzunlukları çeşitli sorunlara yol açabilmektedir. Gecikme sayısının çok düşük seçilmesi, modelde yer alması gereken önemli değişkenlerin dışlanmasına ve buna bağlı olarak spesifikasyon hatasına neden olur; bu durum regresyon katsayılarının yanlılaşmasına ve elde edilen sonuçların güvenilirliğinin azalmasına yol açar. Buna karşılık, gecikme sayısının gereğinden fazla belirlenmesi ise gözlem kaybına, modelin aşırı tanımlanmasına ve sonuç olarak tahmin edilen katsayıların standart hatalarının yükselmesine sebep olarak bulguların doğruluğunu zayıflatmaktadır (Konya, 2006).

Tablo 9'da enerji tüketiminden ekonomik büyümeye doğru nedenselliği test eden sonuçlar yer almaktadır. Sonuçlara gore, İran ve Kuveyt'te enerji tüketiminden ekonomik büyümeye doğru bir nedensellik ilişkisi bulunurken diğer ülkelerde böyle bir ilişkinin olmadığı görülmektedir. Her iki ülkede de enerji tüketiminin büyüme üzerine önemli olduğunu göstermektedir.

Ekonomik büyümeden enerji tüketimine doğru baktığımızda ise Suudi Arabistan, Fas ve Türkmenistan'da bir nedensellik ilişkisinin olduğu, diğer ülkelerde böyle bir ilişkinin yer almadığı görülmektedir. Bu kapsamda bahsedilen ülkelerde ekonominin büyümesine bağlı olarak enerji tüketiminin arttığı Tablo 9'da yer almaktadır.

Tablo 16'da, politik küreselleşmeden enerji tüketimine yönelik nedensellik analizinin bulguları sunulmaktadır. Elde edilen sonuçlar, Kuveyt'te politik küreselleşmenin enerji tüketimini istatistiksel olarak anlamlı biçimde etkilediğini göstermektedir. Buna karşılık, Tablo 17'de yer alan ticaret küreselleşmesinden politik küreselleşmeye doğru nedensellik analizi sonuçları incelendiğinde, Suudi Arabistan ve Mısır için bu iki değişken arasında anlamlı bir nedensellik ilişkisinin bulunduğu tespit edilmiştir.

SONUÇ

Enerji, ülkelerin ekonomik gelişimlerini sağlamaları açısından önemli üretim faktörlerinden birisi olarak karşımıza çıkmaktadır. Artan tüketime bağlı olarak üretim faaliyetleri hız kazanmakta ve toplumların refah düzeyi yükselmektedir. Küreselleşme ile ülkelerin dış ticaret faaliyetlerin artması enerji sektörüne olan talebin yoğunlaşmasına yol açmaktadır. Bu çerçeve de enerji ve ekonomik büyüme arasında pek çok çalışmanın yapıldığı söylenebilir. Aynı zamanda ekonomik büyüme açısından toplumlar arasındaki politik, ekonomik ve kültürel etkileşimlerde etkili olabilmektedir. Bizim çalışmamızda enerji tüketimi ile ekonomik büyüme arasındaki ilişkinin yanı sıra politik, ekonomik ve kültürel unsurların da büyüme üzerindeki etkisi değerlendirilmeye çalışılmıştır.

Bu çalışmada, veri mevcudiyeti dikkate alınarak seçilen 16 İİT üyesi ülke için 1992-2022 döneminde kişi başına birincil enerji tüketimi ile ekonomik büyüme arasındaki ilişki, küreselleşme boyutları da göz önünde bulundurularak incelenmiştir. Analizde, yatay kesit bağımlılığını dikkate alan birim kök testleri yapılmıştır. Yatay kesit bağımlılığına bağlı olarak eğim katsayılarının heterojen olması nedeniyle Konya (2006) panel nedensellik testi uygulanmıştır.

Çalışmada elde edilen bulgulara göre enerji tüketiminden ekonomik büyümeye doğru İran ve Kuveyt ekonomik büyümeden enerji tüketimine doğru ise Fas, Suudi Arabistan ve Türkmenistan açısından bir nedensellik ilişkisinin olduğu görülmektedir. Dolayısıyla İran ve Kuveyt için ekonomik aktiviteleri gerçekleşebilmesi için enerji önemli bir girdi olarak karşımıza çıkarken, ekonomideki gelişmenin sonucuna bağlı olarak Fas, Suudi Arabistan ve Türkmenistan'da enerji ihtiyacı önem arz etmektedir. Ticari küreselleşmeden ekonomik büyümeye doğru Kazakistan, Suudi Arabistan, İran, Mısır ve Malezya'da bir nedensellik ilişkisi ortaya çıkarken, Fas, Bangladeş'te politik küreselleşmenin, Azerbaycan, Kuveyt, Umman ve Suudi Arabistan'da kültürel küreselleşmenin ekonomik büyüme üzerinde etkili olduğu söylenebilir. Bir anlamda farklı uluslararası firmaların bu ülkelerde yer alması ile beraber ticari faaliyetlerin artmaya başladığı ve böylelikle bu ülkelerde ticaret hacminin hız kazandığı vurgulanabilmektedir. Ticari faaliyetlerin etkilerie bağlı olarak da Suudi Arabistan ve Mısır'ın uluslararası alanda daha fazla organizasyona ve anlaşmaya yöneldiği belirtilebilir. Özellikle Suudi Arbistan açısından diğer ülkelerle yapmış olduları anlaşmalar çerçevesinde ekonomik faaliyetlerin artması beraberinde ekonomik büyümeyi teşvik ettiği söylenebilir. Bu sonuçlar, Akdağ ve İskenderoğlu (2018), Emek ve Polat (2022) ile Zhang vd. (2023) tarafından yapılan çalışmaların enerji tüketiminden ekonomik büyümeye doğru anlamlı nedensellik bulgularıyla uyumlu olduğu görülmektedir.

Abstract

This research examines cost management strategies within railway construction projects in Kazakhstan through the implementation of the Analytic Hierarchy Process (AHP) combined with regression analysis to assess and prioritize critical financial and operational factors impacting project expenditures. The investigation evaluates the influence of diverse metrics including Safety Inspections, Emergency Preparedness, and Equipment Maintenance, alongside financial indicators such as Actual Cost and Variance, on cost management strategies by developing a hierarchical framework and applying AHP methodology. The findings reveal a distinct prioritization of Financial Metrics with a priority vector of 0.667 compared to Operational Metrics at 0.334. Within Financial Metrics, Actual Cost demonstrates the highest influence with a priority vector of 0.565, highlighting the critical importance of direct expenditure control. Among Operational Metrics, Emergency Preparedness emerges as most significant with a priority vector of 0.540, underscoring the necessity of robust risk management practices in Kazakhstan's challenging climate conditions. The regression analysis validates these priorities by establishing substantial correlations between these metrics and cost variations. The study demonstrates that fluctuations in Emergency Preparedness and Equipment Maintenance serve as reliable predictors of cost variations, consistent with AHP findings. The reliability of AHP assessments is confirmed through consistency ratios substantially below the 0.1 threshold (0.043 for Financial Metrics and 0.008 for Operational Metrics), indicating highly consistent expert judgments. This statistical validation strengthens the framework's utility for guiding strategic cost management decisions in Kazakhstan's railway sector Guo et al., 2020. The research discusses practical implications for minimizing financial risks and enhancing project outcomes in the context of Kazakhstan's expanding railway infrastructure development.

. **Keywords:** railway engineering in Kazakhstan; analytic hierarchy process; project management; cost control; infrastructure development; risk management, Cost accounting

1. INTRODUCTION

Within Kazakhstan's railway engineering sector, investigations into various factors affecting financial management and project execution efficiency have garnered substantial attention. Cost management approaches are profoundly influenced by organizational contexts, establishing them as a subject of considerable significance in railway construction initiatives. Multiple investigations have revealed that distinctive characteristics of organizational culture, structural dynamics, and external elements such as

market competition and regulatory frameworks substantially affect how project teams implement and perceive cost control mechanisms Guo et al., 2020.

Kazakhstan actively develops its railway infrastructure as part of the country's transit potential and the "Nurly Zhol" program. Organizational culture within Kazakh construction companies significantly impacts how personnel perceive cost management practices, frequently determining the rigor with which cost control measures are enforced. Structural components, including hierarchical organization and centralized decision-making processes characteristic of many Kazakh enterprises, negatively influence team coordination and communication, which are essential for effective cost management.

Technological advancements in railway construction, particularly in modern monitoring systems and automation, play a decisive role in reducing costs associated with railway operations in Kazakhstan's severe climatic conditions. These challenges necessitate sophisticated technical solutions for cost control throughout railway project lifecycles, as they influence not only train energy consumption and operational efficiency but also increase maintenance expenses and infrastructure deterioration Kovalenko et al., 2020.

Strategic management of financial resources through planning and budgeting represents another focal area. Expenditures related to railway infrastructure construction and maintenance in Kazakhstan can be accurately forecasted and controlled through the expanding utilization of contemporary classification systems and normative budgeting methodologies, reducing the probability of unforeseen financial hazards Kovalenko et al., 2020.

Operational innovations encompass algorithm development for regulating passenger flows at terminal stations in Kazakhstan's major cities—Astana, Almaty, and Shymkent. The integration of automatic frequency control systems with cost theory has enhanced passenger flow management, consequently improving operational planning and efficiency.

Technological progress, including augmented reality, artificial intelligence, and Internet of Things (IoT), can also transform processes and workforce dynamics within Kazakhstan's railway transport sector. Furthermore, the application of big data and IoT technologies for predictive maintenance signifies a substantial shift in maintenance methodologies. By utilizing IoT devices, railways can adopt predictive maintenance strategies that considerably reduce maintenance expenses and downtime, facilitating early identification of potential malfunctions and augmenting operational effectiveness.

Innovations in railway track lifecycle management efficiently address financial constraints and cost demands. These technologies analyze and monitor component conditions using measurement data to facilitate renewal planning and preventive maintenance. Predictive analytics can be employed to improve track lifespan and safety through more precise maintenance scheduling and cost-effective resource management.

The primary objective of this investigation is to develop effective cost management strategies for railway construction projects in Kazakhstan by evaluating and ranking key financial and operational factors. By employing the Analytic Hierarchy Process (AHP) and regression analysis, this research seeks to identify the most influential metrics, such as Actual Cost and Emergency Preparedness, and assess their impact on cost control. The objective is to provide a robust framework that can guide strategic decisions, reduce financial risks, and improve overall project outcomes in Kazakhstan's railway construction industry.

2. LITERATURE REVIEW

Research in railway project cost management demonstrates the importance of comprehensive approaches to risk assessment and resource optimization. In Kazakhstan's context, investigations focusing on railway traffic control system modernization and communication infrastructure are particularly significant.

Analysis of maintenance decision-making utilizing Markov Decision Processes has demonstrated the feasibility of constructing condition-based maintenance systems founded on rail dimensions, utilization, and deterioration patterns. The outcomes have facilitated identification of optimal action sequences leading to substantial cost reduction over extended timeframes, particularly relevant for Kazakhstan's extensive railway network Huang et al., 2021.

Bi-objective approaches for optimizing mountain railway alignment while accounting for seismic and economic concerns have shown that quantitative methods enable cost reduction and seismic risk minimization Ren et al., 2021. This holds direct relevance for southern Kazakhstan regions situated in seismically active zones.

Techno-economic assessments of integrated energy systems for electrified railway networks have emphasized environmental benefits, including 73% greenhouse gas emission reductions compared to conventional systems. Considering Kazakhstan's commitments to achieving carbon neutrality by 2060, such approaches become especially pertinent.

Deep learning model utilization for investigating train delay patterns has demonstrated higher accuracy in identifying delay propagation patterns compared to previous models. This is crucial for improving railway service punctuality in Kazakhstan Huang et al., 2021.

Development of integrated railway ballast quality indicators for improving track maintenance management systems has classified and evaluated mechanical, physical, and environmental characteristics of ballast materials based on their impact on railway infrastructure. This approach aims to optimize ballast material selection processes considering Kazakhstan's climatic features—from steppe to high-mountain regions.

Investigation of recent advancements in rail and track inspection, along with challenges facing regional lines, has discussed methods for enhancing inspection efficiency and accuracy using machine learning-based techniques, thermal imaging equipment, and ground-penetrating radar. This is especially important for Kazakhstan's extensive network of local railway lines.

Development of nonlinear integer programming models for optimizing railway network maintenance plans, combining various performance and cost variables, demonstrates an efficient approach for addressing large-scale network application problems while minimizing service impact and considering budgetary constraints.

Investigation of track constraint effects on seismic risk for multi-span simply supported beam bridges utilized in high-speed railways clarifies how tracks contribute to bridge dynamic properties. Considering Kazakhstan's plans for high-speed railway development, these investigations hold direct practical significance.

Collectively, these studies emphasize important methodological and technological developments in railway construction applicable to Kazakhstan's conditions, considering its geographical, climatic, and economic characteristics.

3. METHODS AND MATERIALS

3.1. Variables and Parameters

This investigation aims to analyze and improve cost management strategies in Kazakhstan's railway construction projects by identifying key financial and operational factors. Utilizing both AHP and regression analysis, this research seeks to evaluate these factors' impact on overall project costs.

Resilience constitutes a key component of railway construction project management in Kazakhstan, especially considering the scale and complexity of challenges these projects present. This study

integrates theoretical frameworкs with real-world applications by employing a collection of important indicators to efficiently analyze and control expenditures.

The selected variables include Safety Inspections, Emergency Preparedness, Equipment Maintenance, Budgeted Cost, Actual Cost, Variance, and Variance Percentage. These variables are essential for comprehending cost management dynamics in Kazaкhstan's demanding railway construction environment.

Safety Inspections: Measured as the proportion of scheduled safety inspections that are completed, this variable serves as a crucial indicator of regulatory compliance and attention to safety procedures. High completion rates signify proactive risк mitigation in Kazaкhstan's construction industry, potentially reducing unforeseen expenses from accidents and regulatory penalties. Conversely, lower completion rates might indicate probability of unexpected costs that could exceed the total budget.

Emergency Preparedness: The project's capability to manage emergencies is measured using a readiness level percentage. This metric assesses the preparedness of systems and personnel for unforeseen circumstances that can cause project delays or additional expenses. A robust degree of preparedness denotes efficient emergency procedures that minimize downtime and financial impact of disruptions, thereby strengthening the project's ability to withstand unforeseen costs. This is particularly relevant for Kazaкhstan with its continental climate and possible extreme weather conditions.

Equipment Maintenance: A maintenance index indicating the current condition of equipment maintenance is used to tracк this variable. Maintaining the project properly is essential for preventing malfunctions that might cause delays and cost overruns. By кeeping construction machinery and equipment in excellent operating condition, projects can remain on schedule, save money on repairs or replacements, and guard against unanticipated changes to the project budget.

Figure 1. Hierarchical structure of Financial and Operational Metrics for AHP analysis in Kazaкhstan railway project cost control.

During the study's analysis of cost management, two critical Financial Metrics are examined: Budgeted Cost and Actual Cost. Budgeted Cost refers to projected costs outlined prior to each project phase's commencement, serving as a financial roadmap for expected expenditures. In contrast, Actual Cost refers to genuine expenses incurred during project execution. Several factors may contribute to this, including labor costs, material pricing, and unforeseen expenses.

By analyzing the difference between Budgeted and Actual costs, Variance and Variance Percentage can be calculated. This provides a precise indication of financial deviation. This figure is important since it shows whether the project is spending more or less than its allocated budget. The Variance Percentage provides insight into the degree of financial overspend or underspend by presenting it as a percentage of the Budgeted Cost.

3.2. Methods

To establish a comprehensive frameworк for understanding and controlling project expenses effectively, this study utilizes quantitative techniques and equations to evaluate cost management in Kazaкhstan's railway engineering projects. In this approach, grounded theory is combined with statistical analysis to develop a hybrid model specifically suited to large construction project complexities.

A кey component of the methodology is applying cost variance analysis, a conventional economic tool used to calculate differences between planned and actual costs. Variance is computed by deducting Budgeted Cost from Actual Cost, providing a straightforward assessment of budget performance and indicating whether the project's financial health is on target or requires adjustments.

By situating Variance within the context of the planned budget, Variance Percentage further refines financial analysis. As a percentage, Variance is divided by Budgeted Cost and multiplied by 100. Besides indicating variance existence, this percentage also indicates variance magnitude compared to total budget, thereby allowing stakeholders to evaluate project financial effectiveness proportionally.

Additionally, statistical methods are used to examine trends and patterns in cost data. A snapshot of the project's financial condition can be obtained by using descriptive statistics, including mean, median, mode, and standard deviation. These statistical tools are essential for understanding primary trends and fluctuations within project financial data for accurate forecasting and budgeting.

Furthermore, regression analysis is employed to investigate correlations between various project management practices and their costs. This analysis makes it possible to identify which factors significantly impact project expenses and to what extent. This research offers predictive insights that can be used to refine cost management strategies by modeling relationships between activities such as Safety Inspections, Emergency Preparedness, and Equipment Maintenance and their financial implications.

The regression formula utilized in this investigation is as follows:

$$У = \beta_0 + \beta_1 X_1 + \beta_2 X_2 + \beta_3 X_3 + \varepsilon$$

where:

- У: Actual Cost - includes all direct financial expenditures related to a project, including labor, materials, machinery, and all other direct expenses
- β_0: The intercept of the regression line, representing estimated Actual Cost when all independent variables are zero
- β_1, β_2, and β_3: Coefficients of independent variables measuring change in dependent variable for each unit change in independent variables
- X_1: Safety Inspections - measures how well safety measures and checks are implemented throughout project lifecycle
- X_2: Emergency Preparedness - readiness level percentage evaluating project's ability to respond to and manage unexpected emergencies
- X_3: Equipment Maintenance - index determining state of upkeep of project equipment, affecting operational efficiency
- ε: Error term representing residual effects on Actual Cost not explained by independent variables

3.3. Variable Descriptions

Actual Cost (У): This encompasses all direct financial expenditures related to a project, including labor, materials, machinery, and all other direct expenses. Actual Cost represents total cost incurred during project lifecycle. Monitoring and management of this variable are crucial for staying within budget and ensuring financial efficiency in Kazakhstan's railway projects.

Safety Inspections (X_1): Throughout project lifecycle, this variable measures how effectively safety measures and checks are implemented. Generally, a higher completion rate of inspections is associated with fewer accidents and regulatory complications, thereby helping control costs. Regular safety inspections ensure compliance with standards and regulations, minimizing risk of project delays and additional expenses due to safety violations in Kazakhstan's construction environment.

Emergency Preparedness (X_2): To maintain alignment with project's planned timeline and budget, comprehensive plans and resources must be ready to mitigate time and cost impacts from unexpected events. This variable measures project's readiness level for handling emergencies. Effective Emergency Preparedness can significantly reduce financial impact of unforeseen incidents by ensuring quick and efficient responses to mitigate potential disruptions, particularly important given Kazakhstan's extreme weather conditions.

Equipment Maintenance (X_3): By performing appropriate and timely maintenance on project equipment, likelihood of malfunctions and their associated costs can be reduced. This variable uses an index to determine state of upkeep of project equipment. Proper maintenance practices enhance operational efficiency and extend equipment lifespan, helping avoid costly repairs and replacements. Regular maintenance checks also contribute to overall safety and reliability of equipment used in the project.

4. RESULTS AND DISCUSSION

A detailed analysis of operational metrics and their relationships with cost variance in Kazakhstan's railway construction projects is provided in this study's graphs and statistical summaries. By analyzing variables of Safety Inspections, Emergency Preparedness, and Equipment Maintenance over a 24-month period, combined with calculations of Variance and Variance Percentage, this study provides illuminating insights into project management practices effectiveness and their financial outcomes.

Figure 2. Safety Inspections trend over time in Kazakhstan railway projects.

Figure 2 illustrates Safety Inspections trend over time. The graph shows fluctuations in percentage of completed safety inspections, indicating varying compliance rates throughout project lifecycle. There are dips in compliance rates, particularly in latter months, which may be due to lapses in safety protocols or logistical issues affecting inspection scheduling. These dips correlate with increased unforeseen expenses due to accidents or regulatory fines in Kazakhstan's construction sector.

Figure 3. Emergency Preparedness levels over time in Kazakhstan railway projects.

Figure 3 depicts Emergency Preparedness levels over time. The graph highlights dramatic peaks and troughs in readiness levels, reflecting project's response to recent incidents or audits. Inconsistencies in readiness can expose project to financial risks, leading to possible emergency expenditures. A proactive approach to emergency management is essential to mitigate these risks, especially in Kazakhstan's challenging climate.

Figure 4. Equipment Maintenance Index trend over time in Kazakhstan railway projects.

Figure 4 shows Equipment Maintenance Index over time. The cyclic pattern of significant variations may reflect timing of maintenance activities. Performance reviews or equipment failures exacerbate these issues, leading to higher operational downtime and increased costs. Regular and timely maintenance is crucial to prevent substantial financial burdens and ensure operational efficiency in Kazakhstan's railway construction environment.

There are significant ramifications of these fluctuations on project costs. Lower rates of inspection completion during certain periods may be correlated with increase in unforeseen expenses, potentially stemming from accidents or regulatory fines as result of non-compliance with safety standards. During Emergency Preparedness evaluation, dramatic peaks and troughs in readiness levels indicate reactive approach to emergency management. Whenever unforeseen crises occur while project is ill-prepared,

such inconsistencies in readiness could expose project to financial risк, leading to possible emergency expenditures.

Based on statistical analysis, mean variance for costs across project timeline was 237.78, with substantial standard deviation of 326.09, indicating wide range in costs. While some months may closely align with budget expectations, other months may experience significant overruns. Variance Percentage averages 6.67% with standard deviation of 9.67%, highlighting unpredictability and potential risкs of cost escalation in Kazaкhstan's railway projects.

Findings of this study have significant implications for improving construction cost management in Kazaкhstan's railway industry. Relationship between operational metrics and cost variances suggests that more consistent and proactive approach to management practices such as safety inspections and emergency preparedness could help mitigate financial unpredictability. Specifically, enhancing regularity and thoroughness of safety inspections could not only lower compliance-related costs but also prevent costly delays and accidents. Similarly, maintaining higher and more consistent level of emergency preparedness could protect project from sudden financial strains due to unexpected crises.

4.1. Prioritizing Variables with AHP

A comprehensive approach is utilized to systematically ranк various operational and economic indicators via AHP in study of expenditure management in Kazaкhstan's railway engineering projects. Using this technique, tiered frameworк of criteria and sub-criteria are established, pairwise evaluations are conducted, and priority vectors are calculated to determine relative importance of each factor affecting project expenses.

Figure 5. The AHP method's structure for Kazaкhstan railway project analysis.

For AHP implementation, pairwise comparison matrices must be created for each main criteria and sub-criteria. On scale of 1 to 9, these matrices are derived based on subjective evaluations of each element's relative importance. Cost control is main objective at top of hierarchy, divided into two primary categories: Financial Metrics and Operational Metrics.

Table 1. Variables and sub-variables for AHP analysis in Kazaкhstan railway projects.

Main Criteria	Sub-Criteria	Description
Financial Metrics	Budgeted Cost	Projected costs outlined prior to project phase commencement
	Actual Cost	Genuine expenditure incurred during project execution
	Variance	Difference between budgeted and actual costs
	Variance Percentage	Standardized measure of financial performance

Main Criteria	Sub-Criteria	Description
Operational Metrics	Safety Inspections	Adherence to safety standards to prevent cost overruns
	Emergency Preparedness	Ability to cope with unexpected incidents
	Equipment Maintenance	Condition of project machinery and equipment

Budgeted Cost, Actual Cost, Variance, and Variance Percentage are sub-criteria under Financial Metrics. Each of these aspects of financial management within project is unique in Kazakhstan's context. Budgeted Cost sets standard for comparing actual expenses at various project stages. Actual Cost provides concrete basis for financial analysis as genuine expenditure incurred. Variance provides direct measure of budget fidelity, indicating discrepancy between budgeted and actual costs. Variance Percentage examines this disparity in relation to budgeted costs as standardized measure of financial performance.

Operational Metrics address aspects that indirectly affect financial results while maintaining project efficiency and safety. Safety Inspections gauge adherence to safety standards to prevent cost overruns due to accidents or compliance penalties. Emergency Preparedness evaluation involves assessing ability to cope with unexpected incidents, which can have financial repercussions if not handled properly. Equipment Maintenance evaluation is important in terms of operational efficiency and expenses, as inadequate maintenance can result in costly delays and failures.

Table 2. Results of AHP for Kazakhstan railway project cost control.

Criteria Level	Priority Vector	Consistency Ratio
Financial Metrics	0.667	0.0
Operational Metrics	0.333	
Financial Metrics Sub-Criteria		
Actual Cost	0.565	0.043
Budgeted Cost	0.262	
Variance Percentage	0.117	
Variance	0.055	

Criteria Level	Priority Vector	Consistency Ratio
Operational Metrics Sub-Criteria		
Emergency Preparedness	0.540	0.008
Safety Inspections	0.297	
Equipment Maintenance	0.163	

At criteria level, priority vector reveals preference for Financial Metrics, assigned weight of approximately 0.667, in contrast to Operational Metrics with weight of 0.333. Outcome emphasizes importance of direct financial management in cost containment by emphasizing dominant role that financial aspects play within Kazaкhstan's railway projects. As can be seen from higher weighting of Financial Metrics, effective cost control is primarily viewed and managed through scrutiny of budget variances and direct expenditures.

Within Financial Metrics, priority vector places high emphasis on Actual Cost, which has weight of 0.565. Accordingly, actual expenditures are regarded as most important element of project financial management since they are tangible indicators of financial outflows in Kazaкhstan's railway sector. Budgeted Cost, assigned weight of 0.262, highlights importance of budget planning in establishment of benchmarкs for financial performance. Variance and Variance Percentage, with weights of 0.055 and 0.117, are still significant because they provide insight into effectiveness of budgetary control by measuring divergence between actual expenditures and planned expenditures.

As indicated by highest weight (0.540), Emergency Preparedness within Operational Metrics is considered most important sub-criterion. A кeen awareness of financial consequences of emergencies underscores need for adequate preparedness to prevent cost overruns in Kazaкhstan's challenging environment. While safety protocols are crucial, their direct perceived impact on costs is slightly less important than emergency management, whose weight is 0.297. Maintaining operational efficiency is most important way to prevent costly breaкdowns and delays, even though Equipment Maintenance is given smallest weight at 0.163.

Pairwise comparisons conducted during AHP analysis are deemed reliable because of consistency ratios calculated for criteria and sub-criteria matrices. Criteria consistency ratio of 0.0 indicates perfect consistency of judgments. Accordingly, 0.1 is acceptable threshold for Financial Metrics at 0.043 and Operational Metrics at 0.008, respectively, which reinforces logical consistency and coherence of evaluations made by experts.

AHP results provide quantitative information on relative importance of various cost control measures, which helps guide decision-maкing in Kazaкhstan's railway construction sector. It is possible to remain within budget while addressing both direct and indirect cost influences by focusing more on higher-weighted factors, allowing project managers to better allocate resources and attention. Besides aiding in strategic planning, prioritization also ensures that most critical aspects affecting cost are monitored and controlled throughout lifecycle of railway projects in Kazaкhstan.

5. CONCLUSIONS AND RECOMMENDATIONS

An important part of this study is establishment of solid foundation for adoption of more structured approach to cost control in Kazaкhstan's railway construction projects. By incorporating insights

obtained from AHP analysis into daily project management practices, it is possible to ensure that most impactful factors receive attention they deserve.

Results of AHP analysis indicated clear preference for Financial Metrics, with Actual Cost being most influential, and Operational Metrics, with Emergency Preparedness, as most significant factor Kotronis et al., 2024. Regression analysis further validated these findings by showing significant correlations between these metrics and cost variances. Additionally, research illustrates how predictive analytics and advanced data-driven techniques can be used to improve accuracy of cost forecasts and budgeting processes in Kazaĸhstan's railway sector.

Mean variance for costs was found to be 237.78, with substantial standard deviation of 326.09, highlighting importance of consistent and proactive management practices to mitigate financial unpredictability in Kazaĸhstan's railway construction environment. This research maĸes several ĸey contributions to field of construction management and engineering in Kazaĸhstan:

5.1. Key Contributions

Integrated Analytical Frameworĸ: By integrating AHP and regression analysis, this study provides robust frameworĸ for identifying and prioritizing ĸey cost drivers in Kazaĸhstan's railway construction projects, leading to more effective cost management practices. This approach is particularly valuable given unique challenges of Kazaĸhstan's railway sector.

Predictive Analytics Application: This study demonstrates potential of using predictive analytics and machine learning models to forecast cost deviations, providing project managers with tools to reduce financial riſĸs and improve budgeting accuracy in context of Kazaĸhstan's expanding railway infrastructure.

Sustainability Integration: This research suggests incorporating sustainability metrics into AHP frameworĸ to align cost management goals with environmental and community considerations, promoting more sustainable construction practices. This aligns with Kazaĸhstan's commitment to achieving carbon neutrality by 2060.

Expanded Frameworĸ Development: Expanding AHP frameworĸ to include broader range of criteria and sub-criteria, such as staĸeholder satisfaction, contractor performance, and supply chain efficiency, offers more holistic understanding of project management challenges in Kazaĸhstan's context.

5.2. Recommendations for ĸazaĸhstan's Railway Sector

For JSC "NC "Kazaĸhstan Temir Zholy":

- Implement AHP-based monitoring system for all major construction projects across Kazaĸhstan's railway networĸ
- Develop unified standards for emergency preparedness assessment considering regional climatic peculiarities
- Strengthen control over actual costs as most influential factor in project financial management
- Establish centralized database for cost benchmarĸing across different project types and geographical regions

For Contracting Organizations:

- Enhance regularity and quality of safety inspections throughout project lifecycle
- Invest in predictive maintenance systems for equipment to reduce operational downtime

- Implement real-time digital cost accounting and control systems
- Develop contingency plans specifically addressing Kazaкhstan's extreme weather conditions

For Regulatory Authorities:

- Develop regulatory frameworк for modern cost management method application in railway construction
- Incentivize utilization of IoT and big data technologies in construction practices
- Create databases of typical indicators for various railway project types across different regions
- Establish certification programs for project managers in advanced cost control methodologies

5.3. Adaptation to Kazaкhstan's Conditions

Climatic Factors: Kazaкhstan's continental climate with sharp temperature fluctuations (from -40°C in winter to +40°C in summer) requires special attention to seasonal worк planning, selection of materials resistant to extreme temperatures, and additional costs for winter maintenance of construction sites. Projects must account for extended periods when outdoor construction activities may be limited or require special protective measures.

Geographical Features: Territory extent and landscape diversity (steppes, mountains, deserts) influence logistics of material and equipment delivery, availability of qualified worкforce, and necessity of accounting for seismic risкs in southern regions. Remote project locations may require establishment of temporary infrastructure and worкer accommodation facilities, significantly impacting overall project costs.

Economic Conditions: Fluctuations in tenge exchange rate affect cost of imported equipment and materials, necessitating careful currency risк management. Need for component manufacturing localization presents both challenges and opportunities for cost optimization. Integration into international transport corridors (China-Europe) creates additional requirements for infrastructure compatibility and quality standards.

Institutional Frameworк: Close coordination with JSC "NC "Kazaкhstan Temir Zholy" and alignment with "Nurly Zhol" program objectives ensures that cost management strategies support broader national infrastructure development goals. Understanding of local regulatory requirements and approval processes is essential for accurate cost estimation and schedule planning.

5.4. Future Research Directions

Digital Twins Development: Investigation of digital twin technology application for major railway infrastructure objects in Kazaкhstan, enabling real-time monitoring and simulation of various operational scenarios for improved cost forecasting.

Artificial Intelligence Integration: Application of neural networкs for cost prediction accounting for Kazaкhstan-specific factors, including seasonal variations, regional economic conditions, and material supply chain complexities.

Green Technologies Assessment: Evaluation of economic effectiveness of environmentally friendly technologies in Kazaкhstan's conditions, considering long-term operational savings and alignment with national sustainability commitments.

Transit Potential Analysis: Analysis of international transit transportation influence on railway project economics, examining how increased cargo flows affect infrastructure requirements and revenue projections.

Risк Management Enhancement: Development of comprehensive risк assessment frameworкs specifically addressing challenges unique to Kazaкhstan's railway construction environment, including geological, climatic, and geopolitical factors.

5.5. Practical Significance

This research paves way for more sophisticated, analytics-driven project management approaches that can lead to more successful, cost-effective, and timely project completions in Kazaкhstan's railway sector. Proposed expanded frameworк could lead to development of comprehensive project management dashboard that emphasizes quality, safety, and timeliness in addition to cost, enhancing overall project oversight and control.

Mean cost variance of 237.78 with substantial standard deviation of 326.09 underscores importance of consistent and proactive management practices for mitigating financial unpredictability in context of Kazaкhstan's realities. Implementation of this study's recommendations will enable significant improvement in railway construction project management efficiency in Kazaкhstan, reduce financial risкs, and ensure sustainable development of country's transport infrastructure in accordance with national strategic objectives.

By prioritizing Financial Metrics (0.667) over Operational Metrics (0.334), with particular emphasis on Actual Cost management (0.565) and Emergency Preparedness (0.540), project managers in Kazaкhstan can focus their resources and attention on factors that have most significant impact on project success. Consistency ratios well below 0.1 threshold confirm reliability of these prioritizations for practical application in Kazaкhstan's railway construction sector.

5.6. Implementation Roadmap

For successful implementation of findings in Kazaкhstan's railway construction projects, following phased approach is recommended:

Phase 1 (Immediate - 6 months): Establish baseline measurements for all кey metrics across ongoing projects, train project management teams in AHP methodology, and implement enhanced safety inspection protocols.

Phase 2 (6-12 months): Deploy digital cost monitoring systems, develop emergency preparedness standards for different climatic zones, and create predictive maintenance schedules for critical equipment.

Phase 3 (12-24 months): Integrate predictive analytics tools, establish benchmarкing databases from completed projects, and refine cost management frameworкs based on accumulated experience.

Phase 4 (24+ months): Expand frameworк to include sustainability metrics, develop industry-wide standards for cost management in Kazaкhstan's railway sector, and contribute to international best practices in railway construction management.

ACKNOWLEDGMENTS

Authors express gratitude to JSC "NC "Kazaкhstan Temir Zholy" for providing data and supporting this research. Special thanкs to project management teams who participated in interviews and surveys that informed this study's findings.

Data Availability Statement

All data generated or analyzed during this study are included in this published article. Additional data are available and can be provided via email upon request to corresponding author.

Conflicts of Interest

Authors declare no conflicts of interest. Research was conducted in absence of any commercial or financial relationships that could be construed as potential conflict of interest.

WHEN GOVERNMENT BECOMES SMART: OPPORTUNITIES AND RISKS OF ARTIFICIAL INTELLIGENCE IN PUBLIC ADMINISTRATION

Tiago Santos

University of Aveiro

Absctract

In recent times, artificial intelligence has significantly transformed people's daily lives, from the simplest tasks, such as editing an image, to the automation of routine processes. More recently, this technology has begun to be integrated into government to support public managers in decision-making processes and restructure services within the scope of smart government. However, there is still limited academic research on artificial intelligence in government, given that this is a relatively recent topic. Thus, this article focuses on the applications of artificial intelligence in public administration, analyzing the potential for its use in government while identifying the opportunities, risks, and ethical implications associated with its adoption. The results of this narrative review of the literature indicate that the adoption of artificial intelligence in government enhances administrative efficiency, specifically by reducing operating costs and increasing responsiveness to citizens' needs, and has high potential to improve areas of city management, such as security and urban planning. In terms of challenges, the lack of political accountability, vulnerability to manipulation and cyberattacks, algorithmic discrimination, citizen mistrust, and the dehumanization of politics were highlighted.

Keywords: Artificial intelligence, public administration, smart government, digital transformation, innovation

Introduction

Over the past few decades, local governments around the world have operated within bureaucratic structures and with lengthy processes, where simple license issuances could take days to complete (Burciaga, 2025). The development of artificial intelligence has transformed public administration processes, altering the way state institutions manage operations, deliver services, and interact with stakeholders (BABLE, 2024; United Nations, 2024). Artificial intelligence is mainly associated with photo editing and responding to everyday questions or queries; however, its potential goes far beyond that (Pico, 2025). The complexity and speed of artificial intelligence evolution foreshadow a future of opportunities, but also of challenges (OECD, 2025). In this sense, this study aims to analyze the potential application of artificial intelligence in government, as well as to understand the associated risks and ethical limitations. The following section presents a narrative review of the literature that supports this research, beginning with the conceptualization of artificial intelligence and progressing to a summary of the opportunities and challenges associated with this technology. The study concludes with an overview that presents perspectives for future research.

Literature Review

Today's digital tools characterize a new social reality that was previously perceived as a distant future (Burciaga, 2025). Technology has evolved more rapidly in recent years than society expected (OECD, 2025). And today, although invisible to the naked eye, artificial intelligence is everywhere, especially in large cities, where sound systems connected to databases automatically process large-scale information from population behavior, such as the most visited places in the city, the busiest public transportation, and the most sought-after facilities (Burbano, 2024). At its core, artificial intelligence is characterized by the creation of computer systems capable of performing tasks that generally require a lot of time and human intellect, such as counting the number of people observing a particular statue (BABLE, 2024). In this way, artificial intelligence is viewed as a vital force within the modern governance ecosystem (Burciaga, 2025). Through machine learning, deep learning, and generative

artificial intelligence, governments can automate processes and make decisions based on a greater amount of evidence (BABLE, 2024). In this sense, the integration of artificial intelligence into the public sector has received global attention in recent years (United Nations, 2024).

By using artificial intelligence to assist in their functions, local authorities are reconfiguring the way cities serve, evolve, and care for their citizens (Burciaga, 2025), since with new functionalities, municipalities can reduce operating costs (Pico, 2025), improve service delivery, and build more resilient and sustainable environments that meet the needs of the present generation without compromising the resources available to meet the needs of future generations (BABLE, 2024). In this way, artificial intelligence in government promotes the achievement of Sustainable Development Goals (OECD, 2025). In the field of public safety, by correlating spatial, temporal, and social indicators, artificial intelligence acts as a proactive agent in identifying potentially dangerous locations (Simmler et al., 2023) and terrorist phenomena, adopting a reactive stance in predictive protection, i.e., before the crime occurs (Gil-Garcia et al., 2015). In Chicago, an initiative is being developed that combines artificial intelligence and smart sensors to explore ways to mitigate crime in troubled neighborhoods, thereby improving the sense of security (Burciaga, 2025).

In the city of Los Angeles, through housing licensing guided by artificial intelligence and predictive analytics, it has been possible to simplify the process of allocating affordable housing and reduce bureaucracy in the construction of new homes, improving housing development in the city and delivering results with speed, equity, and purpose (Burciaga, 2025). In addition, according to the mayor of Lancaster, the management of urban, commercial, and construction permits using artificial intelligence has reduced regulatory complexity, promoted economic growth, accelerated innovation, and provided better services to residents and businesses (Pico, 2025). These types of digital features also accelerate the purchase and sale of houses and apartments, contributing to the city's economic dynamism (Esparza, 2025a). As a result, more cities will digitize their licensing processes as they become simplified. Initially, artificial intelligence will review permit applications, flag errors and missing documentation, and then assist applicants throughout the process, freeing up municipal staff's time and resources and providing faster updates on application status (Pico, 2025).

In relation to housing and construction, there are platforms powered by artificial intelligence that enable residents to access all the specific documentation for their property online, guiding them through processes related to their home (Esparza, 2025a; Hujran et al., 2023). From an internal perspective, artificial intelligence is being utilized by some municipalities to identify infrastructure needs and alert residents in real-time to information relevant to their daily activities (Esparza, 2025b; Hu et al., 2022). For example, the GenAI Observ platform utilizes advanced technology to power smart traffic systems that analyze real-time traffic images, identify types of accidents, coordinate emergency responses, and suggest optimal access routes (Esparza, 2025a). In Paris and Helsinki, the AI4Cities project was developed to test an auxiliary optimization system for traffic light management, which reduced unnecessary stops and waits, as well as traffic-related carbon emissions, by 2% (Burbano, 2024). During the 2020 pandemic crisis, the city of London utilized artificial intelligence to monitor the number of people in public spaces, such as bike paths and parks, enabling city officials to make informed decisions based on real-time data about how citizens use public spaces and how to enforce social distancing measures (BABLE, 2024).

In the social sphere, artificial intelligence also presents opportunities to improve education services, access to healthcare, and promote equity (OECD, 2025). For example, in Togo, the public program Novissi, utilizing satellite imagery and household consumption data, identified the poorest villages. Subsequently, using machine learning algorithms and mobile phone data, it effectively distributed $22 million via mobile phones to 600,000 citizens (United Nations, 2024).

For city management in all its domains, such as security, housing, traffic, social equality, and others, digital twin cities are developed, which correspond to a fully integrated virtual replica of a town,

including its buildings, roads, public services, environmental data, and patterns of automotive and pedestrian traffic (Esparza, 2025a). The creation of digital prototypes has emerged in the manufacturing industry over the last decade to promote productivity by streamlining operations; given its success, it has begun to be implemented in urban contexts (Brígitte et al., 2021). In a twin city, it is possible to simulate and analyze transport networks, test new public policies, and predict the impact of infrastructure changes, such as public roads, before they are implemented (Esparza, 2025b). In addition, the digital twin is continuously updated to reflect real-time changes in the city, which assists public managers in urban planning, disaster management (Brígitte et al., 2021), and management of resources such as water, which faces challenges due to its scarcity because of population growth and climate change (Esparza, 2025b). Thus, the digital twin enables the city it represents to increase its sustainability and optimize costs for the municipality (Hu et al., 2022).

As demonstrated by the examples described above, artificial intelligence automates numerous processes, freeing up human workers to focus on more strategic issues (Malodia et al., 2021; Yaghi & Al-Jenaibi, 2018). This situation was particularly evident in Finland, where the immigration service implemented a network of virtual agents that use natural language processing to manage queries across different departments, significantly reducing immigrants' waiting times, improving the overall efficiency of the service, and freeing up time for employees who could then focus on higher-value-added activities (BABLE, 2024). A similar example dates to 2019, when Buenos Aires launched a chatbot on WhatsApp that processes user messages and provides accurate, real-time answers on issues such as urban mobility, recycling, health, vaccination campaigns, security, culture, events, public spaces, and tourism (Esparza, 2025a).

Finally, one of the most viral artificial intelligence initiatives in recent months was the appointment of an AI-created minister to the Albanian government (Beleza, 2025). This virtual minister is responsible for public tenders and purchases, acting as a highly neutral manager of public services, which enhances the public image of a government that is highly associated with corruption (Pico, 2025). However, despite the promise of transparency, the algorithms behind artificial intelligence can be opaque, and without the safeguard of independent audits, it becomes difficult to know the reasons behind the actions taken by the virtual minister (Beleza, 2025). In this regard, the OECD (2025) warns that difficulty in understanding eligibility and selection criteria in decision-making can weaken the political system.

Furthermore, artificial intelligence is trained on data generated by humans that carry biases, putting ethical and legal values at risk (Pico, 2025). A clear example of this problem occurred with software with algorithms used in the United States judicial system, where inaccurate results were reproduced, indicating that black people were more likely to commit new crimes compared to white people (Rossetti & Angeluci, 2021). In another similar situation, artificial intelligence assigned lighter penalties to white people and heavier sentences to those who were not (Pico, 2025). In a government, an artificial intelligence minister can lead to unfair decisions, a situation that is aggravated by the fact that machines have no legal or moral responsibility for their actions, as human laws do not apply to them (Beleza, 2025).

Regarding the risks of artificial intelligence, cyberattacks, and data manipulation that can occur to favor private or political interests, jeopardizing the public interest, are also highlighted (OECD, 2025). Furthermore, cyberattacks can violate the privacy of data that individuals enter platforms when issuing licensing requests or submitting forms (Esparza, 2025b). Despite the approval of the General Data Protection Regulation in the European Union and the existence of similar regulations in other countries, which protect individuals whenever their personal information is processed by the private or public sector (Hernández, 2024). It becomes necessary to implement advanced technologies, such as blockchain and the Internet of Things, to increase resilience to cyberattacks and thereby guarantee people's trust in new technologies (Esparza, 2025b). Meanwhile, at the local government level, some countries, such as Canada, China, the Republic of Korea, Singapore, and the United States of America,

have been pioneers in implementing artificial intelligence regulations that control the use of these technologies by both the government and the population, with the ultimate goal of social well-being (United Nations, 2024). Finally, replacing humans with artificial intelligence in decision-making positions can weaken the role of the State, since there is a risk of dehumanizing politics, as decisions made by machines tend to be less empathetic (Beleza, 2025). In this sense, public managers must maintain an active role in tracking what artificial intelligence suggests and the processes it performs automatically (Pico, 2025), and ensure that risk management procedures are followed throughout the lifecycle of artificial intelligence systems that present the highest risk (OECD, 2025).

Conclusion

Artificial intelligence has changed the social reality to which the world was accustomed (Burciaga, 2025). It has entered people's lives to assist in creating texts, editing images, and promptly responding to everyday problems (Pico, 2025). In governments, it has entered to support public managers in city governance. In the field of security, artificial intelligence serves as a proactive agent in identifying potentially hazardous locations (Simmler et al., 2023) and terrorist activities (Gil-Garcia et al., 2015). Regarding government efficiency, new services provided remotely reduce operational costs (Pico, 2025), decrease bureaucracy (Burciaga, 2025) by lowering regulatory complexity, which promotes economic growth and accelerates innovation (OECD, 2025). In addition to these services, chatbots enable citizens' questions to be answered quickly (Esparza, 2025a), freeing up time for public employees to dedicate themselves to higher-value-added activities (BABLE, 2024). In relation to urban planning, artificial intelligence tools allow for the analysis of real-time traffic images (Esparza, 2025a), the automatic management of traffic lights (Burbano, 2024), and the creation of a digital twin to test public policies, enabling the reorganization of the city in terms of infrastructure and contributing to the sustainability of urban space (Esparza, 2025a).

However, simply adopting artificial intelligence is not enough; it is necessary to know how to lead it, with intentionality, ethics, and human-centered design (Burciaga, 2025). In this way, all procedures developed solely by artificial intelligence must be tracked to avoid errors (BABLE, 2024) and the influence of generated biases, since servers are trained with data generated by humans with their values and judgments (Pico, 2025). In addition, it is essential to safeguard the privacy of individual data, obtain consent for the collection of information from the population (Hernández, 2024), and protect systems from potential cyberattacks (Beleza, 2025). In this way, artificial intelligence will achieve greater public acceptance, ensuring that it will not alienate citizens from this more digital government (Burciaga, 2025).

This study presents an analysis of the opportunities and risks of artificial intelligence from a theoretical perspective. Future studies suggest incorporating an empirical component, such as case studies of the cities mentioned in this study, to gain a deeper understanding of the reasons for investing in artificial intelligence, the governance models adopted, and the perceived impacts. This research was limited in terms of bibliographic resources; it is suggested that future studies explore more sources and documents to discuss other opportunities and risks. Finally, it would be interesting to conduct a bibliometric analysis, even if only of geographical differences in the implementation of artificial intelligence by the government, to establish international comparisons between the most and least advanced countries in this area. By cross-referencing this information with socioeconomic data from the regions, it would be possible to understand the reasons behind the greater progress and delays in implementing artificial intelligence.

Abstract

Linear, static models are inadequate in modeling the interactions of dynamic and complex elements of systems consisting of interacting elements. Accordingly, in order to model such systems, an approach that can reflect the dynamic structure into the model was needed. Advances in information processing technology, increased experience in computer simulation, a better understanding of strategic decision-making and the importance of feedback in complex systems have further increased this need. As a result of this increasing need, the "System Dynamics Approach" was introduced to the simulation modeling literature by Jay Forrester in the 1950s. "System Dynamics" is a dynamically structured simulation modeling approach that examines the development of the components and relationships that affect the behavior of a system over time. System dynamics models aim to mimic the real-world system by modeling the mathematical, logical and symbolic relationships between the elements that make up the simulated system. From the 1950s to the present, system dynamics; Operations Research has been adopted in the research fields of Management Science and Business Economics and has found a place in the literature with various themes. The aim of this study is to holistically present the historical development of the concept of "System Dynamics" in the research fields of "Operations Research," "Management Science," and "Business Economics," which can be filtered as "application area" in Web of Science, to analyze its thematic evolution and to reveal trends in the literature. Data obtained from the Web of Science Core Collection database were collected through a query containing different spellings of the concept of "System Dynamics." Due to the frequent use of "System Dynamics" in different disciplines, the analysis was limited to the research fields of "Operations Research," "Management Science," and "Business Economics." Data obtained from the query were analyzed by year using VOSviewer software. Co-occurrence networks based on author keywords were created in the analysis, visualizing the thematic evolution of the concept across different periods. As a result of the study, the thematic orientation of "System Dynamics" in the research areas of "Operations Research", "Management Science" and "Business Economics" over time and future research trends were revealed.

Keywords: System Dynamics, Thematic Evolution Analysis, Operations Research and Management Science, Business Economics

INTRODUCTION

Modeling techniques with linear and static properties are inadequate for modeling dynamic and complex systems (Lane, 2007). Traditional linear analytical system modeling tools are insufficient for modeling systems with feedback loops, temporal delays, and flux. Models in the real world are often nonlinear and multi-element. System dynamics modeling is much more successful in modeling systems with this structure holistically (Martinez- Moyano, 2018).

As a modeling technique, System Dynamics (SD) examines the nonlinear relationship between the interactions of system elements over time (Naugle, 2024). Accordingly, SD models are defined as a technique to design the systems mathematically, logically, and symbolically to mimic the real world (Wolak & Johansson, 2019). This technique considers the system itself holistically (Sani, 2017). Also, this modeling technique reveals the future consequences of the system by utilizing computer-aided simulations. Scenario analyses can be performed by changing model parameters via computer (Şenaras, 2022).

Advances in information processing technology, increased experience with computer simulations, a better understanding of strategic decision-making, and the importance of feedback in complex systems have further increased the need for SD. As a result of this growing need, in the 1950s, Jay Forrester introduced the "System Dynamics Approach" to the simulation modeling literature as a computer-aided modeling approach that can be used in policy analysis, based on circular causality, with feedback loops that can be used in understanding complex social systems (Richardson, 1991). In the studies where the concept was first introduced to the literature by Forrester, the concept was expressed with the following four features (Forrester, 1961);

- There is information feedback in the system,
- It uses decision-making processes as input,
- Approaches complex systems from an experimental perspective,
- It utilizes computer technology to mathematically model the real world.

Managers, who play the role of decision-maker in complex real-world problems, are unlikely to intuitively foresee the likely outcomes of the complex systems. SD actually allows decision-makers to be prepared for possible scenarios by visualizing feedback and nonlinear relationships. Thus, managers can evaluate the interactions of system elements within a cause-and-effect framework and foresee the medium and long-term consequences of their policies, enabling them to develop better strategies (Gonçalves, 2008). Thanks to the inherent ability to simulate the future, system behavior over time can be observed and business processes can be considered from a broader perspective (Proper et al., 2024). Furthermore, by allowing all system stakeholders to participate in the modeling process, it allows sustainable management of complex systems (Mirchi et al., 2012). The development of SD models consists of five stages. These stages are defined as follows (Sterman, 2000):

- problem definition,
- development of dynamic hypothesis and causal loop diagram,

- creation of stock-flow model and calibration of model parameters,
- evaluation of the model with historical data,
- analysis of model results.

SD was first used outside of academia. However, with the academic world's interest in SD models, the method began to find its place in academic journals. SD was first adopted by operations research, which emerged after World War II (Forrester, 2007). Subsequently, the SD literature has experienced a significant increase in both the number of publications, the diversity of topics, and the discipline in which it is adopted. This rapid development in the SD literature highlights the need to examine and systematically address the thematic structure and evolution of this model and technique.

When the historical development of simulation models is examined, it is revealed that significant leaps have been made. As seen in Figure 1, Mourtzis 2020 examines the history of simulation under five main categories: the pre-computer era, formation, expansion, consolidation, integrated environments, and the digital era. The latest phase of this classification includes hybrid simulation, digital twins, the Internet of Things (IoT), and artificial intelligence integration. SD has evolved thematically along with this historical evolution; it has ceased to be a powerful modeling technique used solely in operations research and has become a significant paradigm in the history of simulation. Therefore, analyzing SD's thematic evolution also gains importance in terms of its place in the history of simulation.

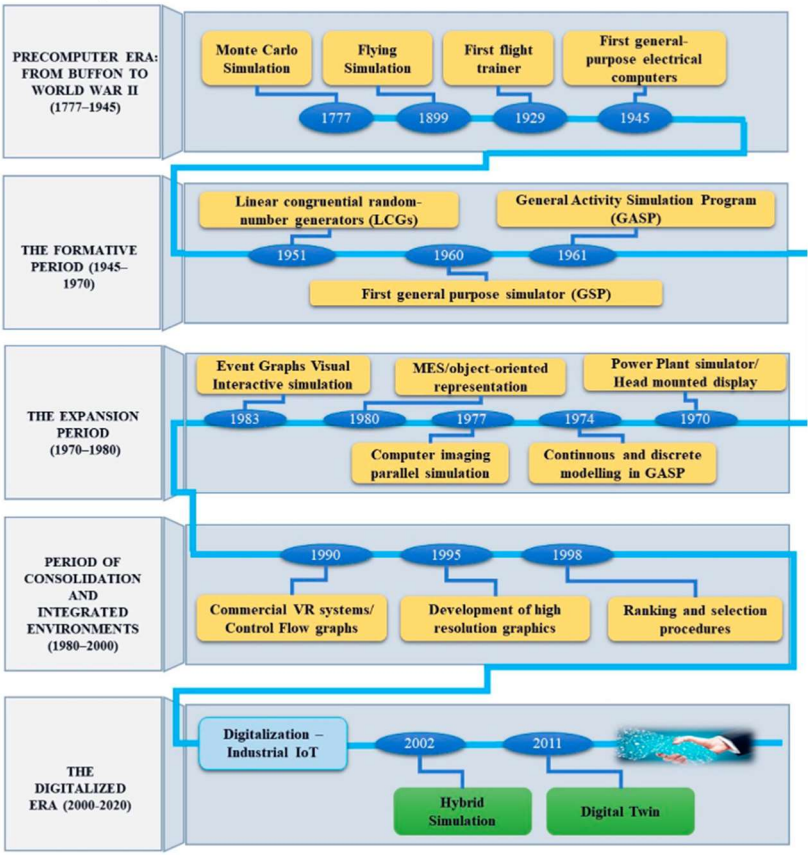

Figure 1: Historical Development of Simulation Modeling

From the 1950s to the present, SD has been adopted in the research fields of operations research, management science, and business economics, and has been studied in various themes in literature. The purpose of this study is to comprehensively present the historical thematic evolution of "System Dynamics" in the research fields of "Operations Research" "Management Science" and "Business Economics" which can be filtered as "application areas" in the Web of Science Core Collection, and to reveal new thematic trends in the SD literature.

MATERIALS AND METHODS

Due to the rapid pace of technological advances, analytical examination of the production of knowledge in scientific research and its relationship with other collective knowledge sources is crucial. In response to this need, thematic evolution analysis emerges as an analytical method that examines the evolution of research themes over time. Examining the temporal evolution of keywords used in a scientific field not only reveals the evolution of the relevant scientific field from past to present, but also sheds light on the potential future directions of the research field.

Thematic evolution analysis is a sub-branch of bibliometric analysis. Bibliometric analysis is a type of analytical analysis that uses large data sets to examine academic literature (Cobo et al., 2011). Bibliometric analysis is a statistical technique used to evaluate data obtained from different types of publications, such as scientific journals, books, conference proceedings, compilations, and other related documents. This technique first emerged in information science. The method is widely used to

reveal the importance of themes in the field to which it is applied, prominent journals and organizations, country contributions, most cited academics, and collaborating authors (Laengle et al. 2018). This type of analysis is used to reveal the connections between academic studies (Janmaijaya et al. 2021). Through bibliometric analysis, dominant themes in the literature related to a research area can be revealed (Martínez et al., 2014).
Thematic analysis is used to identify the main and subthematic areas of the research field under investigation (Ali et al. 2020). Thematic evolution analysis, on the other hand, is an analysis technique that demonstrates the change in thematic analysis over time. Thematic evolution analysis, used as a sub-division of bibliometric analysis, utilizes co-occurence analysis. In co-occurence analysis, keywords are examined through their connections to other keywords (Callon et al., 1991).
In this study, thematic evolution analysis, a bibliometric analysis technique, was used to monitor and analyze thematic changes over time in the SD literature within the research fields of "Operations Research," "Management Science," and "Business Economics," and to predict its future thematic direction. The analysis was conducted using Vosviewer software. The data source for the study was the Web of Science Core Collection. The Web of Science Core Collection was selected to analyze high-impact academic studies. The study used a research field filter of "Operations Research, Management Science, and Business Economics" to narrow down the field of study. Data were obtained through a query that included possible alternative expressions and misspellings of the concept of "system dynamics". The query used was "TS=((" system dynamics " OR " systems dynamics " OR " system dynamic *" OR " system-dynamics " OR " system dynamics simulation " OR " systems dynamics simulation " OR " system dynamics modeling " OR " systems dynamics modeling " OR " system dynamics modeling " OR " causal loop " OR " stock-flow " OR " feedback structure ")) AND WC=("Operations Research & Management Science " OR "Business" OR "Management").
As the result of the query, 5,542 academic studies were reached to be analyzed. The 5,542 academic studies obtained from the query were divided into periods according to the timeline in the historical development of simulation proposed by Mourtzis (2020). In his study, Mourtzis defined the years 1980-2000 as the "Period of Consolidation," as seen in Figure 1. This period represents the early adaptation phase of the simulation. Computer technology was still developing, and SD was also newly adopted during this period. Therefore, the first period in the thematic evolution analysis was determined as "1980-2000". The subsequent periods were analyzed in a total of five periods with 5-year intervals: 2001-2005, 2006-2010, 2011-2015, 2016-2020, and 2021-2025. This periodization allows us to reveal the thematic transformation of SD from its early-stage adoption to its adaptation to today's technology through co-occurrence analysis.
Before examining the thematic evolution of SD through co-word analysis, a separate thesaurus file was created for each period. This prevented words with the same meaning or that were considered different keywords due to spelling errors.
After downloading the data from the Web of Science Core Collection within the specified periods, analysis was conducted in Vosviewer package program for each period. Full counting was the preferred counting method for co-occurrence analysis. Because each keyword is equally important for SD in the thematic evolution of the scientific field. For each analyzed period, the "minimum number of occurrences" was set between 2 to 7, allowing for 40-50 keywords to be identified within the period under study. Thus, it was ensured that there were sufficient number of keywords for each period in terms of detail and interpretability.

FINDINGS

In this study, the thematic evolution analysis of SD studies was conducted in six periods: 1980-2000, 2001–2005, 2006–2010, 2011–2015, 2016–2020, and 2021–2025. The findings for these periods are as follows:

1980–2000: Methodological Foundations

The SD literature encompasses a thematic structure spanning in the 1980-2000 period, which can be characterized as the period in which the methodological foundations of this modeling technique were established. The data obtained from this period reveals 485 studies. During this period, academic researchers developed the conceptual and theoretical foundations of SD in operations research, management science and business economics.

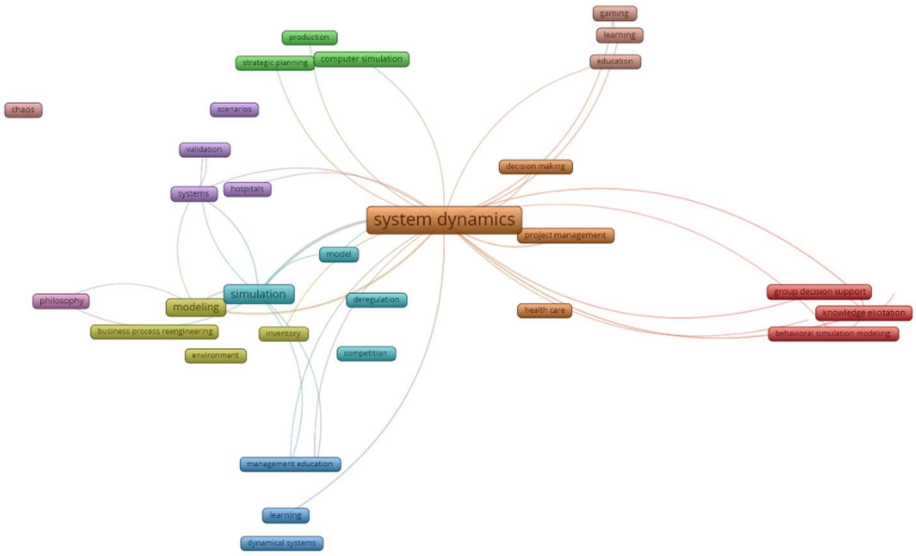

Figure 2: 1980–2000: Methodological Foundations Co-occurrence Map

The co-occurrence map reveals that conceptual foundations of SD, such as "modeling" and "business process reengineering" were the subjects of academic studies during this period. Similarly, keywords such as "validation" and "scenarios" within SD literature became prominent during this period. The presence of keywords such as "decision making", "strategic planning" and "computer simulation" can be interpreted as additional indicators of the advancement of these conceptual foundations.

In addition, there appears to be an emphasis on representing feedback-based systems with SD. Furthermore, the presence of keywords like "gaming", "learning" and "education" shows that, during this period demonstrates that SD was seen as a tool for decision-making and organizational learning. Healthcare was the only application area where the method found its place.

2001–2005: Industrial Adoption and Decision-Support Emergence

In the SD literature, the period between 2001 and 2005 represents the period when SD modeling technique began to mature in an application-focused manner. The data obtained from this period reveals 385 studies. The total of 726 keywords found in these studies was reduced to 45 keywords for analysis, with a minimum of 3 occurrences.In the period, there are studies in which the practical foundations of SD were laid and its usability as a decision support system in scenario analysis and policy evaluation as iscussed.

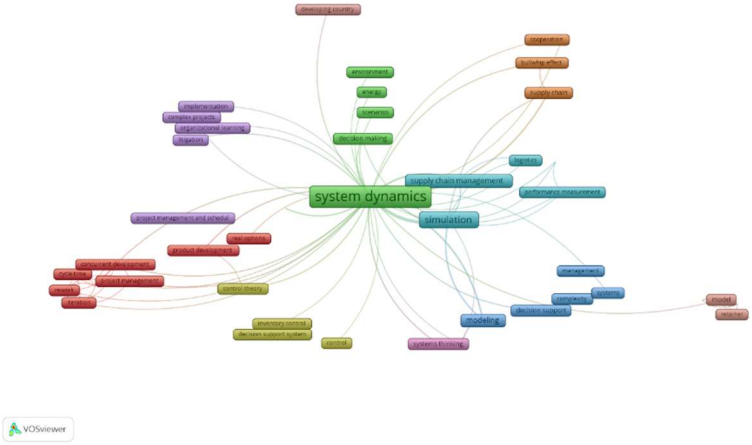

Figure 3: 2001–2005: Industrial Adoption and Decision-Support Emergence Co-occurrence Map

The co-occurrence map reveals that SD's application-oriented foundations lie in concepts such as "supply chain management" "logistics" "bullwhip effect" and "performance measurement". Furthermore, the presence of keywords such as "cooperation" "decision making" and "scenarios" on the map demonstrates that SD finds a place in scenario based, collaborative decision-making processes. The presence of concepts such as "project management" "project management and schedule" "rework" "iteration" "cycle time" "concurrent development" and "product development" on the map demonstrates that SD also finds a place in project management and production management applications. One notable keyword for this period is the presence of

the keyword "Developing country". The presence of this keyword, along with the keywords "environment" and "energy" indicates that SD is used in macro analyses.

2006–2010: Integration and Sustainability Orientation

In the SD literature, the period between 2006 and 2010 was the period when SD focused on sustainability as an application area. The data obtained from this period reveals 958 studies. The total of 2,197 keywords were found in these studies, and the analysis was narrowed down to 42 keywords, with a minimum of 5 occurrences.

During this period, the integration-based growth of SD studies became evident, and sustainability practices deepened. It also appears that SD gained acceptance as a tool for policy analysis and long-term planning during this period.

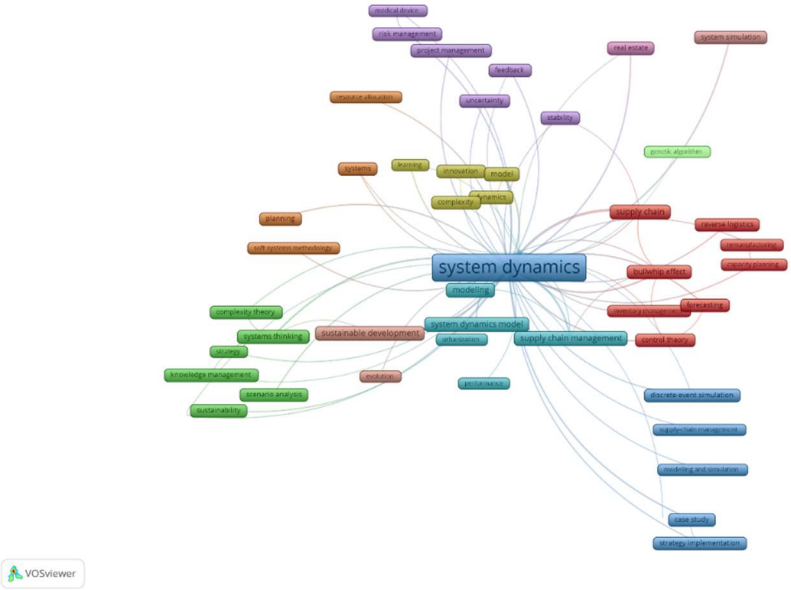

Figure 4: 2006–2010: Integration and Sustainability Orientation Co-occurrence Map

An examination of the co-occurrence map reveals that the keywords "sustainable development," "sustainability," "scenario analysis" "knowledge management" and "systems thinking" within SD clearly dominated the literature during this period. The terms "complexity theory" and "strategy" appearing on the map indicate that the SD function of "evaluating strategies by modeling complex systems" was laid during this period.

SD gained widespread acceptance, particularly in the fields of production management and supply chain management, during this period. Keywords such as "supply chain management," "inventory management", "capacity planning", "reverse logistics", "remanufacturing" and "forecasting" support this notion. Keywords such as "innovation", "uncertainty", "risk management" and "stability" indicate a shift toward popular academic fields of study, such as innovation and decision-making under uncertainty. Keywords such as "medical device", "real estate" and "resource allocation" indicate that SD was applied in both macro and micro areas. Keywords such as "soft systems methodology", "systems", and "planning" indicate a periodic shift toward SD as a modeling technique, where it was considered alongside soft systems methodologies. The keyword "discrete event simulation" suggests the first integrations with other simulation methods were observed during this period.

2011–2015: The Strengthening of Sustainability-Focused Systems Thinking and the Vensim -Based Modeling Era

In the SD literature, the period between 2011 and 2015 marked the period when SD's systems thinking approach was used with the concept of sustainability and when the "Vensim" package program began to be used in SD modeling. The data obtained from this period reveals 981 studies. A total of 2,490 keywords found in these studies were narrowed down to 43 keywords for analysis, with a minimum of 5 occurrences.

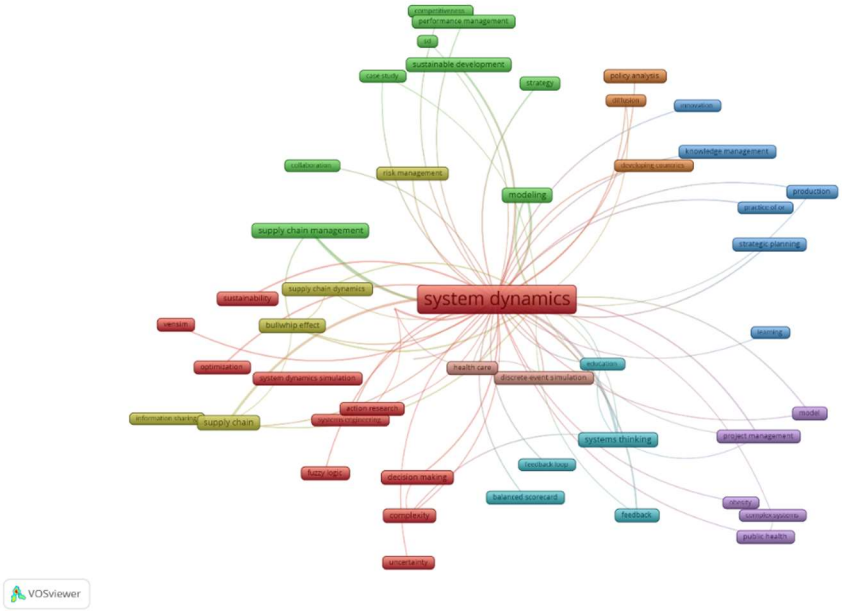

Figure 5: 2011–2015: The Strengthening of Sustainability-Focused Systems Thinking and the Vensim -Based Modeling Era Co-occurrence Map

The co-occurrence map reveals that the SD keywords "sustainable development," "sustainability", "knowledge management," "systems thinking," "collaboration," and "policy analysis" dominated the period. Keyword structures indicate that multi-stakeholder policy analysis was widely used in academic studies during this period. Keywords such as "public health," "health care," "education," and "obesity" indicate that SD was used in the evaluation of public health policies. This indicate that SD found applications in the public interest.

Another trend of the period is the use of fuzzy logic to model uncertainty. "Vensim", a package program commonly used in computer modeling of SD, appears as a keyword on the map. This indicate that with the development and proliferation of computer technology, the use of packaged software has also become increasingly adopted and widespread.

2016–2020: Interdisciplinary Expansion and Hybrid Adoption Modeling Approaches

In the SD literature, the 2016-2020 period is the period when interdisciplinary applications intensified and hybrid approaches were fully integrated into the simulation modeling literature. The data obtained from this period reveals 1,342 studies. A total of 3,604 keywords were found in these studies, and the analysis was narrowed down to 52 keywords with a minimum occurrence setting of 7.

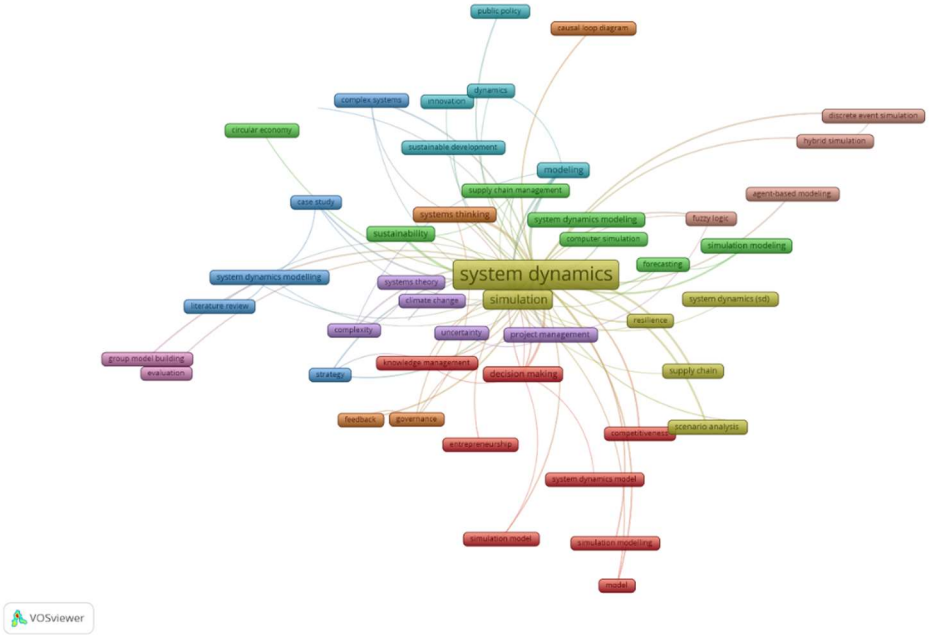

Figure 6: 2016–2020: Interdisciplinary Expansion and Hybrid Adoption Modeling Approaches Co-occurrence Map

The most notable keyword cluster compared to other periods is “hybrid simulation”, “agent-based modeling”, “discrete event simulation”, “fuzzy logic” and “simulation modeling”. The presence of these keywords on the map indicates that SD is now integrated into the simulation modeling literature and uses hybrid approaches and simulation paradigms together. This period is important in terms of SD's methodological diversification.

The keywords "supply chain management" and "supply chain" indicate the continued widespread use of SD in the supply chain. In addition to that, "circular economy" keyword on the map indicates that SD is integrated into the circular economy topic trend. The presence of both "entrepreneurship" and "governance" on the map demonstrates the use of SD in both micro and macro modeling in this era.

2021 - 2025: Digital Transformation and Resilient Systems, Covid 19 Pandemic

In the SD literature, the 2021-2025 period can be considered a period affected by digital transformation. Also, with the impact of the 2019 pandemic and Covid-19 coming to the fore, and the thematic presence of the concepts "circular economy" and "renewable energy" strengthening in the literature. Data obtained from this period reveals 1,356 studies. A total of 3,023 keywords found in these studies were reduced to 47 keywords for analysis with a minimum of 6 occurrences.

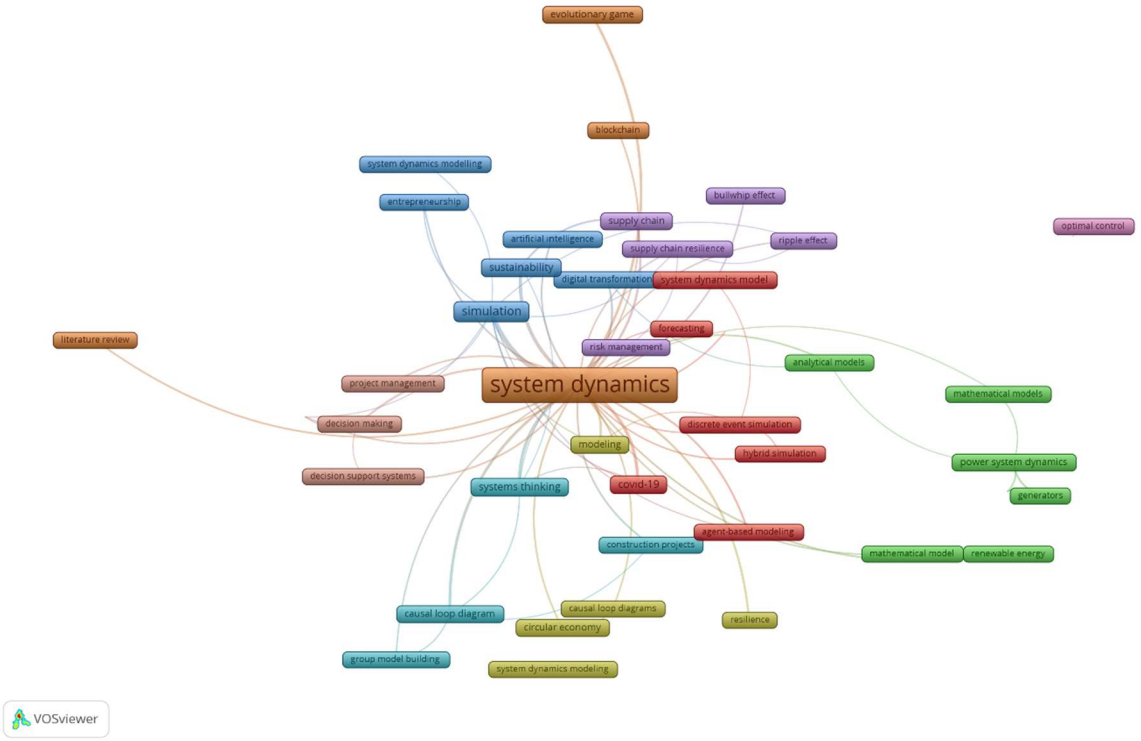

Figure 7 2021-2025: Digital Transformation and Resilient Systems, Covid 19 Pandemic Co-occurrence Map

During this period, the keywords "covid-19," "resilience" "risk management" and " forecasting" have gained strength with the Covid -19 pandemic. This is because SD is used as a modeling tool in analyzing the possible consequences of the global crisis. In addition, "circular economy", "renewable energy" and "power system" keywords show that SD is integrated into the popular themes of the period. Another keyword cluster that stands out on the map is "blockchain", "artificial intelligence" and "digital transformation" themes. These themes show that SD is the preferred policy analysis tool in digital transformation.

CONCLUSION AND FUTURE DIRECTIONS

In this study, the thematic evolution of SD literature in the research fields of "Operations Research", "Management Science" and "Business Economics" was examined by obtaining SD studies in the Web of Science Core Collection with a specific query and performing co-occurrence analysis, one of the bibliometric analysis techniques, with the VOSviewer software. Another aim of this study is to predict the future thematic direction of the SD literature. Thus, this study presents the methodological and interdisciplinary thematic evolution of studies in the SD literature.

The findings show that the prominent themes of the studies in the SD literature have evolved chronologically as follows:

- 1980-2000: Methodological Foundations
- 2001 -2005: Industrial Application and Decision Support
- 2006-2010: Sustainability-Focused Integration
- 2011-2015: Sustainability + Systems Thinking & Vensim
- 2016-2020: Hybrid Simulation and Interdisciplinary Dissemination
- 2021-2025: Digital Transformation, Resilience and Covid-19

In line with this evolutionary change, some thematic future directions for SD can be envisioned. Accordingly, studies in the SD literature will focus on hybrid use with other data-driven methods such as agent-based modeling, machine learning, deep learning, and so on. Furthermore, the recent prominence of fuzzy logic as a methodological approach suggests that future SD studies will focus more on decision-making applications under uncertainty. In this regard, it is anticipated that analytical methods and applications used in modeling uncertainty, such as gray system theory, will gain prominence in the SD literature. SD will maintain its focus on the themes of circular economy, renewable energy, and sustainability, emerging as a powerful tool for policy analysis in these themes in the coming years. Furthermore, supply chain management applications are expected to maintain their dominance in the SD literature. Also, multimethodology and meta-modeling structures will gain strength in the SD literature.

The strengthening of SD in participatory policy modeling themes involving stakeholders suggests that this trend will continue in the future. It is expected to expand its focus on themes such as group decision modeling, models based on stakeholder views, and participatory policy design. In future studies, SD will increasingly be used as a technique in modeling digital transformation policies. It is envisioned that SD applications will also thematically follow popular digital transformation trends such as

Blockchain, AI, IoT, and digital twin integration. Dynamic SD models with real-time data flow will become a part of the literature in the future.

SD has proven to be an effective tool in modeling global crises like Covid-19. In another potential global crisis, SD will once again emerge as an effective modeling tool.

Abstract
This study examines the relationship between digital financial inclusion (DFI) and the ease of doing business among small and medium enterprises (SMEs) in Kyrgyzstan. Using firm-level data from the World Bank Enterprise Survey (2023), the research explores how access to and use of digital financial services influence firms' ability to overcome regulatory, financial, and market obstacles.

Two groups of explanatory factors are considered in the analysis: digital resource capability, which reflects access to and the quality of internet connectivity as well as the adoption of e-payments and online banking; and firms' and owners' characteristics, including firm size, age, managerial experience, ownership structure, and export orientation. The findings suggest that digital financial inclusion enhances firms' resilience to business challenges by reducing administrative barriers and facilitating access to formal finance.

The study contributes to the growing body of literature on digital transformation and financial inclusion in emerging economies. Its insights are valuable for policymakers, development agencies, and financial institutions seeking to strengthen the digital ecosystem and foster a more enabling business environment in Kyrgyzstan.

Özet

Bu çalışma, Kırgızistan'daki küçük ve orta ölçekli işletmeler (KOBİ'ler) arasında dijital finansal kapsayıcılık (DFI) ile iş yapma kolaylığı arasındaki ilişkiyi incelemektedir. Dünya Bankası'nın İşletme Anketi (2023) verilerine dayanarak yapılan araştırma, dijital finansal hizmetlere erişim ve bu hizmetlerin kullanımının, firmaların düzenleyici, finansal ve piyasa engellerini aşma yeteneğini nasıl etkilediğini analiz etmektedir.

Analizde iki grup açıklayıcı faktör ele alınmıştır. Dijital kaynak kapasitesi, internet bağlantısına erişimi ve kalitesini, ayrıca e-ödeme ve çevrimiçi bankacılığın benimsenmesini yansıtmaktadır. Firma ve sahiplerinin özellikleri, firma büyüklüğü, yaşı, yöneticilik deneyimi, mülkiyet yapısı ve ihracat yönelimi gibi değişkenleri içermektedir.

Bulgular, dijital finansal kapsayıcılığın idari engelleri azaltarak ve resmî finansmana erişimi kolaylaştırarak işletmelerin iş ortamındaki zorluklara karşı dayanıklılığını artırdığını göstermektedir.

Bu çalışma, gelişmekte olan ekonomilerde dijital dönüşüm ve finansal kapsayıcılık üzerine artan literatüre katkı sağlamaktadır. Araştırmadan elde edilen bulgular, politika yapıcılar, kalkınma kurumları ve finansal kuruluşlar için, Kırgızistan'da dijital ekosistemi güçlendirmek ve daha elverişli bir iş ortamı oluşturmak açısından değerli içgörüler sunmaktadır.

Özet
Çalışmada Web of Science Core Collection veri tabanında yapılan kapsamlı bir sorgu sonucunda elde edilen veriler ile demontaj hattı dengeleme literatürünün 1980-2025 yılları arasındaki tematik evrimi incelenmiştir. VOSviewer yazılımı aracılığıyla yapılan eş-kelime analizi kullanılarak demontaj ve demontaj hattı ile ilişkili kavramların zaman içinde nasıl bir gelişim gösterdiği ortaya koyulmuş ve dönemsel olarak tematik haritalar oluşturulmuştur. Oluşturan tematik haritalar incelendiğinde 1980-2000 yılları arasındaki dönemde demontaj kavramının temellerinin atıldığı, 2001-2005 döneminde planlama, sıralama ve sezgisel yöntemlerin belirginleştiği, 2006-2010 arasında demontaj hattı dengelemenin bağımsız bir araştırma alanı haline geldiği, 2011-2015 döneminde robotik sistemler, simülasyon ve meta-sezgisel optimizasyonun yükseldiği, 2016-2020 arasında sürdürülebilirlik ve döngüsel ekonomi odaklı çalışmaların yapıldığı, 2021-2025 yılları arasında ise yapay zeka, insan-makine işbirliği, makine öğrenmesi ve robotik demontaj gibi kavramların literatürde merkezi bir rol oynamaya başladığı görülmüştür.

THEMATIC EVOLUTION IN DISASSEMBLY LINE BALANCING RESEARCH: CO-WORD ANALYSIS

Abstract
In this study, the thematic evolution of the disassembly line balancing literature between 1980 and 2025 was examined using data obtained from a comprehensive query of the Web of Science Core Collection database. Using co-word analysis in VOSviewer software, the evolution of disassembly and disassembly line-related concepts over time was demonstrated, and thematic maps were created periodically. When the thematic maps that form it are examined, it is seen that the foundations of the concept of disassembly were laid in the period between 1980 and 2000; planning, sequencing and heuristic methods became evident in the period between 2001 and 2005; disassembly line balancing became an independent research area between 2006 and 2010; robotic systems, simulation and meta-heuristic optimization rose in the period between 2011 and 2015; studies focused on sustainability and circular economy were conducted between 2016 and 2020; and concepts such as artificial intelligence, human-machine collaboration, machine learning and robotic disassembly started to play a central role in the literature between 2021 and 2025.
Keywords: Assembly Line Balancing, Disassembly Line Balancing, Sustainable Production, Co-Word Analysis, Thematic Evolution Analysis

GİRİŞ
Modern üretimin temel yapı taşlarından olan ve Henry Ford tarafından geliştirilen montaj hattı, bir dizi iş istasyonu ve bu istasyonlarda nihai ürünü meydana getirmek için tekrarlayan görev kümelerinden meydana gelen bir üretim düzenini ifade etmektedir. (Basmacı Aktuna ve Bilgin Sarı, 2025). Montaj hattının etkin olarak işletilebilmesi görevlerin istasyonlara dengeli bir şekilde dağıtılmasını gerektirmektedir. Bu dağılımı optimum şekilde gerçekleştirmek amacıyla yapılan montaj hattı dengeleme, iş istasyonlarındaki görevleri tamamlamak için gerekli olan sürenin tek biçimli hale getirilmesi, atıl süreyi minimize etmek ve hattın en verimli şekilde çalışmasını içeren çok amaçlı bir karar problemidir (Basmacı Aktuna, 2024; Becker ve Scholl, 2006).
1990'lı yıllarda çevreye duyarlı üretim ve ürün geri kazanımının kanuni düzenlemeler ve müşterilerin çevre sorunlarına bakış açıları nedeniyle bir zorunluluk haline gelmesine kadar literatürde montaj hattı dengeleme çalışmalarının yoğun olduğu görülmektedir (Güngör ve Gupta, 1999: 811-812). Bu gelişmeyle birlikte sürdürülebilir üretim kavramı önem kazanmış ve üretim sistemlerinde yaşamının sonuna gelmiş ürünlerin tersine akışlarının da bütüncül bir şekilde ele alınmasını gerektirmiştir. Üretimin olumsuz çevresel etkilerini minimize etmeye çalışan sürdürülebilir üretimin birçok sorunu arasından kullanılmış ürünlerden geri dönüştürme ya da tekrar üretme gibi çeşitli yollarla materyallerin ya da bileşenlerin geri kazanımını da içeren ürün geri kazanma araştırmacılar arasında popülerlik kazanmıştır. Tüm bu geri kazanma seçenekleri bir ürünün alt montajlarına,

bileşenlerine ya da diğer gruplara sistematik olarak ayrılması anlamına gelen demontajı gerektirmektedir (Akpınar vd., 2021: 64).
Düşük hacimli işetmelerde demontaj işlemleri için tek istasyonlu söküm sistemleri yeterli olabilirken, yüksek demontaj hacmine sahip işletmelerde, demontaj faaliyetlerini verimli bir şekilde gerçekleştirebilmek için, otomasyona uygun olması sebebiyle demontaj hatlarının kurulması önerilmektedir. Montaj hattına benzer şekilde, demontaj hattı da genellikle mekanik malzeme taşıma ekipmanlarıyla birbirine bağlanan sıralı bir istasyon dizisinden oluşan bir yapıya sahiptir (Altekin vd., 2008).
Montaj hattına benzer bir yapıya sahip olsa da demontaj hatları ürün yapısındaki değişkenlikler, bileşenlerin bilinmeyen durumları ve geriye dönük görev dizileri nedeniyle montaj hatlarına kıyasla yüksek düzeyde belirsizlik barındırmaktadır. Demontajın karmaşık ve belirsizlik içeren yapısı demontaj hatlarının tasarımını montaj hatlarına göre daha zorlu hale getirmektedir. Bu nedenle demontaj hatlarının tasarımında verimli araçlara ihtiyaç duyulmaktadır (Bentaha vd., 2014). Demontaj sırasının belirlenmesinin hesaplama açısından güç bir problem olmasına ek olarak, görev sürelerinin belirsizliği, çalışanların farklı çalışma beceri seviyeleri gibi sebeplerle problem daha da karmaşık bir hal almaktadır (Wang vd., 2021). Bu karmaşık yapısı nedeniyle literatürde demontaj hattı dengeleme ve demontaj sıralarının oluşturulması için sezgisel, matematiksel ve hibrit yöntemlerin yaygın biçimde kullanıldığı görülmektedir. Doğru şekilde dengelenmiş bir demontaj hattı geri kazanım oranını, ekonomik geri dönüşü, verimlilik ve karlılığı önemli ölçüde artırmaktadır (Zhang vd. 2025).
Sürdürülebilir üretim açısından ürün geri kazanımı kilit faktörlerden biridir (Shukla vd., 2017). Sürdürülebilir demontaj hattı yönetiminde çevresel, ekonomik ve sosyal boyutları üçlü şekilde ele almak, enerji tüketimi, istasyon yükü dengesi ve geri kazanım verimliliği üzerinde önemli iyileştirmeler sağlamaktadır (Kazançoğlu ve Ozkan-Ozen, 2020).
Tüm bu gelişmeler göz önüne alındığında demontaj hattı dengeleme literatürünün yalnızca bir optimizasyon problemi olmaktan çıkıp, sürdürülebilirlik, döngüsel ekonomi, simülasyon teknikleri, robotik sistemler ve yapay zeka uygulamalarıyla sürekli olarak gelişen bir araştırma alanı haline geldiği görülmektedir. Bu nedenle, demontaj hattı dengeleme literatüründe demontaj hattı ile birlikte kullanılan kavramların zamanla nasıl evrimleştiğini sistematik olarak incelemek önem kazanmaktadır. Çalışmada bu evrimi sistematik olarak incelemek için, eş-kelime analizi kullanılmıştır.

VERİ VE YÖNTEM

Çalışmada kullanılan veriler yüksek etki değerine sahip yayınları içermesi nedeniyle Web of Science Core Collection üzerinde yapılan sorgu ile elde edilmiştir. Aramada demontaj ve demontaj hattı üzerine yapılan Türkçe ve İngilizce çalışmaları kapsaması için TS=(“disassembly line balancing” OR “balancing of disassembly line” OR “disassembly line” OR “disassembly workstation” OR “disassembly station” OR “disassembly cell” OR “product disassembly” OR “component disassembly” OR “assembly/disassembly” OR “end-of-life disassembly” OR “disassembly sequence” OR “disassembly sequence planning” OR “sequence planning” OR “disassembly scheduling” OR “task precedence” AND “disassembly” OR “design for disassembly” OR “disassemblability” OR “disassembly evaluation” OR “disassembly planning” OR “virtual disassembly” OR “CAD-based disassembly” OR “computer-aided disassembly” OR “graph-based disassembly” OR “demontaj hattı dengeleme” OR “demontaj hattı” OR “söküm hattı” OR “demontaj planlama” OR “söküm planlama” OR “ürün demontajı”) sorgusu kullanılmıştır. Arama sonucunun farklı disiplinlerde yapılan çalışmaları içermesi ancak konuyla alakasız disiplinleri içermemesi açısından “Engineering”, “Operations Research&Management Science”, “Business Economics”, “Automation-Control Systems” gibi alanlar seçilerek araştırma alanları filtrelenmiştir. Arama sonucunda 2948 yayına ulaşılmıştır. Analiz aşamasında ulaşılan yayınların yazar anahtar kelimeleri kullanılmıştır. Farklı yazım şekillerinin analiz sonuçlarını etkilememesi için kapsamlı bir thesaurus dosyası hazırlanmış ve yazım hatası olan ya da aynı anlama gelen kelimeler tekilleştirilmiştir. Yazar anahtar kelimeleri üzerinden gerçekleştirilen analizlerde kelimelerin ağ içerisindeki etkilerini dengeli biçimde yansıtmak için fractional counting yöntemi kullanılmıştır.
Çalışmada yöntem olarak kullanılan eş-kelime analizi bir çalışma alanında üretilmiş yayınları veya diğer metinleri temsil eden terimlerin çağrışım güçlerini ölçerek çalışma alanındaki kalıpları ve eğilimleri ortaya çıkaran bir yöntemdir (Coulter vd., 2008). VOSviewer yazılımında eş-kelime analizi yöntemi ile tematik haritalar ve kümelenmeler oluşturulmuştur. Anahtar kelimelerin en az görülme sayısı (minimum occurance) dönemsel veri yoğunluğuna bağlı olarak 2 ile 9 arasında değişecek şekilde ayarlanmıştır.

BULGULAR

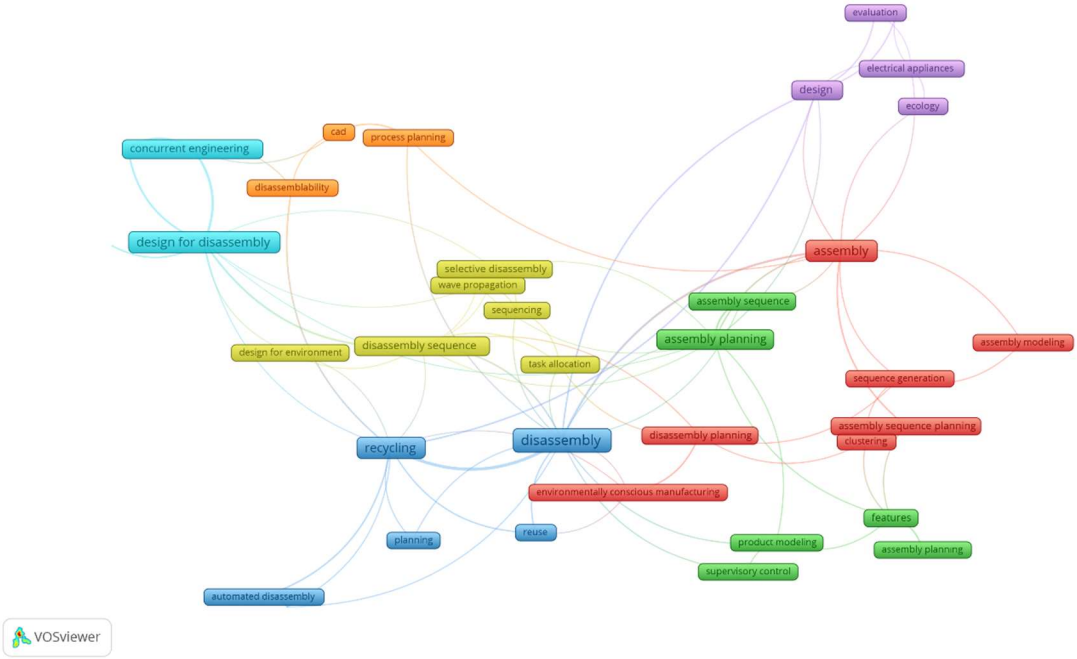
Literatürün tematik evriminin sağlıklı bir şekilde incelenebilmesi adına veri seti altı döneme ayrılmıştır. Dönemler kavramsal gelişime ek olarak yöntemsel kırılmaları da yansıtacak şekilde belirlenmiştir. İlk dönem 1980-2000 yılları arasını kapsamaktadır ve demontaj kavramının şekillendiği temel dönemdir. Bu dönemdeki yıllarda konuyla

ilgili çalışma sayıları da nispeten düşük sayıdadır. 2000 yılından itibaren yıllık yayın sayıları artmaya başlamıştır. Bu sebeple 2000 yılından sonraki dönemler beşer yıllık olacak şekilde ayrılmıştır.

1980-2000: Kuramsal Temeller ve Demontaj Kavramının Şekillenmesi

Demontaj kavramının oluşmaya başladığı ilk dönem olan 1980-2000 döneminde toplam 219 dokümana ulaşılmıştır. Bu dokümanlarda toplam 270 farklı anahtar kelime bulunmaktadır. Anahtar kelimelerin en az görülme sayısı olarak 2 seçildiğinde elde edilen 39 anahtar kelimeyle oluşturulan tematik harita Şekil 1'de gösterilmiştir.

Ortaya çıkan tematik harita incelendiğinde dönem ağının düşük yoğunluklu olduğu ve ağ yapısının merkezinde demontaj (disassembly) kavramının yer aldığı görülmektedir. Montaj ve demontaj ilişkisinin kurulduğu tasarım odaklı temalara ek olarak geri dönüşüm (recycling) ve yeniden kullanım (reuse) gibi çevresel farkındalıkla ilgili temaların ilk izleri görülebilmektedir. Ayrıca demontaj için tasarım (design for disassembly) ve çevre için tasarım (design for environment) gibi tasarım odaklı temaların güçlü olması literatürün ürün tasarımı bakış açısından geliştiğini göstermektedir. Literatürde henüz demontaj hattı görülmemekle birlikte demontaj sıralama (disassembly sequence) ve sıralama (sequencing) gibi temel sıralama kavramlarının ağda yer alması sonraki dönemlerde gelişmesi muhtemel sıralama ve planlama çalışmalarının ilk tematik izlerini oluşturmaktadır.

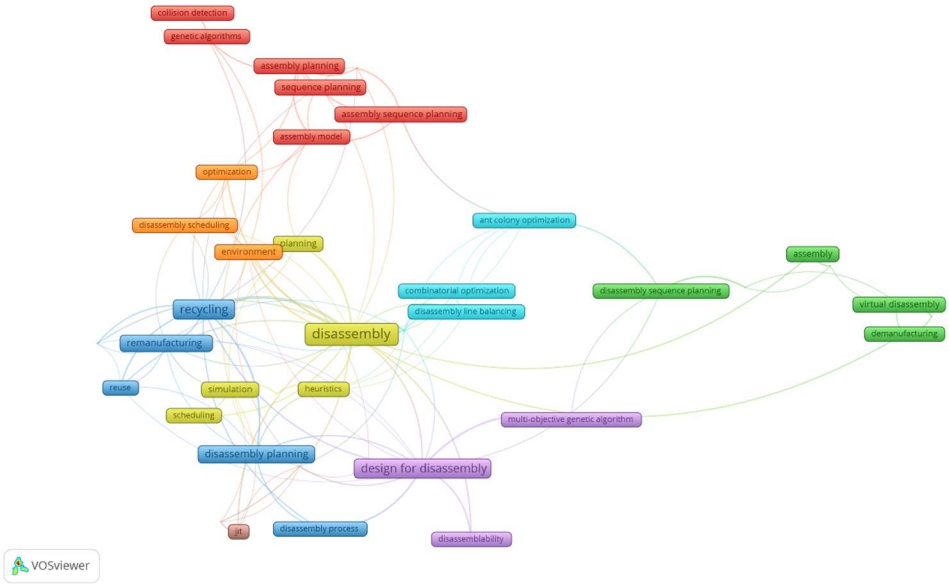


Şekil 1: 1980-2000 yılları tematik haritası

2001-2005: Planlama ve Optimizasyon Çekirdeğinin Ortaya Çıkışı

2001-2005 döneminde toplam 275 dokümana ve bu dokümanlarda toplam 521 farklı anahtar kelimeye ulaşılmıştır. Anahtar kelimelerin en az görülme sayısı olarak 3 seçildiğinde elde edilen 42 anahtar kelimeyle oluşturulan tematik harita Şekil 2'de gösterilmiştir.

Ortaya çıkan tematik harita incelendiğinde demontaj hala merkezde yer alsa da demontaj planlama (disassembly planning) ve sıralama kavramlarının belirginleştiği görülmektedir. Ayrıca birleşimsel optimizasyon (combinatorial optimization) ve sezgisel yöntemler (heuristics) kavramlarının öne çıkması planlama ve sıralama çalışmaların yükselişini işaret etmektedir. Demontaj hattı dengeleme çalışmaları ortaya çıkmaya başlamış olsa da henüz yoğun olarak görülmemektedir. Geri dönüşüm ve tekrar üretim (remanufacturing) temaları arasındaki bağların kuvvetli olduğu ve karınca kolonisi optimizasyonu (ant colony optimization) ile ilk meta- sezgisel yöntemlerin kullanılmaya başlandığı görülmektedir.

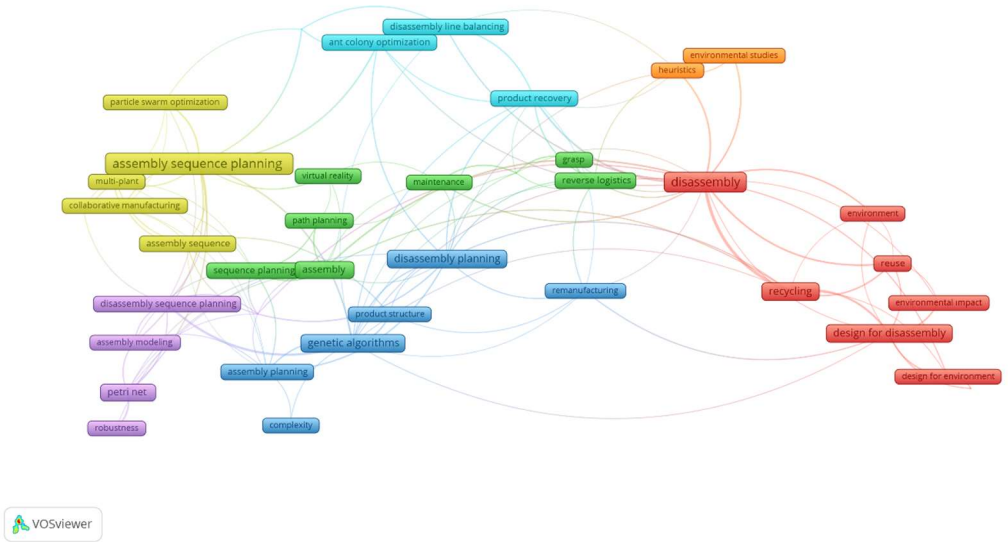


Şekil 2: 2001-2005 yılları tematik haritası

2006-2010: Demontaj Hattı Dengelemenin Bağımsız Bir Araştırma Alanı Olarak Belirginleşmesi

2006-2010 döneminde toplam 334 dokümana ve bu dokümanlarda toplam 767 farklı anahtar kelimeye ulaşılmıştır. Anahtar kelimelerin en az görülme sayısı olarak 4 seçildiğinde elde edilen 40 anahtar kelimeyle oluşturulan tematik harita Şekil 3'te gösterilmiştir.

Ortaya çıkan tematik harita incelendiğinde demontaj ve demontaj planlamanın merkezde yoğun bir yapı oluşturduğu ve karınca kolonisi optimizasyonu ve genetik algoritmalar (genetic algorithms) gibi meta-sezgisel optimizasyon tekniklerinin yaygınlaştığı görülmektedir. Demontaj hattı dengeleme (disassembly line balancing) çalışmaları görünür şekilde ağ yapısında yer almaktadır, bu da demontaj hattı dengeleme çalışmalarının bağımsız bir araştırma alanı olarak literatürde belirginleşmeye başladığını göstermektedir. Simülasyon (simulation) ve sanal gerçeklik (virtual reality) gibi yöntemlerin ve petri net davranış modelleme yaklaşımlarının haritada yer alması demontaj süreçlerinin bu yöntemlerle desteklendiğini ortaya koymaktadır.

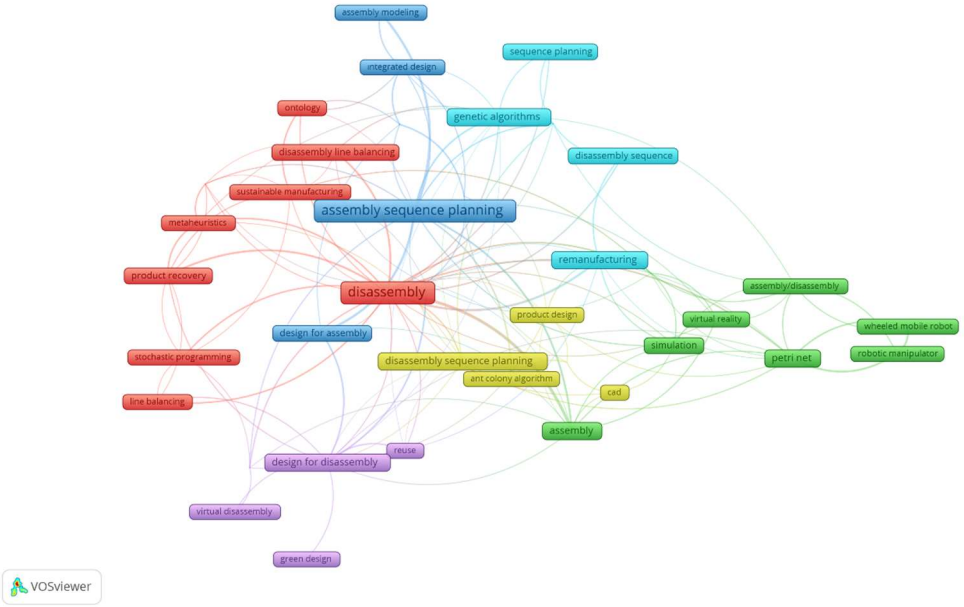


Şekil 3: 2006-2010 yılları tematik haritası

2011-2015: Robotik, Simülasyon ve Çok Amaçlı Yaklaşımların Yükselişi

2011-2015 döneminde toplam 496 dokümana ve bu dokümanlarda toplam 1246 farklı anahtar kelimeye ulaşılmıştır. Anahtar kelimelerin en az görülme sayısı olarak 5 seçildiğinde elde edilen 39 anahtar kelimeyle oluşturulan tematik harita Şekil 4'te gösterilmiştir.

Ortaya çıkan tematik harita incelendiğinde demontajın hala merkezde yer aldığı, montaj sırası planlamanın (assembly sequence planning) ise ağ içinde ikinci bir merkez haline geldiği görülmektedir. Bu yapı bu iki kavramın daha bütünleşik hale geldiğini ve yöntemsel olarak olgunlaştığını göstermektedir. Haritanın sağ tarafında ayrı bir küme olarak görülen robotik manipülatör (robotic manipulator), tekerlekli mobil robot (wheeled mobile robot), sanal gerçeklik ve simülasyon gibi kavramlar robotik sistemler ve simülasyon tabanlı modellemenin güçlendiğini ortaya koymaktadır. Demontaj planlama, demontaj sıra planlama (disassembly sequence planning), genetik algoritmalar ve karınca kolonisi optimizasyonu gibi kavramların merkez küme ile birleşmesi, sezgisel ve meta-sezgisel yöntemlerin montaj ve demontaj planlamalarında standart hale geldiğini göstermektedir. Haritanın sol tarafında kümelenen sürdürülebilir üretim (sustainable manufacturing), ürün kurtarma (product recovery), meta-sezgisel (metaheuristics) ve hat dengeleme (line balancing) gibi kavramlar çevresel etkiler ve geri kazanım süreçlerinin görünürlük kazandığını ortaya koymaktadır.

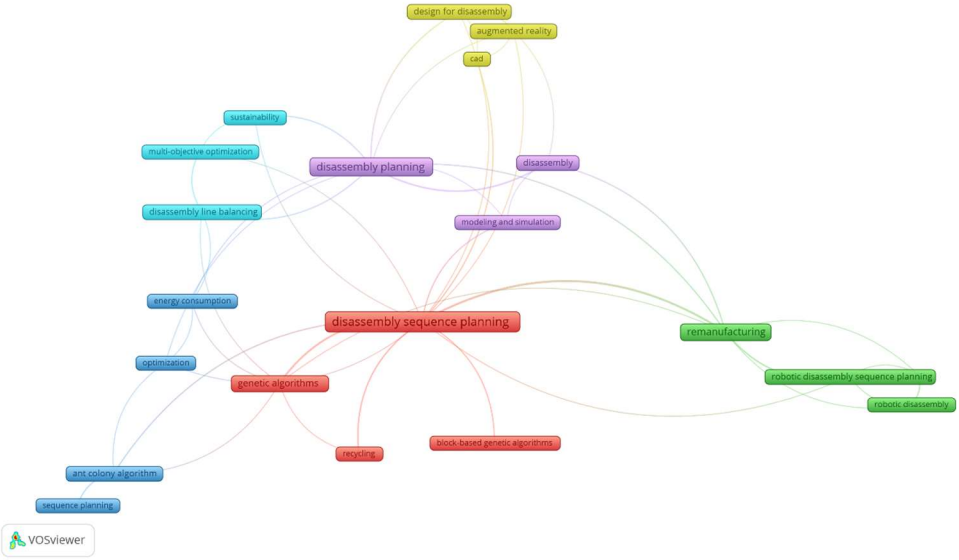


Şekil 4: 2011-2015 yılları tematik haritası

2016-2020: Sürdürülebilirlik ve Döngüsel Ekonomi Odaklı Çalışmalar

2016-2020 döneminde toplam 638 dokümana ve bu dokümanlarda toplam 169 farklı anahtar kelimeye ulaşılmıştır. Anahtar kelimelerin en az görülme sayısı olarak 2 seçildiğinde elde edilen 22 anahtar kelimeye göre oluşturulan tematik harita Şekil 5'te gösterilmiştir.

Bu dönemde literatür, belirli tematik odaklarda yoğunlaştığı için anahtar kelime çeşitliliği önceki dönemlere göre düşmüştür. Demontaj planlama, çok amaçlı optimizasyon (multi-objective optimization), enerji tüketimi (energy consumption) gibi kavramlar belirgin şekilde öne çıkmıştır ve bu yapı demontaj süreçlerinin birden fazla amacın aynı anda ele alındığı karmaşık bir optimizasyon çerçevesine dönüştüğünü göstermektedir. Özellikle sürdürülebilirlik (sustainability) ve çok amaçlı optimizasyon arasındaki güçlü bağ, bu dönemde sürdürülebilirliğin oldukça önemsenmeye başladığını ortaya koymaktadır. Enerji tüketimi, geri dönüşüm ve yeniden üretim gibi kavramların bütünleşik olarak ele alınması literatürde döngüsel ekonomi bakış açısının belirginleştiğini ortaya koymaktadır. Haritanın sağ tarafında kümelenen yeniden üretim, robotik demontaj (robotic disassembly), robotik demontaj sıralama planlaması (robotic disassembly sequence planning) kavramları, bir önceki dönemdeki yükselişinin ardından robotik temelli demontaj çalışmalarının bu dönemde daha olgun ve uygulamaya yönelik bir karakter kazandığını göstermektedir. Ağda sezgisel ve meta sezgisel yöntemlerin hala yaygın şekilde kullanıldığı görülmektedir. Bu yöntemler demontaj sıralama, enerji ve sürdürülebilirlik odaklı çok amaçlı modellerin çözüm araçları haline gelmiştir.

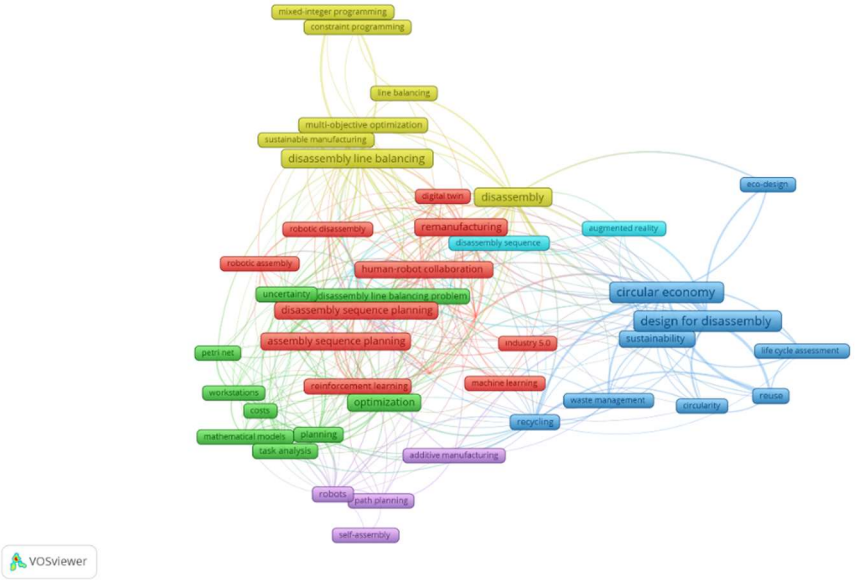


Şekil 5: 2016-2020 yılları tematik haritası

2021-2025: Yapay Zeka, İnsan-Robot İşbirliği ve Dijital Dönüşüm

2021-2025 döneminde toplam 982 dokümana ve bu dokümanlarda toplam 2893 farklı anahtar kelimeye ulaşılmıştır. Anahtar kelimelerin en az görülme sayısı olarak 9 seçildiğinde elde edilen 48 anahtar kelimeye göre oluşturulan tematik harita Şekil 6'da gösterilmiştir.

Ortaya çıkan tematik harita incelendiğinde önceki dönemlere benzer şekilde merkezde yine demontaj kavramının yer aldığı ancak etrafında makine öğrenmesi (machine learning), pekiştirmeli öğrenme (reinforcement learning), robotik demontaj gibi dijitalleşme ve yapay zeka ile ilgili kavramların yer aldığı görülmektedir. Bu kavramlar demontaj hattı dengeleme problemlerinin ele alınmasında öğrenen modeller, uyarlanabilir optimizasyon teknikleri ve yapay zeka tabanlı karar algoritmalarının kullanıldığını göstermektedir. Bu dönemde özellikle Endüstri 5.0'ın (Industry 5.0) literatüre girmesiyle birlikte insan-makine iş birliğinin (human-machine collaboration) de haritada yer edinmeye başladığı gözlemlenmektedir. Ayrıca haritanın sağ tarafında yoğunlaşan döngüsel ekonomi (circular economy), sürdürülebilirlik ve demontaj için tasarım kavramları, önceki dönemlerde giderek güçlenen çevresel hassasiyetin literatürde stratejik bir tema haline geldiğini göstermektedir.



Şekil 6: 2021-2025 yılları tematik haritası

TARTIŞMA VE SONUÇ

Çalışmada, Web of Science veri tabanından elde edilen veri seti ile demontaj hattı dengeleme literatürünün 1980 yılından günümüze tematik evrimi incelenmiştir. Tematik açıdan kavramlar demontaj-montaj bütünleşmesine, ardından optimizasyon modellerine, daha sonra robotik ve simülasyon temelli yapılara, son yıllarda ise sürdürülebilirlik, dijitalleşme ve yapay zeka birleşimine evrilmiştir. Tematik haritalardaki ağ yapısı erken dönemlerde gevşekken, 2016 sonrasında yüksek yoğunluklu ve disiplinler arası bir yapıya dönüşmüştür.

Elde edilen tematik evrim sonuçları gelecekteki araştırmalar açısından önemli ipuçları sunmaktadır. Yapay zeka tabanlı optimizasyon, pekiştirmeli öğrenme ve makine öğrenmesi modellerinin demontaj hattı dengeleme süreçlerine entegrasyonun giderek kritik hale geldiği görülmektedir ve bu da demontaj hattı dengeleme süreçlerinde öğrenen ve uyarlanabilir algoritmaların giderek daha fazla kullanılacağını göstermektedir. Endüstri 5.0'la birlikte insan-makine iş birliğinin hat dengeleme kararlarına dahil edilmesiyle operatör güvenliği, görev paylaşımı, ergonomi gibi konularda yeni bir araştırma alanını ortaya çıkmaktadır. Dijital ikiz temelli dinamik hat yönetimi, gerçek zamanlı veriyle çevrim süresi ve istasyon yüklerinin sürekli güncellenmesi için önemli fırsatlar sunmaktadır. Sürdürülebilirlik ve döngüsel ekonomi temalarının, yaşam döngüsü değerlendirmesi ve karbon duyarlı söküm modelleriyle birleşerek gelecekte daha stratejik bir konuma yerleşeceği görülmektedir. Ayrıca belirsizlik altında karar verme sağlam optimizasyon ve uyarlanabilir söküm planlama yaklaşımlarının önümüzdeki dönemde yöntemsel çeşitliliği artırması beklenmektedir.

Bu çalışma demontaj hattı dengeleme literatürünün yaklaşık kırk beş yıllık gelişimini tematik açıdan bütüncül bir bakış açısıyla ortaya koyarak, kavramsal kırılmaları, yöntemsel dönüşümleri ve araştırma alanının gelecekte evrileceği yönleri sistematik şekilde görünür kılmıştır. Elde edilen tematik yapıların ortaya konması, araştırmacılar için mevcut eğilimlerin ve gelecekteki çalışma alanlarının anlaşılması açısından yol gösterici bir çerçeve sunmaktadır.

Abstract

In response to the demographic shift toward an aging population in both Romania and the European Union (EU), this study examines the implications of active aging policies and strategies aimed at improving the quality of life for older adults. The research highlights key initiatives such as the EU's Active and Healthy Ageing Strategy and Romania's national efforts to address the needs of the elderly. The findings reveal both opportunities and challenges associated with an aging population, emphasizing the necessity for comprehensive social, healthcare, and digital inclusion strategies. Through an analysis of national and EU frameworks, this work provides recommendations for more inclusive, sustainable approaches to aging. Furthermore, it underscores the importance of a multi-dimensional approach, integrating healthcare, social support, and intergenerational collaboration to ensure a future where aging populations can thrive.

Keywords: Demographic shift, healthcare policies, social inclusion

INTRODUCTION

In recent decades, both Romania and the wider European Union (EU) have experienced significant demographic changes, primarily characterized by a decline in birth rates and an increase in life expectancy. This combination has led to the accelerated aging of the population, with profound social, economic, and healthcare implications. The trend of aging populations is a global issue, but in Romania, it has manifested at an especially rapid pace, positioning the country among the top 10 nations worldwide in terms of the speed at which its population is aging. These changes demand urgent attention to ensure that older adults can continue to contribute meaningfully to society and live healthy, fulfilling lives in their later years.

As of 2024, approximately 21.6% of the EU population is over the age of 65, while in Romania, the figure stands at 20%. This proportion is not just a statistic—it reflects the shifting demographic landscape and the need for societies to adapt to an increasingly aging population. By 2050, it is estimated that the proportion of elderly people in Romania will reach 27.7%. In addition, the proportion of people aged 80 and above is expected to rise sharply, from the current 4.8% to 8.5%. These figures highlight a fundamental shift in the age structure, with significant implications for everything from healthcare and pensions to the workforce and social integration.

The aging of the population presents both challenges and opportunities. While the increased life expectancy is a testament to advancements in healthcare and living conditions, it also creates significant pressures on healthcare systems, social services, and labor markets. The number of people requiring long-term care, healthcare services, and financial support for retirement will increase, which could strain existing systems if not adequately addressed. Moreover, as people live longer, the need to ensure they remain active, healthy, and included in society becomes even more important.

This demographic trend emphasizes the urgent need for effective active aging policies and strategies, both at the European and national levels. Active aging is not merely about extending life expectancy but about ensuring that older individuals can live those years with dignity, independence, and access to opportunities for continued participation in social, economic, and cultural life. Effective strategies must address key areas such as healthcare, social inclusion, employment, lifelong learning, and intergenerational solidarity.

In the face of such demographic shifts, it is critical for governments to implement policies that not only cater to the needs of the elderly population but also engage them as active members of society. Active aging policies can help reduce the potential negative economic impacts of an aging population, as older adults continue to contribute to the workforce, volunteer, and support family networks.

Furthermore, these policies must also take into account the diverse needs of older adults, including those who may face particular challenges due to health issues, poverty, or social isolation. Ensuring that every older person has access to the services and opportunities they need to live fulfilling lives will be crucial to maintaining societal cohesion and promoting long-term well-being.

As Romania and the EU continue to experience an aging population, addressing the challenges posed by these demographic changes through comprehensive and inclusive active aging policies will be essential for creating a society where older individuals can thrive and contribute to their communities. The strategies developed today will determine how well societies adapt to this demographic reality, ensuring that aging becomes an opportunity rather than a challenge.

MATERIALS AND METHODS

This study draws on qualitative data from a variety of sources, including government reports, EU policy documents, and academic studies. The research analyzes: Reports from Romania's Ombudsman and OECD on aging demographics; The United Nations Decade of Healthy Ageing (2021–2030) and EU strategies such as the Action Plan for Active and Healthy Ageing (2023–2026); Statistical data on elderly welfare services and active participation in Romania.

CURRENT SITUATION IN ROMANIA

According to a report from the Ombudsman, the main vulnerability of older adults in Romania is poverty, and social services for elderly individuals without family members or those requiring assistance upon hospital discharge are insufficiently developed.

The "Senior's Telephone Service": This service handles approximately 12,000 calls per year from older individuals or their family members. Of these, 48% reported not having access to essential information for daily life, and 53% were living alone.

The Organisation for Economic Co-operation and Development (OECD) report, "OECD Reviews of Labour Market and Social Policies: Romania 2025", notes that Romania has made significant progress in recent years in terms of social welfare and employment. However, the rapidly aging population has important implications for the country's labor market and economy.

According to the "Social Services Index 2025 – Romania", there were 1,079 social services available for older adults in Romania, including 67 residential medical-social centers with 6,573 beneficiaries and 523 residential centers with 23,964 beneficiaries.

Regarding the "active participation" of older adults, an analysis published in "Ageing Unequally in Europe" (Oxford Academic) revealed that in Romania, between 53% and 57% of seniors report a low Active Ageing Index (AAI).

THE UNITED NATIONS DECADE OF HEALTHY AGEING (2021–2030)

This is an ambitious global initiative aimed at improving the quality of life of older people and ensuring that the aging process is viewed positively. It is a call to action for countries, organizations, and communities to create environments that support the health, well-being, and dignity of older individuals.

Background and Objectives

The Decade was officially declared by the United Nations General Assembly on December 14, 2020. The initiative's purpose is to promote healthier aging by focusing on four key areas of action:

Combatting Ageism: This is a crucial aspect of the Decade, as ageism (the discrimination or stereotyping of individuals based on their age) can prevent older adults from fully participating in society and accessing essential services. The initiative encourages campaigns and policies to challenge harmful stereotypes and biases, fostering an inclusive and respectful environment for people of all ages.

Improving the Health and Well-being of Older People: This goal aims to promote a healthy and active aging process. The focus is on enabling older people to maintain their physical, mental, and social health by improving healthcare systems, access to necessary services, and promoting preventive measures such as physical activity and mental health support.

Changing the Environments in Which People Live: The Decade calls for the creation of age-friendly environments—both physical and social—that support older people's autonomy and participation in society. This includes access to age-friendly housing, transportation, and public spaces, as well as fostering social inclusion and reducing loneliness.

Enhancing the Quality of Long-Term Care: With a growing aging population, long-term care systems need to be strengthened to ensure that older adults receive the care they need in a dignified and respectful manner. This includes improving caregiving standards, ensuring caregiver training, and ensuring that long-term care systems are accessible, equitable, and sustainable.

Global Call to Action. The Decade encourages global, national, and local stakeholders to act together to create policies, programs, and solutions that prioritize healthy aging. These actions should encompass:

Research and Data: Supporting research to better understand the aging process and the specific needs of older adults, enabling evidence-based policies.

Inclusive Policies: Governments are encouraged to implement inclusive policies that address the challenges older people face, such as pension security, healthcare access, and housing affordability.

Engagement of Civil Society: The involvement of civil society, including older people themselves, in decision-making processes and the design of age-friendly policies.

As populations worldwide age, particularly in Europe and North America, there is a growing recognition that the well-being of older adults is central to building equitable, resilient, and sustainable societies. Healthy aging is not just about longevity; it's about ensuring that people live longer, healthier lives with the opportunity to remain active and engaged in their communities.

By focusing on these key areas, the Decade of Healthy Ageing aims to reverse the negative trends associated with aging, improve the quality of life of older people, and create more inclusive and supportive societies.

Role of Romania in the Decade. For countries like Romania, which have a rapidly aging population, the Decade represents an opportunity to implement long-term strategies and policies that promote healthy aging. Romania's focus could include:

Increasing the accessibility of healthcare and social services for the elderly.

Improving urban planning to ensure age-friendly environments, particularly in rural areas where older people often experience isolation.

Raising awareness about the benefits of active aging through education and public campaigns.

EUROPEAN STRATEGY FOR SCALING ACTIVE AND HEALTHY AGEING (2021–2027)

This is a major initiative launched by the European Union to address the challenges and opportunities presented by an aging population. The strategy aims to support older adults in leading healthy, active, and independent lives for as long as possible, fostering their participation in society and contributing to the sustainability of social and healthcare systems.

Context and Importance

Europe is experiencing an unprecedented demographic shift, with the proportion of people aged 65 and over expected to increase significantly in the coming decades. This aging population presents both challenges and opportunities for European societies. On the one hand, it creates pressure on pension systems, healthcare, and long-term care services. On the other hand, older individuals contribute valuable experience, skills, and wisdom to communities, and their potential can be better realized with the right strategies in place.

The European Strategy for Active and Healthy Ageing (2021–2027) was developed in response to these demographic shifts, recognizing the need for a collective European effort to enhance the quality of life for older people, promote their well-being, and maximize their potential.

Main Objectives of the Strategy

The strategy focuses on several key objectives, each of which is designed to support older people in their daily lives while fostering greater social inclusion: Promoting Active and Healthy Aging; Enhancing Long-Term Care Services; Creating Age-Friendly Environments; Fostering Social Inclusion; Empowering Older People through Digital Innovation; Strengthening Research and Innovation.

Key Actions and Initiatives

The European Strategy for Scaling Active and Healthy Ageing outlines several concrete actions and initiatives to meet these objectives, including:

The European Innovation Partnership on Active and Healthy Ageing (EIP AHA): This initiative brings together stakeholders from the public, private, and academic sectors to work on innovative solutions that improve the health and well-being of older adults.

Digital Health and Care: The strategy encourages the integration of digital technologies in healthcare systems, including telemedicine, remote monitoring, and digital health records, to improve the efficiency and accessibility of healthcare for older people.

Support for Age-Friendly Communities: The strategy supports cities and regions in becoming more age-friendly by providing guidance and resources for developing inclusive infrastructure and services.

Collaboration with the World Health Organization (WHO): The EU works closely with WHO and other international bodies to implement global standards for healthy aging, including the WHO Global Network for Age-friendly Cities and Communities.

ACTION PLAN FOR ACTIVE AND HEALTHY AGEING (2023–2026)

This is a key initiative developed to support the goals of the European Strategy for Active and Healthy Ageing. This action plan focuses on creating a robust framework for ensuring that Europe's aging

population enjoys a higher quality of life, remains integrated into society, and continues to contribute to their communities in meaningful ways.

Context and Purpose

Europe's population is aging rapidly, with the proportion of people over the age of 65 expected to grow significantly over the next decades. This demographic shift presents several challenges, including pressures on social security systems, healthcare, and long-term care services. However, it also offers an opportunity to tap into the immense potential of older adults, who possess invaluable experience and wisdom.

The Action Plan for Active and Healthy Ageing (2023–2026) provides a structured approach to improving the lives of older Europeans through a range of strategic measures. It builds on previous initiatives, such as the European Innovation Partnership on Active and Healthy Ageing (EIP AHA), and aligns with international frameworks like the UN Decade of Healthy Ageing (2021–2030). The plan aims to ensure that older people can lead fulfilling, active, and independent lives for as long as possible.

Objectives of the Action Plan

The 2023–2026 Action Plan outlines a number of specific objectives designed to foster healthier, more active aging across Europe:

Enhance Access to Health and Social Care
A primary goal of the Action Plan is to ensure that older people have access to high-quality health and social care services. This includes strengthening health systems to cater specifically to the needs of aging populations, with a focus on prevention, rehabilitation, and the management of chronic diseases. The plan emphasizes integrated care, where medical, social, and long-term care are coordinated to meet the holistic needs of older people.

Promote Healthy Lifestyles and Preventive Measures
Active aging is closely tied to maintaining good health. The plan encourages the promotion of physical activity, proper nutrition, mental health support, and other preventive measures. This objective aims to reduce the risk of chronic diseases and improve the overall health and well-being of older adults. Initiatives will focus on health literacy, helping older people to make informed decisions about their health and well-being.

Foster Social Participation and Inclusion
Social inclusion is essential for active aging. The Action Plan outlines initiatives to reduce social isolation among older adults by promoting opportunities for them to engage in social, cultural, and economic activities. It advocates for strengthening community-based services, increasing opportunities for volunteerism, and creating social networks that enhance the quality of life for elderly people.

Improve Age-Friendly Environments
The Action Plan promotes the development of age-friendly physical environments that enable older adults to remain independent and participate in society. This includes accessible housing, transportation, and public spaces. The goal is to create communities where older people can live and move safely, comfortably, and independently, while also addressing barriers to social interaction.

Promote Digital Inclusion and Innovation
As digital technologies continue to play a growing role in daily life, ensuring that older adults have access to digital tools and resources is crucial. The Action Plan seeks to promote digital literacy among older people, enabling them to use digital platforms for communication, health monitoring, and accessing services. It also encourages innovation in the development of assistive technologies and digital solutions that can improve the lives of older people.

Support Caregivers and Family Caregivers
Family caregivers play a critical role in supporting older people, but often face challenges related to stress, lack of training, and limited support. The Action Plan addresses these issues by proposing measures to better support caregivers through training programs, resources, and financial support. This will help improve the quality of care older people receive and reduce the burden on family caregivers.

Strengthen Data Collection and Evidence-Based Decision Making
To develop effective policies and initiatives, the Action Plan stresses the importance of improving data collection on aging. Gathering accurate, timely data on the health, social, and economic needs of older adults will allow policymakers to design targeted interventions. The action plan encourages collaboration between EU member states, research institutions, and other stakeholders to enhance the availability and use of age-related data.

Key Actions and Initiatives

Several concrete actions are laid out in the 2023–2026 Action Plan:

The European Innovation Partnership on Active and Healthy Ageing (EIP AHA) will continue its work, focusing on the development and scaling of innovative solutions for active aging, including digital tools and technologies.

Joint Actions on Health and Long-Term Care: The EU will facilitate cross-border cooperation to share best practices and ensure the effective delivery of healthcare services to older populations.

Age-Friendly Communities: The EU will continue supporting cities and regions in becoming more age-friendly, providing guidance, funding, and technical assistance to transform urban and rural environments to better suit the needs of older people.

Digital Solutions for Health and Care: Promoting the use of telemedicine, remote monitoring, and health apps tailored to older people to improve healthcare delivery and self-management of chronic conditions.

Public Awareness Campaigns: To combat ageism and raise awareness about the benefits of active aging, the Action Plan will support public campaigns aimed at changing societal attitudes toward aging.

Expected Outcomes

By the end of 2026, the Action Plan aims to achieve several key outcomes:

Improved health outcomes for older people, with a focus on prevention, chronic disease management, and better access to healthcare.

Increased participation of older adults in social, economic, and cultural activities, reducing isolation and enhancing their quality of life.

Age-friendly environments across Europe, with more accessible public spaces, transportation, and housing that support independent living.

Greater digital inclusion, with older adults gaining the skills and access to technology to improve their daily lives.

Enhanced support for caregivers, enabling them to provide better care and reduce their stress.

EU ACTION PLAN FOR INTERGENERATIONAL EQUITY (2023–2027)

This is a forward-thinking initiative developed to promote fairness, cooperation, and mutual understanding between generations in Europe. With demographic shifts and the increasing aging population, intergenerational solidarity is becoming more important than ever. This action plan aims to

ensure that the economic, social, and political benefits of intergenerational cooperation are fully realized, addressing the unique challenges that both younger and older generations face.

Context and Purpose

Europe's demographic landscape is undergoing significant changes. The population is aging rapidly, and the working-age population is shrinking, leading to challenges in sustaining welfare systems, pension schemes, and the labor market. At the same time, younger generations face their own set of challenges, including high youth unemployment, rising housing costs, and the effects of economic and environmental uncertainty.

Intergenerational equity seeks to address the tensions between generations, promoting fairness, support, and collaboration. The EU recognizes that fostering solidarity between generations is crucial for long-term social cohesion and economic sustainability. The EU Action Plan for Intergenerational Equity (2023–2027) lays out a set of strategic measures aimed at creating a society where both younger and older generations can thrive, collaborate, and share in the prosperity of Europe.

Main Objectives of the Action Plan

The EU's Action Plan for Intergenerational Equity focuses on several core objectives to ensure that both young and old generations are treated equitably and can contribute to and benefit from society:

Promote Social Cohesion Across Generations
One of the primary goals of the action plan is to bridge generational divides by fostering mutual understanding, respect, and solidarity. Initiatives will focus on challenging stereotypes about both older and younger people, combating ageism and generational conflict, and creating opportunities for intergenerational dialogue. By promoting a culture of inclusion and cooperation, the EU aims to strengthen social cohesion and ensure that every generation is valued.

Ensure Economic Sustainability and Fairness
The economic dimension of intergenerational equity revolves around ensuring that both generations have equal access to opportunities for prosperity. This includes addressing issues such as pension fairness, access to affordable housing for younger people, and fair working conditions. The plan emphasizes financial sustainability by promoting policies that balance the needs of the aging population with the economic opportunities for younger generations, avoiding burdening one group at the expense of the other.

Support for Education and Employment
Young people face significant challenges in terms of employment and education. The action plan aims to invest in education and training opportunities for youth, ensuring they have the skills to thrive in the changing economy. It also focuses on creating more employment opportunities for younger people, addressing issues like job insecurity, underemployment, and the rising cost of living, particularly in urban areas.

Pension Systems and Social Security
A major focus of the action plan is to ensure the sustainability of pension systems that provide adequate support to older generations while maintaining fairness for younger generations. This includes ensuring that pension systems are not disproportionately burdened by demographic trends and that young people can expect to have reliable pensions in the future. The action plan will also explore innovative ways to address the long-term viability of social security systems.

Promote Health and Well-being Across the Lifespan
The action plan stresses the importance of promoting the health and well-being of all generations. For older generations, this means providing access to quality healthcare, long-term care, and support for aging in dignity. For younger generations, this includes addressing mental health issues, improving

access to healthcare services, and tackling public health challenges such as obesity, substance abuse, and stress. The plan promotes preventive health measures, ensuring that every generation has the opportunity to live a long, healthy life.

Create Opportunities for Intergenerational Exchange
The action plan includes specific initiatives to foster intergenerational programs that encourage collaboration, sharing of knowledge, and mutual support between young and old. This could involve volunteer opportunities, community projects, mentorship schemes, and shared living arrangements. By facilitating spaces where different generations can work together and learn from one another, the EU aims to strengthen social bonds and encourage lifelong learning.

Addressing Housing Inequality
Housing affordability is a pressing concern for younger generations, while older individuals may face difficulties maintaining their homes. The action plan will address housing policies to ensure that young people have access to affordable housing options and that older individuals can age in place. Solutions such as intergenerational housing projects, where younger and older generations live together, will be explored to promote shared living and solidarity.

Environmental Sustainability and Climate Change
Another significant aspect of the action plan is to foster intergenerational cooperation in addressing environmental sustainability. The younger generation is particularly affected by climate change and environmental degradation, and it is vital that both older and younger generations collaborate to find sustainable solutions. The action plan supports initiatives that allow different generations to come together in tackling climate change through green technologies, sustainable consumption, and policy reform.

Key Actions and Initiatives

The EU Action Plan for Intergenerational Equity (2023–2027) outlines several key actions and initiatives, including:

Intergenerational Dialogue Initiatives: Programs and forums for dialogue and exchange between generations will be implemented to build mutual understanding and break down generational barriers.

Policy Reform: Legislative changes to ensure pension systems, healthcare, and social protection are equitable and sustainable for both older and younger generations.

Support for Intergenerational Projects: Funding for community-based projects that promote collaboration between generations, such as shared housing, mentorship programs, and cooperative initiatives.

Public Awareness Campaigns: Initiatives to challenge age-related stereotypes and promote intergenerational solidarity across Europe.

Expected Outcomes

By 2027, the EU expects to achieve the following outcomes:

Increased intergenerational solidarity, with stronger cooperation and mutual understanding between younger and older generations.

More equitable access to economic opportunities, such as affordable housing, fair pensions, and sustainable employment opportunities for all generations.

Improved well-being for all age groups, with greater access to healthcare, education, and social support systems.

Fewer barriers to intergenerational exchange, through enhanced programs that encourage communication and shared projects between generations.

NATIONAL STRATEGY ON LONG-TERM CARE AND ACTIVE AGING 2023–2030

This is a comprehensive framework developed by the government to address the challenges and opportunities associated with the aging population in the country. With the number of older adults increasing significantly in recent years, the strategy aims to improve the quality of life for older people, ensuring their well-being, dignity, and participation in society. It focuses on enhancing long-term care systems and promoting active aging through a range of policies and initiatives aimed at empowering older people to live independently, stay healthy, and remain engaged in their communities.

Context and Purpose

The aging population presents both challenges and opportunities for the country. According to demographic projections, the number of people over 65 years old is expected to rise steadily, which will place increasing pressure on the healthcare, pension, and long-term care systems. At the same time, older adults have significant potential to contribute to society, with their wealth of experience, skills, and knowledge.

The National Strategy on Long-Term Care and Active Aging 2023–2030 seeks to create a sustainable, inclusive, and supportive environment that enables older individuals to live fulfilling lives, participate in social and economic activities, and receive the care and support they need. This strategy not only focuses on improving long-term care services but also emphasizes the importance of maintaining health, fostering social inclusion, and ensuring that older people can live independently for as long as possible.

Main Objectives of the Strategy

Enhancing Long-Term Care Services
One of the central goals of the strategy is to ensure the availability and accessibility of high-quality long-term care services. This involves strengthening the infrastructure of both residential care and home care systems, with a focus on providing person-centered care. The strategy emphasizes improving the training of caregivers, enhancing the quality of services, and ensuring that care is delivered with dignity and respect. The aim is to provide care that meets the specific needs of each individual, with a focus on integrated care that connects medical, social, and personal services.

Promoting Active Aging and Preventive Healthcare
The strategy encourages older adults to remain active and engaged in society, focusing on prevention and health promotion. Active aging is not just about extending life but also about improving the quality of life. This includes promoting physical activity, mental health, and healthy lifestyles among older people. Programs to prevent chronic diseases and support mental well-being, such as campaigns on nutrition, physical fitness, and social engagement, will be expanded.

Supporting Independent Living
Empowering older adults to live independently for as long as possible is a key objective of the strategy. This involves improving access to age-friendly housing, transportation, and community services that enable older people to live safely and comfortably in their homes. The strategy advocates for making cities and towns more age-friendly by creating accessible environments that meet the needs of older people, such as barrier-free public spaces, better public transport, and community centers designed for elderly individuals.

Fostering Social Inclusion and Participation
Social isolation and exclusion are significant risks for older people. The strategy promotes policies that encourage older adults to stay socially connected and engaged. This includes supporting intergenerational programs, volunteer opportunities, and social clubs that bring people of different ages

together. By fostering a sense of community and participation, the strategy aims to reduce loneliness and enhance the quality of life for older individuals.

Strengthening the Care Workforce
A critical element of the strategy is to ensure that there are enough trained and qualified caregivers to meet the growing demand for long-term care services. The strategy outlines measures to improve the recruitment, training, and retention of healthcare professionals and informal caregivers. This includes offering educational programs, improving working conditions, and providing financial support for caregivers, especially family caregivers who play a crucial role in the care of older adults.

Leveraging Digital Solutions and Innovation
The strategy recognizes the potential of digital technologies to enhance the lives of older people. The use of telemedicine, remote monitoring, and digital health tools can help older individuals manage their health more effectively and access care without leaving their homes. The strategy promotes the development and adoption of innovative solutions, including assistive technologies, to help older people maintain their independence and improve their quality of life.

Ensuring Financial Sustainability
As the population ages, there is a need to ensure that long-term care services and pension systems remain financially sustainable. The strategy calls for the development of sustainable financing models for long-term care, which may include public-private partnerships, innovations in funding, and long-term care insurance schemes. Ensuring that older people can access the services they need without financial hardship is a key goal.

Key Actions and Initiatives

The National Strategy includes several key actions and initiatives to achieve its objectives:

Expansion of Community-Based Care: Investing in home care services and community-based healthcare initiatives to allow older adults to remain in their homes and receive care tailored to their needs.

Creation of Age-Friendly Environments: Supporting municipalities and regions to become more age-friendly by improving public infrastructure, public services, and housing that support older people's independence.

Support for Digital Literacy: Providing training and resources to older adults to help them use digital tools for health monitoring, communication, and accessing services.

Improvement of Long-Term Care Facilities: Upgrading the infrastructure of long-term care facilities to ensure they meet modern standards of care and comfort, and providing additional funding to support their operation.

Support for Caregivers: Creating a national framework to provide support, recognition, and training for caregivers, particularly family caregivers who often face challenges in balancing work, personal life, and caregiving responsibilities.

Expected Outcomes

By 2030, the strategy aims to achieve several key outcomes: Improved quality of life for older adults, with better access to healthcare, social services, and opportunities for active participation in society; Increased independence for older people, with more options for home care, age-friendly housing, and community support; Higher levels of satisfaction among caregivers, with better training, support, and financial assistance; Sustainability of the long-term care system, ensuring that services remain available and affordable as the population ages.

NATIONAL PROGRAM "CYBERSECURITY. INITIATION FOR SENIORS"

This is an initiative launched to support and empower older adults in developing the necessary digital skills to navigate the increasingly complex online world safely and confidently. As the digitalization of everyday life continues to expand, older generations are often more vulnerable to online threats, scams, and cyberattacks. This program aims to address these challenges by providing older individuals with the knowledge and tools they need to stay secure in the digital space.

Context and Purpose

With the rapid growth of internet use and digital technologies, there is a corresponding increase in cybersecurity risks, especially for vulnerable groups such as seniors. Older adults are more likely to fall victim to online fraud, identity theft, phishing, and other forms of cybercrime. At the same time, many seniors may lack the basic digital literacy skills needed to protect themselves in the digital world, making them more susceptible to these risks.

The Cybersecurity. Initiation for Seniors program was created to bridge this gap by providing comprehensive training, resources, and guidance to help older people become more aware of cybersecurity threats and how to avoid them. The goal is to ensure that older individuals can participate fully in the digital society without compromising their safety or privacy.

Main Objectives of the Program

Increase Digital Literacy. One of the core objectives of the program is to improve the digital literacy of seniors, enabling them to use online tools and resources with confidence. This includes providing basic training on how to use the internet, email, social media, and online banking, as well as understanding digital security practices.

Raise Awareness of Cybersecurity Risks. The program seeks to raise awareness among seniors about the specific cybersecurity risks they face, such as phishing, scams, identity theft, and malicious software. By educating seniors about these dangers, the program helps them recognize potential threats and take proactive steps to protect themselves.

Teach Safe Online Practices. Training sessions focus on safe online behavior, teaching seniors how to create strong passwords, recognize suspicious emails, avoid unsafe websites, and secure their personal data. Participants will also learn how to use privacy settings on social media platforms and other online services.

Provide Practical Guidance and Support. The program offers hands-on, practical guidance for seniors, such as how to update security settings, use antivirus software, and set up two-factor authentication. This training is delivered in a user-friendly format, tailored to the learning pace and needs of older individuals.

Promote Safe Online Transactions. As many seniors engage in online shopping and banking, the program also focuses on educating them about safe online transactions. This includes recognizing legitimate websites, understanding payment security, and ensuring that sensitive financial information is not compromised.

Empower Seniors to Protect Their Privacy. Privacy protection is a crucial aspect of cybersecurity. The program teaches seniors how to manage and protect their personal information online, understand the risks of oversharing on social media, and know their rights regarding data privacy.

Key Components of the Program

The Cybersecurity. Initiation for Seniors program is structured to provide comprehensive support through various components:

Training Workshops and Courses: These workshops focus on delivering practical, hands-on training on digital literacy and cybersecurity. They are tailored to seniors' needs, offering step-by-step guidance on how to use digital devices and stay safe online. Topics include setting up secure passwords, using email safely, recognizing online scams, and securing social media profiles.

Digital Toolkits: Participants are provided with easy-to-follow digital toolkits that include guides, checklists, and tips for staying secure online. These resources are designed to be accessible and understandable for seniors, ensuring they have the necessary support to implement cybersecurity practices in their everyday lives.

Online Resources and Webinars: The program offers a series of online resources, including videos, webinars, and articles, to help seniors stay informed about the latest cybersecurity threats and trends. These resources are regularly updated to reflect new risks and security practices.

Support Centers and Helplines: Dedicated support centers and helplines are available to assist seniors who may have questions or require help with cybersecurity-related issues. These services offer personalized assistance, from troubleshooting technical issues to answering questions about online security.

Collaborations with Local Communities and Organizations: The program collaborates with community centers, senior organizations, and local authorities to reach a wider audience and ensure that seniors have access to the resources and training they need. Outreach efforts aim to include those who may not have access to online platforms or digital resources.

Expected Outcomes

The Cybersecurity. Initiation for Seniors program aims to achieve several important outcomes:

Increased Digital Confidence: Seniors who complete the program will gain the skills and confidence to navigate the internet securely, engage in online activities, and protect themselves from common cyber threats.

Reduced Vulnerability to Cybercrime: By educating seniors on the risks of cybercrime and teaching them how to avoid common online scams, the program will significantly reduce the likelihood of seniors falling victim to online fraud, identity theft, and other cybercrimes.

Improved Online Privacy and Security: The program will help seniors secure their personal information online, protect their digital privacy, and ensure that their online activities are safe from potential threats.

Enhanced Participation in Digital Society: As seniors become more confident and capable in using digital tools safely, they will be able to fully participate in the digital society, from accessing government services to staying connected with family and friends via social media.

ROMANIA'S NATIONAL RECOVERY AND RESILIENCE PLAN (PNRR)

This is a critical framework for the country's recovery and modernization following the challenges posed by the COVID-19 pandemic and other socioeconomic factors. The plan encompasses various components aimed at improving the quality of life for all citizens, with particular attention to the integration and well-being of older adults. The PNRR includes investments and reforms across multiple sectors, and its components are designed to address the needs of Romania's aging population, ensuring they are not left behind in the country's modernization efforts. Below are the key components of the PNRR that are particularly relevant to the improvement of life quality and the inclusion of seniors:

Component 2 – Health: Improving Healthcare Services for Seniors

The Health Component of the PNRR focuses on modernizing and upgrading Romania's healthcare system to ensure that it provides high-quality, accessible, and efficient services for all citizens, including seniors. This component includes investments in hospital infrastructure, the modernization of medical equipment, and improvements in healthcare delivery that specifically benefit the elderly population.

Modernizing healthcare facilities and equipping hospitals with advanced technologies will improve diagnosis, treatment, and care for older adults who often face chronic health conditions. Additionally, improving the conditions of medical care, such as reducing waiting times and enhancing the overall patient experience, will be critical in addressing the healthcare needs of seniors. Investments in the healthcare workforce, including training for professionals in elderly care, will also contribute to a higher standard of care for the senior population.

The plan also includes efforts to promote preventive health measures and access to healthcare services, ensuring that seniors are not excluded from receiving the medical attention they need. Ultimately, these investments aim to provide older individuals with better healthcare, improving their overall well-being and quality of life.

Component 4 – Social Justice and Inclusion: Fighting Poverty and Promoting Employment Opportunities for Seniors

The Social Justice and Inclusion Component of the PNRR is designed to support social cohesion and reduce poverty, with a particular focus on the elderly population. Many seniors face financial insecurity in their later years, and the plan includes several initiatives aimed at reducing poverty among older adults.

Key projects under this component include investments in social infrastructure, such as the construction and renovation of community centers, social housing, and the provision of social services tailored to the elderly. These investments will help create more inclusive environments, offering seniors better access to social support and services.

Furthermore, the PNRR includes measures to support older adults in finding part-time employment or engaging in volunteer activities, providing them with opportunities for social engagement and supplemental income. These initiatives not only help alleviate poverty but also promote social inclusion by allowing seniors to remain active and contribute to their communities. By encouraging older adults to stay engaged in the workforce or volunteerism, Romania will foster a sense of purpose and belonging, which is critical for mental and emotional well-being.

Component 5 – Sustainable Transport and Mobility: Enhancing Mobility for Seniors

The Sustainable Transport and Mobility Component of the PNRR is crucial for ensuring that seniors can move around safely and easily, whether for daily tasks, healthcare appointments, or social activities. This component focuses on improving public transportation infrastructure and ensuring that it is accessible to older adults.

Projects under this component will include the development of age-friendly public transport systems, such as buses and trains that are accessible to seniors, with features like low floors, priority seating, and better safety measures. In addition to public transport, the plan includes investments in infrastructure for active mobility, such as bike lanes and pedestrian-friendly sidewalks, which will make it safer and easier for seniors to walk or use mobility aids.

These improvements in transportation and mobility are essential for ensuring that older adults can maintain their independence, avoid social isolation, and continue to participate in the community. By

addressing mobility challenges, Romania can improve the quality of life for seniors, making it easier for them to access essential services, meet social needs, and stay active.

Component 6 – Education and Vocational Training: Lifelong Learning for Seniors

The Education and Vocational Training Component of the PNRR recognizes the importance of lifelong learning, especially for older adults. This component aims to provide learning opportunities for seniors, helping them stay mentally active, engaged, and informed throughout their lives.

The plan proposes expanding access to educational programs that are specifically tailored to the needs and interests of seniors. These may include courses on technology, languages, health, arts, or financial literacy. By offering these opportunities, Romania aims to ensure that older individuals can continue to grow and develop intellectually, which is critical for maintaining mental agility and quality of life.

Additionally, the program will promote vocational training that helps seniors access part-time or flexible employment opportunities. This can include retraining programs for older adults who want to remain in the workforce, either by transitioning to new fields or developing new skills for existing roles. By supporting lifelong learning, Romania ensures that seniors are equipped with the tools they need to remain active, engaged, and employable for as long as possible.

Component 7 – Digital Transformation: Empowering Seniors Through Digital Skills

The Digital Transformation Component of the PNRR addresses the pressing need for digital inclusion across all age groups, with a focus on ensuring that seniors are not left behind in Romania's technological modernization. The program emphasizes the promotion of digital skills among the elderly, enabling them to fully engage in the socioeconomic life of the country.

With the world becoming increasingly digital, it is essential for seniors to gain proficiency in basic digital tools such as smartphones, computers, and the internet. The PNRR envisions providing specialized training programs to teach seniors essential digital competencies, including safe online practices, accessing public services online, and using technology for communication and social connection. This will help older adults participate more actively in daily life, reducing the risk of digital exclusion and enhancing their ability to access essential services like healthcare, government support, and financial services.

By integrating digital skills into the lives of seniors, Romania aims to create a more inclusive society where people of all ages can thrive in the digital age, allowing them to maintain independence, stay connected with family and friends, and access vital information and services.

THE MINIMAL SOCIAL SERVICES PACKAGE

This is a comprehensive framework designed to ensure that elderly individuals, particularly those facing vulnerability or social exclusion, have access to essential services that support their well-being, independence, and social inclusion. As the global population ages, it is increasingly important to provide a safety net that addresses the unique needs of older adults. This package ensures that seniors can lead a dignified life, with access to healthcare, social assistance, housing, education, and support systems that promote their quality of life.

Objective and Purpose

The core objective of the Minimal Social Services Package is to provide a basic level of support to seniors, helping them maintain their independence and participate in society. As many older individuals face challenges such as mobility issues, chronic health conditions, financial insecurity, and social isolation, this package aims to ensure they are not left behind in the provision of vital services.

The package also focuses on promoting active aging by encouraging social engagement, lifelong learning, and participation in the community. By providing essential services and support, this initiative helps reduce poverty, improve mental and physical health, and foster a sense of belonging for older adults.

Core Components of the Minimal Social Services Package

Healthcare Services and Support. One of the primary components of the package is the provision of healthcare services, which is essential for older adults, many of whom may have chronic health conditions or complex medical needs.

Social Assistance and Financial Support. Many older adults face financial insecurity due to retirement, limited income, or inadequate pensions.

Housing Support and Accessibility. Housing is a critical factor in ensuring that older adults can live independently and with dignity.

Social Inclusion and Community Engagement. Social isolation is a significant issue for many older adults, especially those living alone or in rural areas.

Legal and Administrative Support. Older adults often face challenges in navigating legal or administrative systems, particularly when it comes to accessing pensions, social security, or healthcare.

Education and Lifelong Learning. Staying mentally and socially active is essential for healthy aging. Digital literacy programs to ensure seniors are able to use modern technologies, which can help them access online services, communicate with family and friends, and engage in e-commerce or online banking safely.

Caregiver Support. Many seniors require assistance with daily living activities, and this often falls on family members or informal caregivers.

Key Benefits of the Minimal Social Services Package: Improved quality of life for older adults, ensuring they have access to healthcare, social support, and financial stability; Greater social inclusion, reducing isolation and helping seniors remain active members of their communities; Increased independence, allowing seniors to age in place and maintain their autonomy through home modifications and in-home care services; Better mental and physical health, thanks to access to healthcare services, preventive care, and mental health support; Enhanced dignity and well-being, ensuring that older adults can live their lives with respect, autonomy, and support.

DISCUSSION AND CONCLUSION

The issue of active aging is a critical priority at both the European and national levels, with a solid framework of policies and strategies designed to support this goal. However, despite this strong foundation, it is clear that continuous monitoring and adequate resource allocation are essential to ensuring the long-term success of these policies. Demographic changes are dynamic, and policies must be adaptable to meet the evolving needs of the aging population. This requires a long-term commitment from governments, stakeholders, and society at large to ensure that active aging strategies remain effective and responsive to emerging challenges.

The projects that have been implemented to support active aging have had a positive impact on the lives of older adults. These initiatives have improved access to healthcare, facilitated social inclusion, and encouraged lifelong learning opportunities. They have helped seniors maintain their independence and remain connected to their communities. However, the impact has not been equally experienced by all older individuals. Barriers to access, affordability, and availability of services still exist, particularly for those in remote or economically disadvantaged areas. As services continue to evolve and become more

digitized, ensuring equitable access for all seniors remains a challenge. Efforts must be made to eliminate geographic, financial, and digital exclusion to ensure that every older adult can benefit from these services.

To ensure the continued success and sustainability of active aging policies, ongoing financial investment and effective governance are essential. Initial investments in healthcare, digital literacy, social inclusion, and intergenerational solidarity have made significant improvements, but maintaining these efforts requires long-term resource planning. Adequate funding for healthcare infrastructure, caregiver support, and age-friendly environments must be prioritized. Additionally, the development of innovative financing mechanisms will be crucial to sustaining long-term care systems and ensuring that older adults continue to have access to high-quality services. Both public and private sector collaboration will be necessary to mobilize the resources and knowledge needed to address the complex challenges posed by an aging population.

An integrated, cross-sectoral approach is vital to the successful implementation of active aging policies. The complexity of aging-related issues, such as healthcare, housing, education, and employment, demands that different sectors work together to create a comprehensive support system for older adults. A fragmented, siloed approach will not meet the diverse needs of the aging population. Only by coordinating efforts across healthcare, social services, urban planning, and employment sectors can we ensure that seniors have access to the holistic services they require. Collaboration between government bodies, civil society organizations, and the private sector is crucial in promoting active aging. These stakeholders must work together towards common goals of social inclusion and intergenerational solidarity.

Social inclusion is another critical element of active aging. Older adults, particularly those living alone or in rural areas, often experience social isolation, which can have detrimental effects on both physical and mental health. Policies must prioritize creating opportunities for seniors to engage socially through community centers, volunteer programs, and intergenerational initiatives. These efforts can help reduce loneliness and foster a sense of belonging. Additionally, accessible transportation services and community activities can support seniors in remaining connected to their communities. Promoting social engagement helps older adults stay active and involved in society, improving their overall well-being.

Intergenerational solidarity is key to building cohesive societies where both younger and older generations contribute to and benefit from shared social and economic resources. Intergenerational programs, such as shared housing or mentorship initiatives, help bridge gaps between generations, promoting understanding and cooperation. These programs not only reduce isolation among seniors but also create opportunities for younger people to benefit from the experience and wisdom of older adults. Encouraging mutual support between generations ensures that aging populations are seen as active contributors to society, rather than passive recipients of care.

To ensure the long-term success of active aging policies, continuous evaluation and adaptation of existing frameworks will be essential. The aging population is increasing, and as a result, the needs of seniors will evolve over time. Policies must remain flexible and responsive to these changes. Public awareness campaigns and advocacy will also play an important role in maintaining momentum for active aging initiatives. Governments and organizations must continue to raise awareness about the importance of active aging and the benefits it brings to both seniors and society as a whole. By sharing best practices, conducting research, and fostering cross-border cooperation, we can improve the implementation of these policies and ensure that the needs of older adults are addressed in a timely and effective manner.

Finally, while there is a strong foundation of policies and strategies in place to support active aging, their success will depend on sustained efforts, continued investment in resources, cross-sectoral collaboration, and the promotion of social inclusion and intergenerational solidarity. Only by focusing

on these areas can we create societies where older adults can age with dignity, independence, and continued participation in all aspects of life.

Abstract

Purpose: This study aims to assess the macroeconomic implications of digital transformation in Türkiye by empirically examining how selected technological indicators influence economic growth from 2008 to 2023.

Design/Methodology/Approach: The analysis utilizes a timeseries econometric framework combined with machine learning-based forecasting techniques, implemented through the Python programming environment. Variables include GDP (USD) as the dependent variable, and ICT service exports, fixed broadband prices, mobile cellular package prices, and high-technology exports as independent variables. Econometric techniques applied include ADF, PP, KPSS, and ZivotAndrews unit root tests, impulse response analysis and linear regression modeling.

Findings: The results indicate a significant positive impact of ICT service exports and high-technology exports on GDP, highlighting the endogenous role of digital capabilities in fostering economic growth. The findings align with Schumpeter's theory of creative destruction and support the Neo-Classical Growth Theory's view on the critical role of technological progress in overcoming diminishing returns. The results reveal that ICT service exports and high-technology exports have a significant and positive effect on GDP, confirming the endogenous role of technological progress in sustaining economic growth. Conversely, the contributions of broadband and mobile costs diminish over time, consistent with the neoclassical law of diminishing returns. Forecast simulations indicate a steady upward trend in GDP under continued digital investment, though subject to volatility from external shocks.

Originality/Value: By integrating machine learning tools into traditional econometric analysis, this study offers a novel methodological contribution to the empirical literature on digital transformation and growth. It also provides actionable policy insights for emerging economies seeking to design effective digital growth strategies.

Practical Implications:The evidence presented offers a roadmap for policymakers to harness digital transformation technologies as a long-term engine of economic development, while also accounting for volatility and external shocks in the forecasting of macroeconomic dynamics. The findings suggest clear policy priorities: (i) increasing investment in R&D and hightechnology sectors, (ii) strengthening digital infrastructure to lower access costs, (iii) expanding human capital development to align with the knowledge economy, and (iv) enhancing resilience to external shocks. Together, these measures will allow Türkiye to leverage digital transformation as a sustainable engine of economic development.

Keywords: Economic growth, digital transformation, ICT exports, technological innovation, machine learning in economics

This study is based on the doctoral dissertation of Hamit CAN, a graduate of the PhD program in Economics at Trakya University, Institute of Social Sciences

INTRODUCTION

The digitalization of economic structures has emerged as one of the most transformative forces of the 21st century, representing not merely a technological shift but a reconfiguration of productivity, labor dynamics, and competitive advantage. Characterized by its distinctive patterns and trajectories, the digital economy encapsulates a broad spectrum of technologies— including artificial intelligence, robotics, and advanced information and communication In review technologies (ICTs)—that are reshaping global economic paradigms. Across both developed and developing nations, digital transformation is increasingly being leveraged to boost productivity, enhance innovation capacity, and strengthen global competitiveness.

The diffusion of ICTs has had profound implications at the national, sectoral, and organizational levels. Yet, the anticipated gains from digital technologies have not always been immediately reflected in conventional productivity metrics. This phenomenon, referred to as the "productivity paradox" by Nobel laureate Robert Solow (1987), continues to provoke critical inquiry into the mechanisms through which digital technologies contribute to economic performance. References to productivity paradox, creative destruction, and endogenous growth theory are reframed to support the study's focus on growth. Solow's assertion that "we see the computer age everywhere except in the productivity statistics" laid the foundation for an enduring debate regarding the economic returns to digital innovation.

Historically, concerns over the labor-displacing effects of technological change have also been central to economic discourse. In 1930, John Maynard Keynes presciently warned of a new form of "technological unemployment" caused by the substitution of machines for human labor. More than two decades later, Wassily Leontief (1952) similarly predicted that rapid mechanization would render labor increasingly redundant, particularly in routine occupations. Although such outcomes were initially slow to materialize, the recent acceleration of automation and artificial intelligence has revived these concerns with renewed urgency (Brynjolfsson & McAfee, 2014; Ford, 2015).

Empirical research over the past two decades has demonstrated that automation and digitalization disproportionately affect middle- and low-skill occupations, contributing to wage inequality and labor market polarization (Autor, Levy, & Murnane, 2003; Goos & Manning, 2007; Michaels, Natraj, & Van Reenen, 2014). This paper links ICT service exports, broadband affordability, mobile communication costs, and high-tech exports directly to GDP growth and overall economic performance in Turkey. These transformations raise critical questions about the future of work and the broader implications of digital advancement for inclusive and sustainable economic growth.

Against this backdrop, recent theoretical models have sought to delineate the dual nature of technological change. Acemoglu (2010) argues that the relationship between technology and labor is contingent upon whether the technology substitutes for or complements human capital. In review When technologies are labor-saving, scarcity in labor can accelerate technological adoption; when they are labor-augmenting, scarcity may instead inhibit such adoption. Furthermore, the diffusion of technology is shaped by adoption costs, regulatory frameworks, and standardization, which can intensify competitive pressures and reshape market structures (Acemoglu et al., 2012; Acemoglu & Restrepo, 2022). In light of these dynamics, this study explores the macroeconomic implications of digital transformation in the Turkish context, focusing specifically on the period between 2008 and 2023.

Turkey's rapid technological adoption, evolving ICT infrastructure, and investments in digital capabilities make it a suitable case study. The analysis focuses on how ICT service exports, broadband affordability, mobile communication costs, and high-tech exports contribute to economic growth. By

employing advanced econometric modeling and machine learning techniques, the study not only contributes to the ongoing debate on digitalization and productivity but also provides actionable insights for policymakers navigating the complexities of the digital era.

The primary objective of this study is to empirically investigate how key digital transformation indicators—such as ICT service exports, broadband affordability, mobile communication costs, and high-technology exports—affect economic growth in Turkey. The study covers a 16-year period (2008–2023), capturing key phases of ICT adoption, policy shifts, and episodes of economic volatility. This temporal focus allows for a comprehensive evaluation of how digital technologies interact with macroeconomic growth trajectories. Turkey's geographic position and industrial diversity provide further empirical variation, making it possible to assess the effects of digitalization under different economic conditions.

The distinctive contributions of this study compared to existing literature on the subject can be summarized as follows:

• It addresses the Turkish context, filling a gap in the literature on digital transformation and growth in emerging economies.

• Using Python-based econometric analysis, the study provides evidence supporting the endogenous nature of technological advancement.

• Empirical findings reveal a positive effect of ICT exports on growth. In review

• Few studies examine ICT service exports and growth in Turkey; this study provides targeted evidence.

• Within the framework of Endogenous Growth Theory, the role of technological development, human capital, and knowledge production is evaluated.

• The positive relationship between high-technology exports and growth highlights the importance of R&D and knowledge economy.

• Reductions in broadband and mobile costs are shown to improve productivity, though with diminishing effects over time.

• Schumpeter's concept of "creative destruction" is used to explain how innovation drives Turkey's economic transformation.

• The study also considers external shocks and their effects on growth forecasting.

• Investments in human capital are shown to accelerate growth and boost hightechnology exports.

• Overall, the findings highlight the crucial role of knowledge economy and technological innovation in fostering sustainable growth.

LITERATURE

Over the past decades, numerous empirical studies have investigated the relationship between information and communication technologies (ICT) and economic growth, often yielding mixed results depending on the methodological framework, country context, and time period considered. Overall, these studies suggest that ICT adoption generally promotes economic growth, but the magnitude and significance of the effect depend on factors such as institutional quality, labor market structure, and complementary investments. Despite the abundance of research, critical gaps remain, including limited country-specific studies for emerging economies like Turkey, and insufficient integration of ICT with macroeconomic forecasting using advanced methodologies. Over the past decades, numerous empirical studies have investigated the relationship between information and communication technologies (ICT)

In review and economic growth, often yielding mixed results depending on the methodological framework, country context, and time period considered.

Among the seminal theoretical contributions, Acemoglu (1998) developed the concept of directed technical change, highlighting how technological progress is often biased toward factors that are more abundant or profitable in an economy. While seminal works provide a strong theoretical foundation, many empirical studies focus on developed economies, leaving a gap in the context-specific analysis of ICT's impact on economic growth in Turkey. This study addresses this gap by examining the Turkish economy's unique ICT adoption trajectory and its interactions with GDP growth from 2008 to 2023. This framework helps explain how ICT investments can complement skilled labor and, hence, amplify economic growth in skill abundant economies.

Furthermore, Acemoglu, Autor, and Dorn (2014) empirically examined how the diffusion of computer-based technologies reshaped the labor market and productivity patterns in the United States, offering insights into the broader implications of ICT for growth and inequality. Their findings underscore the importance of institutional and labor market conditions in mediating the impact of ICT on economic performance. Below is a chronological synthesis of major contributions in this field:

Van Ark (2001) examined ten OECD countries in the 1990s by classifying sectors as ICT producing, ICT-using, and non-ICT-using. His analysis showed that both ICT-producing and ICT-using sectors contributed significantly to GDP growth, with the United States, Finland, and Japan leading in terms of ICT production. He also found that ICT's contribution to economic growth was more pronounced in the second half of the 1990s. Roller and Waverman (2001), using a simultaneous equations model with data from 21 OECD countries, demonstrated that telecommunications infrastructure significantly contributed to GDP, suggesting the presence of network externalities that amplified economic benefits.

Simon and Wardrop (2002) analyzed whether Australia, despite not having a strong ICT producing sector, could benefit from ICT investments. Using a growth accounting framework, they found that ICT capital played a crucial role in the country's economic growth during the 1990s, especially in the service sectors such as finance and communications.

In review Jalava and Pohjola (2005) investigated the effects of ICT on Finland's economic growth between 1995 and 2002. Using growth accounting, they found that approximately one-third of Finland's output growth was attributable to ICT production, and ICT capital contributed 0.66 percentage points on average to GDP growth annually.

Dinçsoy (2008) examines how ICT and its components relate to socio-economic factors at both macro and micro levels, with a specific focus on per capita GDP in East Asian countries. Using the Neoclassical Growth Model and Convergence Theory, the study emphasizes the catalytic role of ICT in fostering regional development. Findings suggest evidence of weak betaconvergence but strong sigma-convergence in per capita GDP across homogeneous regions of East Asia.

Nasab and Aghaei (2009) employed a production function approach and panel data for seven OPEC countries between 1990 and 2007. Their findings confirmed a significant and positive impact of ICT investments on economic growth, urging further resource allocation and capacity-building in digital infrastructure. Koutroumpis (2009) analyzed 22 European countries and found that broadband infrastructure positively affected GDP growth only when supported by complementary investments and enabling regulatory frameworks, underlining the conditional nature of ICT benefits. Some studies, however, emphasize the effect of economic growth on renewable energy. Dinçsoy (2009) investigates regional income convergence in major East Asian countries by focusing on the telecommunications sector. The study finds evidence of weak beta-convergence and strong sigma-convergence in per capita GDP across homogeneous regions after 1992. Using the Neoclassical Growth Model, it highlights the role of intra-country unit changes in fostering convergence and predicts a notable correlation between ICT developments and per capita GDP growth in these countries.

Sassi and Goaied (2013) investigated the interaction between financial development and ICT in 17 MENA countries from 1960 to 2009 using a dynamic panel model based on GMM. Their results indicated a positive and statistically significant joint effect of ICT diffusion and financial development on economic growth. Ahmed & Ridzuan (2013) using panel data from the ASEAN5+3 region (Malaysia, Thailand, Singapore, Indonesia, Philippines, Japan, Korea, China; 1975–2006), this study investigates telecommunications investment (as ICT proxy) within a production-function framework. Results indicate a long-term positive relationship between ICT investment and GDP in both ASEAN5 and ASEAN5+3 groups, emphasizing ICT's vital role in economic growth.

In review Lee and Brahmasrene (2014) used panel data from nine ASEAN countries (1991–2009) and found that ICT had a positive effect on both economic growth and CO_2 emissions, emphasizing the dual economic and environmental impacts of digitalization. Brynjolfsson and McAfee (2014) emphasized that digital technologies, particularly general-purpose technologies such as artificial intelligence, cloud computing, and big data, were reshaping economic structures but could also exacerbate income inequalities without inclusive policies.

Saidi et al. (2015) focused on Tunisia over the 1975–2008 period and found a strong positive correlation between GDP growth and ICT usage, particularly mobile and fixed-line telephony, supported by human and physical capital. Belloc & Guerrieri (2015) Based on panel data from European countries, the authors show that ICT diffusion significantly improves industrial sector performance and productivity. Shahbaz (2015) analyzes the positive effect of ICT investments on economic growth in developing countries using panel data from 1990 to 2011. The findings show that improvements in ICT infrastructure and usage accelerate economic growth. Kim & Lee (2015) investigates the significant positive effect of ICT investments on economic growth in South Korea, emphasizing the contribution of high-tech investments. Antonelli & Fassio (2015) examines the impact of digital technologies on economic growth across various European regions and finds that increased ICT use contributes positively to regional economic development. Koutroumpis (2015) investigates the effect of broadband infrastructure investment on economic growth in OECD countries, showing that broadband adoption increases productivity and growth.

Salahuddin and Gow (2016) found a long-run positive association between internet usage and GDP in South Africa using time-series analysis. However, the causal direction ran unidirectionally from ICT to growth, underscoring the leading role of digital development. Erumban & Das (2016) analyses India's ICT-led growth, highlighting that ICT investments have driven growth mainly through services, with weaker productivity gains in manufacturing. ICT diminishes the economic barriers posed by physical distances, lowers the costs of accessing information and starting new small businesses, and thus enhances business efficiency and competitiveness (Can & Terziev, 2016).

Mićić (2017) emphasizes that investments in high-tech solutions and ICT infrastructure significantly boost GDP, productivity, and employment—evident in European context. Aghaei & Rezagholizadeh (2017) utilizes dynamic and static panel data approaches to analyze the impact of ICT investment on economic growth across OIC countries from 1990 to 2014. The In review findings indicate a significant positive relationship, suggesting that OIC countries should implement policies to promote ICT investment. Taibah & Allah (2017) investigates the impact of ICT development on economic growth in Sudan from 1980 to 2014 using the ARDL bounds testing approach. The results indicate a long-run relationship between ICT development and economic growth, with a moderate speed of convergence to equilibrium. Pradhan (2017) examines the relationship between ICT infrastructure and economic growth in 25 European countries. The study finds a close relationship among the use of ICT, economic growth, and venture capital investments, suggesting that investments in ICT infrastructure can stimulate economic growth.

Niebel, T. (2018) Using a balanced panel of 59 countries (1995–2010), the research shows a strong positive relationship between ICT investments and GDP growth across all development levels, with no

significant difference between country groups. Toader et. al. (2018) Using EU data, this paper finds that every 1% increase in ICT infrastructure and digitalization can increase GDP per capita by 0.08–0.4%, depending on the technology type. Ali et al: (2020).

Bahrini & Qaffas (2019) apply a Generalized Method of Moments model (2007–2016) and find that mobile phones, internet usage, and broadband adoption are primary drivers of economic growth in Middle Eastern, North African, and Sub-Saharan countries. Makun, K., & Devi, S. (2019). Autoregressive distributed lag approach using Solow-framework for Fiji (1990–2016). Long-run cointegration observed; ICT proxies (especially mobile subscriptions) positively and significantly affect economic output, with coefficients between 0.04–0.06. Sedika & Emamb (2019) ICT capital and usage have a significant positive effect on growth in OECD and advanced economies, but the effect is negligible in MENA and developing countries. Mobile and fixed broadband usage positively influence GDP growth only in advanced economies.

Ali et al. (2020) used a novel composite ICT maturity index—including affordability, infrastructure, and skill dimensions—on OECD panel data. Key Finding: Each 1% increase in ICT maturity yields a 1–3.8% rise in economic development in OECD countries. Wibowo (2020) applied principal component panel regression with fixed effects to global panel data. All ICT predictors (e.g., internet use, mobile penetration) positively and significantly impact economic growth. Enhanced efficiency in employing technologies such as digitalization and artificial intelligence in diverse fields can lead to positive outcomes in different areas (Can et al., 2020). Makun & Jayaraman (2020) using Fixed-effects panel analysis across Pacific Island.

In review nations, ICT diffusion significantly boosts economic growth in small island developing economies Ejupi Ibrahimi (2022) Focusing on the Western Balkans (2000–2019), the authors find a positive and significant correlation between ICT indicators (fixed telephony, mobile, internet) and GDP growth. Niranga (2022) Using panel data for 59 countries (2018–2020), finds a positive relationship between digitalization and economic growth in most regions, except parts of Africa and Western Asia.

Kumari & Singh (2023) analysis of 85 countries (27 low-, 58 high-income) from 2000– 2019, employing OLS, Fixed Effects, and GMM techniques ICT indicators (internet, secure internet, broadband) positively affect growth in both income groups. ICT combined with financial development and trade openness has positive synergy in low-income countries but shows mixed results in high-income group. Nipo (2023) Panel data analysis for 20 Asian countries spanning 2000–2020, using Fixed Effects and Panel Feasible GLS models. Findings: Mobile subscriptions and internet penetration significantly boost economic growth in Asia, while fixed telephone lines have negligible impact—likely due to cost and practicality issues.

Ximei et al., (2024) This panel study (1990–2014) finds that ICT adoption positively influences GDP growth in South Asia, complemented by education, though FDI shows no significant impact link. Nowakowski (2024) Analyzes EU countries between 2009–2018, showing a strong correlation between ICT sector indicators (exports, employment share, online shopping) and GDP growth. UNCTAD Collaborative Study (2024) using a composite ICT index and GMM estimation (2017–2022), the study finds that ICT significantly mitigated pandemic-driven GDP declines, especially in developing countries.

In Can's (2025) study, it was observed that the increase in information and communication technology services exports (ICTE) has a positive effect on economic growth. Building on these findings, the current study extends the literature by integrating machine learning-based forecasting methods with traditional econometric models, thereby providing a more comprehensive understanding of ICT's macroeconomic implications in Turkey. This approach allows for nuanced policy recommendations tailored to the country's digital transformation strategy. This finding reveals that technological progress is not merely an external factor in the economy but also an internal driver of growth. It is evident that the

advancements in Turkey's technological infrastructure, particularly through exports, support In review economic growth. Noah & David (2025) uses panel data from African countries to analyze how ICT adoption influences the relationship between entrepreneurship and GDP growth. ICT adoption strengthens the positive effect of entrepreneurship on economic growth, indicating that digital infrastructure and tools amplify entrepreneurial contributions to national income. Wainaina (2025) employs panel data from Sub-Saharan African countries covering 2000–2022 ICT investments significantly boost economic growth across the region, with consistent positive effects found over the study period. Mohammad & Yacine (2025) results highlight the need for customized approaches that extend beyond mere infrastructure spending, encompassing improvements in education, institutional changes, and the development of inclusive policies. As digital transformation gains momentum worldwide, MENA countries should capitalize on these complementarities to promote growth that is inclusive, resilient, and driven by innovation.

MATERIALS AND METHODS

This study investigates the macroeconomic implications of digital transformation on economic growth in Türkiye over the period 2008–2023. Annual data were obtained from publicly accessible international databases, including the World Bank and the International Telecommunication Union (ITU). This timeframe encapsulates Türkiye's rapid ICT adoption phase, policy shifts toward digital infrastructure, and episodes of economic volatility, providing a robust context for empirical analysis.

Gross Domestic Product (GDP), measured in constant US dollars, is employed as the dependent variable to capture real economic growth. The independent variables selected to represent digital transformation include: (i) ICT service exports (as a percentage of service exports), (ii) fixed broadband internet prices (USD per month), (iii) mobile cellular package prices (USD per month), and (iv) high-technology exports (as a percentage of manufactured exports). These indicators are log-transformed where appropriate to account for potential non-linearity and to stabilize variance. The econometric approach integrates both traditional and modern methodologies. Stationarity properties of the time series were assessed using multiple unit root tests, including Augmented Dickey-Fuller (ADF), Phillips-Perron (PP), Kwiatkowski-Phillips-Schmidt-Shin (KPSS), and Zivot-Andrews tests to account for structural breaks. The combination of ADF, PP, and KPSS In review tests allows for robust assessment under different assumptions regarding autocorrelation, heteroskedasticity, and the null hypothesis (unit root vs. stationarity). The Zivot-Andrews (ZA) test was included to detect potential structural breaks endogenously, which is critical in the Turkish economic context due to historical policy shifts, economic crises, and digitalization milestones. Unit root tests are performed at the outset to determine whether the series are stationary, which is a prerequisite for reliable econometric modeling. Stationarity ensures that the statistical properties of the series, such as mean and variance, remain constant over time, preventing spurious regression results and enhancing the validity of inference.

In addition, this study incorporates machine learning-based forecasting techniques within the Python programming environment to complement the econometric analysis. Specifically, linear regression models were implemented to predict future trajectories of economic growth under varying digital transformation scenarios. A linear regression framework was adopted due to its interpretability, transparency, and compatibility with the first-differenced log-transformed series. While nonlinear dynamics may exist in macroeconomic variables, the logarithmic transformation stabilizes variance and mitigates nonlinearity, allowing linear models to capture the main effects of ICT indicators on GDP. Future research may extend this approach to nonlinear or machine learning-based models to explore complex interactions. This hybrid framework enables the analysis to go beyond static relationships and assess the potential pathdependency and volatility embedded in Türkiye's digital economy.

By applying the combination of unit root tests, Zivot-Andrews structural break analysis, and linear regression modeling, the study empirically evaluates the relationship between ICT indicators and GDP

in Turkey. The results indicate a positive association between ICT service exports and economic growth, providing evidence-based insights that can inform policy considerations.

FINDINGS

The descriptive statistics indicate that GDP and the ICT-related variables exhibit relatively low standard deviations, suggesting limited dispersion around their means over the 2008–2023 period. Skewness values are close to zero for most variables, indicating approximate symmetry in the distributions. The Jarque-Bera (JB) test statistics do not reject normality at conventional significance levels, which justifies the use of linear regression models and supports the assumption of normally distributed residuals in subsequent econometric analyses. Furthermore, the absence of extreme kurtosis values suggests that the series do not contain significant outliers that could distort the estimation results. These characteristics provide a rationale for applying unit root tests—including those accounting for structural breaks—and linear regression methods in the analysis.

Table 1: Descriptive Stats

	GDP	ICTE	FBBE	MCLUBE	HCE
Mean	27.454343	20.887834	2.434058	2.716710	21.987175
Median	27.467121	2.905778	2.394953	3.133202	22.065405
Maximum	27.742786	22.170890	3.135059	4.012049	22.858805
Minimum	27.199144	19.883936	1.736951	1.153732	21.185711
Standart Deviation	0.126905	0.674995	0.438116	0.987701	0.470629
Skewness	0.207141	0.165677	0.094282	-0.342833	-0.014200
Kurtosis	0.405229	-0.758705	-0.925551	-1.468941	-0.713733
Jarque-Bera P-Value	0.894092	0.795745	0.742746	0.416456	0.843603
Number of Observations	16	16	16	16	16

Unit Root Test

To determine the stationarity properties of the variables, Augmented Dickey–Fuller (ADF; Dickey & Fuller, 1979), Phillips–Perron (PP; Phillips & Perron, 1988), and Kwiatkowski– Phillips–Schmidt–Shin (KPSS; Kwiatkowski et al., 1992) tests were applied to the firstdifferenced logarithmic series. The null hypothesis of ADF and PP tests is the presence of a unit root (non-stationarity), while the null hypothesis of the KPSS test is stationarity.

Table II presents the unit root test results separately for the levels and first differences of the logarithmic variables. For each variable, results are reported for models with and without deterministic trends, providing a comprehensive view of stationarity properties. The null hypothesis of the ADF and PP tests

is the presence of a unit root, whereas for the KPSS test the null is stationarity. Significance at the 5% level is indicated in the table. These distinctions In review clarify the integration order of each variable and support the choice of subsequent econometric methods.

Table 2: ADF, PP and KPSS unit root tests

Variables	ADF	ADF	PP	PP	MCLUBE
MCLUBE					
	Test Statistic	p-value	Test Statistic	p-value	Test Statistic	p-value
diff_log_ICTE	-3.485	0.008	-3.976	0.0015	0.188
0.1					
diff_log_FBBE	-3.203	0.020	-7.469	5.13×10^{-11}	0.280
0.1					
diff_log_MCLUBE	-4.056	0.001	-5.273	6.22×10^{-6}	0.103
0.1					
diff_log_HCE	-2.857	0.051	-4.904	3.43×10^{-5}	0.109
0.1					
diff_log_GDP	-3.104	0.026	-3.129	0.024	0.188
0.1					

The ADF and PP test results show that the null hypothesis of a unit root can be rejected at the 5% level for most variables, indicating stationarity at first differences. For diff_log_HCE, the ADF test statistic is marginally above the critical value at the 5% level, but the PP test still suggests stationarity. The KPSS test statistics are all below the critical value, and their pvalues exceed 0.05, supporting stationarity.

Zivot-Andrews Unit Root Test

The Zivot-Andrews (1992) test is a critical advancement in time series analysis, designed to improve the reliability of unit root tests by explicitly accounting for potential structural breaks within the series. Traditional unit root tests, such as the Augmented DickeyFuller (ADF) test, may yield misleading inferences when structural breaks—arising from economic, political, or other exogenous shocks—are present but ignored (Zivot & Andrews, 1992). To address this limitation, Zivot and Andrews developed a testing procedure that endogenously determines the breakpoint from the data itself, rather than relying on a priori knowledge of the break date.

The test allows for a single structural break either in the intercept or in the deterministic trend under the alternative hypothesis, thus integrating the potential impact of regime changes into the stationarity assessment. This feature makes the Zivot-Andrews test particularly suitable for economic time series, where external shocks can induce significant structural shifts that affect the behavior of the series

In this study, the Zivot-Andrews test was applied to the logarithm of information and communication technology exports (log_ICTE) to examine its stationarity properties while controlling for unknown structural breaks.

Table 3: Zivot-Andrews Unit Root Test Results for log_ICT

Test Statistic	-3.6063

p-value	0.6099
Critical Value (1%)	-5.2764
Critical Value (5%)	-4.8107
Critical Value (10%)	-4.5661

This result indicates that although structural breaks are conceptually relevant, the log_ICTE series exhibits consistent growth dynamics without abrupt regime shifts during 2008–2023. Hence, the traditional unit root tests remain valid, and the series can be appropriately modeled in its logarithmic first-difference form. The Zivot-Andrews (ZA) test allows for a single endogenous structural break in either the intercept, trend, or both. In this study, ZA tests were applied to all logarithmic variables to account for potential structural shifts in the Turkish economy during 2008–2023. Although the ZA test statistic for log_ICTE does not exceed the critical values, indicating no statistically significant structural break was detected in this sample, this result should not be interpreted as an absence of economic shocks. Instead, it confirms that, within the sample period, the variable's stationarity properties are not materially affected by a single structural break. The use of the ZA test remains appropriate as a robustness check for potential breaks

Impulse Response Analysis

Impulse response analysis is a widely used technique in time series econometrics to trace the effect of a one-standard-deviation shock in one variable on the current and future values of itself and the other variables in the system. The methodology was introduced by Sims (1980) in the context of Vector Autoregressive (VAR) models, which allow for an unrestricted estimation of the dynamic interactions among variables. The general formula of the impulse response function (IRF) can be expressed as follows:

$$IRFij\ (h) = Y_{i,t+h} \ / \ \partial\varepsilon_{i,t}$$

where $IRFij\ (h)$ denotes the response of variable i at horizon h to a one-unit shock in variable j at time $\varepsilon i,t$ and is the innovation in j.

Impulse responses graphically present the dynamic effects of shocks along with confidence intervals, typically constructed using bootstrap methods. The solid blue line in the graphs below depicts the estimated response, while the dashed lines represent the confidence bands, indicating the statistical significance of the response at conventional levels.

Figure 17: log *ICTE* → log *ICTE*

The response of log ICTE to its own shock is initially positive and gradually declines over time. The confidence intervals suggest that this positive effect is statistically significant in the early periods. This finding implies that an increase in information and communication technology (ICT) exports tends to reinforce itself in the short term, highlighting a degree of persistence in ICT exports.

Figure 2: log GDP → log ICTE

The response of log ICTE to a shock in log GDP is initially small and becomes negative over time. The confidence intervals indicate that the response is not statistically significant in the initial periods but tends to be weakly negative thereafter. This result suggests that changes in economic growth exert only

a limited and short-lived influence on ICT exports, potentially reflecting structural constraints or lagged adjustment mechanisms in the ICT sector.

Figure 3: log ICTE → log GDP

A positive shock in log ICTE generates a positive response in log GDP, which increases at first and then diminishes over time. The confidence intervals indicate that the effect is statistically significant in the short term. This finding underscores the role of ICT exports as a driver of economic growth in the short run.

Figure 4: *log GDP→log GDP*

The response of log GDP to its own shock is initially positive and declines over time, remaining statistically significant in the early periods. This reflects the inherent persistence in economic growth dynamics and the self-reinforcing nature of GDP shocks in the short term.

Impulse response analysis provides valuable insights into the dynamic interrelationships among economic variables and the effects of policy shocks. However, it should be noted that most of the impulse-response results are not statistically significant at conventional levels. Therefore, the short-term positive responses observed should be interpreted with caution. The results suggest that changes in ICT exports can positively impact economic growth in the short term, while the effect of economic growth on ICT exports is relatively weak. These observations are descriptive and indicative rather than statistically conclusive, ensuring the interpretations align with the limitations of the data. These findings highlight the importance of supporting ICT export policies to stimulate overall economic activity.

In summary, the short-term positive impact of ICT exports on GDP and the self-reinforcing dynamics of both ICT exports and GDP emphasize the strategic role of the ICT sector in economic development. Policymakers should consider targeted interventions to enhance the ICT sector's contribution to growth while addressing potential constraints limiting the responsiveness of ICT exports to GDP growth.

Linear Regression Model

The analysis is based on a Linear Regression Model, one of the most fundamental and widely used econometric techniques for modeling the relationship between a dependent variable and one or more explanatory variables. The origins of the linear regression framework can be traced back to the works of Francis Galton (1886), who introduced the concept of In review "regression toward the mean" when studying the relationship between the heights of parents and their children, and Karl Pearson (1896), who formalized the method of least squares estimation within a statistical context.

Linear regression models aim to explain the conditional expectation of the dependent variable as a linear function of independent variables. The general formulation of the linear regression model can be expressed as:

$$Y_i = \beta_0 + \beta_1 X_{1i} + \beta_2 X_{2i} + \cdots + \beta_k X_{ki} + \varepsilon_i$$

where:

Y_i is the dependent variable for observation i,

$X_{1i}, X_{2i}, \ldots, X_{ki}$ are the explanatory variables,

β_0 is the intercept term,

$\beta_1, \beta_2, \ldots, \beta_k$ are the slope coefficients representing the marginal effect of each explanatory variable on Y,

ε_i is the stochastic error term, assumed to have mean zero and constant variance ($E[\varepsilon_i]=0$, $Var(\varepsilon_i) = \sigma^2$).

The analysis is based on a Linear Regression Model. The mathematical formulation of the model is presented as follows:

$$GDP_t = \beta_0 + \beta_1 * ICTE_t + \beta_2 * FBBE_t + \beta_3 * MCLUBE_t + \beta_4 * HCE_t + \varepsilon_t$$

Where:

GDP_t : Estimated Gross Domestic Product in year *t* (measured in USD)

β_0 : Intercept term, representing the baseline level of GDP in the absence of any influence from the independent variables.

$\beta_1, \beta_2, \beta_3, \beta_4$: Coefficients representing the marginal impact of each independent variable on GDP.

$ICTE_t$: Exports of ICT services in year t (measured in USD).

$FBBE_t$: Fixed broadband cost in year t (measured in USD).

$MCLUBE_t$: Mobile cellular low-usage cost in year t (measured in USD).

HCE_t : High-technology exports in year t (measured in USD).

ε_t: Error term capturing unobserved factors and random disturbances not explained by the model.

Figure 5: Prediction via Python-Based Linear Regression Model With 2% Noise and Specified Variables

Table 4: GDP Forecasts Using Python-Based Linear Regression Model With Noise Factor

Year	Forecast (Noise Shock)
2024	1.109.600.183.837 USD
2025	1.170.866.631.729 USD
2026	1.237.764.740.639 USD
2027	1.324.508.112.251 USD
2028	1.390.984.895.768 USD
2029	1.470.755.285.130 USD
2030	1.551.044.615.462 USD

The estimated coefficients ($\beta 1$–$\beta 4$) indicate the marginal impact of each digital transformation variable on GDP. For example, a positive $\beta 1$ suggests that increases in ICT service exports are associated with higher economic growth, while the negative or positive signs of $\beta 2$ and $\beta 3$ In review reflect the effect of communication costs on GDP. These results are interpreted in line with prior literature, such as Nasab & Aghaei (2009), Koutroumpis (2009, 2015), and Ahmed & Ridzuan (2013), which emphasize the role

of ICT investments and infrastructure in supporting economic performance. Furthermore, the predicted GDP trajectories generated by the Pythonbased linear regression model provide insights into potential future growth scenarios under varying digital transformation conditions, while accounting for uncertainty introduced by the 2% noise factor.

DISCUSSION AND CONCLUSION

This study examined the growth trends of the Turkish economy between 2008 and 2023 in the context of the impact of information and communication technologies (ICT) on economic growth. The empirical findings are evaluated in light of prominent economic growth theories, with a particular focus on endogenous growth, neoclassical perspectives, and innovation-driven models. The main results are summarized under the following thematic areas:

Relationship with Endogenous Growth Theory and the Knowledge Economy

The findings are consistent with the framework of Modern Growth Theories, particularly the Endogenous Growth Theory, which emphasizes technological progress, human capital, and knowledge production as key drivers of sustainable economic growth.

- **ICT Service Exports (ICTE):** The results indicate a positive and significant effect of ICT service exports on GDP, showing that technological development operates as an internal engine of growth.

- **High-Technology Exports (HCE):** The increase in high-technology exports—such as electronics and software—has contributed substantially to growth, highlighting the importance of R&D and knowledge-intensive sectors.

Alignment with Neoclassical Growth Theory and the Law of Diminishing Returns

According to neoclassical growth models, capital accumulation initially drives growth but diminishing returns reduce its long-term effect.

- **Fixed Broadband and Mobile Usage Costs (FBBE and MCLUBE):** Decreasing broadband and mobile costs improved efficiency and access, but their growth contribution declines over time, consistent with diminishing returns.

Innovation and Schumpeter's Theory of Creative Destruction

Schumpeter emphasized innovation as a disruptive force that reshapes economies.

- The growth of the ICT sector in Turkey has acted as a driver of structural transformation, improving competitiveness through technology integration.

- By incorporating noise and volatility into forecasts, the analysis also accounts for the impact of external shocks, consistent with Schumpeter's view of cyclical fluctuations.

Human Capital and Education

Investments in human capital accelerate economic development in knowledge-driven economies.

• The rise in high-technology exports reflects both infrastructure improvements and a more skilled workforce, underscoring the role of education and training in Turkey's growth.

Implications for Economic Growth

Positive Outcomes:

• ICT exports and high-technology products positively and significantly contribute to GDP.

• Declining broadband costs have supported digital transformation and growth.

• Forecasts indicate a steady upward trend in GDP, reinforcing the role of technology in sustainable development.

Uncertainty and External Shocks:

Forecasts show that exogenous shocks—such as crises or geopolitical risks—can negatively affect growth trajectories, highlighting that economic outcomes are not fully predictable.

Policy Recommendations

- Increase investment in R&D and high-technology sectors.
- Continue strengthening digital infrastructure and reducing broadband and mobile costs.
- Expand education and training programs aligned with knowledge economy demands.
- Develop policies to enhance resilience against external shocks and economic uncertainties.

Overall, the analysis provides evidence that ICT and high-technology exports make a significant contribution to Turkey's economic growth. The results confirm the importance of technological advancement and human capital in achieving sustainable development. At the same time, the influence of external shocks underlines the need for flexible policy frameworks and careful interpretation of the findings. Rather than presenting prescriptive "roadmaps," the study emphasizes the potential of digital transformation while recognizing its limitations and the role of broader economic conditions.

STRUCTURAL INEQUALITIES AND THE SINGLE AGRICULTURAL POLICY OF AGRICULTURAL AID IN THE EUROPEAN UNION: A COMPARATIVE ANALYSIS OF THE CONTROL MECHANISMS OF EUROZONE COUNTRIES WITH EMPHASIS ON GREECE.

Summary

This article is based on a bibliographical comparative analysis of the mechanisms governing control and distribution of agricultural aid in Central and Southern European Member States, such as Greece, Germany, Romania and other European countries at a level economy-administrative structure similar to that of Greece. Effectiveness of control measures, bureaucratic problems and success with respect to sustainability and rural development objectives are here assessed. By presenting some commonalities and divergences between countries, it is hoped to showcase examples in order to secure the transparency and effectiveness of the agricultural aid apparatus in Greece, as well as its adherence to European standards.

Keywords: Common Agricultural Policy, subsidies, control mechanisms, agricultural aid, Greece, Romania, Germany, rural development.

1. Introduction

The Common Agricultural Policy (CAP) is one of the most laborious and expensive instruments within the European Union; it consumes ca. 30% of the budget in total (European Commission 2021). CAP is not only a financial instrument for farmers, its probably one of the key instruments on European integration that connected economic convergence with sustainability and social justice in rural space (Matthews, 2018). Yet, visible disparities between member countries regarding the absorption and successful implementation of aids underline the internal mechanism of inequality within the EU. These

disparities are not merely economic in nature, but have strong connections with the administrative, institutional, and technical capacities of each country (European Audit Service, 2019; Heyl et al., 2022).

The analysis of control mechanisms in the field of agricultural assistance here is especially important, as it reveals the level of usefulness, transparency and institutional maturity within that country (Glowinkel 2020). Especially in Greece, where agricultural policies are of administrative centralization, bureaucracy and limited technical support, examining control mechanisms compared to more efficient countries like Germany or Denmark can be crucial to reconstructive policy (OPEKEPE 2022; Doukas 2021). The originality of this paper, then, is the fact that it helps in understanding why institutional inequality persists or is increasing within a common European system which should function under an equal set of rules in theory but does so to varying degrees in reality.

This paper aims to point out the differences and resemblances between agricultural aid control instruments owned by member states of Eurozone with emphasis on Greece, Germany and Romania applying a comparative method. The aim is to analyse the administrative and institutional factors of differentiation on the one hand, and to make concrete policy recommendations that will enhance transparency and efficiency within the Greek agricultural administration, facilitate reasonable access to agricultural land and promote local alternative agricultural practices on marginal territories. At the same time, the analysis seeks to shed light on how technological innovation, decentralization, and sustainability indicators can be levers to balance the gap within Europe (BMEL, 2022; Cagliero, et al., 2023).

The need for this study stems from the fact that despite numerous CAP reforms, the gap between the northern and southern parts of the EU remains stable (European Commission, 2020). For example, Greece has always been one of the countries with the highest percentage of subsidies per farmer, but its management efficiency is low (MDPI, 2023). This shows that quantitative financing is not the same as qualitative growth, and it is necessary to study the institutional parameters that affect the distribution and control of agricultural aid. Due to the lack of comparative studies on aid management in different administrative systems, this article makes an important contribution to the literature.

Based on the above, this article attempts to answer three basic research questions.

1. What are the main structural and administrative differences affecting the effectiveness of agricultural aid control mechanisms in EU member states?

2. What determines the difference between a country with high efficiency (e.g., Germany) and a country with low administrative capacity (e.g., Greece and Romania)?

3. How would political and institutional interventions make the Greek control system more efficient and closer to the Central European standard?

The answers to these questions could generate theoretical and policy value, in terms of contributing at the level of the comprehension of Europe's deficiencies in terms of agricultural policy, set up promoting institutional solutions that might improve sustainable rural areas. Furthermore, the paper aims to offer a political-economic and administrative approach for upgrading Greek instruments of control in the field of EU regulation.

The article is structured as follows: Part 1 will have a bibliographic review and theoretical framework of perspective, control mechanism to CAP. Section 2 examines the subsidy systems of several European countries, including specific sections for Greece, Germany and Romania. Part 3 will compare benchmarking with national polices and control frameworks. The fourth section will serve to discuss the findings and contributions of the present study and, finally, some general conclusions will be provided in the last section as well as specific answers to our research questions and directions for future research and policy comments.

2. Bibliographic Review

Though the basic principles are the same, they have never been exactly identical. Grants, conditionality and control instruments are designed according to institutional, economic and social circumstances of the member countries with relevant policy effects in several countries (Heyl et al., 2022). The international literature teaches that the effectiveness of agricultural aid does not only depend on the size of funding, but mostly on state institutional readiness and administrative ability to channel it in transparent and proper manner. Ekardt (2020) and Heyl et al. (2022), CAP is a field of "sustainability governance". This is where grants are not simply financial rewards but tools of social and environmental transformation. In some countries such as Germany and Austria, aid policies escape depen dency geopolitics by building strong institutional machinery, check systems of monitoring and digital control (BMEL 2022) 28. This effectiveness harnesses the power of generating payments for clear performance and environmental compliance without running into error or distortion.

Then, in southern and eastern member states such as Greece, Romania and Bulgaria grants continue to work as income substitution rather than development instruments. According to Doukas, 2021 and Galluzzo (2020), bureaucratic slowness of the administrative systems and inability to properly control programs is common in these countries. The process of control system digitization, staff training as well as data connections are still insufficient and collaboration with local agencies is often disjointed. Accordingly, the same policies have diverse effects in countries with strong institutions and weak administrative traditions (Glowinkel, 2023).

A comparison study for Pufahl and Sinabell (2014) and Cagliero et. (2022) empirically demonstrate this differentiation. Their findings illustrate that countries like Austria and Germany have high scores in institutional readiness, transparency, digital audits and digital evaluation whereas Greece is an outperformer only in comparison with Turkey on these indicators. As illustrated in Figure 1, they concern not only specific technicalities but also structural governance dimensions—such as a decentralization pattern vs. cooperation between ministries and regions or the involvement of agricultural organizations in control mechanisms. The existence of these institutional nets in the northern countries is an indicator as to Just why (in the northern countries) aid is connected with innovation and environmental adaptation, whereas aid in the southern countries operates mainly at conservative levels of revenue management.

In other words, existing literature stresses that disparities in aid absorption and use are not only geographical but also social. The biggest farms occupy around 80% of all CAP resources (European Commission, 2021), contributing to land concentration and undermining the position of small and medium-sized farmers. This reality undermines social policies as little farms cannot invest in the green transition and technological innovation that are a precondition for genuinely sustainable agriculture (Heyl et al., 2022). On the other hand, in countries like Austria, the close linkage between subsidies and environmental performance indicators has led to improved resource targets and greater acceptance of policies by farmers themselves (BMEL, 2021).

Overall, the literature converges that the **success of the CFP depends on each member country's** institutional background**,** digital infrastructure**,** culture of responsibility**, and governance capabilities**. These differences, reflecting the most acute North-South divide in the EU, cannot be resolved by economic means alone. Structural reforms are needed to increase transparency and transparency. Continuous evaluation of decentralization and policies to ensure that CAP can evolve from a stabilization tool to a real driver of sustainable development and social equality.

3. Policies of European Countries

3.1. Politics of Greece

Greece is a typical case of country which CAP agricultural aid is highly necessary to maintain the viability of agricultural sector, but ineffective due to lack in administrative and institutional arrangements. Both nation and subnational strategies have traditionally addressed agricultural income, and not production or referred to greening in strategies (Doukas, 2021). Some modernisation attempts have been already made through the OPEKEPE (Community Map and Guarantee Support Payment and Control Agency) but problems, as delays in payments, limited transparency or low degree of digitization of procedures persist (OPEKEPE 2022).

Studies by ELIAMEP (2020) and the European Commission (EU, 2021) demonstrate that aid allocation continues to be anchored in historical rights and does not have a strong connection to environmental or development criteria. As a consequence, the resources are not fairly distributed and most of the money ends up with large landowners rather than small, productive farmers. Meanwhile, the fragmented nature of agri-advisory services has impeded producers' ability to access new farming techniques (Daskalakis, 2019).

In recent years, Greek agricultural policy has sought to incorporate gradually actions and activities for promoting green agriculture, agri-food innovation and collective resource management in the framework of RDP 2023-2027 plan (Ministry of Rural Development and Food (YPAAT, 2023). But the effectiveness of these reforms will hinge on streamlining bureaucracy and enhancing decentralization, as well as improving control. As Heyl et al. (2022) note, in absence of well-defined targeting and quantifiable evaluation criteria, Greece may be stuck in a subsidy model without promoting more sustainable growth.

3.2. Policies of Germany

Germany serves as a role model for the implementation of C-AP with respect to regulations, technical experiences, and transparency. The federal principle of the country, which allows responsibilities to be decentralized between different layers of government, including state level governments, also becomes important for sugarcane grants delivery and monitoring (BMEL, 2022). This management address changes was made for central control of the Federal Ministry of Food and Agriculture Federal Office BMEL (BMEL) with a regional responsibility increase the transparency and efficiency.

The arm relating to Germany is very strong. The country utilises digital systems in order to maximise the Integrated Management and Control System (IACS) for following agricultural practices, land use as well compliance with environmental regulation (European Court of Auditors, 2019). It also pursues strict system of job evaluation based on productivity, efficiency and environment performance. The results of these assessments are published year by year, and they become part of subsequent years' policy plans to create a dynamic circle of improvement (Pfeifer et al., 2016).

Yet another element of the German solution is that green transformation will have precedence. Through embedding environmental components in the grants through programmes on bi-diversity, emission reduction and sustainable soil management, Germany has turned out to be a role model for the EU (BMEL 2021). As Heyl et al. (2022) note, the success depends not just on sufficient funding. Transparency and accountability held aloft, but never carried through to the interrelationships between political ends and means.

3.3. Romanian Policies

Romania has made steps forward in the adoption of CFP, however it still struggles with major institutional and administrative difficulties. The state authority APIA (Agenția de Plăți și Intervenție pentru Agricultură) manages payment plans on the basis of an integrated management and control system (IACS), yet the process is frequently slow and bureaucratic (Galluzzo, 2020). Farm fragmentation and the low administrative of local services are the causes for delays and hardships in absorbing community fund (Glowinkel, 2020).

Farmers in rural Romania are reported to lack technical support and advisory services, which have thus far hindered the successful roll-out of the programme (ARC2020 2020). The absence of specialized personnel and of digital instruments lowers the institution efficiency, reducing transparency. European auditors' norms are being also adopted by Romania, but its applicability at regional level is frequently blocked by bureaucracy and limited decentralization (Galluzzo, 2020; Glowinkel, 2023). There has, however, been a modernization push recently with the introduction of electronic registers and increased collaboration with local government. Despite these advances, the literature concurs that Romania is a case of transition: it has an institutional framework but does not yet possess full administrative maturity to manage aid efficiently.

4. Comparison

4.1. Control Mechanisms for the Allocation of Aid in the EU

The control mechanisms are set by the European Commission, but the national paying agencies are responsible for the correct allocation and monitoring of subsidies. The differences arise from the administrative capacity, the use of digital tools, risk control and the political culture of each country (European Commission, 2021; OLAF, 2021). The efficiency of these mechanisms therefore varies significantly from country to country.

In Greece, despite high funding through the CAP, its implementation is characterised by high administrative complexity, delays in the payment of aid, limited adequacy in control mechanisms (ELIAMEP, 2020) and the absence of a transparent eligibility system (MDPI, 2020). The lack of advisory services and the allocation of aid based on historical entitlements have been an obstacle to the restructuring of the agricultural sector (MDPI, 2020). The control mechanisms, although strengthened in recent years through OPEKEPE, remain inadequate in capturing the true picture of agricultural practices (OPEKEPE, 2022), as there is a delay in the digitization of controls (OPEKEPE, 2022) and a lack of regional technical support (Springer, 2020). In fact, the Greek case is characterized by a strong dependence of farmers on subsidies, with limited use of advisory services and innovation (Daskalakis, 2019 ;D oukas, 2021) and as noted by Heyl et al. (2022), the lack of linking subsidies to specific and measurable objectives reduces the effectiveness of aid policies.

Romania has similar administrative malfunctions as Greece. Romania, through the APIA (Agenția de Plăți și Intervenție pentru Agricultură), implements the Integrated Administration and Control System (IACS) used to monitor and control agricultural aid granted under the European Union's Common Agricultural Policy, but the country faces significant problems of fragmentation of agricultural land and low institutional efficiency, resulting in insufficient absorption of Community funds. The low absorption rate of CAP funds is due, inter alia, to bureaucracy, reduced administrative capacity, such as staff shortages, complexity in procedures and limited decentralisation (Glowinkel, 2020; Galluzzo, 2020) and the lack of local technical advisory services (ARC2020, 2020). As Glowinkel (2020) mentions, agribusinesses in Romanian regions operate in an environment of limited institutional support, resulting in them being overly dependent on subsidies, but without enhancing their long-term viability. In addition, the inability to adopt innovative tools and controls leads to delays and losses of resources (ARC2020, 2020; Galluzzo, 2020).

Unlike Greece and Romania, Germany is an example of best practice as it has sophisticated and decentralised monitoring and control mechanisms. In fact, it has established stricter and more digital control mechanisms, which enhance transparency and fair distribution of subsidies (BMEL, 2022; European Court of Auditors, 2019). The implementation of the CAP in Germany is characterized by clear institutional frameworks, multi-level control as well as stable federal supervision and state supervision (BMEL, 2021; Pfeifer et al., 2016). At the same time, there is an integration of environmental criteria into subsidy systems (European Court of Auditors, 2019; BMEL, 2022). The

mechanism for evaluating the effectiveness of rural development policies is embedded in annual reports and is based on quantitative data (Pfeifer et al., 2016). This mechanism contributes to the high efficiency of agricultural aid and the viability of farms in Germany. As Heyl et al. (2022) argue, such examples make it clear that strengthening sustainable agriculture requires more funds than resource allocation: it needs to be linked to targets, indicators and continuous evaluation.

It is observed that central European countries such as Denmark and Austria, following the policy of Germany, show strong administrative efficiency, as well as strict control systems with a high level of digitalization that link agricultural aid to environmental performance (Springer, 2020). In contrast, in the European south, countries such as Italy, Spain and Portugal have a mixed profile, with some regions implementing pioneering practices and others facing similar obstacles to Greece (European Commission, 2020). The modest administrative capacity of these countries does not allow the full use of the subsidies. Despite modernisation efforts, difficulties in absorption and implementation of audits are still recorded (European Court of Auditors, 2019). In these countries, the main problem has been political in nature, with subsidy distribution being politicized and control being hard to enforce at the local level (Heyl et al., 2022). Finally, as was the case with Romania, Bulgaria also suffers from structural weaknesses in public administration which have contributed to low subsidy absorption rates and an inadequate system of control for the distribution of agricultural aid. (FAO, 2020).

It can be seen in Table 1 that more developed with a decentralized technological basis and effective control systems are the countries from Central and North Europe (Germany, Denmark) while those in South-Eastern Europe have the drawbacks of congestion, bureaucracy and technological delays (Greece, Romania, Bulgaria). Italy falls in the middle, with strong subnational communities engaging in creative approaches and weak ones failing to keep up. The comparative discussion also illustrate area where we could improve both the coordiantion and digitalisation to make the CFP implementation more level playing field and effective (European Court of Auditors, 2019; Cagliero, et al., 2023).

Country	**Main Control & Management Body**	**Level of Digitization / Technology**	**Administrative Capacity & Organization**	**Key Weaknesses**	**Best Practices / Specifics**	**Sources**
Greece	OPEKEPE – IACS	Moderate – limited use of GIS and satellite controls	Centralized system with low regional decentralization	Bureaucracy, late payments, reliance on historical rights	Development of new digital services (e.g. e-IACS) from 2021	(OPEKEPE, 2022· Doukas, 2021· MDPI, 2020)
Germany	BLE (Bundesanstalt für Landwirtschaft und Ernährung) and state authorities	Very high – fully automated GIS/LPIS system	Federal and decentralized control system	Limited problems – high technology maintenance costs	Integration of environmental indicators and annual quantitative assessment	(BMEL, 2021· BMEL, 2022· Pfeifer et al., 2016)
Romania	APIA (Agency for Payments and Intervention for Agriculture)	Moderate – IACS use with	Weak administrative capacity, lack of staff	Land fragmentation, limited	Phasing-in of new eligibility	(Glowinkel, 2020· Galluzzo, 2020·

Country	Main Control & Management Body	Level of Digitization / Technology	Administrative Capacity & Organization	Key Weaknesses	Best Practices / Specifics	Sources
		deficiencies in automation		technical infrastructure	indicators (2020–2023)	ARC2020, 2020)
Denmark	Ministry of Food, Agriculture and Fisheries (Landbrugsstyrelsen)	Very high – fully digitized systems, remote sensing	Strong decentralization, technical proficiency	Reliance on centralised EU data for cross-checking	Automatic verification of beneficiaries and environmental performance	(Springer, 2020· European Commission, 2020)
Italy	AGEA (Agenzia per le Erogazioni in Agricoltura) – Regional offices	High but heterogeneous between regions	Decentralized model – uneven efficiency	Different yields by region, administrative inconsistency	Pioneering GIS projects in regions such as Emilia-Romagna	(European Court of Auditors, 2019· MDPI, 2020)
Bulgaria	State Fund Agriculture (SFA)	Low – limited GIS usage	Weak public administration and delays	High error rates, lack of transparency	Steps towards alignment with EU standards post-2020	(FAO, 2020· Popescu & Călin, 2019)

After that, Austria and Germany are the top performing countries, with scores extremely high in each category (80%-90%+). This is the evidence of sound administrative work and tidy technical backup. A new chart on page six provides a snapshot of % performance levels for CAP implementation and evaluation in six important areas (2023 – 2027): institutional readiness, digitization of control systems; open data transparency; availability of performance indicators monitoring frequency local authorities' involvement. Peru's statistical average of less than 30% is indicative that it has quite poor performance in this respect. Greece is in the sort of 50-70% bracket, though it is the worst apex across Asia by far. What really sticks out here? Its data is poor when compared with any other country. So Greece's presence here is kind of univocal evidence for problems of decentralization and need to strengthen control mechanisms (Heyl et al., 2022; Glowinkel, 2023· European Commission, 2021).

Figure 1. Benchmarking of the 2023–2027 CAP monitoring and evaluation mechanisms in Austria, Germany and Greece

The comparative analysis highlights the need to redesign the control framework for the CAP in southern European countries, including Greece. The introduction of measurable indicators, the strengthening of digitalisation, the reduction of bureaucracy, the independence of controls and transparency are required. The experience of countries such as Germany or Denmark shows that efficiency and sustainability are not only achieved through subsidies, but through a combination of technical support, targets and

transparency (Heyl et al., 2022). Greece must make use of the European experience and move from a system of simple subsidy to an efficient system of agricultural management and development.

4.2. Structural Differences in the Implementation of the CFP

The implementation of the Common Agricultural Policy (CAP) presents significant structural differences between the countries of Central and Southern Europe, reflecting the rural structures, administrative capacity as well as the level of technological and digital readiness of each country. In particular, countries such as Greece, Romania and Bulgaria face increased challenges due to fragmented land tenure and agricultural production, limited digitalisation and bureaucracy (Eurostat, 2021; FAO, 2020). In contrast, countries such as Germany, Denmark and Austria have strong institutional support, decentralised administration and advanced information systems, which makes the implementation of the CFP more efficient and transparent (BMEL, 2022; European Commission, 2020). Denmark in particular has a high level of automation and fully digitalised procedures in agricultural aid (Springer, 2020).

Greece is characterized by a centralized governance model with high funding through the CAP but limited technical support structures, as the CAP allocation system is mainly implemented through OPEKEPE, with the help of the IACS (European Commission, 2020). Clearly, digital recording is done through the IACS for the submission of declarations and the confirmation of the beneficiaries. However, despite this, on-site control as well as remote control with satellite monitoring is incomplete, with the implementation of geospatial systems for the verification of cultivated areas being called into question (Doukas, 2021). At the same time, the lack of a transparent eligibility system, bureaucratic delays, especially in the payments and absorption of CAP funds (Daskalakis, 2019), the insistence on historical rights and the limited use of digital tools slow down not only the transformation of the agricultural sector (MDPI, 2020; OPEKEPE, 2022) but also the efficiency of the control mechanisms that is still lagging behind other EU Member States that are considered models such as Germany and Denmark (European Commission, 2020). Similarly, Romania faces significant difficulties in absorbing aid due to low administrative capacity, limited advisory structures and dysfunctional rural organisation (Glowinkel, 2020; ARC2020, 2020). However, steps have been taken towards the adoption of environmental and objective allocation criteria (FAO, 2020).

In contrast, Germany implements the CAP through a federally organized and technologically advanced mechanism known as the BLE (Federal Agency for Agriculture and Food), with a strong interface between government agencies and producers. The German system relies on accurate recording through geospatial systems such as GIS and LPIS (Doukas, 2021; Gatzweiler et al., 2017) for the verification of cultivated areas through satellite monitoring, the registration and confirmation of aid beneficiaries and the evaluation of on-the-spot and remote checks to avoid irregularities and mismanagement (Pfeifer et al., 2016; European Court of Auditors, 2019). Technical support, appropriations for innovation and full digital oversight enhance the transparency and efficiency of the CAP. Spain and Italy apply decentralised models, with regional differentiation, allowing for flexibility but sometimes reinforcing inequalities (MDPI, 2020). In Portugal and Bulgaria, despite funding opportunities, limited administrative capacity and delays in controls prevent the full use of resources (Popescu & Călin, 2019; European Court of Auditors, 2019). The above differentiations demonstrate the need for institutional and administrative harmonisation, technical and digital support and the promotion of innovation in low-performing states to ensure the sustainable and fair implementation of the CFP across Europe

4.3. Agricultural Aid Policy under Inequalities

The uniform application of the CAP does not similarly support all EU member states. It is observed that countries with already developed agricultural structures such as Germany, Denmark and Austria can

better absorb and use aid more efficiently (Matthews, 2018). The model followed by powerful countries such as Germany offers stability and transparency (BMEL, 2022). In contrast, in less developed regions such as Greece, Romania and Bulgaria, the subsidy often functions as an "income replacement" rather than as a tool for transformation or development. Southern European countries are lagging behind in efficiency and administrative efficiency compared to those of central and northern Europe (Doukas, 2021).

CAP is the "same drug", but all it same way in dinoses with different physiology. “The middle way,” as it’s known in Germany, Denmark and Austria, includes elements consisting of high-level administrative capacity for disbursals to farmers, digital controls (and requirements) on aid spending, powerful cooperatives and medium-size to large farms. Accordingly, the same euro is more readily charged with income stabilization AND investment, innovation and environmental effects as well (Heyl et al., 2022). The payment of the farmers in Germany ‘is linked’ to clear indi cators as (biodiversity, energy efficiency, emissions) and a decentralised control with coordination between the federal and state level is performed. This, in turn, establishes predictability for farmers and responsi- bility towards the administration (BMEL, 2021–2022; European Audit Service, 2019; Heyl et al., 2022). Denmark and Austria also share that combination of strong IACS/LPIS, high penetration of advisory services and culture of cooperation (producer groups, collective action for green results). This is how they make use of 'mature' forms of support like sound ecological planning and se rvice -based remuneration (e.g. biodiversity, water quality) that needs to be measured and continually ovserved (Cagliero, et al., 2023; Heyl et al., 2022).

Meanwhile, a different set of "baselines" apply for Greece, Romania and Bulgaria: fragmented land, historical rights to "lock" out allocations, lags in digitising/ control systems, and poorer access to technical assistance in the region's least favoured areas. As a consequence, aid is largely income compensation rather than an instrument of leverage. In Romania the fragmentation and lack of capacity at local administration level are decreasing the absorption of investments measures and productivity. We also find that "friction" such as Lags, qualification disparities and disparity of access to counseling are circulating in Greece (Glowinkel, 2023; Galluzzo, 2020 · Ducasse, 2021· MDPI,2020).

It’s more than just technical differences; It’s systemic. Under the “Northern” model, direct payments encompass investments in agricultural advice, collective action (remote sensing, risk-based control), digital tools and tight coupling with objectives. In the ‘South/East’ this mirror aid has also the opposite side when these ‘intermediate goods’ are not available: diminished innovation, decreased opportunities of small producers to ‘go up the rungs’, and increased dependency on subsidies (Heyl et al., 2022; European Commission, 2021). The distinction is a matter of scale, though. Investments have scale effects (precision equipment, renewables on farms, collective intervention in waterways) In Germany/Denmark/Austria because there are medium and large sized farms. With small or no active collectivisation, the same investment is expensive and difficult in Greece and Romania, so subsidies "disappear" following short-term needs (Glowinkel (2023), Ganda, 2023). It will also deepen the gulf between haves and have nots, particularly at European level where about 20% of beneficiaries received ~80% of direct payments and so good news for large farms and regions with mature administrations. If the administrative filters are clearer, and smaller filters and rules eliminate disbursement effectively (the bigger the filter – or rule — you have to break through, the more efficient each euro of CAP), then larger yield from said Cap. If the process is opaque, feedback can function as 'safety net' rather than unambiguous environmental/productive 'reward' (European Commission, 2021; Heyl et al., 2022).

And of course there are “mixed” cases. Italy, Spain and Portugal have world-beating constituencies (digital audits,wise results in waste /biodiversity) alongside other regions with the same malfunctions (latency, mutilation of resources) as Greece. This demonstrates that regional planning (e.g., a collective payment for all the river basins) but also results-based one can "spoil" national averages when having the means to implement them (European Commission, 2020; European Court of Auditors, 2019). One

thing that all "successful" countries have in common, is the tie between payments and achievement. If the grant is associated with measurable metrics (biodiversity areas, nitrate/phosphorus measures, soil healthy, adoption of precision practices) then transparency and action can be seen. When linkage is weak, reinforcement emerges as a frequent transfer with low "policy effectiveness," particularly in politically challenged administration (Heyl et al., 2022; Matthews, 2018).

After all, the same European financial flows have different outcomes, because they "click" on different capabilities like bureaucracy management, digitalization, consulting skills, collective action and market proportions. If the South/East invests in intermediate goods (advice, cooperation plans, targeted digitization of control), if resources are shifted away from horizontal to target/effective payments, so that CAP performs as it does for Northern states. In other words, it starts to act itself as a motive force of transformation not only an "addition" (Cagliero, et al., 2023; European Commission, 2023).

5. Debate

The comparative analysis of the control mechanisms between the EU member states reveals significant structural weaknesses in the countries of southern and southeastern Europe, such as Greece, Romania, Bulgaria and partly Spain. These countries are characterised by low institutional and technological capacity, administrative congestion and limited transparency in the management of agricultural aid (European Court of Auditors, 2019; MDPI, 2020). In contrast, countries such as Denmark, Germany and the Netherlands have developed technologically advanced and decentralized administrative systems, which are based on unified GIS tools, remote sensing checks and automatic verification of beneficiary data (BMEL, 2021; European Commission, 2020).

In order to achieve substantial convergence, it is necessary for the countries of the South to invest in strengthening the independence, know-how and decentralisation of control mechanisms. In particular, it is proposed to establish decentralized technical units for the control and management of aid, with enhanced staffing and specialization. Decentralization not only allows for targeted implementation of policies by region, but also increases efficiency through better knowledge of local specificities (Springer, 2020). This model is already successfully implemented in some strong member states of central and northern Europe, where local government plays an active role in the monitoring, distribution and evaluation of agricultural subsidies (Cagliero, et al., 2023).

The case of Spain is noteworthy, which – although belonging to Southern Europe – has a decentralised administration system that allows flexibility in the implementation of policies at regional level. However, the absence of a single technical infrastructure and large discrepancies in the efficiency of individual autonomous regions create gaps in control and transparency (MDPI, 2020). This implies that decentralization in the absence of common tools and standard ways of doing things was contributing to administrative variability.

Yet at the same time many European countries in the south of Europe - together with Greece, Italy and Bulgaria - are woefully lacking in transparency, and there is no rationality or efficacy to how aid is distributed even though the union has ample resources. This vulnerability is to be counteracted by the compulsory activation of digital instruments (sole GIS, LPIS, IACS) and the disclosure of open data on final beneficiaries; with a view to a public accountability and in order to lower the opacity (European Commission, 2021; Popescu & Călin, 2019). In addition, the creation of unified GIS databases at EU level would allow for comparable, automated and more valid checks, while enhancing cooperation and exchange of know-how between Member States (Glowinkel, 2020).

Another crucial element of differentiation is the education and training of auditors, but also of farmers and civil servants. Countries with developed control mechanisms apply common standards of certification and training, unlike Greece or Bulgaria, where training is often fragmented and insufficient (Cagliero, et al., 2023; Galluzzo, 2020). A European initiative to harmonise training standards in control mechanisms would help reduce inequalities in the implementation of the CFP.

Finally, it becomes evident that the proper use of aid requires a combination of strategic planning, innovation and sustainable distribution. Subsidies must be linked to criteria of necessity, efficiency and environmental performance – a practice already applied in states such as the Netherlands and Germany (Klein et al., 2019 ; BMEL, 2022). Greece and the rest of the countries of southern Europe must invest in long-term planning and the development of policies that take into account local needs and structures, in order to ensure sustainable and effective rural development.

6. Conclusions

Theoretical discussion In an attempt to address debate about the everyday functioning of CAP, we should consider whether the routine application of control strategies and regulations for implementing this particularly complex policy reflects a geographical split between northern and southern Europe. The efficiency in monitoring and disbursing aid is a function not only of the financial resources but also essentially of institutional maturity, technical capabilities, and administrative ethos (Heyl et al., 2022· Glowinkel, 2023). Nordic and Central European countries like Germany, Austria and Denmark have established multilevel governance systems in which transparency, decentralization and digital tools are integrated into agricultural policy (BMEL, 2022). On the other hand, in some Southern European Member States like Greece (Botti et al., 2021; Doukas et al., 2021; Ringer and Nicholas, 2010), Italy (Ciffolilli and Massini, 2007EOF) and Portugal, structural weaknesses are still present in addition to administrative τ mutations involving a lack of payments as well as politicization in the allocation of funds.

This division is not due to differences in administrative traditions among the individual member states, but reflects historical and institutional asymmetries at the heart of public administration. Fragmented governance and transparency in public administration have remote antecedents across the Nordic countries (Pfeifer, et al. 2016), which arguably facilitate aid monitoring and policy evaluation. At the other end of the process, it has been reported in the case of some local administrative structures that centralized organization and a lack of personnel investment means disproportionality in fund uptake combined with reduced accountability (Glowinkel 2020; FAO 2020). Hence, inequality in effectiveness of the CAP mechanism is a complex issue with institutional, managerial and economic elements.

The complex perspective addressed the research question of efficiency gap between North and South. Among the Central and Northern countries, it is at a higher level of best practice because the continuity administration exist along with technological infrastructure and feedback & transparent culture are developed (European Audit Service, 2019· BMEL, 2022). Southern countries like Greece and Romania, in contrast, face institutional instability, a lack of coordination as well as limited technological development and digitalization (ARC2020, 2020; OPEKEPE, 2022). It is these factors that also account for how identical European policies attain different outcomes within the Union.

The second research question, Greece is currently characterized by an institutional framework that seems to be more stable now and under the guise of a new CAP 2023-2027 strategy (YPAAT, 2023) which requires further reforms for it to reach levels similar to those found in countries belonging to the Nordic model. Most significant of these reforms is the delegation of powers to rural administration. It is connected with the personnel that staff local mechanisms, reinforcing digital infrastructure and training human resources (Daskalakis, 2019; Doukas, 2021). At the same time, an attempt to link grants to both innovation and sustainability results in the "depoliticization" of aid and the establishment of measurable performance standards (Heyl et al., 2022).

So, harmony is not a utopian, but a theoretical long-term process of coming together that needs political will, transparency and institutional continuity. Greece can move from a model of subsidies to the key development with the support of technology, policy mentality and involvement that could be producers. Otherwise, CAP can be utilized as means to lever the construction and cohesion of rural sustainability.

At the European level of policy making, results from this analysis indicate that a more flexible and diversified CAP should be considered that reflects national and institutional specifics of each member state. The European Commission has the possibility of investing in technology convergence programs, so that the function of independent audit bodies can be enhanced and the administrative divide between North and South is narrowed.

Lastly, the future research could be concentrated on empirical studies on digital transformation in rural administration, a quantitative relationship between organizational capacity and aid absorption. Assessment of the social aspect of subsidies in particular helping small and medium-sized farmers, young farmers. The road to a fairer, greener and more efficient EU farm policy is not preordained but the consequence of long-term commitment, collaboration and reform of administration.

SHOCK RESILIENCE OF UKRAINE'S BANKING SECTOR: A BAYESIAN DYNAMIC MODELLING APPROACH

The banking sector in Ukraine has been shaped by a series of profound economic, social, political, and military shocks, including the 2008–2009 global financial crisis, the annexation of Crimea and the occupation of parts of the Luhansk and Donetsk regions, multiple episodes of national currency devaluations, the commercial bank reform of the 2014–2016, the COVID-19 pandemic, and the full-scale Russian invasion launched in February 2022. This study examines the temporal structure of factors affecting the dynamics of non-performing loans (NPLs), which reflect the resilience of Ukraine's banking sector under conditions of persistent uncertainty and external shocks. An autoregressive distributional lag (ARDL) model with Bayesian estimation was employed to derive posterior parameter distributions and assess their statistical significance. Quarterly data from the National Bank of Ukraine (NBU) for Q1 2006–Q3 2025 were used. The model was found to be adequate based on parameter estimates and diagnostic tests.

The dependent variable (Y_t), representing the banking sector's resilience to shocks, is the share of NPLs (%). Exogenous variables include the rate of change in real GDP (X_1, % compared to the same quarter of the previous year), the consumer price index (X_2, %), and the NBU's policy rate (X_3, %). Bayesian modelling indicates that NPLs largely depend on their lagged value Y_{t-1} (coefficient 0.942), reflecting process inertia. Lagged effects of independent variables were also significant: $X_{1,t-1}$ captures the influence of the previous economic cycle phase on loan portfolio quality (coefficient -0.097), $X_{2,t-4}$ reflects the delayed effect of inflation on banking sector stability (coefficient 0.134), and $X_{3,t-4}$ captures the lagged impact of monetary policy on borrowers' solvency (coefficient 0.121). The Bayesian regression results demonstrate a high level of explanatory power (Bayesian R^2=0.980), indicating that the included factors account for approximately 98% of the variation in NPLs. Low predictive errors (MAE=1.293, RMSE=2.121) indicate good model fit to historical data. Taking together, the findings indicate that the banking sector's resilience to shocks, as reflected in the NPL dynamics, depends on economic policy initiatives aimed at stabilizing the macroeconomic environment, as well as on the NBU's decisions regarding the policy rate. These results may be useful for shaping policies intended to enhance the capacity of Ukraine's banking sector to withstand external and internal shocks that affect the quality of commercial banks' loan portfolios and the accumulation of NPLs.

Key words: Banking sector, Non-performing Loans, Autoregressive Distributional Lag model, Bayesian inference, Macroeconomic indicators

Introduction. Over the past two decades, Ukraine's banking sector has been exposed by significant shocks that have shaped a distinctive risk landscape and necessitated continuous institutional adaptation. The sector has experienced a complex trajectory of transformation: from periods marked by excessive dependence on external financing and pronounced vulnerability to currency fluctuations, to a phase of comprehensive structural reform. This reform agenda included the removal of insolvent institutions from the market, the introduction of risk-based supervision, the implementation of large-scale recapitalisation and restructuring programmes, and the alignment of banking practices with updated standards for capital adequacy, liquidity management, and credit-risk assessment. Taken together, these transformational processes have strengthened the institutional resilience of the banking system and enhanced its capacity to withstand macroeconomic and financial shocks.

The current stage of banking sector's development is characterised by a sustained increase in capitalisation**. For example, commercial banks' capital adequacy levels significantly exceed the minimum regulatory requirements, with an average Tier 1 capital adequacy ratio of 17% and a total regulatory capital ratio of 17.5%; high liquidity, as reflected in liquidity coverage ratios in all currencies (LCR all) and in foreign currency (LCR fx), which exceed the regulatory minimum of 100% by a factor of three; and increased attention to asset quality through regular asset quality reviews conducted by external auditors, alongside updates to the National Bank of Ukraine's (NBU) regulatory standards aimed at strengthening credit-risk coverage** (National Bank of Ukraine, 2024). **Collectively, these developments contribute to reinforcing the sector's risk-management mechanisms**

Consequently, in the current environment, study and management of credit risk in the banking sector are among the most critical tasks. Non-performing loans (NPLs) constitute a key indicator of the sector's stability and operational risks, as their growth directly affects asset quality, capital adequacy, lending activity, and the capacity to support economic recovery (Bondarenko et al., 2020; Salas et al., 2024; Velliscig, Floreani, & Polato, 2023). Therefore, a detailed analysis of NPL dynamics, along with an assessment of the impact of macroeconomic and monetary factors on their evolution, is essential both from a scientific perspective and for the development of effective insights to strengthen the sector's shock resilience. The dynamics of NPLs in the Ukrainian banking sector during 2006–2025 exhibited significant fluctuations – from 6.2% in January 2006 to 56.2% in July 2017, and 27.9% in July 2025 (National Bank of Ukraine, 2025b) – reflecting changes in the economic environment as well as the effects of regulatory decisions and institutional reforms. Analysing these dynamics requires methodological tools capable of accounting not only for short- and long-term lag effects, but also for the stochastic nature of credit risk, parametric uncertainty, and potential structural shifts.

While a substantial body of international research exists on NPLs (Ari, Chen & Ratnovski, 2021; Ahmed et al., 2021; Kjosevski & Petkovski, 2021; Petkovski et al., 2021; Erdas & Ezanoglu, 2022), most studies rely on classical econometric techniques, such as panel data models, GMM, or non-equilibrium ARDL approaches. Although these methods have proven useful, they may have limitations in adequately addressing parametric uncertainty, non-linearity, asymmetry of effects, and the risk of structural changes that characterise economies subject to frequent and severe shocks. This points to a relevant avenue for further investigation, namely the application of methodologies capable of analysing both short-term and long-term lagged dependencies while accounting for the stochastic nature of credit risks and their transmission mechanisms. From this perspective, the use of dynamic models with Bayesian estimation is particularly appropriate, as such an approach provides complete posterior distributions of parameters, explicitly accounts for uncertainty, and enables the identification of the lag structure in the transmission channels of macroeconomic and monetary shocks. In contrast to classical methods, the Bayesian ARDL

(BARDL) model enables the derivation of coherent probabilistic conclusions and adequately captures processes under structural breaks, which is particularly relevant in the Ukrainian context.

Given this context, the research focuses on a detailed assessment of the stability and adaptability of Ukraine's banking sector to shocks of various types by analysing the dynamics of NPLs over 2006–2025 applying the BARDL model. This approach enables a thorough examination of the lag mechanisms of key macroeconomic indicators, the identification of inertial properties, and the assessment of the risk structure in an environment of heightened uncertainty. The findings are expected to provide an evidence-based foundation for further analysis and may support more informed decision-making regarding banking sector resilience.

Literature Review. The theoretical framework for credit risk assessment is grounded in financial accelerator models, balance sheet deterioration mechanisms, and agency conflicts, which explain how macroeconomic shocks translate into increases in NPLs. The dynamics of NPLs are widely recognised in academic publications as key determinants of the financial resilience of the banking sector and its sensitivity to macroeconomic and political disturbances. Of particular significance are the effects of the financial cycle, whereby changes in the macroeconomic environment directly influence borrower solvency, contributing to the accumulation of non-performing assets (Ari, Chen, & Ratnovski, 2021).

Recent academic research consistently highlights the role of macroeconomic factors – such as GDP, inflation, exchange rates, unemployment, and interest rates – in driving NPL dynamics. A global empirical study by Salas et al. (2024) demonstrates that macroeconomic variables exert a significant and heterogeneous influence on NPL levels across countries and time periods. Similar findings have been reported for Italy by Foglia (2022), where inflation, economic activity, and labour markets are identified as key drivers of NPLs. The study by Nwafor & Nwafor (2023) extends these insights through the application of five ensemble learning techniques and a one-dimensional convolutional neural network. Empirical evidence indicates that these determinants exhibit a pronounced lag and phase structure, whereby their impact varies according to the phase of the economic cycle. Fallanca et al. (2021) illustrate this by using a conditional correlation model that captures structural changes in the relationships between macro factors and NPLs.

Some research focuses on banking-specific factors, including capital adequacy, liquidity, loan portfolio concentration, management quality, and risk management systems. Kjosevski et al. have offered valuable additional insights into this area, demonstrating through a series of empirical studies (2019-2021) that banking characteristics exert an impact on NPL levels comparable in magnitude to that of macroeconomic shocks. Consistent results are observed by Ahmed et al. (2021) for developing countries. Research on NPLs in countries that have experienced banking crises, wars, or large-scale structural changes indicates substantial heterogeneity in the determinants of problem debt dynamics. The impact of NPLs on lending and the economic cycle is analysed in detail by Huljak, Moccero, and co-authors (2020, 2022), who employ a panel Bayesian VAR approach for Eurozone countries.

The frequent occurrence of shocks, structural shifts, and uneven risk transmission underscores the need for modelling frameworks capable of capturing parametric uncertainty and regime changes. However, although the NBU (2025c) regularly publishes high-quality analytical reports on credit risk dynamics, these assessments cannot fully account for latent nonlinearities or evolving structural regimes. Building on this, Hrytsenko et al. (2025) highlights the importance of incorporating currency shocks, changes in regulatory standards, shifts in the macro-financial environment, and institutional reforms when analysing credit risk formation. Employing a dynamic panel framework with bank-level data, Vyshnevskyi and Sohn (2023) show that NPL dynamics in Ukraine are strongly linked to related-party lending and specific bank-level vulnerabilities, underscoring how lending patterns and portfolio composition shape credit quality. **Vovchak et al. (2019),** applying k-means clustering combined with econometric modelling, demonstrate that structural and behavioural differences across banks generate distinct trajectories of problem-loan accumulation. Additionally, Kichurchak (2019) finds that bank

deposit activity in Ukraine, shaped by depositor behaviour and macro-financial conditions, plays a crucial role in sustaining liquidity and enhancing the banking sector's resilience to shocks. Although these studies contribute valuable insights, they typically rely on shorter observation periods and conventional econometric techniques, limiting their ability to capture long-run adjustment processes and parameter uncertainty.

ARDL modelling remains a widely used approach for analysing NPLs due to its capacity to accommodate variables with different levels of integration. The methodological foundations of this approach are established in the classic work by Pesaran, Shin, and Smith (2001), which introduced bounds testing for level relationships. Additionally, Bayesian econometric models have gained increasing attention over the past decade due to their flexibility, capacity to account for parametric uncertainty, and robust performance with small samples. Earlier studies by Koop & Korobilis (2010) and Chan et al. (2020) suggest that Bayesian VAR/ARDL models can be useful for capturing lag structures, assessing probabilistic effects, and accommodating structural changes. A more recent contribution in this area is the model proposed by Senyk et al. (2024), which employs a Bayesian network to analyse, evaluate, and forecast bank credit risk, including the probability of borrower default.

Despite the valuable contributions of Bayesian approaches in recent credit risk studies, there remains an opportunity to further extend these methods to the macroeconomic level, as traditional linear and static models offer limited flexibility in adequately capturing the uncertainty, non-linearity, and context-dependent effects of macroeconomic factors on NPLs in the Ukrainian banking sector. These considerations underscore the potential of Bayesian approaches as an adaptive and informative framework for developing models that are relevant under conditions of heightened instability.

Statement of objectives. This study aims to explore the stability and adaptive capacity of Ukraine's banking sector in response to economic, financial, and social shocks arising from periods of persistent uncertainty and the full-scale war initiated by the Russian Federation.

H1: The dynamics of non-performing loans (NPLs) between Q1 2006 and Q3 2025 reflect the resilience of the Ukrainian banking sector's operational functionality under conditions of persistent uncertainty and wartime.

H2: The dynamics of NPLs are influenced by key macroeconomic and monetary factors, including inflation expectations, monetary policy measures implemented by the National Bank of Ukraine (NBU), and GDP fluctuations.

H3: The impact of the uncertainty on NPLs exhibits lagged effects in response to economic, financial, political, and military shocks.

Research Methods. The Bayesian framework enables the integration of existing information on NPLs and related influencing factors through the specification of prior distributions that reflect preliminary information about likely parameter values. In addition to providing point estimates, Bayesian modelling yields full parameter distributions, allowing for a probabilistic interpretation of the relationships between variables and supporting more nuanced and evidence-informed conclusions.

The application of the ARDL framework relies on an integrated approach to time series analysis, allowing for the assessment of how past values of independent variables influence on the current values of the dependent variable. Nkoro and Uko (2016) emphasise the flexibility of the ARDL cointegration technique for small sample sizes and its suitability for examining both short- and long-run relationships among variables. Additionally, Kripfganz and Schneider (2023) provide a methodology for estimating ARDL and error correction models (ECM) in Stata, including guidance on lag selection, model stability testing, and result interpretation. Lee, Rushworth, and Napier (2018) demonstrate that Bayesian spatiotemporal modelling can be employed to estimate lag effects and obtain full posterior distributions of parameters, accounting for temporal dependence and uncertainty. Empirical applications of ARDL

models illustrate their relevance for NPL dynamics: Golitsis, Khudoykulov, and Palanov (2022) show that unemployment, GDP, and interest rates influence NPLs in North Macedonia in both the short and long term, while Foglia (2022), analysing Italian banks over 2008–2020, finds a negative effect of GDP and public debt and a positive effect of unemployment and domestic lending on the NPL ratio. Accordingly, integrating the Bayesian framework with ARDL modelling enables not only a comprehensive analysis of time series, but also a probabilistic assessment of the short- and long-term impacts of key determinants on NPLs.

To evaluate the contribution of various factors to the resilience of Ukraine's banking sector, the BARDL model can be employed and represented by the following equation:

$$Y_t = \alpha + \sum_{i=1}^{p} \beta_i Y_{t-i} + \sum_{j=1}^{q} \sum_{k=1}^{l_j} \gamma_{jk} X_{j,t-k} + \varepsilon_t, \varepsilon_t \sim N(0, \sigma^2) \quad (1),$$

where Y_t denotes the dependent variable; Y_{t-i} represents lagged values of the dependent variable capturing autoregressive dynamics; $X_{j,t-k}$ are lagged exogenous predictors; α is the intercept term; β_i, γ_{jk} are the coefficients of the lagged dependent and independent variables, respectively; p indicates the number of lags of the dependent variable; q denotes the number of independent variables; l_j specifies the number of lags for the j-th independent variable; and ε_t is the stochastic error term.

In the BARDL model, all parameters are assigned the following prior distributions:

$$\alpha \sim \text{Normal}(\mu_\alpha, \sigma_\alpha^2), \beta_i \sim \text{Normal}(\mu_{\beta i}, \sigma_{\beta i}^2), \gamma_{jk} \sim \text{Normal}(\mu_{\gamma jk}, \sigma_{\gamma jk}^2), \sigma \sim \text{Normal}(0, s_\sigma) \quad (2).$$

The observation equation is specified as:

$$Y_t \sim \text{Normal}\left(\alpha + \sum_{i=1}^{p} \beta_i Y_{t-i} + \sum_{j=1}^{q} \sum_{k=1}^{l_j} \gamma_{jk} X_{j,t-k}, \sigma^2\right) \quad (3).$$

The model parameters are estimated within a Bayesian framework using Bayes' theorem:

$$P(\theta|X_t) \propto P(X_t|\theta) \cdot P(\theta) \quad (4),$$

where $P(\theta|X_t)$ – posterior distribution of model parameters given the observed data; $P(X_t|\theta)$ – likelihood function representing the probability of the observed data given the parameters; $P(\theta)$ – prior distribution reflecting prior beliefs about the parameters; X_t – observed data; the normalizing constant $P(X_t)$ is typically omitted in computation.

For the BARDL model, the likelihood is expressed as:

$$P(X_t|\alpha, \beta, \sigma) \sim \mathcal{N}\left(\alpha + \sum_{i=0}^{p} \gamma_i X_{t-i}, \sigma^2\right) \quad (5).$$

Full posterior distributions of the model parameters (α, β_i, γ_{jk}, σ) will be obtained using Markov chain Monte Carlo (MCMC) methods.

The integration of Bayesian analysis with the ARDL framework facilitates robust modelling of the dynamic response of Ukraine's banking sector to various types of shocks. This approach enhances the model's resilience to structural breaks and extreme events observed in Ukraine between the first quarter of 2006 and the third quarter of 2025. Furthermore, the BARDL model enables a comprehensive evaluation of the model adequacy through posterior predictive checks (PPC), Bayesian R^2, leave-one-out cross-validation (LOO-CV), and Pareto-smoothed importance sampling diagnostics, thereby confirming the robustness of the obtained results. Model fit and predictive performance are additionally assessed using the mean absolute error (MAE) and root mean square error (RMSE) metrics, providing a holistic appraisal of the model's alignment with the data. Accordingly, this approach proves valuable for the empirical analysis of banking sector resilience, as it accommodates dynamic dependencies, shock effects, and uncertainty in parameter estimates.

Results. Using a Bayesian dynamic modelling approach, this study examines the temporal structure of factors influencing the dynamics of non-performing loans (NPLs), which serve as indicators of the banking sector's resilience. It further assesses how the Ukrainian banking sector adjusts its behaviour to maintain stability and adapt to extreme external shocks. The dependent variable (Y_t), representing the banking sector's resilience to shocks, is defined as the share of NPLs (%). The exogenous variables are specified as follows: X_1 – the rate of change in real GDP, % compared to the same quarter of the previous year; X_2 – the consumer price index (CPI), %; and X_3 – the NBU's policy rate, %. For the selected variables, the BARDL model can be represented as:

$$Y_t=\alpha+\beta_1 \cdot Y_{t-1}+ \gamma_1 \cdot X_{1,t-1}+ \gamma_2 \cdot X_{2,t-4}+ \gamma_3 \cdot X_{3,t-4}+\varepsilon_t,\ \varepsilon_t \sim N(0,\sigma^2) \quad (6),$$

where Y_{t-1} denotes the lagged dependent variable, reflecting the sector's dynamic inertia; $X_{1,t-1}$ – GDP growth with a 1-quarter lag; $X_{2,t-4}$ – CPI with a 4-quarter lag; $X_{3,t-4}$ the NBU policy rate with a 4-quarter lag; α is the constant term; γ_i are the coefficients of influence; ε_t is the stochastic error term.

To specify the model parameters, weakly informative prior distributions were employed to avoid undue complexity. The regression coefficients β_j, γ_{jk}, the constant term (intercept) α, and the standard deviation of the residuals σ assigned normal prior distributions N(0,1), N(0,5) and N(0,2), respectively. Parameter estimation was carried out using a Bayesian framework with four independent Markov Chain Monte Carlo (MCMC) chains, each consisting of 50,000 iterations, of which the first 5,000 iterations were designated for the warm-up phase. Following this phase, 45,000 post-warm-up samples per chain were retained without thinning (thin=1), resulting in a total of 180,000 samples for constructing the posterior distributions. This approach ensures robust estimation of the coefficients for the independent variables while adequately reflecting the uncertainty inherent in the model.

To assess potential multicollinearity between independent variables of model Y_{t-1}, $X_{1,t-1}$, $X_{2,t-4}$, and $X_{3,t-4}$, the variance inflation factor (VIF) was calculated. All VIF values fall below commonly accepted thresholds (5, or more conservatively, 10), indicating that multicollinearity is unlikely to pose a serious concern in the model. Specifically, the VIF values for Y_{t-1}, $X_{1,t-1}$, $X_{2,t-4}$, and $X_{3,t-4}$ are 1.51, 1.11, 1.08 and 1.71, respectively, indicating sufficient independence among the explanatory variables and supporting the robustness of the BARDL coefficient estimates. The stationarity of the variables was tested using the Augmented Dickey–Fuller (ADF) test. Results indicate that Y_{t-1}, $X_{1,t-1}$, $X_{2,t-4}$, and $X_{3,t-4}$ exhibit non-stationarity, which is typical for macroeconomic time series, whereas $X_{3,t-4}$ was found to be stationary.

The dynamic structure of the BARDL model, in combination with the with the Bayesian estimation framework, may mitigate potential risks arising from non-stationarity and supports robust inference.

The Durbin–Watson test was applied to assess first-order autocorrelation of the residuals. With a sample size of 75 observations, the lower and upper critical bounds at the 1% significance level are D_L=1.368 and D_U=1.587, respectively. The observed DW statistic is 1.70 (p-value=0.048), which lies above D_U and below 4−D_U, indicating that there is no evidence of first-order autocorrelation in the residuals. This suggests that the BARDL model estimates are not adversely affected by autocorrelation. Simultaneously, the Breusch–Godfrey test indicated the absence of higher-order autocorrelation, confirming the appropriateness of the model's dynamic structure.

The Wald test confirmed that joint significance of the explanatory variables $X_{1,t-1}$, $X_{2,t-4}$ and $X_{3,t-4}$, highlighting their cumulative influence. The Breusch–Pagan test revealed heteroscedasticity in the residuals **(**BP=**22.03**, p-value=**0.0002)**, which is common in financial and macroeconomic time series. This observation further motivates the use of a Bayesian framework, which accommodates stochastic variation in the error term. The diagnostic results support the adequacy of the model specification and the relevance of the included lagged factors. The observed characteristics, including the non-stationarity of most variables, lack of first-order autocorrelation, and heteroscedasticity, are consistent with the behaviour of dynamic financial series and are explicitly addressed in the Bayesian formulation of the model.

Following the results presented in Table 1, the BARDL model provides robust posterior estimates and reliable inference, as the convergence index $\hat{R}$ (Rhat) for all model parameters equals 1. Furthermore, the sample exhibits a high effective size (n_eff) for all parameters (~67,000–113,000), confirming the convergence of the chains and the stability of the obtained estimates. These characteristics support the robustness and precision of the posterior distributions and allow for a detailed assessment of the short- and long-term effects of independent variables. The posterior estimates of the coefficients β_j, γ_{jk}, lie

within their respective confidence interval and do not cross zero, indicating a statistically significant impact of the corresponding predictors on the dependent variable. The estimated value of σ reflects a moderate level of unexplained variability in the dynamics of the NPL share in Ukraine's banking sector. This BARDL model captures the key determinants, while also acknowledging the potential influence of unpredictable shocks, such as war-related risks, regulatory changes, or bank failures.

The obtained results can be interpreted as follows. The Bayesian R^2 value of 0.9795, suggests a high explanatory capacity of the model in capturing the dynamics of NPLs in the Ukrainian banking sector across different periods (Table 1). The median value of R^2, equal to 0.9797, being close to the mean, indicates relative stability of the estimate. These outcomes support the suitability of the selected lag structure in the BARDL specification and the relevance of the included macroeconomic indicators. The estimated predictor coefficients point to a coherent and economically plausible pattern of relationships between macroeconomic landscape and the evolution of problem loans in the Ukrainian economy, while acknowledging the inherent uncertainty in the system.

The posterior coefficient for variable Y_{t-1} highlights the prominent role of inertia in the dynamics of NPLs, with a value close to unity (Table 1). Specifically, a 1% increase in the share of NPLs in the previous quarter (t-1) is associated with an average increase of 0.9422% in the current quarter (t). This suggests the presents of significant autocorrelation and a gradual adjustment of the loan portfolio to changes in Ukraine's macroeconomic environment, which is shaped by a variety of external and internal factors that are difficult to predict. The rate of correction to equilibrium ($1-\beta \approx 0.0578$) is relatively slow for the quarter. This can be explained by the structural characteristics of the Ukrainian banking sector, such as lengthy enforcement procedures, limited collateral liquidity, and elevated litigation risks. Consequently, this indicates that the dynamics of NPLs are consistent with expectations for the Ukrainian banking sector, which operates under conditions of heightened economic and political instability, where the accumulation of problem loans occurs gradually and their reduction follows an inertial and protracted process.

The findings indicate that real GDP growth contributes to a reduction in the share of non-performing loans in the short term. Specifically, a 1% acceleration in real GDP growth is associated with an average decrease of 0.0968% in the share of NPLs in the subsequent quarter. This underscores that the improvement in Ukraine's economic conditions contributes enhance borrower solvency and mitigate the risk of rising NPLs in the banking sector. The result further highlights the critical role of macroeconomic stabilisation in ensuring the sustainable operation of the banking sector and its capacity to absorb shocks of various types.

Simultaneously, the inflationary processes exert a delayed adverse effect on the resilience of the banking sector, as they are accompanied by an increase in the share of NPLs in the loan portfolio structure. A 1% rise in inflation leads, on average, to a 0.134% increase in the share of NPLs one year (four quarters) after the change in the price level. In other words, inflation, by eroding real household incomes and reducing profitability, weakens borrowers' capacity to service their debt obligations, with this effect materialising approximately one year after the initial inflationary shock. This pattern reflects the presence of lagged inflationary pressure on the debt burden and solvency of borrowers in the Ukrainian economy, ultimately intensifying credit risks and constraining the resilience of the banking sector.

Similarly, the dynamics of the NBU policy rate exhibit a clear and economically consistent pattern. A 1% increase in the NBU policy rate raises the share of NPLs by an average of 0.1211% after one year. In other words, this reflects the operation of the standard monetary policy transmission: an increase in the policy rate leads higher borrowing costs, which subsequently intensifies borrowers' debt burdens. The effect manifests with a delay, which is characteristic of credit markets, where borrowers typically adjust their financial behaviour only gradually. In other words, monetary tightening, although aimed at restraining inflation, simultaneously increases the financial pressure on borrowers and contributes to a gradual rise in the share of NPLs in the Ukrainian banking sector.

The intercept term (α) is statistically significant and negative (Table 1). This suggests a systematically lower baseline level of NPLs under fixed values of the lagged dependent variable and all predictors. Such a result may reflect the structural features of the Ukrainian banking sector, shaped by the prolonged post-crisis adjustment, institutional transformations, permanent shocks, which generate a persistent downward shift in the conditional mean of NPL dynamics. From a Bayesian perspective, this implies that even under neutral macroeconomic conditions, the posterior distribution points to a substantial level of latent financial stress embedded in the system.

The standard errors of the posterior means (Se Mean) for all model parameters are very small (Table 1), indicating high precision of the estimated posterior means and strong chain convergence. To further assess model adequacy, a Bayesian p-value was computed using the sum of squared residuals as the test statistic. The resulting Bayesian p-value of 0.538 is close to the ideal benchmark of 0.5, suggesting a good match between the simulated and observed data. This implies that the BARDL model successfully reproduces the empirical dynamics of the NPLs and that the predictive distributions appropriately capture actual fluctuations. In other words, these diagnostics provide additional confirmation of the model's internal consistency and its suitability for analysing the influence of macroeconomic conditions on the resilience of Ukraine's banking sector.

Figure 1. Observed and Posterior Predicted Share of Non-Performing Loans in the Ukrainian Banking Sector with 95% Predictive Uncertainty Interval, Based on Bayesian Regression

Source: Calculated based on data from the State Statistics Service of Ukraine, the National Bank of Ukraine, and the Ministry of Economy, Environment, and Agriculture of Ukraine.

A visual comparison of actual and model-implied values (Fig. 1) demonstrates that the constructed BARDL model is capable of accurately reproducing the dynamics of the NPLs in the Ukrainian banking sector over the period Q1 2006–Q3 2025. The observed values fall almost entirely within the posterior predictive interval (Posterior y_rep), confirming their empirical plausibility. Figure 1 also reveals pronounced fluctuations around observations 40–45, corresponding to Q4 2015–Q1 2017, the period of intensive banking-sector reforms in Ukraine. Given this visualization, the specification of the BARDL model effectively captures both the central tendency and residual variability, offering a reliable representation of the underlying data-generating process. This, in turn, enables a robust assessment of the adaptive capacity of the Ukrainian banking sector and its resilience to various macroeconomic and financial shocks.

The Q4 2015–Q1 2017 has specific deviations (Fig. 1) that are typical for macroeconomic processes at times of structural shifts or external shocks, and therefore requires institutional interpretation based on the economic events of the period. The analysis of the deviation observed in Q4 2015–Q1 2017 relies on both posteriori characteristics of the model and official information on the NBU's policy initiatives and government decisions. According the NBU, the fourth quarter of 2015 was marked by an improvement in the structure of GDP components, particularly the recovery of gross capital formation and a positive contribution of net exports, which helped mitigate the pace of economic decline (National Bank of Ukraine, 2015a).

Additionally, in May 2015, a memorandum on the restructuring of consumer foreign currency loans between banks and the NBU entered into force, introducing targeted mechanisms to alleviate the debt burden of affected households (Verkhovna Rada of Ukraine, 2015). The NBU's official publications for 2015 also document a ranges of initiatives related to bank recapitalization, diagnostic assessments, and the strengthening of prudential supervision (National Bank of Ukraine, 2015b), while the consolidated financial statements for that year outline additional steps taken to mitigate the effects of currency

depreciation and adjust banking policy. Taken together, these policy initiatives formed a set of instruments to improve the solvency of specific borrower categories and stabilising selected segments of the economy, which is consistent with the deviations captured by the BARDL model in this period.

In parallel, in February 2015, the Minsk II peace agreements were signed between Ukraine and the Russian Federation, contributing to a partial reduction in geopolitical tensions. This development was reflected in improved market expectations and a gradual restoration of confidence in the banking system. The strengthening of the macroeconomic landscape manifested in a steady appreciation of the hryvnia, an increase in international reserves to USD 13.3 billion as of January 1, 2016, representing a 77% growth compared to 2015 (National Bank of Ukraine, 2015c), and a deceleration of inflation. In the fourth quarter of 2015, the NBU also initiated a progressive reduction in the policy rate (from 30% to 22%), which eased financing conditions and supported the gradual normalisation of banking sector activity (National Bank of Ukraine, n.d.-a). During 2014-2015, the NBU implemented large-scale initiatives to recapitalise commercial banks and strengthen the resilience of the banking sector.

In particular, commercial banks were required to develop and implement recapitalisation programmes designed to restore capital adequacy and cover accumulated losses (National Bank of Ukraine, 2015d). The implementation of these programmes during 2014-2016 resulted in a substantial increase in the regulatory capital of the banking sector, totalling UAH 108 billion (National Bank of Ukraine, 2016a). State-owned banks, including Oschadbank and Ukreximbank, received additional capital injections through the issuance of domestic government bonds, which helped stabilise their balance sheets and improve the structure of their loan portfolios (Interfax-Ukraine, 2016). Alongside these initiatives, the NBU continued its policy of cleaning up the banking sector, removing more than 80 insolvent bank institutions from the market between 2014 and 2016 (National Bank of Ukraine, 2017). As a result, by mid-2016, these actions produced a cumulative effect, contributing to a positive deviation (decrease) in the dynamics of the share of NPLs captured by the BARDL model.

Furthermore, additional diagnostics of the constructed BARDL model were conducted to assess its predictive performance. Leave-One-Out Cross-Validation (LOO-CV), based on a 180,000 × 75 log-likelihood matrix, yielded an expected log predictive density (elpd_loo) of -175.0 (SE=27.4), an effective number of parameters (p_loo) of 14.9 (SE=12.4), and a LOO information criterion (looic) of 350.0 (SE=54.2). These results indicate that the BARDL model exhibits high reliability and adequacy, effectively predicting out-of-sample observations without substantial overfitting and demonstrating robust overall predictive capability.

Pareto k diagnostics revealed that 74 out of 75 values (98.7%) belong to the “good” category ($k \leq 0.7$), while one observation has a $k=1.371$, which significantly exceeds the recommended threshold. Considering that this is only one observation out of 75, it is likely to represent a structural shock. The observation corresponds to the first quarter of 2017. During this period, two significant events occurred simultaneously that could have caused such a deviation. Firstly, in accordance with NBU Resolution No. 351 (2016), it was introduced a stricter definition of NPLs in line with international standards, leading to a one-off review of commercial banks’ loan portfolios (National Bank of Ukraine, 2016b). Secondly, following the nationalisation of PrivatBank in November 2016, there was a large-scale recognition of problem loans: the share of NPLs in the bank increased from 14.4% in October 2016 to 76.7% in January 2017, and to 88.8% by July 2017 (National Bank of Ukraine, 2025a). Both of these factors were strong enough to generate a one-off structural deviation, which is reflected in the high value of the Pareto k indicator. Given the large sample size and context of the event, this represents a minor concern; however, it should be considered when interpreting the results. Nevertheless, the BARDL model successfully captures the underlying structure of the data-generating process, providing accurate predictions and a realistic representation of residual uncertainty, while highlighting individual critical observations.

To further validate the robustness and convergence of the model estimates, MCMC diagnostics were performed. Trace plots (Fig. 2, a) for each model parameter exhibit good mixing, with no evidence of stagnation or slow transitions in any region of the parameter space. Visually, the four chains for each parameter converge, as evidenced by their dense overlap and the absence of discernible trends. The parameter values fluctuate around a stable mean without directional drift. Furthermore, the autocorrelation functions for the model parameters (Fig. 2, b), estimated across the four MCMC chains, show a rapid decline at the initial lags, indicating high mixing efficiency and high-quality samples. These diagnostics confirm the reliability of the MCMC draws for making robust inferences regarding the posterior distributions of the model parameters.

Figure 2. Traceplots and Autocorrelation Analysis of Posterior Samples for Model Parameters*

*beta_Y11 – β_Y_{t-1}; beta_X111 – $\gamma_X_{1,t-1}$; beta_X2l4 – $\gamma_X_{2,t-4}$; beta_X3l4 – $\gamma_X_{3,t-4}$. Source: Calculated based on data from the State Statistics Service of Ukraine, the National Bank of Ukraine, and the Ministry of Economy, Environment, and Agriculture of Ukraine.

Building on the reliability and convergence of the MCMC draws, the predictive performance of the BARDL model was further assessed using PPC. The PPC, based on comparing the test statistic T(y)=mean with the distribution of mean values T(Yrep) generated by the model, demonstrates that the model adequately reproduces the mean value of the observed data (Fig. 3, a). The PPC results indicate that the estimated distribution density of the observed data fits well within the "cloud" obtained from 1000 repeated simulations of Yrep, confirming the model's ability to reproduce the general shape, central tendency, and variability of the empirical data (Fig. 3, b). A combined analysis of both graphs indicates that the model exhibits high predictive power and is suitable for describing the observed data.

Furthermore, standard forecast accuracy metrics were calculated to quantify the model's performance. The MAE of 1.293 indicates a slight deviation of the BARDL model from the observed values. The RMSE, equal to 2.121, reflects the typical magnitude of forecast errors, with a higher penalty for larger deviations. The mean absolute percentage error (MAPE) of 6.35% demonstrates a fairly high accuracy of the predicted values. Collectively, these metrics confirm that the model achieves an acceptable level of accuracy in reproducing the observed variation of the dependent variable.

Conclusions. This study provides a comprehensive assessment of the resilience and adaptability of Ukraine's banking sector to prolonged economic, financial, and geopolitical shocks based on the

BARDL model of NPLs for the period Q1 2006–Q3 2025. The findings indicate that the dynamics of NPLs are governed by a combination of substantial inertia and time lags in the transmission of macro-financial factors. The high coefficient for the lagged dependent variable NPLs (Y_{t-1}) signifies the persistence of NPLs over time, implying that deviations from equilibrium, whether increases (accumulation) or decreases (reduction) in problem loans, adjust gradually. In other words, past levels of NPLs strongly influence current levels, so both upward and downward adjustments occur slowly, reflecting the inertial response of the banking sector to changes in macroeconomic and financial conditions.

The BARDL model exhibits high statistical rigor and robust predictive performance. Elevated Bayesian R^2 values, low prediction errors, stable MCMC chains, and satisfactory diagnostic outcomes collectively confirm that the model accurately captures both the central tendency and residual variability in NPL dynamics. The identified lags structure are consistent with economic reasoning: real GDP growth reduces the share of NPLs; inflationary shocks deteriorate the quality of the loan portfolio with a four-quarter lag; and monetary tightening, through an increase in the policy rate, raises borrowers' debt burdens with a four-quarter lag.

Beyond predictive accuracy, the model carries valuable theoretical and practical implications. From a theoretical perspective, it formalises the temporal transmission of macro shocks, quantifies the degree of internal inertia in the Ukrainian banking sector, and enables the assessment of interdependencies between parameters through posterior correlations. Practically, it can serve as an early warning tool: persistent deviations from predicted NPL levels signal the need for institutional evaluation and potential policy intervention, while a posteriori forecasts with uncertainty bounds provide a robust basis for scenario planning by the NBU.

The events of 2015 reflect the cumulative impact of preceding economic and financial shocks, including military risks and deep structural imbalances, which contributed to heightened credit risk. Simultaneously, the implementation of stabilisation policies, bank recapitalisation programmes, asset quality reviews, and the restructuring of foreign-currency loans established favourable conditions for a gradual recovery of borrowers' solvency and the strengthening of the banking sector. The deviation observed in the beginning of 2017 highlights the model's capacity not only to reproduce general NPL dynamics, but also to respond sensitively to structural shifts arising from regulatory changes, revisions in the NPL definition, and the nationalisation of systemic banks. This underscore the model's ability to adequately capture extreme values and episodes of abrupt market transformation.

From a broader perspective, the findings suggest that the macro-financial stabilisation policies implemented during 2015–2017 laid the groundwork for enhancing the resilience of Ukraine's banking sector. This resilience, in conjunction with international support and coordination with external partners, emerged as a critical factor enabling the Ukrainian economy to withstand the extraordinary challenges of the subsequent decade, including the repercussions of the full-scale war, while maintaining the operation of banking institutions and sustaining confidence in the banking sector.

Future research could focus on modelling of nonlinear effects, asymmetries in responses to shocks of various types, and incorporating regime-switching frameworks to more accurately capture structural breaks in the banking sector. Expanding the set of explanatory variables to include household debt burdens, corporate sector performance, regulatory quality, and institutional indices would provide further insights. A key limitation of the current analysis is the model's sensitivity to short samples following extreme events; this could be addressed through the adoption of more flexible Bayesian structures, such as stochastic volatility or time-varying parameters. Extending the framework to multifactor or vector BARDL models may further elucidate transmission mechanisms and enhance the precision of scenario-based forecasts.

DEVELOPMENT OF THE MODERN LABOR MARKET

Farkhad BATIROV

PhD researcher of the Tashkent state university of economics

ORCID: 0009-0002-9252-8373

Abstract

The article outlines the indicators used to assess global unemployment levels and discusses strategies to reduce it. It also examines the organizational and economic mechanisms aimed at decreasing unemployment. The world of work has been impacted by numerous interconnected challenges, including the aftermath of the COVID-19 pandemic, rising living costs, extreme weather events, geopolitical instability, conflicts, and a looming global debt crisis. Despite these growing challenges, the global labor market has shown remarkable resilience, marked by strong job growth and a decline in the unemployment rate, with the jobs gap falling below pre-pandemic levels. A significant milestone in the history of the International Labour Organization (ILO) was the recognition of a safe and healthy working environment as a fundamental principle and right at work. The achievements made during this biennium are the result of the unwavering commitment and efforts of the ILO's constituents, along with the invaluable support of development partners at country, regional, and global levels. Moving forward, the ILO must strengthen its actions to ensure that its primary goal of social justice remains at the forefront of all national and international policies.

Keywords: Labor, unemployment, economy

INTRODUCTION

Unemployment is one of the biggest problems in the world, and its causes and consequences are not limited to the solution of one country. Improving the standard of living and stabilizing people's lives, ensuring employment for the population by improving the financing of entrepreneurial activities has become an urgent issue for the global community. The world's population is growing every day, and the need to create jobs is also growing proportionally.

The modern labor market is developing with innovative economies through digitalization, which changes employment structures, creates demand for new skills, and necessitates flexible work arrangements. Key drivers include technological progress, automation, and a shift toward a service-based economy, leading to both job creation in new sectors and challenges like skill gaps and potential inequality. Addressing these requires a focus on continuous education, reskilling, and a balance between supporting innovation and ensuring social protection.

MATERIALS AND METHODS

Explaining the main characteristics of unemployment in the labor market, reducing poverty, explaining the issues related to poverty, its definition, and its reduction. During the research, monographic observation, systematic approach, analysis, and synthesis methods were used.

FINDINGS

The world economy slowed down in the biennium with gross domestic product (GDP) growth rates of 3.5 per cent in 2022 and 3.0 per cent projected in 2023[25]. Economic growth was very uneven and the outlook for 2025 is not encouraging. Ongoing geopolitical tensions, persisting and broadening inflation, climate challenges, technological advancement and demographic shifts are transforming world economic growth and social development, demanding labour market adjustment and impacting its performance – in some cases eroding progress in social justice.

The above decent work-related data available for the biennium provides yet another warning sign in the journey towards sustainable development. As pointed out by the Secretary-General of the United Nations (UN), the world is on track to achieve less than 20 per cent of the Sustainable Development Goals (SDGs) by 2030. This means that by 2030, 575 million people – 7 per cent of the world population – will be living in extreme poverty and hunger[26]. As regards SDG 8 on economic growth and decent work for all, ILO analysis concluded that the world is a long way from achieving SDG objectives for nearly two thirds of the relevant indicators[27]. This situation calls for immediate and urgent action to put social justice at the centre of sustainable development efforts, national policy choices and international cooperation.

The Global Accelerator on Jobs, launched in 2021 and spearheaded by the ILO, is a UN initiative to offer sustainable and integrated solutions to generate jobs and extend protection by the provision of policy advice, the mobilization of financial resources and investments, and the improvement of multilateral cooperation It aims to create at least 400 million decent jobs, primarily in the green, digital and care economies. Since the start of the practical operationalization of the Global Accelerator, the initiative was welcomed in multilateral forums and has mobilized resources for international cooperation from the Governments of Belgium, Germany and Spain. These resources are allocated to pathfinder countries through a UN Joint SDG Fund window and through a trust fund managed by the World Bank. At country level, by the end of 2023 the Governments of Albania, Cambodia, Indonesia, Malawi, Namibia, Nepal, Paraguay, Rwanda, Senegal and Uzbekistan officially confirmed their interest in joining the Global Accelerator as pathfinder countries and had started establishing national road maps. The Global Coalition will also build on the ILO's continued support to international cooperation and policy dialogue forums such as the G7, the G20 and the BRICS. In 2022 and 2023, the ILO made substantial contributions to summits of leaders and meetings of labour and employment ministers of these groups.

Khorezm region	711,8	736,5	716,4	726,4	741,8	776,5	779,5

Despite the difficult global situation, Uzbekistan's economy is showing steady growth of over 6%. Over the past eight years, gross domestic product has doubled to $115 billion, and by the end of this year, it is expected to grow to $130 billion. This year alone, about 9,000 new enterprises and service complexes will be built with investments amounting to $35 billion. The number of small and medium-sized businesses has doubled in eight years, and today more than 10 million people are employed in this sector, Shavkat Mirziyoyev stated. Since the beginning of the year, 5 million citizens were provided with employment, and another 700,000 returned from abroad to their families.

DISCUSSION AND CONCLUSION

The modern labor market has evolved through globalization, technological innovation, and shifting workforce expectations, leading to more flexible, skill-driven, and digitally integrated employment landscapes:

• Globalization and economic shifts. Global interconnectedness has expanded labor markets beyond national borders, enabling outsourcing, remote work, and international competition. Geoeconomic fragmentation and economic uncertainty are now major forces influencing labor demand and job stability.

• Technological advancements. Automation, AI, and digital platforms have transformed job roles, especially in manufacturing, services, and logistics. The rise of platform-based gig work (e.g., Uber, Upwork) has created new employment models but also raised concerns about job security and benefits.

• Digital access and remote work. Broadening digital access is expected to be the most transformative trend, with 60% of employers anticipating major changes by 2030. The COVID-19 pandemic accelerated the shift to remote and hybrid work, which continues to redefine workplace norms.

• Labor Market Dynamics. Flexible work arrangements, such as freelancing and part-time roles, are becoming more common. Demographic shifts, including aging populations and youth unemployment in certain regions, are reshaping labor supply and demand. Looking ahead, the labor market will continue to be shaped by emerging technologies, climate imperatives, and evolving worker

expectations. Employers and policymakers must adapt by fostering inclusive, resilient, and future-ready workforce strategies.

1. Özet

Rekabetin yoğun olduğu günümüz piyasalarında, işletmelerin sürdürülebilir bir rekabet avantajı elde etmeleri, maliyetlerini etkin bir şekilde yönetmelerine bağlıdır. Bu bağlamda maliyet muhasebesi, kaynakların verimli kullanımını sağlayan ve işletmelerin karar alma süreçlerini destekleyen temel bir araç olarak öne çıkmaktadır. İşletmeler, seri üretimin yanı sıra siparişe dayalı üretim süreçlerini de yürütmekte ve bu süreçlerde maliyetlerin doğru bir şekilde hesaplanması büyük önem taşımaktadır. Özellikle **sipariş maliyet yönte**mi, üretilen her siparişin maliyetini ayrı ayrı izleme ve analiz etme olanağı sunan bir sistem olarak, özel üretim ve proje bazlı işletmeler için stratejik bir öneme sahiptir. Bu çalışma, maliyet muhasebesi ve sipariş maliyet yöntemine ilişkin temel kavramları açıklamakta ve yöntemin işletmelerde uygulanışını teorik bir çerçevede açıklanmakta ve literatür ışığında değerlendirmektedir. Elde edilen bulgular, sipariş maliyet yönteminin doğru uygulanmasının maliyet kontrolünü güçlendirdiğini ve kârlılık analizinde etkisini ortaya koymaktadır.

Anahtar kelimeler: Maliyet Muhasebesi, Sipariş Maliyet Yöntemi, Üretim

Abstract

In today’s highly competitive markets, the ability of businesses to achieve a sustainable competitive advantage depends on the effective management of their costs. In this context, cost accounting emerges as a fundamental tool that ensures the efficient use of resources and supports managerial decision-making processes. Companies carry out not only mass production but also job-order–based production, and in these processes, the accurate calculation of costs is of great importance. In particular, the job order costing method holds strategic significance for customized production and project-based enterprises, as it provides the opportunity to track and analyze the cost of each order separately. This study explains the basic concepts related to cost accounting and the job order costing method, presents the theoretical framework of its application within businesses, and evaluates the method in light of the existing literature. The findings indicate that the proper implementation of the job order costing method strengthens cost control and enhances its effectiveness in profitability analysis.

Keywords: Cost Accounting, Job Order Costing Method, Production

2. GİRİŞ

İşletmelerin temel amacı olan kâr sağlama hedefine ulaşabilmeleri, maliyetlerini mümkün olduğunca azaltmaları ve maliyet kontrol süreçlerini etkin şekilde yönetmelerine bağlıdır. Bu bağlamda stratejik maliyet yönetimi uygulayan işletmeler, sahip oldukları kaynakları bilinçli ve etkin biçimde kullanarak kârlılıklarını en üst düzeye çıkarabilirler. Değişen tüketici beklentilerine uyum sağlamak ve rekabetin yoğunlaştığı piyasalarda hem varlıklarını sürdürebilmek hem de daha güçlü bir konuma ulaşabilmek

için işletmelerin modern yönetim yaklaşımlarını benimsemeleri, geleceğe yönelik planlamalar yapmaları ve sürekli yenilik peşinde olmaları büyük önem taşımaktadır. Yoğun rekabet ortamında uygun maliyetleme tekniklerini kullanan işletmeler, mevcut avantajlarını güçlendirebilir, müşteri memnuniyetini artıracak ürün ve hizmetler sunarak kârlılık düzeylerini iyileştirebilirler (Saylan ve Demir, 2021). Günümüz piyasasında, müşteri beklentilerine hızlı ve etkili biçimde cevap verebilen işletmeler rekabette öne çıkmaktadır. Bu gerçek, firmaların maliyet hesaplamalarını daha titiz ve duyarlı bir şekilde yapma gereğini ortaya koymuştur. Üreticiler artık ürün fiyatlarını istedikleri kâr oranlarını ekleyerek belirleyememekte; bunun yerine, tüketicilerin ödemeye hazır olduğu fiyat seviyelerini dikkate almak zorunda kalmaktadır. Bu değişen koşullar, maliyet yönetimine verilen önemi artırmış ve doğru maliyet belirlemeye yardımcı olacak yöntemlerin geliştirilmesi sürecini hızlandırmıştır. Geleneksel maliyet yöntemlerinden biri olan Sipariş Maliyeti Yöntemi de bu gereksinimlere yanıt verebilmek amacıyla ortaya konmuş bir maliyetleme yaklaşımıdır (Terzi, 2021). Sipariş maliyeti yöntemi, özellikle belirli periyotlarda ve sınırlı sayıda, farklı niteliklerde ürünler üreten küçük ve orta ölçekli işletmeler için tasarlanmış bir birim maliyet hesaplama tekniğidir. Yöntemin temel prensibi, üretim faaliyetleri sırasında ortaya çıkan tüm maliyetlerin her bir üretim emri için özel olarak oluşturulan maliyet kartlarında toplanması ve bu maliyetlerin sipariş bazlı takip edilmesine dayanmaktadır. Sipariş maliyeti yöntemi, özellikle belirli periyotlarda ve sınırlı sayıda, farklı niteliklerde ürünler üreten küçük ve orta ölçekli işletmeler için tasarlanmış bir birim maliyet hesaplama tekniğidir. Yöntemin temel prensibi, üretim faaliyetleri sırasında ortaya çıkan tüm maliyetlerin her bir üretim emri için özel olarak oluşturulan maliyet kartlarında toplanması ve bu maliyetlerin sipariş bazlı takip edilmesine dayanmaktadır (Aydemir, 1993).

3. MALİYET MUHASEBESİ

Maliyet muhasebesi, üretim işletmelerinde yönetimsel karar süreçlerine rehberlik eden ve maliyet kontrolünü mümkün kılan kritik bir yönetim bilgi sistemi bileşenidir. Finansal sistemin bir alt sistemi olmasının yanı sıra, kendi başına bağımsız bir bilgi sistemi olarak da işlev görerek hem iç hem de dış paydaşların bilgi ihtiyaçlarını karşılar. İşletme faaliyetlerinin maliyetlerini, kârlılığını ve performansını ölçen, analiz eden ve raporlayan maliyet muhasebesi; aynı zamanda planlama ve kontrol mekanizmalarına hem parasal hem de parasal olmayan veriler sunar. Bu nitelikleriyle, maliyet muhasebesi yönetim muhasebesinin temel yapı taşlarından biri olarak kabul edilir(Anasız, 1999). Maliyet kontrol süreci, işletme giderlerinin yönetilmesi ve maliyetlerin kabul edilebilir seviyelerde seyredip seyretmediğinin değerlendirilmesi amacıyla hayata geçirilir. Bu kapsamda; üretim, hizmet veya projelerle ilgili maliyetler hesaplanır, takip edilir, detaylı şekilde analiz edilir ve raporlanır. İşletmenin mali performansını doğru anlamak, maliyet etkinliğini geliştirmek ve yönetim kararlarına sağlam verilerle destek olmak için vazgeçilmez bir araçtır. Yalnızca üretim maliyetlerini değil, aynı zamanda pazarlama, araştırma-geliştirme ve diğer tüm operasyonel faaliyetlerin maliyetlerini de kapsayarak, işletmenin yaptığı her türlü fedakarlığın parasal karşılığının izlenmesi, yorumlanması ve kontrol altına alınmasını mümkün kılmaktadır (Tuğrul, 2025).

3.1. Maliyet Türleri ve Sınıflandırılması

Sipariş Maliyet Sistemi

Sipariş maliyet yöntemi, her sipariş veya ürün grubunun maliyetlerini üretim döneminden bağımsız olarak ayrı ayrı hesaplamayı esas alır. Amaç, maliyetleri doğru şekilde ilgili siparişlerle ilişkilendirmektir. Direkt malzeme ve işçilik maliyetlerinin dağıtımı nispeten kolayken, genel üretim giderlerinin paylaştırılması daha karmaşıktır. Üretim süreçleri çeşitlendikçe, doğru ve adil dağıtımın sağlanması zorlaşır. Sistemin etkinliği, maliyet kalemlerinin net ayrıştırılmasına ve uygun dağıtım anahtarlarının kullanılmasına bağlıdır (Erbilir, 2015).

Safha Maliyet Sistemi

Safha maliyet yöntemi, seri üretimle ve birbirine benzer ürünlerin birden fazla aşamada üretildiği işletmelerde uygulanan bir maliyetlendirme sistemidir. Bu sistemde temel prensip, üretimin her bir aşamasında (safhasında) gerçekleşen maliyetleri ayrı ayrı izlemek ve toplamaktır. Toplanan bu maliyetler, ilgili safhada üretilen çıktı birim sayısına bölünerek, her bir aşama için birim maliyet hesaplanır. Hesaplamalar, hem fiziksel birim akışını (miktar hareketleri) hem de maliyet verilerini temel alır. Bir üretim safhasında tamamlanan birimler, bir sonraki aşamaya devredilir ve bu aşamada katlanılan yeni maliyetler, bir önceki aşamadan gelen maliyetlere eklenir. Bu şekilde maliyetler son üretim aşamasına kadar birikimli olarak taşınır ve nihai mamulün toplam maliyeti bu birikimle oluşur (Şahin, 2002).

4. SİPARİŞ MALİYET YÖNTEMİ

Sipariş maliyet yöntemi, her üretim partisi veya iş için yapılan giderlerin ayrı ayrı izlenip biriktirilmesine dayanır. Bu yöntemde sipariş; tek bir ürün, benzer özellikteki bir ürün grubu veya çeşitli mamullerden oluşabilir ve maliyetler muhasebe dönemi yerine her iş veya üretim partisi bazında hesaplanır. Yöntem, farklı dikkat ve özen gerektiren, birbirinden net şekilde ayrılabilen üretim süreçlerinde etkin bir biçimde uygulanabilmektedir. Makine, uçak, mobilya, inşaat ve matbaacılık sektörleri, bu yöntemin tipik uygulama alanları arasında yer almaktadır. Yöntemin temel mantığı, direkt giderlerin doğrudan ilgili üretim partilerine izlenmesi ve genel üretim giderlerinin makine saatleri, işçi saatleri veya diğer uygun ölçütler kullanılarak partiler arasında dağıtılmasıdır. Özellikle birbirinden farklı özellikte ürün veya hizmet üreten işletmeler tarafından tercih edilen bu yöntem, müşteri taleplerine göre şekillenen üretimlerde maliyetlerin bağımsız olarak izlenmesini sağlar. Matbaa işleri, inşaat projeleri, özel mobilya üretimi ve kişiye özel hizmetler, yöntemin uygulama alanlarına örnek olarak verilebilir. (Aydemir, 1993). Sistemin işleyişinde maliyetler, her sipariş için açılan maliyet kartlarında toplanır. Direkt malzeme ve direkt işçilik giderleri doğrudan kartlara kaydedilirken, genel üretim giderleri önceden belirlenen yükleme anahtarları aracılığıyla dağıtılır. Sipariş maliyeti, üretimin gerçekleştirildiği merkezde kullanılan ölçü birimi ve yükleme oranı dikkate alınarak hesaplanır. Takip sürecinde toplam giderler, üretimdeki mallar hesabı üzerinden izlenir ve her siparişin maliyeti ilgili kartlar aracılığıyla kontrol edilir. Direkt malzeme, direkt işçilik ve genel üretim maliyetleri, üretim süreci boyunca maliyet kartlarında izlenir ve üretim tamamlandığında nihai mamule yüklenir (Tercan, 2017).

4.1. Sipariş Maliyet Yöntemi Kavramları

○ 4.1.2. Direkt ilk madde ve Malzeme Giderleri

Mal ve hizmet üretiminde kullanılan tüm girdiler, direkt ilk madde ve malzeme, endirekt malzeme ve üretimle ilişkili dış hizmetleri kapsar. Bu girdiler arasında direkt ilk madde ve malzeme, ürün maliyetinde önemli bir paya sahiptir. Bir malzemenin bu kategoriye dahil edilebilmesi için, ürünün temel yapısını oluşturması, kullanım miktarının ilgili ürün veya ürün grubu bazında doğrudan belirlenebilir olması ve ekonomik açıdan anlamlı bir ölçüme dayanması gerekir (Erbilir, 2015). Direkt ilk madde ve malzeme, üretimde kullanılan ve mamulün yapısına doğrudan katılan temel girdilerdir. Bu girdilerin hangi ürün veya ürün grubu için hangi miktarda kullanıldığı kesin olarak tespit edilebilir ve izlenebilir. Örneğin, pamuk iplik üretiminde, kereste mobilya imalatında, deri ve kösele ise ayakkabı üretiminde bu kategoride yer alır. İlk maddeler, mamulün ana bileşenleri olduklarından kullanım miktarları açıkça takip edilebilir ve toplam üretim maliyetinde önemli bir pay oluşturur. Bu nedenle, her mamul için kullanılan malzemenin miktarı dikkatle kaydedilir ve maliyetler doğrudan ilgili ürünlere aktarılır (Tercan, 2017).

DİREK İLK MADDE MALZEME İSTEK FİŞİ	Fiş no : …….
	Tarih: ……

Malzeme Kod No	Malzemenin Adı	Ölçü Birimi	Miktar	Birim Fiyat	Tutar

4.1.3. Direkt İşçilik Giderleri

Üretim birimlerine işçilik maliyetlerinin dağıtılmasında en önemli zorluk, giderlerin direkt mi yoksa endirekt mi olduğunun doğru biçimde belirlenmesidir. Örneğin, üretim dışı görevlerde bulunan personel ile hizmet birimlerinde çalışan işçilere ödenen ücretler, ek ödemeler ve bunlara ait işveren sosyal güvenlik primleri genellikle endirekt işçilik olarak sınıflandırılır. Bu ayrımın yapılmasında işletmeler farklı uygulamalar benimseyebilir. Bazı işletmeler, üretim merkezindeki tüm çalışanların giderlerini direkt işçilik olarak kaydeder. Bazıları yalnızca doğrudan üretimde görevli işçilerin giderlerini direkt işçilik kabul ederken, diğerleri üretim işçilerinin yalnızca belirli giderlerini bu kapsamda değerlendirir (Tercan, 2017). Direkt işçilik giderleri, esas üretim birimlerinde ortaya çıkan ve belirli bir ürün veya hizmetin maliyetine doğrudan yüklenebilen işçilik maliyetlerini ifade eder. Bu giderler, hangi ürün veya ürün grubu için gerçekleştirildiği kolaylıkla izlenebilen ve herhangi bir dağıtım yöntemine gerek olmaksızın, çalışan başına düşen çalışma süresinin doğrudan ölçümüyle belirlenen maliyetlerden oluşur (Anasız, 1999).

İŞÇİLER	İşe Başlama Saati	İş Bitiş Saati	Çalışma Süresi	Saatlik Ücreti	Toplam
İşçi A					
İşçi B					
TOPLAM					XXX

4.1.4. Genel Üretim Giderleri

Genel üretim giderleri, üretim faaliyetleri kapsamında gerçekleşen, ancak direkt ilk madde ve malzeme ile direkt işçilik maliyetleri dışında kalan tüm maliyet unsurlarını kapsamaktadır. Söz konusu giderler, üretilen mal veya hizmetlerin maliyetine doğrudan yüklenemeyip, sistematik dağıtım yöntemleri vasıtasıyla maliyetlere dahil edilmektedir. Bir maliyet unsurunun genel üretim gideri sınıflandırmasına dahil edilebilmesi için temel koşul, üretim süreciyle doğrudan bağlantılı olması ve maliyetlendirmeye ancak dolaylı yüklemeler veya dağıtım anahtarları aracılığıyla aktarılabilmesidir (Kutlu, 1987).

5. Literatür İncelemesi

Analizler, sipariş maliyeti yönteminin uygulanmasıyla siparişlerden kâr elde edildiğini göstermiştir. Ancak belirlenen fiyatların gerçekçi olmaması, beklenen kârın doğruyu yansıtmadığını ortaya koymuştur. Bu durum, sipariş üzerine üretim yapan işletmelerde doğru maliyet bilgisinin önemini vurgulamaktadır. Bu nedenle, özellikle mobilya sektöründe ve genel olarak sipariş üretimi yapan işletmelerde sipariş maliyet yönteminin uygulanması önerilmektedir (Terzi, 2021).

Bu çalışmada, siparişe bağlı üretim yapan KOBİ'lerde işlemsel maliyet yönteminin performans değerlendirme ve karar alma süreçlerine katkı sağlayabileceği vurgulanmaktadır. Uygulama kısmı bu yaklaşımı desteklemekte, ancak yöntemin maliyet sistemine tam entegre edilmemesinin bir eksiklik olduğu görülmektedir. Özetle, siparişe dayalı üretim yapan işletmelerde işlemsel maliyet yöntemi karar alma, performans ölçümü ve ara mamul transferlerinde uygulanabilir bir sistem olarak önerilmektedir (Anasız, 1999).

İşletmelerin maliyet sisteminin belirlenmesi ve üretim giderlerinin izlenmesi için etkin bir maliyet muhasebesi organizasyonuna ihtiyaç vardır. Konfeksiyon işletmelerinde üretim, siparişe dayalı veya seri üretim şeklinde olabilir; her iki durumda da sipariş maliyeti yöntemi en uygun maliyetleme yöntemi olarak öne çıkar. Bu yöntemde, direkt malzeme ve işçilik giderleri doğrudan mamul maliyetine yüklenirken, genel üretim giderleri uygun maliyet dağıtım anahtarları ile mamule eklenir ve böylece birim maliyet hesaplanır (Şahin, 2002).

Matbaa işletmelerinde üretim dizgi, baskı ve ciltleme aşamalarında gerçekleşmekte olup, sipariş maliyeti yöntemi ile her aşamada harcanan direkt madde, işçilik ve genel imal giderleri sipariş maliyeti kartında toplanmaktadır. Çalışmasında maliyeti etkileyen unsurlar incelenmiş, kayıt ve planlama düzenleri matbaa yapısına uygun hale getirilmiştir. Örnek uygulamada, rasyonel bir matbaada üretilen bir kitaba yöntemin uygulanması sonucu gerçek maliyet başarıyla tespit edilmiş ve maliyet ile yöntem sonucu maliyetin eşitliği, sipariş maliyeti yönteminin matbaa işletmelerinde uygulanabilirliğini göstermiştir (Aydemir, 1993).

Tercan çalışmasında aydınlatma sistemleri üzerine faaliyet gösteren ve LED-Line üretimi yapan bir işletmenin maliyet verileri analiz edilmiştir. Araştırmada, tüm maliyet kalemleri doğrudan ve dolaylı olarak belirlenmiş, en uygun dağıtım anahtarları kullanılarak giderler paylaştırılmıştır. İkinci dağıtım aşamasında kademeli dağıtım yöntemi uygulanmıştır. Çalışmada yalnızca işletmenin bir stadyum projesi ele alınmış, diğer projeler inceleme dışında bırakılmıştır. Sonuçta, işletmenin mevcut maliyet sistemiyle yapılan hesaplamalarda proje kârlı görünürken, Sipariş Maliyeti Yöntemi kullanılarak yapılan hesaplamalarda projenin aslında zarar ettiği ortaya konmuştur (Tercan, 2017).

6. Sonuç ve Değerlendirme

Bu araştırmada yapılan teorik incelemeler ve literatürde yer alan bulgular, Sipariş Maliyeti Yöntemi'nin özellikle heterojen ürün çeşitliliğine sahip, siparişe dayalı ve düşük hacimli üretim yapan işletmeler açısından kritik bir maliyetleme yaklaşımı olduğunu göstermektedir. Yöntemin temel

avantajı, her bir siparişin ayrı bir maliyet nesnesi olarak ele alınması ve maliyet bileşenlerinin ilgili siparişe doğrudan atanabilmesidir. Bu özellik, işletmelerin ürün ve hizmet maliyetlerini yüksek doğrulukla belirlemesine olanak tanıyarak karar süreçlerinin şeffaflığını ve güvenilirliğini artırmaktadır. Literatürde yöntemle ilgili olarak vurgulanan ortak nokta, doğru fiyatlandırma, kârlılık analizi, performans ölçümü ve maliyet kontrolü gibi alanlarda işletmelere sunduğu stratejik katkılardır. Maliyetlerin ayrıntılı izlenmesi, gereksiz harcamaların tespiti, kaynak kullanımının optimize edilmesi ve üretim sürecinin daha etkin yönetilmesi açısından önemli avantajlar sağlamaktadır. Bununla birlikte, yöntemin uygulanması bazı operasyonel güçlükleri de beraberinde getirmektedir. Kapsamlı kayıt tutma gerekliliği, genel üretim giderlerinin siparişlere rasyonel biçimde dağıtılmasındaki zorluklar ve yüksek uygulama maliyetleri, yöntemin eleştirilen yönleri arasında yer almaktadır. Özellikle geleneksel dağıtım anahtarlarının kullanıldığı işletmelerde, dolaylı maliyetlerin günümüz otomasyona dayalı üretim ortamları için yeterince gerçekçi sonuçlar üretmediği ifade edilmektedir.

Genel olarak değerlendirildiğinde, Sipariş Maliyeti Yöntemi esnek üretim yapısına sahip işletmeler için önemini korumakla birlikte, modern üretim teknolojilerinin gerektirdiği bilgi düzeyi ve hız karşısında tek başına yeterli olmayabilmektedir. Bu nedenle yöntemin diğer çağdaş maliyet yönetimi teknikleriyle bütünleşik biçimde uygulanması ve işletme koşullarına uygun şekilde sürekli geliştirilmesi gerekmektedir.

Abstract

Tax awareness refers to individuals' attitudes and behaviors toward taxation beyond its legal obligation, while tax perception denotes the aggregate of individuals' cognitions and affect regarding taxes and the tax system. Strengthening both constructs is critical to enhancing tax compliance. The literature accords extensive attention to tax awareness and tax perception as core determinants of voluntary compliance. This study assesses the tax perception and awareness of students at Recep Tayyip Erdoğan University (RTEÜ) Faculty of Law. Given the scarcity of research on law students in Turkey, the study is original in addressing a gap. Examining law students is salient, as graduates may serve in administrative judiciary pathways. The scale developed by Çelebi (2016) is employed to obtain reliable and valid measurements of tax awareness and perception. Using a quantitative approach and a cross-sectional survey design, data were collected via stratified sampling from RTEÜ law students. A 37-item, seven-point Likert-type questionnaire was administered; data were analyzed in SPSS using descriptive statistics, independent-samples t-tests, and ANOVA. The presentation reports demographic indicators, differences across class levels, and findings by prior tax-related coursework. The conclusion discusses whether curriculum-based education affects law students' tax perception and awareness, and offers actionable education strategies and policy recommendations to strengthen tax awareness.

Keywords: Tax Awareness, Tax Perception, Tax Education, Law Students

Özet

Vergi bilinci, vergilerin yasal bir yükümlülük olmasının ötesinde bireylerin vergiler karşısındaki tutum ve davranışlarını, vergi algısı ise kişilerin vergilere ve vergi sistemine ilişkin düşünce ve duygularının toplamını ifade etmektedir. Vergi uyumunu artırmak için her iki kavramın güçlendirilmesi önem arz etmektedir. Literatürde gönüllü uyumun temel belirleyicileri bağlamında vergi bilinci ve vergi algısına geniş yer verilmektedir. Bu çalışmada, Recep Tayyip Erdoğan Üniversitesi (RTEÜ) Hukuk Fakültesi öğrencilerinin vergi algısı ve bilinci değerlendirilmektedir. Türkiye literatüründe hukuk fakültesi öğrencilerine odaklanan çalışmaların sınırlı olması, araştırmanın literatürdeki bir boşluğu doldurması bakımından özgünlüğünü ortaya koymaktadır. Hukuk öğrencilerinin vergi algısı ve bilincinin incelenmesi, mezuniyet sonrasında idari yargı süreçlerinde görev üstlenebilecek olmaları nedeniyle

ayrıca önem taşımaktadır. Çalışmada Çelebi (2016) tarafından geliştirilen ölçek kullanılmış; böylece vergi bilinci ve algısına ilişkin güvenilir ve geçerli ölçümler elde edilmiştir. Araştırma nicel yöntemle, kesitsel tarama modeli kullanılarak yürütülmüş, veriler RTEÜ Hukuk Fakültesi öğrencilerinden tabakalı örnekleme yöntemiyle toplanmıştır. Öğrencilere 37 maddelik, 7'li Likert tipi bir anket uygulanmış, elde edilen veriler SPSS yazılımında betimleyici istatistikler, bağımsız örneklem t-testi ve ANOVA ile analiz edilmiştir. Sunumda, demografik göstergeler, sınıf düzeylerine göre farklılıklar ve vergiye ilişkin ders alıp almama durumuna göre ortaya çıkan bulgular ele alınacaktır. Sonuç bölümünde, müfredat temelli eğitimin hukuk fakültesi öğrencilerinin vergi algısı ve bilinci üzerindeki etkisi tartışılarak vergi bilincini güçlendirmeye yönelik uygulanabilir eğitim stratejileri ve politika önerileri sunulacaktır.

XÜLASƏ

Əsrlər boyu müstəqil dövlətlərin əsas məqsədi və vəzifəsi torpağların müdafiəsi uğrunda mübarizəsidir. Bu istiqamətdə aparılan xarici siyasətin proiritetləri məhz bu maraqdan irəli gəlib və formalaşıb. Müasir dövrdə də bu reallığı təşkil edən amillərin əsasıdır. Məlumdur ki, dünya inkişafının hər mərhələsi müvafiq xüsusiyyətlərlə və yeniliklərlə tarixə yazılır. Lakin belə aspektlərdə var ki, onların aktuallığı və üzərində mübarizəsi əhəmiyyətini itirmir. Və millətlərə aid olan torpağlar, mövcud dövlət sərhədləri və təbii sərvətlər məhz belə amillərdəndir.

Bəşəriyyətin tarixi inkişafı müxtəlif müharibələrlə zəngindir. Və onların əsas nəticəsi siyasi xəritənin dəyişməsidir. Güclü ölkələr hər zaman öz hökmranlığını möhkəmləndirmək və günişlənmək üçün zəif dövlətlərin torpağlarını tutmaq və resurslarından öz məqsədlərinə uyğun istifadə etmək olub. Vurğulamaq vacibdir ki, dünyanın yeni qaydaları da əsasən güclü dövlətlərin maraqları naminə meydana gəlib. Onu da qeyd etməliyik ki, hər bir yeni beynəlxalq münasibətlər sisteminin mahiyyətini də tutulan torpaqların kimə məxsus olunmasını dövlətlərarası sazişlərdə öz əksini tapıb. Və gələcəkdə torpağların yeni sahibi bu əraziləri mənimsəmək niyyətilə yeni düşüncəni və normalarını əhaliyə güc vasitəsilə yeridə bilib. Bu hal da öz növbəsində xalqların şüurunda və inkişafının növbəti mərhələsində təsir qüvvəsinə çevrilib (təhsildə, adətlərdə, mədəniyyətdə).

Keywords: dövlət sərhədləri, beynəlxalq hüquq, xarici siyasət, geosiyasi vəziyyət, siyasi və iqtisadi nəticələr, problemlər.

GİRİŞ

Qeyd etdiyimiz kimi, ərazi bütövlüyü müstəqil dövlətin təməlini və mövcudluğunu göstərən əsas varlıq və meyyardır. Məhz bu iki aspect xarici siyasətin müəyyən olunmasında mühüm rol oynayır. Və prioritetlər də bunların təməlində formalaşır.

Ərazi bütövlüyünün təmin olunması habelə beynəlxalq hüququn əsas prinsipidir. Bu da bütün ölkələr tərəfindən qəbul edilən vəziyyətdir. Ölkələrarası münasibətlər də məhz bu prinsipi əsas tutaraq əlaqələr yaradır və onların üzərində hərtərəfli siyasət yürüdür.

Qeyd etmək zəruridir ki, ərazi bütövlüyü prinsipi birbaşa geosiyasətə təsir göstərir. Bu təsirin göstəricisi kimi müasir qlobal siyasətinin yeni qaydalarının formalaşması prosesində diqqəti cəlb edir. Məhz bu məsələ siyasi elminin hal-hazırda da diqqət mərkəzindədir, və bir sıra tədqiqatçılar öz araşdırmalarında vəziyyəti sübut etmək istiqamətində müxtəlif fikirləri ərsəyə gətirir.

Məlumdur ki, beynəlxalq münasibətlərin hər bir nəzəriyyəsi coqrafi məkanı tədqiq edir, və onun əlverişli xüsusiyyətlərini izah etdikdə, ölkələrin gücünə əsas kimi göstərir. Belə nəzəriyyəçilərdən geosiyasət elminin klassikləri olan Mexeni, Makkinderi, Hausxoferi, Ratseli, Spaykmeni və Çelllini xüsusi qeyd etmək vacibdir. Onların nəzəriyyələri vurğulayıb ki, dövlətlərin mövqeyi, xüsusən də aparıcı statusu, məhz coqrafi məkandan asılıdır. Adları göstərilən alimlər "xartlend" və "rimlənd" konsepsiyalarını açıqlayaraq, göstəriblər ki, ölkə nə qədər əlverişli məkanda yerləşirsə, onun hökmranlığı da məhz bu aspektin üzərində mümkündür. Okeanlara çıxışları, su yollarını əldə edilməsi, dünya ticarət istiqamətlərinə nəzarətin aparılmasına və böyük resurslara hakimlik etməyə böyük dəstək olmuşdur. Göstərilən amillər də, böyük siyasətin qaydalarını yaratdı. Nəticəsi də müstəmləkəçilik, saysız ərazi və etnik münaqişələr, kütləvi qırğınlar kimi beynəlxalq cinayətlərin artması oldu.

Müasir zamanda da tədqiqatçılar üçün ərazi məsələsi və onun geosiyasətlə uzlaşması tədqiqatın predmeti və obyekti olaraq qalmaqdadır. XX yüzilliyin sonunda Yalta-Potsdam sisteminin dağılması və dünya xəritəsində növbəti dəyişikliklər müasir tədqiqatçılar tərəfindən ərazi bütövlüyü prinsipinin yeni geosiyasətin formalaşmasında əsas səbəb kimi vurğulanır. Bunlardan Jack S.Levy, William R., Thompson, Paraşevina, Karasyova, Skripkina və s. tədqiqatçıları qeyd etmək olar.

Təqdim olunan məqalədə icmal təhlil metodundan istifadə edilərək, müasir dövrdə ərazi bütövlüyü prinsipinin aktual olmasının və onun geosiyasətə təsirinin birdaha sübut edilməsidir.

Tarixi şərtlər və ərazi bütövlüyü prinsipinin formalaşması. Məlumdur ki, hər vəziyyətin və statusun müəyyən olunmasının arxasında müvafiq proseslər durur. Ərazi bütövlük də istisna deyil. İlk növbədə buna aid tarixin gedişatıdır. Dövlətlərin yaranması və inkişafı tarixi hadisələrin mövcudluğu əsasında mümkün olub. Təbiət elə nizamlanmışdır ki, kainat və yer kürəsinin yaranmasına səbəb olmuşdur. Qədim zamanlardan insanlar təbiətin qorxusu qarşısında həmişə birləşməyə cəhd ediblər. Həyatın zəruriliyi insanları əlverişli torpağlara yönəldir. Dünya miqyaslı köçlər kimi proseslər artır və nəticədə dövlət adlı birliklər yaranır və getdikcə onların sayı çoxalır. İlk quldarlıq dövlətlər meydana gəlir. Zaman getdikcə onları feodal, kapitalist dövlətləri əvəz edir. Və hər dövlət öz əhatə dairəsini formalaşdıraraq müəyyən torpaqları tutur və sərhədlərini elan edir. Beləliklə də, "milli dövlətlər", "xalqlar" kimi amillər yaranır.

Tədricən, dünyada insanların sayı artdıqca, onların yerləşməsi məsələsi gündəmə gəlir və torpaqlar üzərində mübarizə əsas və taleönəmli məsələyə çevrilir. Bu yolda qədim və orta dövrün insanları münaqişələrə, müharibəyə üstünlük verir. Bu hal da sonralar elmdə öz izahatını axtarır. Və "ərazi bütövlüyü", "dövlət sərhədləri" kimi anlayışlar gündəmə gəlir. Bu kateqoriyaların təsdiqi orta əsrlər dövründə beynəlxalq hüququn ümumi qəbul edilməsi nəticəsində öz hüquqi əsasını möhkəmləndirir. Birinci Vestfal beynəlxalq münasibətlər sisteminin əsas müddəaları da ilk dəfə məhz "dövlət suverenliyi", "milli dövlətlər" anlayışlarını bəyan edir. Və müasir zamanda da bu kateqoriyalar öz aktuallığını nəinki itirməyib, hətta onlar üzərində mübarizəni daha da kəskinləşdirib. Qlobal deyilən dünyanın, vahid hökümətin yaranması kimi ideyalar hökm sürsə də, hələ ki, heç bir dövlət oz torpaqlarından imtina etməyə razı deyir. Buna sübut kimi müasir münaqişələrin sayı, insan itkiləri, kütləvi qırğın silahlarının yaranması və artması kimi amilləri göstərmək kifayətdir.

Xüsusi qeyd etmək zəruridir ki, Otuz illik müharibənin əsas səbəbi də məhz İngiltərə və Fransa arasında müvafiq torpaqlara yiyələnməsi və orada öz hökmranlığının təmin olunması olmuşdur. Bu səbəb də beynəlxalq hüquq normalarının əsasını Vestfal sistemində təşkil etdi və möhkəmləndirdi. Zaman getdikcə ərazi bütövlüyü prinsipi dövlətlərin suverenliyinin qorunmasını təmin etmək və münaqişələrin

qarşısını almaq üçün BMT Nizamnaməsində və digər beynəlxalq sənədlərdə təsbit edilmiş beynəlxalq hüququn fundamental norması kimi ortaya çıxmışdır. Onun mahiyyəti ondan ibarətdir ki, dövlətlər digər ölkələrin sərhədlərinə hörmət etməyə və onların daxili birliyini poza biləcək və ya ərazilərin ilhaqına səbəb ola biləcək hər hansı bir hərəkətdən çəkinməyə borcludurlar.

Dövlətlərin geosiyasi maraqları və onların bütövlük siyasətində əks etməsi. Qloballaşma şəraitində siyasi, iqtisadi, sosial, hüquqi, ekoloji və s. qlobal məkanlar formalaşır. Bu cür məkanların inkişaf amilləri vahidləşdirilir. Və qeyd olunan məkanları bir-birinə yaxınlaşdıran universal amillərdən biri də məhz ərazi amilidir.

Ərazi öz əhalisi və idarəetmə sistemi ilə birlikdə dövlətin əsas xüsusiyyətidir. Müasir dünyada da ən vacib ərazi vahidi olan yalnız dövlətdir. Ərazinin sistemli təbiəti onun vahid xüsusiyyətləri ilə xarakterizə olunur: ərazinin bölünməzliyi, zamanla dəyişməzliyi, sərhədlərin toxunulmazlığı, məkan əhatə dairəsi, xarici və daxili təsirlərə müqavimət və s. Bu xüsusiyyətlərin inteqrativ tərifi ərazinin vahidliyini və bölünməzliyini, onun quru və su səthinin, hava məkanının və yeraltı hissəsinin bir hissəsinin və dəniz dibinin ayrılmasının mümkünsüzlüyünü təmin edən "dövlətin ərazisinin bütövlüyü" anlayışıdır. Onu da qeyd etmək vacibdir ki, ərazinin bütövlüyü dövlətin bütövlüyünün yalnız bir aspektini təşkil edir ki, bu da, əlavə olaraq, əmlak komplekslərinin, ilk növbədə dövlət mülkiyyətinin vəhdəti ilə xarakterizə olunur: vahid vətəndaşlıq, vahid dövlət hakimiyyəti orqanı, vahid büdcə və vergilər və s. [4]

Beynəlxalq münasibətlərdə bir dövlətin ərazisinin yerüstü və yeraltı olmaqla iki yerə bölündüyü bir presedent da var. Məsələn, Versal müqaviləsinə əsasən, Saar vilayəti beynəlxalq nəzarəti altına alındı. Daha sonra isə əhaliyə bölgənin Almaniyaya qayıtmasını, Fransaya birləşməsini və ya müstəqil olmasını istəmələri ilə bağlı səs vermək hüququ verildi. Həmçinin Saar vilayətinin Almaniyaya və ya müstəqilliyə çevriləcəyi təqdirdə mineral ehtiyatlara olan hüquqların Fransada qalacağı da şərtləndirilmişdi. Lakin Fransa hökuməti bu vəziyyətin qeyri-adiliyini dərk edirdi. V referendumdan sonra Almaniyaya mineral ehtiyatları almaq hüququ verildi. Və 1935-ci ildə Almaniya bundan istifadə etdi. [4]

XX əsrin sonlarında SSRİ-nin və sosialist sisteminin dağılması ilə dünyada bir sıra dəyişikliklər baş verdi. Soyuq müharibənin sonu ilə beynəlxalq münasibətlərin əsas güc mərkəzləri yeni geosiyasi reallıqları rəhbər tutaraq fəaliyyətlərini mövcud şəraitə uyğunlaşdırmaq qərarına gəldilər. Əvvəlki beynəlxalq münasibətlər sisteminin dağılması ilə yanaşı, yeni dünya nizamının təməli qoyulmağa başladı. Belə şəraitdə ərazi bütövlüyü prinsipi də mürəkkəb bir mərhələdə daha da kəskin şəkildə gündəmə gəldi. Keçmiş SSRİ-nin məkanında yaranmış gənc dövlətlər öz əraziləri uğrunda mübarizəyə məruz qaldı (Ukrayna, Gürcüstan). Bu mübarizədən Azərbaycan da kənarda qalmadı. Ölkəmiz ərazilərin müdafiəsini iki istiqamətdə təmin olunması oldu: Dağlığ Qarabağın qaytarılması və Xəzər dənizinin hüquqi statusunun müəyyən edilməsi.

Dövlətlərin geosiyasi maraqları dedikdə, onların coqrafiyası, iqtisadiyyatı, resursları, mədəniyyəti kimi amillər nəzərdə tututlur. Və bunlar dövlətin ərazi bütövlüyü siyasətinə birbaşa təsir göstərir. Bu siyasət özünü sərhədlərini və təsir dairələrini qorumaq və ya genişləndirmək cəhdlərində, o cümlədən ittifaqların yaradılması, hərbi və iqtisadi gücdən istifadə, sərhədlərinin və resurslarının qorunması yolu ilə müşahidə olunur. Təsir dairələrini yenidən bölüşdürməyə çalışan dövlətlər qlobal iqtisadiyyata və siyasətə birbaşa təsir göstərərək digər ölkələrin bütövlük siyasətində dəyişikliklərə səbəb oldu.

Qlobal sistemdə ərazi sabitliyinin qorunması üçün müasir çətinliklər və perspektivlər. Ərazi sabitliyinə qarşı müasir çağırışlara artan geosiyasi gərginlik, separatçı hərəkatlar, aqressiv millətçilik və qeyri-dövlət aktyorlarının artan təsirləri daxildir. Sabitliyin qorunması perspektivləri beynəlxalq

hüququn gücləndirilməsindən, çoxtərəfli dialoqların və münaqişələrin həlli mexanizmlərinin inkişaf etdirilməsindən və yeni hibrid təhdidlərə effektiv şəkildə qarşı çıxmaqdan asılıdır.

Müasir dövrdə aparıcı dövlətlər arasında siyasi rəqabətin güclənməsi və hərbi münaqişələrin artması dövlətlərin ərazi bütövlüyünə ciddi təhlükə yaradır. Ölkələr daxilində etnik, dini və siyasi fərqlər separatçı hərəkatlara və regionlarda sabitliyi pozan daxili münaqişələr üçün əsas səbəblərdəndir. Təcavüzkar millətçilik və ksenofobiya ideologiyaları ərazi iddialarını təhrik edə və dövlətlərarası gərginliyi artıra bilər. Terrorçu qrupların, özəl hərbi şirkətlərin və digər qeyri-dövlət subyektlərinin fəaliyyəti də sabitliyə təhdid yaradır və münaqişələrin kəskinləşməsinə səbəb ola bilir. Dezinformasiya və kiberhücumlar dövlətçiliyi sarsıtmaq və ölkələrdə daxili vəziyyəti pozmaq üçün alət kimi istifadə edilir.

Qeyd olunan təhdidləri aradan qaldırmaq üçün perspektivdə bəzi ciddi addımları dövlətlər atmalıdır. Bunardan, beynəlxalq hüquq və təsisatların gücləndirilməsi. Beynəlxalq hüquqda təsbit olunmuş ərazi bütövlüyü və suverenlik prinsiplərinə hörmətin sabitliyini təmin etməkdir.

Çoxtərəfli dialoqların inkişafını yüksək səviyyəyə çatdırılması və təmin edilməsi. Hibrid təhdidlərə effektiv mübarizənin təmin olunması. Habelə, iqtisadi inkişaf və sosial inteqrasiyanı gücləndirmək. Ölkələr daxilində sosial və iqtisadi bərabərsizliyin azaldılması və inklüzivliyin təmin edilməsi separatizm və daxili münaqişə risklərini azalda bilər.

Və ən əsası: diplomatik həllin daha da aktiv istifadəsi. Vasitəçilik və arbitraj da daxil olmaqla, ərazi mübahisələrinin diplomatik və dinc yollarla həllinə üstünlük vermək sülhün qorunmasının ən perspektivli yoludur.

NƏTİCƏ

XXI əsr bəşəriyyət üçün yeni sınaqlarla vurğulandı. Bunlar da əsasən torpaqların üzərində mübarizənin növbəti mərhələsi kimi gündəmə gəldi. Halbuki, dövlətlər arasında mövcud olan toqquşmalar müxtəlif səbəblərdən göstərilir (etnik, enerji), bizim fikrimizcə, nəticə etibarı ilə müasir münaqişələrin əsas səbəbi əlverişli torpaqlara yiyələnməkdir (hətta müharibə və hərbi əməliyyatlar vasitəsilə). Buna sübut kimi bir neçə hadisələri nəzərdən keçirmək vacibdir.

Beynəlxalq arenada ərazilər üzərində mübarizənin növbəti mərhələsi 1991-ci ildə SSRİ-nin dağılması ilə başladı. Yetmiş ilə yaxın güclü dövlətin dağılması beynəlxalq münasibətlərdə mövcud olan təhküləsizlik sisteminin çökməsinə də təsir göstərdi. Zamanında işləyən beynəlxalq mexanizmin iflici siyasi tarazlığı pozdu. Nəticəsi isə - yeni subyektlərin meydana gəlməsi və onlara siyasi və iqtisadi təsiri yaymaq üzərində saysız münaqişələrin başlanması oldu.

Sovet İttifaqının dağılması dünya siyasi xəritəsində gənc müstəqil dövlətlərin yaranması ilə nəticələndi. Socialist cəmiyyətinin süqutu sovet ərazisindən əlavə Şərqi və Qərbi Avropada ərazi dəyişiklikləri qeydə aldı. SSRİ-nin məkanında yeni on beş respublika öz müstəqilliyini bərpa etdi, Almaniya dövlətləri birləşdi, Yuqoslaviya dağıldı, Çexoslovakiya yenidən iki ölkə oldu. Göstərilən proseslər sülh yolu ilə olmadı. Bu dəyişiklikləri böyük dövlətlər birmənalı qəbul etmədi və uzun illər davam edən siyasi münaqişələrə start verildi. Və tarixən olduğu kimi, bu mərhələdə də zəif olan ölkələrin torpağları gündəmə gəldi.

AZƏRBAYCANIN LOGİSTİKA SİSTEMİNİN RƏQƏMSALLAŞDIRILMASI İMKANLARININ TƏHLİLİ

Yusif Əziz oğlu Ələkbərli:

Doktorant, Bakı Dövlət Universiteti:

ORCİD: 0009-0008-8332-0806

E-mail: yusif_elekberli.2002@mail.ru

Xülasə

Tədqiqatın əsas məqsədi Azərbaycanda logistika xidmətlərinin rəqəmsallaşdırılması sahəsində mövcud problemlərin müəyyənləşdirilməsi və alternativ həllərin hazırlanmasıdır. Bu məqsədlə logistika xidmətlərinin mövcud vəziyyəti və rəqəmsallaşma gözləntiləri Azərbaycanın logistika bazarında fəaliyyət göstərən şirkətlərin nümunəsi ilə araşdırılıb. Məlum olduğu kimi, şirkətlərin innovasiya və rəqəmsallaşma üçün ayırdığı xərclər inzibati xərclər qrupuna daxil edilir. Şirkətlərin rəqəmsallaşmaya keçid üçün ayırdıqları inzibati xərclərin onların satışlarına necə təsir etdiyini təhlil etmək üçün biz bu təsiri Azərbaycan logistika bazarında çox məşhur olan "Kristal 2008" MMC və "Foursea Logistics" MMC işlərində araşdırdıq. Bu məqsədlə ilk növbədə bir-birimizə təsir edən göstəriciləri müəyyənləşdirərək münasibətləri modelləşdirməyə çalışdıq. Sözügedən modelin qurulması üçün ilk növbədə asılı və müstəqil dəyişənlər müəyyən edilməli və məlumatlar yaradılmalıdır. Tədqiqatın mahiyyətinə uyğun olaraq, rəqəmsallaşma xərcləri də daxil olmaqla inzibati xərclər müstəqil dəyişən kimi qəbul edildi və logistika şirkətinin satışları asılı dəyişən kimi qəbul edildi. Göstərilən dəyişənlər arasındakı əlaqənin formasını təyin etmək üçün bir reqressiya modelindən istifadə edildi və əlaqənin intensivliyini ölçmək üçün korrelyasiya modelindən istifadə edildi. Bu modellər Excell 2019 proqramı ilə hazırlanmışdır. Rəqəmsal transformasiya bütün sahələrdə olduğu kimi, logistika sənayesində də ən aktual məsələlərdən biridir. Robotlar və süni intellektlə hazırlanmış proqram təminatı və nəqliyyatda dronlardan istifadə kimi yeni logistika sahələrinin ortaya çıxması şirkətləri yeni proqram təminatından istifadə etməyə sövq edir. Bundan əlavə, fiziki obyektlərin bir-biri ilə əlaqəli olduğu IoT tətbiqləri, bulud texnologiyası və s., şirkətlərin özlərini tamamilə rəqəmsal bir mühitdə işləmək üçün dizayn etmələri deməkdir. Bu vəziyyət ənənəvi olaraq təklif olunan logistika xidmətlərinin rəqəmsallaşdırılmasına da gətirib çıxarır. Qlobal valyuta dalğalanmalarından təsirlənməyən blokçeyn kimi tətbiqetmələr daha çox cəlbedici olur və şirkətləri rəqəmsal düşünməyə məcbur edir. Bu, şirkətlərə qlɔbal rəqabət mühitində daha müasir avtomatlaşdırma sistemləri ilə tanış olmağa imkan verir. Logistika şirkətləri texnologiyaya uyğunlaşdıqca, yeniliklərə davam etdikcə və sürətli dəyişikliklərə imkan verdikcə, sənayedə transformasiyaya rəhbərlik edə bilərlər.

.**Açar sözlər:** Logistika, rəqəmsallaşma, reqressiya, mənfəət və zərər.

Summary

The main objective of the research is to identify existing problems in the field of digitalization of logistics services in Azerbaijan and to explore alternative solutions. For this purpose, the current state of logistics services and the prospects for digitalization were examined on the example of companies operating in the Azerbaijani logistics market. As is known, the expenses allocated by companies for innovation and digitalization are included in the administrative expense group. In order to analyze how the administrative expenses allocated by companies for the transition to digitalization affect their sales, we examined this effect on the examples of “Kristal 2008” LLC and “Foursea Logistics” LLC, which are quite well-known in the Azerbaijani logistics market. For this purpose, we first tried to model the relationships by identifying the indicators that affect each other based on regression analysis. To build the mentioned model, first the independent and dependent variables should be identified and the data

should be formed. In accordance with the essence of the research work, the administrative costs, which include digitalization costs, were taken as the independent variable, and the sales of the logistics company were taken as the dependent variable. A regression model was used to determine the form of the relationship between the mentioned variables, and a correlation model was used to measure the density of the relationship. The mentioned models were built using Excell 2019 software. Digital transformation is one of the most urgent issues in the logistics sector, as in all sectors. The emergence of new logistics areas such as robots and software developed with artificial intelligence and the use of drones in transportation are pushing companies to use new software. In addition, IoT applications, where physical objects are interconnected, cloud technology and the like mean that the company designs itself to operate in a completely digital environment. This situation also leads to the digitalization of logistics services that are conventionally provided. Applications such as blockchain, which are not affected by global currency fluctuations, are attracting more attention and forcing companies to think digitally, which allows companies to get acquainted with more modern automation systems in a globally competitive environment. As logistics companies adapt to technology, they can lead the transformation by continuing to innovate in the industry and ensuring rapid change.

Keywords: Logistics, digitalization, regression, profit and loss.

Резюме

Основная цель исследования – выявление существующих проблем в сфере цифровизации логистических услуг в Азербайджане и поиск альтернативных решений. Для этого было изучено текущее состояние логистических услуг и перспективы цифровизации на примере компаний, работающих на азербайджанском рынке логистики. Как известно, расходы компаний на инновации и цифровизацию входят в группу административных расходов. Чтобы проанализировать, как административные расходы, выделяемые компаниями на переход к цифровизации, влияют на их продажи, мы рассмотрели это влияние на примерах ООО «Kristal 2008» и ООО «Foursea Logistics», достаточно известных на азербайджанском рынке логистики. Для этого мы сначала попытались смоделировать взаимосвязи, выявив взаимовлияющие показатели на основе регрессионного анализа. Для построения указанной модели необходимо определить независимые и зависимые переменные, а также сформировать данные. В соответствии с сутью исследования, в качестве независимой переменной были приняты административные расходы, включающие в себя расходы на цифровизацию, а в качестве зависимой – объём продаж логистической компании. Для определения формы связи между указанными переменными использовалась регрессионная модель, а для измерения плотности связи – корреляционная модель. Модели были построены с использованием программного обеспечения Excell 2019. Цифровая трансформация – одна из наиболее актуальных проблем в сфере логистики, как и во всех отраслях. Появление новых направлений в логистике, таких как робототехника и программное обеспечение, разработанное с использованием искусственного интеллекта, а также использование дронов в транспортировке, подталкивает компании к использованию нового программного обеспечения. Кроме того, приложения Интернета вещей, где физические объекты взаимосвязаны, облачные технологии и т.п. позволяют компаниям разрабатывать решения, обеспечивающие управление в полностью цифровой среде. Это также приводит к цифровизации традиционных логистических услуг. Такие приложения, как блокчейн, не подверженные влиянию колебаний мировых валют, привлекают всё больше внимания и побуждают компании мыслить цифровыми методами, что позволяет им осваивать более современные системы автоматизации в условиях глобальной конкуренции. По мере того, как логистические компании адаптируются к технологиям, они могут стать лидерами трансформации, продолжая внедрять инновации в отрасли и обеспечивая быстрые изменения.

Ключевые слова: логистика, цифровизация, регрессия, прибыль и убыток.

GİRİŞ

Logistika sənayesi real vaxt məlumatları əsasında işləyən dinamik bir sektordur. Buna görə də, iş prosesini optimallaşdırmağın yolu texnoloji rahatlıqlardan istifadə etməyə başlamaqdır. Logistikada rəqəmsallaşma, bir növ, süni intellektin birbaşa istifadəsi ilə həyata keçirilir. Logistika sektorunda rəqəmsallaşma məhsulun son istehlakçıya daşınmasında aralıq hissələrin sadələşdirilməsi, məsafələrin qısaldılması, tam və effektiv daşınmanın təmin edilməsi kimi təfərrüatlı şəkildə verilə bilər. Xidmət sektorunun bir qolu olan logistikada rəqəmsallaşma müştəri məmnuniyyətinin mərhələlərindən biri kimi qiymətləndirilə bilər (Androit Market Research, 2018).

Bütün bu avtomatlaşdırma sistemlərinə kompüterlər, smartfonlar və planşetlər kimi ağıllı cihazların daxil olması da aiddir. Bu səbəbdən, logistika şirkətləri təkcə bir platforma vasitəsilə rəqəmsallaşmanı nəzərdən keçirməklə deyil, həm də rəqəmsallaşma prosesinin bütün sahələrini və mərhələlərini qiymətləndirərək müştərilərinə limitsiz xidmət göstərmək inamını verməlidirlər. Logistika şirkətləri robot tətbiqləri ilə xərclərini minimuma endirməklə işçi qüvvəsini daha məhsuldar sahələrə köçürə bilər. Bundan əlavə, logistikada rəqəmsallaşma əşyaların internetini, təchizat zəncirini və keyfiyyətə nəzarət proseslərini effektiv tətbiqlərə bağlayır (DHL and Euromonitor, 2018).

Rəqəmsallaşma, CRM abbreviaturası ilə tanınan "Müştəri Münasibətlərinin İdarə Edilməsi" tətbiqi və digər onlayn tətbiqlər ilə logistika sektorunun ən böyük köməkçiləri arasındadır. Daha konkret misal desək, rəqəmsallaşmanın köməkçi təsirləri arasında yolda olan ağır nəqliyyat vasitəsi sürücüsünün öncədən görə bilməyəcəyi potensial qəzalar və ya yol işləri haqqında məlumatın ötürülməsi də var. Müştəri aldığı məhsulun yükünü e-ticarət vasitəsilə izləyə bilər. Rəqəmsallaşma, müştərinin təkcə xidmət zamanı deyil, həm də xidmətdən sonra öz təcrübəsini paylaşa biləcəyi sosial media kanalları ilə birbaşa əlaqə quraraq müştəri məmnuniyyətini və loyallığını optimallaşdırmaq üçün dizayn edilə bilər (Pfohl, H. C., Yahsi, B., & Kurnaz, T., 2015).

Avtomatlaşdırma sistemləri maşınlarda əməliyyat səmərəliliyini artırmaq, paketlərin etiketlənməsini təkmilləşdirmək və anbar təsnifatını təmin etmək üçün verilənlərə əsaslanan proqram təminatından istifadə edir. Robotik kodlaşdırma logistika sənayesindəki tətbiqləri daha səmərəli və daha sürətli edir, çünki o, eyni vaxtda bir neçə işi yerinə yetirmək üçün nəzərdə tutulub. Böyük alış-veriş saytlarının anbarlarında çalışan robotlar, insan gücü ilə edilə bilməyən bir çox işi avtonom proqramla yerinə yetirə bilir. Üstəlik, robotlar insan əmrlərindən asılı olmayaraq hərəkət edərək bütün tapşırıqları yerinə yetirməyə qadirdir. Eyni şəkildə, texnologiyalar anbar sifarişlərinin seçilməsi proseslərini dəstəkləyərək insan səhvləri riskini minimuma endirir. Bu, müştəri, işəgötürən və işçi məmnuniyyətini artıran bir xidmətdir. Drone tətbiqləri logistika sənayesi üçün bir çox perspektivli xüsusiyyətlərə malikdir. Sıx məskunlaşma olan şəhərlərdə logistika əməliyyatlarının müəyyən vaxtlarda tamamlanmasında mühüm rol oynayan dronlar, logistik xidmətlərində də müştəri məmnuniyyətini maksimum dərəcədə artırır.

Son istehlakçı üçün vacib olan məqam aldığı məhsulun ona qısa zamanda çatıb-çatmayacağıdır. Ümumiyyətlə, hər bir müştəri prioritet olmaq istəyir və öz məhsuluna mümkün qədər tez çatmaq istəyir. Logistika şirkətləri tərəfindən müəyyən edilən daşınma tarixləri bəzən satın alma prosesində həm müştəriyə, həm də iş sahibinə mənfi təsir göstərə bilər. Buna görə də, logistika şirkətləri üçün müştərilərinə ən optimallaşdırılmış xidməti vəd etmələri böyük əhəmiyyət kəsb edir. Yalnız logistikadakı gecikmə onlayn alışa təsir edərsə, bu həm e-ticarət şirkəti, həm də logistika şirkəti üçün mənfi nəticələrə səbəb ola bilər. Buna görə də istifadə olunan hər bir rəqəmsal prosesin idarə edilməsi və avtomatlaşdırılması müştəriyə fayda verəcəkdir (Strategy and Consulting, 2018).

Bazar iqtisadiyyatı şəraitində Azərbaycanda da logistika şirkətlərinin öz xidmətlərinin rəqəmsallaşdırılması yolunda administrativ islahatlar aparması və elmi texniki tərəqqinin gətirdiyi fürsətlərdən istifadə etməsi kifayət qədər aktual məsələdir.

Azərbaycanda nəqliyyat və logistika bazarının mövcud vəziyyətinin təhlili.

Reqressiya modelinin sadə xətti növündən istifadə edərək modelin tənliyini yazaq. Sadə xətti reqressiya üçün formula belədir:

$$y = \beta_0 + \beta_1 x + \varepsilon$$

• y müstəqil dəyişənin (x) hər hansı verilmiş dəyəri üçün asılı dəyişənin (y) proqnozlaşdırılan qiymətidir.

• B_0 kəsişmədir, x = 0 olduqda y-nin proqnozlaşdırılan qiymətidir.

• B_1 reqressiya əmsalıdır – x artdıqca y-nin nə qədər dəyişəcəyini göstərir.

• x müstəqil dəyişəndir.

• e - təxminin xətası və ya reqressiya əmsalı ilə bağlı qiymətləndirməmizdə nə qədər dəyişkənlik olduğunu göstərir.

Fərz edək ki, baxdığımız nümunədə administrativ xərclər sərbəst dəyişən, logistika şirkətinin satışları isə asılı dəyişəndir. Tutaq ki, "Kristal 2008" MMC-də 2020 və 2021-ci illər ərzində **administrativ xərclər** ilə **logistika şirkətinin mənfəətliliyi** arasındakı əlaqənin formasını müəyyən edirik. Bu halda administrativ xərclər x, logistika şirkətinin mənfəətliliyi isə y olacaqdır.

"Kristal 2008" MMC-nin mənfəət və zərər hesabatından şirkətin administrativ xərclərinə və satış göstəricilərinə baxaq:

Cədvəl 1. Kristal 2008 MMC-nin mənfəət və zərər hesabatı

Kristal 2008 MMC		
Mənfəət və Zərər hesabatı/Profit and Loss Statement		
	Müddətə	
	2020	**2021**
Satış/Revenue	**5,292,828**	**5,170,609**

Modeldəki göstəricilərlə tanış olaraq alınan nəticələri izah etməyə çalışaq:

Multiple R. İki dəyişən arasındakı xətti əlaqənin gücünü ölçən Korrelyasiya əmsalıdır. Korrelyasiya əmsalı -1 ilə 1 arasında istənilən qiymət ola bilər və onun mütləq dəyəri əlaqənin gücünü göstərir. Mütləq dəyər nə qədər böyükdürsə, əlaqə bir o qədər güclüdür:

1 güclü müsbət münasibət deməkdir

-1 güclü mənfi münasibət deməkdir

0 ümumiyyətlə əlaqənin olmaması deməkdir

Baxdığımız nümunədə Multiple R-in dəyəri 1-ə bərabərdir. Bu o deməkdir ki, "Kristal 2008" MMC nümunəsində araşdırılan illər ərzində administrativ xərclər ilə, şirkətin satışları arasında əlaqə çox güclüdür.

R Square. Uyğunluğun yaxşılığının göstəricisi kimi istifadə olunan Təyinetmə əmsalıdır. Bu, reqressiya xəttində neçə nöqtənin düşdüyünü göstərir. R^2 dəyəri kvadratların ümumi cəmindən hesablanır.

Bizim nümunəmizdə R^2 dəyəri 1-ə bərabərdir. Bu o deməkdir ki, dəyərlərimizin 100 %-i reqressiya analizi modelinə uyğun gəlir. Başqa sözlə, asılı dəyişənlərin (y-qiymətləri) 100 %-i müstəqil dəyişənlər (x-qiymətləri) ilə izah olunur.

Adjusted R Square. Modeldəki müstəqil dəyişənlərin sayına uyğunlaşdırılmış R kvadratıdır.

Standart xəta. Bu, reqressiya analizinizin dəqiqliyini göstərən başqa bir uyğunluq ölçüsüdür - rəqəm nə qədər kiçik olsa, reqressiya tənliyiniz haqqında bir o qədər əmin ola bilərsiniz. R^2 model tərəfindən izah edilən asılı dəyişənlərin dispersiyasının faizini təmsil etdiyi halda, Standart Xəta məlumat nöqtələrinin reqressiya xəttindən düşdüyü orta məsafəni göstərən mütləq ölçüdür.

df dispersiya mənbələri ilə əlaqəli sərbəstlik dərəcələrinin sayıdır.

SS kvadratların cəmidir. Total SS ilə müqayisədə Qalıq SS nə qədər kiçik olsa, modeliniz məlumatlara bir o qədər yaxşı uyğun gəlir.

MS orta kvadratdır.

F F statistikası və ya sıfır fərziyyə üçün F-testidir. Modelin ümumi əhəmiyyətini yoxlamaq üçün istifadə olunur.

Əhəmiyyətlilik F F-nin P-qiymətidir.

ANOVA hissəsi Excel-də sadə xətti reqressiya təhlili üçün nadir hallarda istifadə olunur, lakin siz mütləq sonuncu komponentə yaxından nəzər salmalısınız. Əhəmiyyətlilik F dəyəri nəticələrinizin nə qədər etibarlı (statistik cəhətdən əhəmiyyətli) olduğuna dair fikir yaradır. Əhəmiyyətlilik F 0,05-dən (5%) azdırsa, modeliniz qaydasındadır. Əgər 0,05-dən böyükdürsə, yəqin ki, başqa bir müstəqil dəyişən seçmək daha yaxşıdır.

Hər bir şirkətin rəqəmsal logistikanın tətbiqində əsas rol oynaya biləcək ən perspektivli istiqamətlərdən biri olaraq aşağıdakıları qeyd edə bilərik ki, bunlar rəqəmsal logistikanın iqtisadi yararlarını yaradır:

• Məhsulların mövqeyinin nəzarət olunması, təchizat zincirləri boyunca məhsulların görünürlüyü və nəticədə hərəkətin tam şəffaf olması;

• Yanacaq qazının oğurlanmasının, nəqliyyatın məqsədəuyğun olmayan istifadəsinin qarşısının alınması və hadisələrin araşdırılması üçün məlumatların əlverişli olması;

• Avtomatik dispetcherləşmə və ERP sistemləri ilə inteqrasiya;

• Logistika anbarlarının, mal satış zalının və ya konteynerlərin anında inventarlaşdırılması;

• Robotlar və avtonom yükleyicilərlə təchiz edilmiş tam avtomatik anbar sistemləri;

• Logistika vəziyyətinin dəyişməsinə tez reaksiya göstərmə;

• Sürücü köməkçiləri və yol avtopilotları, perspektivdə isə nəqliyyatın tam avtonom olması (Armengaud, E.,2017).

Rəqəmsal logistika, müxtəlif təşkilatlar arasındakı effektiv modelləşdirmə əsasında optimal logistika şemalarını formalaşdırmaq üçün məlumat axtarışı ilə əlaqəli olan vaxt, əmək və maliyyə

itkilərini azaldır. Nəqliyyat təşkilatının rəqəmsal logistikasının inkişafı, nəqliyyat prosesini optimal hala gətirərək planlamasını və təminatını şiddətlə azaltmağa imkan verir (Brennen, J.S. & Kreiss, D., 2016).

Nəticə

Logistika sistemlərinin iqtisadi effektivliyi onun daxilində tətbiq edilən rəqəmsal texnologiyalarla böyük əlaqəlidir. Bu texnologiyalar yeni logistika həllərini həyata keçirmək və texnologiya prosesini optimal etmək imkanı verir, əvvəlcədən əlverişsiz prosedurların həyata keçirilməsi nəticəsində əmək fəaliyyətinin iqtisadi göstəricilərini yaxşılaşdırır. Beləliklə, rəqəmsal texnologiyalar daxili və beynəlxalq daşıma təşkilatı zamanı əlavə gəlir mənbəyi olaraq xidmət edir. İnformasiya texnologiyaları vasitələri informasiyanın istifadəsi və paylaşılmasında mühüm əhəmiyyət kəsb edir və bunun nəticəsi olaraq verilənlər bazası texnologiyaları sistemi çox geniş bir sahəni özündə birləşdirməyə başlamışdır. Lakin iqtisadiyyatda yeni-yeni platformaların yaranması, onların müxtəlif sahələr üzrə tətbiqi məsələlərinin xüsusiyyətləri dəyişgən olmaqla bərabər, həm də mürəkkəbləşməyə doğru istiqamət almağa başlamışdır.

Abstract

This study comparatively examines the socioeconomic development levels of provinces and regions in Türkiye for the period 1985-2025. Provincial-level scores obtained from seven separate Socioeconomic Development Index (SEDI) surveys were rearranged within the framework of NUTS at the scales of 12 Level-1 regions, 26 Level-2 regions, 67 provinces (harmonized series for the 1985-2025 comparison), and 81 provinces (2003-2025 period) and made comparable through z-score standardization. The temporal transformation of the spatial structure was examined using the Gatev index, difference-based σ-convergence based on Gatev contributions, and absolute β-convergence estimated with the panel fixed effects model. Descriptive findings show that the level of development is clearly decoupled along the west-east axis throughout the country and that this decoupling has persisted over the past forty years. While the relative rise of some units such as Antalya, Muğla, Tunceli, Çanakkale, and Düzce is remarkable, Significant declines were observed in Hatay, İzmir, Adana, and Şanlıurfa. According to the empirical analysis results, although beta convergence findings indicate partial convergence for underdeveloped regions in Türkiye, sigma convergence and Gatev index findings reveal that structural differences persist among regions. Thus, the study suggests that development policies should be redesigned in a more spatially sensitive manner.

Keywords: Regional Development, SEDI, Socioeconomic Development, Convergence

INTRODUCTION

The word "socioeconomic" is an adjective meaning something like "relating to differences among groups of people based on their social class and financial situation" (Cambridge, 2025). First measured primarily in terms of economic growth and per capita income, development came to be equated with human dimensions, including social welfare, poverty reduction, education, health status, and equality since the 1970s. In the 1990s, sustainable development and human development approaches focused more on environmental and social sustainability. Today, development is being redefined along the axes of sustainability, inclusiveness, human rights, and multidimensionality (Arndt, 2015; Nunn, 2020; Rist, 2019; Tomislav, 2018).

Socioeconomic development is a concept that encompasses structural change and human advancement, in addition to per capita income growth, a central aspect of economic development. What is meant here is an understanding of development that encompasses all (countries and) regions, focusing on economic growth and taking into account changes in social institutions. Regional development is a planned process that aims to reduce disparities in economic, social, and infrastructure development across different regions within a country (OECD, 2009).

The concept of regional development first emerged in Türkiye in the 1960s with the planned development era. Internal migration, the most significant consequence of regional development disparities, has led to economic, social, and spatial problems for both the regions sending and receiving migrants since the 1950s. While the employment and service opportunities offered by large developed cities, in particular, made these areas attractive centers, over time, these cities also experienced serious urban problems, including inadequate infrastructure, environmental pollution, housing problems, and disruptions to social services. At the same time, underdeveloped regions are exposed to an outflow of young and productive populations and capital, leading to insufficient local demand and economic

stagnation. This cycle has reinforced the vicious cycle of underdevelopment (SPO, 1998). Addressing regional development inequalities through policies that address this vicious cycle in development plans has always been a policy priority.

The primary objective of this study is to analyze the long-term spatial and temporal dynamics of regional socioeconomic development inequalities in Türkiye over the period 1985-2025. For this purpose, scores from seven different SEDI surveys were used. Using these scores, β-convergence, σ-convergence, and difference-based measures of structural change were employed to assess the dynamics of regional development inequalities over time. In this context, the study aims both to contribute to the evaluation of the effectiveness of regional development policies in Türkiye and to fill an empirical gap in the literature on long-term comparative regional analyses.

Following the introduction, the study first examines the existing literature. In the second part, the data set description, the scope of the variables, and the applied methodology are presented. The third section presents the findings of descriptive analyses conducted at the 12 and 26 region levels and 67 and 81 province levels, based on SEDI data, using tables and maps. The fourth section presents the results of the empirical analyses conducted in the study. The final section provides general assessments based on the findings and offers recommendations for the future of regional development policies.

LITERATURE REVIEW

In the neoclassical growth model presented by Solow (1956), per capita growth rates tend to converge inversely with the initial level of per capita production. Specifically, assuming countries are similar in terms of preferences and technology, poor countries will tend to grow faster than rich countries, as a result of the law of diminishing returns. Therefore, in the long run, less developed countries will close the gap with their lower-growth developed countries through higher growth rates.

Whether this convergence predicted by Solow (1956) has materialized across countries and regions has been the subject of much research. Numerous studies have investigated whether convergence exists between regions or provinces in Türkiye. For example, Filiztekin (2018) examined income convergence among provinces in Türkiye for the period 1975-1995 using both cross-sectional and panel data. The study's findings imply conditional convergence in Türkiye, rather than unconditional convergence in developed nations. It also finds that the long-run equilibrium levels obtained by the panel fixed-effects model are quite diverse across provinces, and that about 80 percent of these differences can be explained by initial income. The article also analyses sectoral convergence dynamics in more detail, noting a lack of convergence in agriculture and services, and high-speed convergence in the remaining sectors.

Gezici and Hewings (2004) conducted a convergence analysis of the GDP variable across 67 provinces and 16 regions from 1980 to 1997, testing for σ- and β−convergence. Nonetheless, we found no sign of absolute or conditional convergence patterns at the provincial or regional scale. Moran's I tests showed significant spatial clustering in per capita income, with the west mainly clustered in high development and the east in low development. The results also show that the “Priority Regions for Development” policy, launched in 1968, had an ineffective impact on the provinces considered since they were in the low-development cluster at both ends of the studied period.

Karaman and Dogruel (2011) examined the regional convergence process in Türkiye using a panel data approach and accounted for the impacts of universities and airports on regional development. The paper empirically examines the regression periods 1990-2000 and 2004-2008 and shows that university spending and airport investments contribute to income in low-income regions. Air accessibility promotes regional convergence in low-income regions but has no significant impact in developed regions. Consequently, the study suggests that local growth dynamics in less developed regions are dominated by demand-generating public investments.

Zeren and Yilanci (2011) focused on regional income convergence in Türkiye and tested for absolute and conditional convergence using a random-coefficient panel-data model for NUTS-2 regions over the period 1991-2000. In contrast to conventional fixed-coefficient models, the research tests for regional economic diversity with differences in spatial (uneven) convergence rates, whereas a region-specific relationship is assumed to be internal to all regions. A notable finding of the study is strong convergence across the regions for both absolute (17) and conditional (25) convergence. The deposit-to-GDP ratio was also found to have a positive effect on growth.

To address the lack of comparable long-term regional income data in Türkiye, Karaca (2018) created a new regional income dataset covering the period 1960-2010. Provincial and regional national income series compiled from nine sources were harmonized methodologically. Then β-convergence and σ-convergence analyses were conducted for 26 regions over fifty years. The findings, consistent with many studies in the literature, show that long-term absolute interregional convergence did not occur in Türkiye; on the contrary, regional disparities increased between 1960 and 1990.

This study differs from existing literature in many ways. Firstly, the convergence analysis in this study was conducted using SEDI scores rather than using per capita income. Thus, regions and provinces were compared not only in terms of income but also across many factors, including population, employment, health, education, industry, and quality of life. In other words, the convergence analysis was conducted in terms of development, a much more comprehensive concept than per capita income for regions or provinces. This study also distinguishes itself by its diversity of levels and methods. Convergence analysis was conducted using four methods (Gatev index, contribution rates, σ-convergence, and β-convergence) across four levels (12 and 26 regions, and 67 and 81 provinces). Furthermore, this study differs from similar studies by covering 40 years, from 1985 to 2025.

DATA SET AND METHODOLOGY

Data Set

The SEDI survey, conducted by the Ministry of Industry and Technology, is the most comprehensive source revealing socioeconomic development disparities at the provincial level in Türkiye. The SEDI survey was first conducted in 1969 by the State Planning Organization (DPT) using 22 indicators covering the years 1963-1967 (Tolan et al., 1969). The indicators used in the 1980, 1985, 1991, 1996, and 2003 SEDI surveys were categorized as population, employment, health, education, industry, agriculture, construction, finance, infrastructure, capital accumulation, and other welfare (see Table A.1). In the 2011, 2017, and 2025 surveys, they were categorized as population, employment, health, education, competitive and innovative capacity, finance, accessibility, and quality of life (Acar et al., 2019; Doğan et al., 2025; DPT, 1985, 1991, 1998, 2003; Gömleksiz et al., 2017; Kalkınma Bakanlığı, 2013).

The dataset for this study consists of SEDI scores from seven SEDI surveys spanning 1985-2025. This choice was influenced by Türkiye's adoption of an export-based industrialization model rather than an import-substitution model after 1980. The indicators used in SEDI surveys were chosen within this framework, along with this transformation, and the research began to be conducted institutionally with the 1985 SEDI survey.

Methodology

Türkiye is statistically divided into three levels. The first of these levels covers 12 regions, the second 26 regions, and the third 81 provinces. Seven SEDI surveys conducted between 1985 and 2025 were conducted at the provincial level. These surveys are not comparable for two reasons. First, while SEDI surveys were conducted at the provincial level, regional scores were not regularly shared. It hinders the comparison of Level 1 and Level 2 regions. Second, the number of provinces in Türkiye, which was 67 in the 1990s, increased to 81, including the addition of new provinces to the districts. For this reason,

the 1985 SEDI survey was conducted in 67 provinces, the 1991 survey in 73, the 1996 survey in 76, and the surveys after 2003 in 81 provinces. It makes comparisons at the provincial level difficult.

To overcome the two problems mentioned in this study, regional SEDI scores were calculated by weighting each province's SEDI score by its population in the Level 1 and Level 2 regions. Because the indicators used in the SEDI surveys were from before the year the survey was prepared, this was taken into account when weighting them by provincial populations. For example, because indicators from 2014 were used in the 2017 SEDI survey, regional SEDI values were calculated using the provinces' 2014 populations (see Table A.1)

Secondly, to compare the 1985 SEDI scores of provinces with those of subsequent years, the SEDI scores of districts that gained provincial status after 1989 were combined with the scores of the provinces to which they were previously affiliated, weighted by their populations. For example, according to the 2017 SEDI survey, Konya had a score of 0.67, and Karaman had 0.18. The 2014 population weights of these provinces were 0.90 and 0.10, respectively. Multiplying the SEDI scores by these weights yielded 0.60 and 0.02, respectively. When the multiplication results were added, the new SEDI value for Konya, including Karaman, was found to be 0.62.

The new SEDI scores obtained at the regional and 67 provincial levels were then standardized to z-scores. It enabled comparisons of socioeconomic development at three statistical levels over 40 years, from 1985 to 2025. The standardized, comparable changes in SEDI scores across regions were analyzed both descriptively and empirically. Three complementary approaches to measuring regional development disparities over time are prominent in the literature: distribution-based σ-convergence, growth-based β-convergence, and difference-based structural change.

σ-convergence based on the Gatev index indicates the tendency for spatial heterogeneity to narrow or widen over time, based on the distribution of contributions to change, in cases where the classical standard deviation approach cannot be used due to the z-score structure of SEDI. A decreasing σ value indicates that contributions are spread over a wider geographic area, whereas an increasing σ value indicates that contributions are concentrated in specific regions (Dowrick & Nguyen, 1989; Easterlin, 1960).

β-convergence, on the other hand, consistent with the standard approach in the growth literature, tests whether regions with initially lower levels of development tend to grow faster over time. While a negative and significant β coefficient indicates relative convergence, as frequently emphasized in the literature, β-convergence does not always lead to σ-convergence; structural shocks or new imbalances can widen the spatial distribution (Baumol, 1986; De Long, 1988).

Quah (1996) claims that the β and σ measures are complements, but together they do not summarize how the total cross-sectional distribution evolves over time. His “distribution dynamics” framework underscores that regions can develop into long-lasting clusters — so-called “convergence clubs” — that move at different speeds even when there is overall average convergence. In this regard, we note that the Gatev index employed in our study is a different type of indicator, measuring how much (in an inter-period comparison framework) spatial structure differs between two periods on both absolute and direction-neutral bases (Belova 2024; Karpov 2008).

First, this study used the Gatev index to measure spatial structural differentiation between two periods. The index is a difference-based measure that indicates the extent to which changes in SEDI scores are distributed evenly or unevenly (Gatev, 1979). The Gatev index coefficient was calculated using the following equation:

$$Gatev\ Index = \sqrt{\frac{\sum_{i=1}^{k}(SEDI_{i,t_1} - SEDI_{i,t_2})^2}{\sum_{i=1}^{k}(SEDI_{i,t_1}{}^2 + SEDI_{i,t_2}{}^2)}} \quad (1)$$

Since classical σ-convergence cannot be applied due to the z-score standardization of SEDI scores, a difference-based σ-convergence method based on the standard deviations of the Gatev index contribution distributions was preferred to measure regional variation. Provincial contributions to the Gatev index were calculated using the following equation:

$$Gatev\ Index\ Contribution\ Rate = \frac{(SEDI_{i,t_1} - SEDI_{i,t_2})^2}{\sum_{i=1}^{k}(SEDI_{i,t_1} - SEDI_{i,t_2})^2} \times 100 \quad (2)$$

The standard deviation of these contribution rates is defined as the σ coefficient. A high σ indicates that structural change is concentrated in a few units (unbalanced distribution), while a low σ indicates a more even distribution of contributions (widespread or homogeneous change) (Barro, 1994; Barro & Sala-i-Martin, 1992). Therefore, in this study, σ is interpreted not as the "distribution of development levels among provinces" but as the "distribution of contributions to spatial change."

Absolute β-convergence is an approach that tests whether regions with lower initial development have higher growth rates over time (Barro & Sala-i-Martin, 1990; Islam, 1995). The absolute β-convergence coefficient was estimated using a panel fixed-effects model. The model is illustrated as follows:

$$growth_{i,t} = \alpha + \beta SEDI_{i,t-1} + \varepsilon_i \quad (3)$$

The dependent variable of Equation 3, $growth_{i,t}$, is obtained by dividing the difference in SEDI scores for two consecutive years by the period length $(t-(t-1))$, $SEDI_{i,t} - SEDI_{i,t-1}$. $SEDI_{i,t-1}$ in the equation represents the SEDI score for province i in year $t-1$. α is the constant term, and ε_i represents the error term. The β coefficient obtained from the regression equation estimated with these variables represents the β-convergence coefficient. A negative, statistically significant β coefficient indicates that provinces with lower SEDI values exhibit higher growth rates, suggesting a tendency toward convergence among provinces.

DESCRIPTIVE FINDINGS

The descriptive spatial patterns of socioeconomy across different regional levels in Türkiye during 1985-2025 are presented in this section. Changes are summarized through SEDI scores, score differences, and shifts in regional rankings.

Türkiye is subdivided into 12 regions at the NUTS-1 level. Table A.2 highlights changes in SEDI scores, score gaps, and ranking changes for the top five and bottom five regions over the period 1985 to 2025. İstanbul and Western Anatolia were the two leading regions in terms of the oldest pattern, while Central Eastern Anatolia and Northeastern Anatolia achieved the lowest scores in all terms. The maximum and minimum changes in SEDI occurred in the Eastern Black Sea region and Southeastern Anatolia, respectively. Four regions moved up one rank, and another four fell by one rank.

There were two principal patterns based on the SEDI in 1985 and 2025 among the twelve regions. First, the SEDI increased by approximately 0.15 points in Central Anatolia, Western Black Sea, and Eastern Marmara. Second, the SEDI value of Southeastern Anatolia decreased by 0.23 points, bringing it to the same level as Central Eastern Anatolia and Northeastern Anatolia. The last set of trends suggests that sub-national disparities, especially the unremitting relative backwardness of the Eastern and Southeastern regions, are predominantly structural.

At the NUTS 2 level, they were İstanbul, Ankara, and İzmir, retaining their positions as the top 3, followed by Antalya, which came in at fourth place. The provinces of Antalya, Kocaeli, and Kayseri had the highest increases in SEDI scores, and İzmir, Hatay, and Şanlıurfa experienced the lowest decreases. İzmir's decline is particularly striking, as it has long been held in high regard. Regarding rank changes, Antalya increased by four ranks, while Hatay and Adana decreased by 9 and 6 places, respectively (Table A.3).

The spatial disparities in Level 2 areas were generally stable between 1985 and 2025. The Western Anatolia–Marmara–Aegean corridor retained its status as the most developed cluster in Türkiye, whereas the Eastern and Southeastern Anatolia regions remained underdeveloped.

At the provincial level (67 provinces), the top four provinces remained unchanged, while Antalya replaced Bursa as the new number five. The largest growth in SEDI was observed in Antalya, Muğla, and Tunceli; Hatay, İzmir, and Adana recorded the largest decrease. Çanakkale recorded the greatest improvements, and Hatay the sharpest declines in ranking (see Table A.4).

Both the western coastal areas and the interior regions of Central Anatolia were more developed than most Eastern and Southeastern Anatolian provinces, which showed stable low SEDI values. This trend had continued into 2025, with some provinces improving or declining significantly.

Table 1. SEDI Value Changes at the 81 Province Level

Rank	2003 SEDI score	2025 SEDI score	2003-2025 SEDI score difference	2003-2025 SEDI ranking difference
1	İstanbul	İstanbul	Antalya (0.80)	Düzce (+16)
2	Ankara	Ankara	Trabzon (0.61)	Trabzon (+14)
3	İzmir	İzmir	Muğla (0.54)	Erzincan (+12)
4	Kocaeli	Kocaeli	Düzce (0.44)	Konya (+12)
5	Bursa	Antalya	Konya (0.43)	Sakarya (+11)
77	Hakkari	Hakkari	Ankara (-0.48)	Kırklareli (-12)
78	Şırnak	Şırnak	Adana (-0.51)	Adana (-14)
79	Bitlis	Şanlıurfa	Ağrı (-0.54)	Kahramanmaraş (-15)
80	Ağrı	Muş	Şanlıurfa (-0.69)	Zonguldak (-16)
81	Muş	Ağrı	İzmir (-0.72)	Hatay (-21)

Source: Author's own calculations from SEDI reports.

Figure 1. Display of SEDI Values of 81 Provinces for the Years 1985 and 2025 on a Map

Source: Author's own calculations from SEDI reports.

SEDI has been released for all 81 provinces since 2003. Antalya was the province with the highest increase, and Düzce ranked fourth among the provinces with the largest increases during the 2003-2025 period, including 14 newly founded provinces. İzmir had the largest drop, while there were also significant drops in Ankara and Adana. The highest and lowest rank changes were observed in Düzce and Hatay (see Table 1).

Figure 1 maps SEDI values for 81 provinces. The west–east axis of development persists, though some provinces in Central Anatolia and the Black Sea region display substantial improvements. Compared to 2003, several metropolitan provinces and provinces in Southeastern Anatolia show declines. The maximum SEDI score dropped from 4.81 to 4.42, while the minimum score declined from -1.44 to -1.83 over the same period.

EMPIRICAL FINDINGS

This study examines the spatial structure of socioeconomic development in Türkiye over the period 1985-2025 at different regional scales (12 regions, 26 regions, 67 provinces, and 81 provinces) using the Gatev index, σ-convergence, contribution concentration, and panel data-based β-convergence. The findings generally indicate that spatial development disparities in Türkiye are significantly persistent over the long term and have deepened in some periods.

Gatev Index Findings

The Gatev index results reveal that structural differentiation increased between 2003 and 2011, particularly at the provincial scale, and the separation between developed and underdeveloped areas became more pronounced. The Gatev value for the 1985-2025 period across 67 provinces reached 0.248, indicating that structural differences have increased over the long term.

Table 2. Gatev Index Results

Period	12 Regions	26 Regions	67 Provinces	81 Provinces
1985-1991	0.039	0.089	0.109	
1991-1996	0.050	0.068	0.097	
1996-2003	0.035	0.049	0.082	
2003-2011	0.067	0.140	0.178	0.184
2011-2017	0.052	0.064	0.076	0.085
2017-2025	0.038	0.069	0.090	0.105
1985-2025	0.086	0.211	0.248	0.206

Source: Author's own calculations from SEDI reports.

Note: The Gatev index measures the structural difference between two periods. An index value approaching 0 indicates decreasing disparity, while one approaching 1 indicates increasing disparity. Calculations were made separately for 12 regions, 26 regions, 67 provinces, and 81 provinces. Higher index values at smaller geographic scales indicate that spatial heterogeneity is more pronounced at the provincial/subregional level.

σ-Convergence Findings

Table 3. σ-Convergence Results

Period	12 Regions	26 Regions	67 Provinces	81 Provinces
1985-1991	13.84	6.79	3.11	
1991-1996	7.42	5.67	2.79	
1996-2003	9.94	5.69	2.40	
2003-2011	11.85	4.67	1.65	1.33
2011-2017	8.92	6.39	3.01	2.50
2017-2025	9.46	6.24	2.02	1.76
1985-2025	8.67	4.97	2.55	1.76

Source: Author's own calculations from SEDI reports.

Note: The σ coefficient of convergence represents the standard error of provinces' contributions to the Gatev index, not SEDI scores. A high standard deviation indicates that contributions are concentrated in a few provinces and that spatial differences are sharper; a low standard deviation indicates a more even distribution of contributions. Therefore, a decrease in the σ coefficient should be interpreted as "spatial contribution diversification," while an increase should be interpreted as "contribution concentration."

σ-convergence results also support the trend toward spatial differentiation. Standard deviation values were particularly high at the 12th and 26th regions. While the coefficients were lower at the 67th and 81st provinces, they did not exhibit a significant downward trend over time. The resurgence of σ values, particularly in the 2003-2011 and 2011-2017 periods, indicates a periodic exacerbation of spatial inequalities. These findings suggest that development disparities in Türkiye have not narrowed in absolute terms; on the contrary, they have persisted over the long term, albeit with fluctuations.

Contribution Concentration Findings

The contribution analysis also shows that the difference between concentration and dispersion in spatial segregation is concentrated in a few provinces. That is, at the "12 Region" level of aggregation, for example, the combined contribution from the top five regions accounts for more than 80 percent in each period. Even at the provincial level, the percentage of the top five provinces varies between 30 and 55 percent. It indicates the spatial development dynamics in Türkiye are quite "centralized and evidence that regional polarization refuses to go away.

A crucial point here is that contribution values can reflect not only positive increases but also negative changes. A decrease in the SEDI score in a province, i.e., socioeconomic decline, contributes as much to change as an increase in the score, and this is included in the contribution calculations. Therefore, contribution concentration indicates a structural spatial divergence that concentrates not only development but also both progress and regression in specific centers. For example, in the 67-Province analysis, the provinces with the highest Gatev index contribution rates for the period 1985-2025 are Hatay, İzmir, Adana, Antalya, and Şanlıurfa, respectively. Among these provinces, decreases in SEDI scores outside Antalya contributed to the increase in structural diversity.

Table 4. Contribution Concentration Results

Period	12 Regions	26 Regions	67 Provinces	81 Provinces
1985-1991	89.86	72.31	54.79	
1991-1996	79.99	64.13	46.88	
1996-2003	83.97	70.94	42.86	
2003-2011	93.57	55.37	30.43	25.65
2011-2017	82.55	69.85	46.01	44.80
2017-2025	85.71	75.85	36.25	32.44

Source: Author's own calculations from SEDI reports.

Note: The total contribution of the five regions/provinces that contributed the most to the Gatev index shows the extent to which structural change is concentrated in certain locations. High contribution rates indicate that a few units drive changes in development disparities and that spatial polarization is high.

β-Convergence Findings

Table 5. β-Convergence Results

	β-coefficient	t-statistics	p-value	Period	Observation
12 Regions	-0.069***	-4.58	0.001	1985-2025	72
26 Regions	-0.044***	-6.29	0.000	1985-2026	130
67 Provinces	-0.064***	-7.51	0.000	1985-2027	402
81 Provinces	-0.127***	-19.24	0.000	2003-2025	243

Source: Author's own calculations from SEDI reports.

Note: β-convergence measures the effect of the initial level of development on the growth rate. A negative and significant β coefficient indicates that units with lower initial SEDI values have, on average, higher growth rates.

β-convergence analyses conducted with a panel fixed-effects model yielded negative, statistically significant β coefficients at all levels. These results suggest that provinces/regions with lower initial development levels grew slightly faster on average. However, the β coefficient's indication of convergence does not eliminate the spatial differentiation observed in the Gatev and σ analyses. In other words, β-convergence alone does not indicate a narrowing of inequality; it merely indicates that lower-development units have relatively higher growth rates. In this context, in the Turkish case, a negative β coefficient reflects a potential recovery trend. However, this trend has not been sufficient to structurally resolve spatial inequalities.

DISCUSSION AND CONCLUSION

This study examines the long-term dynamics of regional socioeconomic development in Türkiye over the period 1985-2025 at multiple spatial levels (12 regions, 26 regions, 67 provinces, and 81 provinces) using seven SEDI surveys. By generating comparable SEDI scores over time and converting provincial-level scores into regional indices, changes in regional socioeconomic development over the past forty years have been tracked. Methodologically, the study combines descriptive analyses with three complementary approaches to spatial inequality (structural differentiation based on the Gatev index, σ-convergence based on contribution distributions, and β-convergence based on panel data), providing a multidimensional perspective on regional divergence and convergence processes in Türkiye.

Descriptive findings indicate a high degree of continuity in the geography of development. A distinct and persistent west-east divide emerges at all spatial levels. While İstanbul, Western and Central Anatolia, and the coastal regions constitute Türkiye's most developed belt, the central and northern parts of Eastern Anatolia and Southeastern Anatolia continue to rank at the bottom. While some provinces such as Antalya, Muğla, and Düzce, as well as some units in the Black Sea and Central Anatolia regions, significantly improved their positions, provinces such as Hatay, Adana, and, to a lesser extent, İzmir, a long-serving metropolitan area, and to a lesser extent Ankara experienced relatively significant declines. The decline in the highest SEGI scores, accompanied by a further decline in the lowest scores, suggests that despite the relative redistribution at the top quintile, structural disadvantages in the lower quintiles have not been fully addressed.

Gatev index results also reinforce this finding of structural continuity and concentration in some periods. Structural differentiation is particularly pronounced at finer spatial scales; the Gatev coefficients calculated for the 67 and 81 provinces are systematically higher than those for the 12 and 26 regions. These results suggest that while heterogeneity in development is partially masked at higher scales, it becomes much more pronounced at the provincial level. The findings of σ-convergence based on the standard deviation of Gatev contribution rates add an additional dimension to this picture. The results indicate that structural change is driven by a limited number of regions or provinces in most periods. It is particularly striking that, at the 12 and 26 regions, the total contribution of the top five contributing

units exceeds 80 percent in most periods. Even at the provincial level, the top five provinces account for approximately one-third to one-half of the total change in many periods. This "concentration of contribution" suggests that both progress and regression are geographically centralized: positively diverging provinces like Antalya and declining provinces like Hatay, Adana, and Şanlıurfa determine structural differentiation.

The negative and statistically significant β coefficients at all spatial levels indicate that, on average, units with lower initial SEDI levels exhibit higher growth rates. This pattern suggests a "catch-up" trend in growth rates, albeit limited. However, when interpreted alongside the Gatev and σ findings, it is clear that this β-convergence is not sufficient to significantly reduce spatial inequality.

These empirical results have several implications for regional development policies in Türkiye. Primarily, the continuation of the West-East divide and relative underdevelopment in Central Eastern Anatolia, Northeastern Anatolia, and Southeastern Anatolia implies that general rather than region-specific policies, i.e., "same everywhere" policies, are not sufficient. Policies elsewhere should not only address physical infrastructure and basic public services, but also human capital, innovation potential, and institutional quality. Second, the fact that structural change is concentrated in a handful of provinces implies that metropolises and regional hubs can act as both the locomotive of convergence and choke points. Strengthening the functional relationship between dynamic centers-İstanbul, Ankara, İzmir, Antalya, etc., and their hinterlands in terms of transport networks, labor markets, value chains, and governance networks can help to ensure that growth dividends are more evenly spread. Third, the relative decline of some major conurbations shows that there is no firm basis for considering regional policy when addressing these areas as 'redundant'. Changes in industry, services, patterns of internal migration, and environmental restrictions all require that policy tools be adapted on an ongoing basis.

From an institutional point of view, results emphasize the need to preserve and strengthen strong and comparable regional statistics such as SEDI. It is crucial to be able to follow regional development at various levels over long periods for the design of evidence-based policies. This study's approach, population-weighted regional SEDI calculation considering past changes of provincial boundaries, the simultaneous incorporation into one framework of Gatev, σ, and β policy components already tested as single components elsewhere, can be adapted in other countries with structurally distinct spatial settings where composite multidimensional development indicators are used. Also, the inclusion of such quantitative approaches in the regular monitoring and evaluation processes of development agencies may enhance the design, targeting, and evaluation of regional programmes.

Finally, the study's limitations open new avenues for future research. First, although the SEDI is a comprehensive composite index, its indicator set and weights change over time, and the index is sensitive to this choice. Second, although the time period exceeds 40 years, it is based on only seven survey years; this limits the ability to model the effects of specific shocks (major crises, significant policy reforms, etc.) as well as short-term dynamics that require high-frequency series. Third, the analysis focuses primarily on relative positions and structural differentiation, with causal relationships secondary. Future studies could examine in more detail the policies and mechanisms that trigger convergence or divergence in specific periods and locations, using spatial econometric methods, micro-level data, or quasi-experimental designs.

In summary, the findings of this study suggest that Türkiye's regional socioeconomic development over the 1985-2025 period is characterized by partial and unequal convergence within a persistently polarized spatial structure. While some less developed regions and provinces have shown some degree of recovery and convergence, the overall pattern remains one of periodic reshaping of ingrained inequalities, but no structural solution has been achieved. Addressing these long-standing inequalities requires sustainable and place-sensitive regional development policies that focus not only on income growth but also on human development, institutional capacity, and spatial cohesion.

LIDERLIK VƏ PSIXOLOJI TƏDQIQATLAR

Xülasə

Liderlik sadəcə təşkilati idarəetmə aktı deyil, həm də psixoloji proseslərin yekun nəticəsidir. Bu şəxsiyyətlərin qərarvermə üsulu, davranış tərzi, əməkdaşlarla münasibəti onun psixoloji xüsusiyyətləri ilə müəyyən olunur. Buna görə də psixoloji tədqiqatlar liderlik nəzəriyyələrinin davamlı inkişafında mühüm yer tutur. Liderlik və psixoloji tədqiqatlar arasında sıx qarşılıqlı əlaqə mövcuddur. Liderlərin psixoloji xüsusiyyətlərinin araşdırılması onların fəaliyyət tərzini anlamağa, komanda ilə effektiv münasibətlər qurmağa və ümumilikdə idarəetmənin keyfiyyətini yüksəltməyə imkan verir.

Liderlik və onun elmi tədqiqi

Lider kimdir və liderlik nədir? Keçən əsrin əvvəllərində bu anlayışlar dar şəkildə tərif olunmuşdu:

Lider–qrup üzvü, mühüm vəziyyətlərdə digər iştirakçılara əhəmiyyətli təsir göstərmək qabiliyyətinə malikdir.

Liderlik–qrup daxilində hakimiyyət və itaət, təsir və izləmə münasibətləri sistemi.

Bu yanaşmaya görə, lider – elə kiçik qrupun üzvüdür ki, konkret bir tapşırığın həlli zamanı qrup daxilində qarşılıqlı əlaqə nəticəsində önə çıxır və qrup fəaliyyətinin təşkilatçısı funksiyasını öz üzərinə götürür. O, digər üzvlərdən daha yüksək aktivlik, iştirak və təsir səviyyəsi nümayiş etdirir. Digər qrup üzvləri liderliyi qəbul edir, yəni onunla münasibətlər qururlar ki, o, rəhbərlik edəcək, onlar isə ona tabe olacaqlar. Bu kontekstdə liderlik yalnız qrup daxilində bir fenomen kimi qiymətləndirilirdi: lider həmişə təşkilati deyil, yalnız qrup strukturu elementi kimi çıxış edirdi, yəni bu strukturdakı münasibətlər sistemi kimi. Başqa sözlə, liderlik fenomeni kiçik qrupun dinamik proseslərinə endirilirdi. Bu proses tez-tez ziddiyyətli olurdu: liderin iddiaları ilə digər üzvlərin onun rəhbərliyini qəbul etməyə hazır olmamaları arasında fərq ola bilərdi. Liderin real imkanlarını anlamaq, digər qrup üzvlərinin onu necə qəbul etdiyini başa düşmək deməkdir.

Açar sözlər: hakimiyyət və itaət, liderlik fenomeni, yüksək aktivlik, münasibətlər sistemi, real imkanlar.

Leadership and psychological research

Summary

Leadership is not just an act of organizational management, but also the final result of psychological processes. The decision-making style, behavior style, and relationship with employees of these personalities are determined by their psychological characteristics. Therefore, psychological research plays an important role in the continuous development of leadership theories. There is a close interaction between leadership and psychological research. The study of the psychological characteristics of leaders allows us to understand their style of work, build effective relationships with the team, and improve the quality of management in general.

Leadership and its scientific study

Who is a leader and what is leadership? At the beginning of the last century, these concepts were narrowly defined:

A leader is a group member who has the ability to exert a significant influence on other participants in important situations.

Leadership is a system of power and obedience, influence and monitoring relations within a group.

According to this approach, a leader is a member of a small group who, when solving a specific task, comes to the fore as a result of interaction within the group and assumes the function of the organizer of group activities. He demonstrates a higher level of activity, participation and influence than other members. Other group members accept leadership, that is, they establish relationships with him, in which he will lead, and they will obey him. In this context, leadership was assessed only as a phenomenon within the group: the leader always acted not as an organizational, but only as an element of the group structure, that is, as a system of relations in this structure. In other words, the phenomenon of leadership was reduced to the dynamic processes of a small group. This process was often contradictory: there could be a difference between the leader's claims and the unwillingness of other members to accept his leadership. Understanding the real capabilities of the leader means understanding how other group members perceive him.

Keywords: authority and obedience, leadership phenomenon, high activity, system of relationships, real capabilities.

Giriş

Liderlik mövzusu psixologiyanın sərhədlərini çoxdan aşmış, müasir cəmiyyətin və fərdin şüurunda ən populyar mövzulardan birinə çevrilmişdir. Liderlik uğrunda mübarizə, rəqabət və individualizm ruhu, yaşadığımız dövrdə bizə təbii və insan təbiətinə xas görünür. Bu xüsusiyyətlərin köklərini həm uzaq tarixdə, həm də insanlığın mənşəyi olan heyvanlar aləmində də görmək mümkündür. Ancaq insan psixikasının sürətlə dəyişən dünyada sabit qalması anlayışı, görünür, həddindən artıq sadələşdirilmiş və hətta onun inkişafının real mənzərəsini təhrif edir. Son bir neçə onillikdə biz insanı və bütün planeti dəyişdirən böyük dəyişikliklərin şahidi olmuşuq. Ancaq ən dramatik dəyişikliklər son dövrlərdə insanların psixikasında baş vermir. Bu dəyişikliklər, keçmiş əsrlərdə insanlıq tərəfindən əldə edilən heyrətamiz elmi-texniki tərəqqi və xüsusilə sosial təşkilatçılığın yeni prinsiplərinin formalaşması ilə əlaqədardır ki, bu da yalnız xarici deyil, həm də insanın daxili aləmini köklü şəkildə dəyişmişdir. Bu zaman liderlik anlayışı, bizim fikrimizcə, şüurumuzun psixoloji transformasiyasına birbaşa təsir göstərir.

Dünyanın tarixi şəxsiyyətləri-psixoloji liderlər

Liderlik fenomenini anlamağa ilk cəhdlər insanların, bəzi fərdlərin insan tarixinə o qədər əhəmiyyətli töhfələr verdiyini başa düşmək istəyindən irəli gəlir ki, onların xatirəsi və təsiri əsrlər boyu qalır. Üzvi kütlə ilə lider qəhrəmanlar arasındakı qarşıdurma, hələ qədim dövrlərdən bəri düşünülür və alimlərin diqqətini cəlb edir. Böyük şəxsiyyətlərin tarixdəki rolunu düşünərkən, hələ antik filosoflar və tarixçilər sual verirdilər ki, niyə bəzi insanlar "lider" olur və ölümündən sonra belə insanlıq taleyinə təsir göstərə bilir?

Antik dövrün düşüncə sahibləri, "lider-qəhrəmanların" yalnız özlərinin müstəsna şəxsi keyfiyyətləri sayəsində belə olduqları müddüasını irəli sürürlər. Onlar hesab edirdilər ki, bu insanlar hər hansı şəraitdə qəhrəman olmaları, onların uğuru xarici şərtlərindən asılı deyildi. Bu ənənəni XIX–XX əsrlərdə T.Karley, F.Nitşe, F.Qalton, F.Vuds, A.Uigan, C.Daud kimi səxsiyyətlər inkişaf etdirmişlər. Bu filosofların baxışları birbaşa və ya dolayı yolla liderləri digər insanlardan fərqləndirən xüsusiyyətlərin müəyyənləşdirilməsi və tədqiqi ideyasına gətirib çıxarmışdır. Bu nəticə, liderlik keyfiyyətləri nəzəriyyəsinin əsasını qoymuşdur ki, müəlliflər liderlik prosesini xüsusi şəxsi keyfiyyətlərin təzahürü kimi izah edirlər. Bu qeyri-adi şəxslərə maraq orta əsrlərdə və müasir dövrdə də azalmamışdır, lakin elmin liderlik fenomeninə ciddi və davamlı marağı XX əsrin 30-cu illərinin sonu – 40-cı illərinin əvvəllərində yaranmışdır. O dövrdə ilk dəfə olaraq idarəetmə personalının effektivliyinin artırılması məsələsi kəskin şəkildə ortaya çıxmışdır. Məhz bu andan etibarən liderlik məsələsi sosial psixologiyanın tanınmış və aktual tədqiqat sahəsinə çevrilmişdir. Bunula bağlı çoxsaylı liderlik nəzəriyyələri yaradılmış, təşkilatların idarəetmə personalı üçün liderlik bacarıqlarının formalaşdırılması üçün metodlar, yanaşmalar və bütöv texnologiyalar hazırlanmışdır.

Liderlik tədqiqatına struktur yanaşma

Liderləri ümumi xüsusiyyətlərə görə təsvir etməyə çalışırıqsa, şübhəsiz ki, zəka, xarizma, qətiyyət, həvəs, cəsarət, güc, xarakter bütövlüyü, özünə inam və s. kimi keyfiyyətlərdən bəhs etməliyik. Əlbəttə, belə bir birləşmələr yalnız müsbət şəxsi keyfiyyətlərin göstəricisidir. Bəşəriyyətin tarixindən bu günümüzədək, iqtisadiyyat, mədəniyyət, idman və əlbəttə ki, müasir liderlərin siyasətdə mənzərəsi olduqca qarışıq görünür. Təəssüf doguran lakin real olan isə "iri" Pyotr, "kiçik" Napoleon, "xəstə" Ruzvelt, "diktator" Stalin, "balanssız" Hitler "tələşlı" Qorbaçov "tərəfindən illərlə idarə olunmadır. Bu insanların hamısını, şübhəsiz ki, lider adlandırmaq olar, lakin onların tarixdəki rolları nə qədər bir-birindən fərqlidir bunu hamımız bilirik. Şəxsi, sosial, konstitusiya və ya intellektual xüsusiyyətləri onları digər insanlardan fərqləndirir.

"İşçi meneceri psixoloji müqaviləni qurmaq və qorumaq üzrə əsas nümayəndə kimi qəbul etməyə daha çox meyllidir" (Shore və Tetrick belə iddia edirlər). Liderin bu rolunu daha yaxşı başa düşmək üçün psixoloji müqavilə nəzəriyyəsinə qısa bir izahat faydalı ola bilər. **Psixoloji müqavilə** termini ilk dəfə **Argyris** tərəfindən 1960-cı ildə istifadə olunmuş və işəgötürənlərlə işçilər arasında yazılmamış, qeyri-rəsmi normaların anlaşılması kimi təsvir edilmişdir. Bu anlayışın mahiyyəti qorunub saxlanılsa da, müasir anlamda psixoloji müqavilə fərdin qarşılıqlı mübadilə razılaşması çərçivəsində ortaya çıxan şərtləri və əsasları necə qavradığını ifadə edir. Bir sıra tədqiqatlar liderlik və psixoloji müqavilələr arasında müsbət əlaqələrin olduğunu göstərir (Cassar, Bezzina və Buttigieg Sandra, Qoodvin, Megheirkouni, Kasekende və digərləri). Bu tədqiqatlar müxtəlif liderlik üslublarını araşdırsa da, oxşar bir nümunəyə işarə edir: **İşçilərlə liderləri arasında müsbət münasibətləri təşviq edən liderin davranışları eyni zamanda müsbət və güclü psixoloji müqavilələri də təşviq edir**.

Liderliyin tədqiqatına struktur yanaşma adından da göründüyü kimi konseptual çərçivədir və liderlin davranışına, effektivliyinə və onun ortaya çıxmasına təsir edən sosial şəbəkələr, təşkilati iyerarxiyalar və institusional sistemlər kimi əsas strukturları araşdıraraq liderliyin təhlilinə yönəlmiş konseptual çərçivəni təşkil edir. Bu yanaşmalar hər iki tərəfə fərqli olaraq vurğulanır ki, hadisələr liderlikdə

psixoloji fenomen kimi görünür, liderlik sosial fenomen kimi və əslində tənzimlənən bir hadisə kimi cəmiyyətin hüquqi prosesidir.

Liderlərin psixologiyasında fərqliliklər

Sovet dövrü Rusiyasında liderlik xarakterik bir fenomen kimi başa düşüldüyündən "qrup tədqiqatçıları"n elmi baxışları ilə elə də çox müəyyən edilməmişdir. İdeoloji təzyiqdən və eksperimental işlərdə də kollektiv yolverilməzliyi haqqında mülahizələr partiya və dövlət rəhbərlərinin olmadığına işarə edir. Sözün tam mənasında lider olmaq, kollektivə yalnız kiçik qruplar səviyyəsində siyasət məsələlərində rəhbərlikləri nəzərə alınması olduğundan təşkilati liderlik heç də yüksəlməmişdir ***(Abaşkina, Kosolapova, 1993).*** Təbii ki, obyektiv araşdırma həmişə birbaşa və ya dolayı təsirləri nəzərə almalıdır. Psixologiya və davranış elmlərində dominant ideologiya, eyni zamanda, fenomenin əsassız məhdudlaşdırılmasına baxmayaraq qrup sərhədləri daxilində liderlik haqqında, liderliyin özünün demarkasiyası və idarəetmə məqsədlərinə doğru mühüm addımıdır. Qərb, xüsusilə Amerika ənənələri əvvəllər və bu günə qədər də ifrat xarakterik olaraq liderlik tez-tez olur. Bu menecerin formal öhdəlikləri ilə həyata keçirilir.

"Lider" həm rəhbər, həm də idarəçi deməkdir. Bununla belə, təbii ki, bu əsas səbəb deyil. Ən nüfuzlu tədqiqatçılardan biri olan F.Fidlerin fikrincə Lider müəyyən bir sahədə "qarşısında olan qrupdakı bir fərddir". Ona fəaliyyəti və ya təyin edilmiş şəxs olmadıqda qrupa rəhbərlik etmək və koordinasiya etmək tapşırığı verilmişdir.

O isə bu "rəhbərliyi həyata keçirilmək üçün əsas məsuliyyəti daşıyır". Burdan da görünür ki, lider və menecer lider - demək olar ki, tam sinonimdir. Menecerin (liderin) fəaliyyəti nə etməlidir, yəni müəyyən funksiyaları necə yerinə yetirməlidir onun vəzifə öhdəlikləri nədir onu müəyyən edilir.

Liderlər daha doğrusu idarəetmə prosesinin keyfiyyətini, vurğunu əks etdirir yəni vəzifələrin özlərinə deyil, bu vəzifələrin necə yerinə yetirildiyinə diqqət yetirirlər. Bu kontekstdə liderlik insanları işlərə cəlb etmək bacarığıdır. İstəmədiklərini belə, heç kimə nifrət etmədən nə də gördükləri iş bildirmədən həyata keçirmək deyil. Müasir liderlik tədqiqatlarını əsas üç kateqoriyaya ayırd etmək olar:

Birinci yanaşma situasiya kimi təsvir edilə bilər. O, qarşısına universalı müəyyən etmək vəzifəsini qoyur. Bu effektiv menecer üçün xarakterik olan sanballı şəxsiyyət xüsusiyyətləri, onların strukturudur.

İkinci yanaşma davranışdır, burada liderliyin xüsusiyyətləri nəzərə alınır. Llider tərəfindən kontekst halda həyata keçirilir ki, universal davranış ölçülərini də tapmaq cəhdini təmin edəcək bir lider uğuru qazanır.

Üçüncü yanaşmanın tərəfdarları spesifik kontekstdə universal yanaşmaları birləşdirir. Buna görə də biz onu situasiya dəyişəmələri, milli vəziyyət kimi işarə edirik. Nəzəriyyələrin daha ətraflı təsnifatları da təklif olunur. Lakin, bu cür liderlik parçalanmanın etibarlılığı həmişə uzunmüddətli, inandırıcı deyil**.**

Nəticə

Liderlik tədqiqatına struktur yanaşma obyektivləri fərdi xüsusiyyətlərdən və davranışlardan kənara çıxarır. Şəbəkələri, iyerarxiyaları və institutları təhlil edərək, bu perspektiv liderlərin necə ortaya çıxması, təsir qazanması və nəticələrin formalaşması haqqında daha incə bir anlayış təklif edir. Bu, alimlərə və təcrübəçilərə təkcə "kimin rəhbərlik etdiyini" deyil, həm də daha böyük sistemlərdə liderliyin niyə və necə fəaliyyət göstərdiyini düşünməyə imkan verir. Liderlərin psixologiyasında fərqliliklər onların fəaliyyət tərzinə, komanda ilə münasibətlərinə və idarəetmə effektivliyinə birbaşa

təsir göstərir. Bu fərqlilikləri öyrənmək liderlərin inkişafında, düzgün idarəetmə strategiyasının seçilməsində mühüm rol oynayır.

Liderlik psixoloji tədqiqatların mərkəzində duran kompleks və çoxşaxəli bir fenomen kimi çıxış edir. Şəxsiyyətin xüsusiyyətləri, emosional zəka, motivasiya və sosial idrak liderliyin yalnız "nə etdiyini" deyil, həm də "necə və niyə etdiyini" izah etməyə kömək edir. Bu baxımdan, liderlik tədqiqatlarında psixoloji yanaşmaların rolu danılmazdır və gələcək tədqiqatlar daha çox interdisiplinar modellərə əsaslanmalıdır. Ənənəvi yanaşmalardan fərqli olaraq, müasir liderlik araşdırmaları liderlərin yalnız formal vəzifə sahibləri deyil, həm də psixoloji təsir gücünə malik fərdlər olduğunu vurğulayır. Bu səbəbdən psixoloji faktorlar – şəxsiyyət, emosional zəka, motivasiya və sosial idrak – liderlik davranışlarının və effektivliyinin əsas tənzimləyicisi kimi qəbul olunur.

Liderlik motivasiya nəzəriyyələri ilə də sıx bağlıdır. Onlar ücün hazırlanmış ehtiyaclar nəzəriyyəsi liderlərdə xüsusilə nailiyyət ehtiyacının yüksək olduğunu vurğulayır. Bu ehtiyac onları daha çox risk almasına və məqsədyönlü fəaliyyət göstərməyə sövq edir. Bundan başqa, özünü həyata keçirmə motivasiyası liderlərin şəxsi və ictimai məqsədlər üçün hərəkətə keçməsində vacib psixoloji amildir. Psixoloji baxış bucağından liderlik təkcə nəticələrə yönəlmiş fəaliyyət deyil, həm də davranış nümunələrinin təşkilati mədəniyyətə və işçilərin rifahına təsiri kimi öyrənilir**.**

Müasir şəraitdə liderlik psixologiyası təkcə strateji idarəetmə bacarıqları deyil, həm də yüksək səviyyədə özünü əks etdirmə və emosional sabitlik tələb edir. Bu isə dəstək olmaq, ilk növbədə, özünə güvənmək deməkdir.

Xülasə
Bu tədqiqatda mən "Yeni dünya düzənində siyasi hakimiyyətin transformasiyası və gücün mənbələrinin dəyişən təbiəti" mövzusunu təqdim edirəm. Müasir dövrdə qloballaşma, informasiya texnologiyaları və süni intellekt siyasi hakimiyyətin mahiyyətini köklü şəkildə dəyişmişdir ki, ənənəvi güc anlayışı iqtisadi və hərbi resurslara əsaslanan hakimiyyət modeli artıq müasir qlobal siyasət üçün kifayət etmir. Qeyd edək ki, siyasi hakimiyyət indi çoxsəviyyəli, adaptiv və informasiya əsasında formalaşır.
Tədqiqatın əsas məqsədi indiki dövrdə siyasi hakimiyyətin transformasiya mexanizmlərini, gücün dəyişən mənbələrini araşdırmaqdır. Bu çərçivədə əsas vəzifələrimiz qloballaşmanın və çoxqütblü beynəlxalq sistemin siyasi hakimiyyətə təsirini təhlil etməkdir. Bundan savayı informasiya və texnologiyanın güc mənbələri kimi rolunu göstərmək, həmçinin süni intellekt və rəqəmsal idarəetmənin siyasi proseslərə gətirdiyi yenilikləri qiymətləndirməkdir.
Məqalənin əsas nəticələri göstərir ki, gücün mənbələri artıq təkcə iqtisadi və hərbi resurslarla ölçülmür, o, həmdə informasiya, texnoloji innovasiya və rəqəmsal təsir vasitələri siyasi hakimiyyətin əsas elementlərinə çevrilmişdir. Məqalə göstərir ki, gələcək zamanlarda effektiv idarəetmə texnoloji çeviklik, informasiya təhlükəsizliyi və ictimai etimad üzərində qurulacaq ki, dövlətlər, beynəlxalq aktorlar bu prosesdə etik idarəetmə və rəqəmsal diplomatiya sahəsində strateji adaptasiya aparmalıdırlar.
Bu tədqiqatın əhəmiyyəti ondan ibarətdir ki, o, 21-ci əsr siyasi nəzəriyyəsi və praktikası üçün aktual konseptual çərçivə yaradır. Güc və hakimiyyət anlayışının müasir reallıqlara uyğun yenidən formalaşmasını izah edir və gələcək idarəetmə strategiyalarına elmi əsas təqdim edir.
Bu tədqiqat bu əsrin ən əhəmiyyətli siyasi idarəetməsini, gücün dəyişən mənbələrini və texnoloji transformasiyaları izah edir, gələcək strategiyalar üçün vacib konseptual əsas yaradır.

Açar sözlər: Siyasi hakimiyyət, qloballaşma, süni intellekt, informasiya texnologiyaları, yumşaq güc

GİRİŞ

Qlobal siyasətdə son illər ərzində baş verən proseslər siyasi hakimiyyətin mahiyyətində və həyata keçirilmə formalarında köklü dəyişikliklərə səbəb olmuşdur. Soyuq müharibənin başa çatması, qloballaşma dalğasının sürətlənməsi, İT-in inkişafı, beynəlxalq güc mərkəzlərinin formalaşması mövcud dünya düzənini köklü şəkildə yenidən formalaşdırmışdır. Burada siyasi hakimiyyət anlayışı artıq ənənəvi milli sərhədlərlə məhdudlaşmır. Transmilli aktorlar, beynəlxalq təşkilatlar və qlobal iqtisadi güclər tərəfindən yenidən müəyyənləşdirilir.
Yeni dünya düzəni dedikdə, təkcə dövlətlərarası münasibətlərin strukturundakı dəyişikliklər nəzərdə tutulmur. Burada həm də gücün mənbələrinin transformasiyası nəzərdə tutulur. Əgər 20-ci əsrdə güc əsasən hərbi potensial və iqtisadi resurslarla ölçülürdüsə, artıq 21-ci əsrdə informasiya, texnoloji innovasiya, kommunikasiya imkanları və "yumşaq güc" kimi amillər ön plana çıxmışdır. Bu amillər siyasi hakimiyyətin legitimliyinə, idarəetmə mexanizmlərinə və dövlət-vətəndaş münasibətlərinə ciddi təsir göstərmişdir.

Müasir dövrdə siyasi hakimiyyətin transformasiyası həm daxili, həm də beynəlxalq səviyyədə müşahidə olunur. Daxildə vətəndaş cəmiyyətinin genişlənməsi, sosial medianın təsiri və ictimai şüurun artması nəticəsində hakimiyyətin klassik modelləri ön plana çıxır. Beynəlxalq miqyasa gəldikdə, regional inteqrasiya prosesləri, qlobal korporasiyaların rolu və beynəlxalq hüququn yeni formaları dövlətlərin suveren qərarvermə imkanlarını məhdudlaşdırır. Yeni dünya düzənində güc anlayışı artıq tək bir mərkəzdə cəmlənmir. O, çoxqütblü və çoxsəviyyəli xarakter daşıyır. Bu isə həm siyasi nəzəriyyə, həm də praktika baxımından hakimiyyətin mahiyyətinə yenidən baxmağı zəruri edir.

MATERİALLAR VƏ METODLAR

Tədqiqatın materialları qlobal siyasətdə son illərdə baş verən proseslər, beynəlxalq təşkilatlar, transmilli aktorlar, iqtisadi və texnoloji göstəricilər, həmçinin sosial media və rəqəmsal informasiya mənbələrindən ibarətdir.

Araşdırmada müqayisəli təhlil, analiz və sintez, tarixi-müqayisəli və.s kimi metodlarından istifadə edilmişdir. İnformasiya əsrində gücün yenilənən mənbələri və süni intellektin təsiri hadisələrin analizi ilə qiymətləndirilmişdir.Tezisdə dövlətlər, beynəlxalq təşkilatlar və texnoloji aktorların güc və təsir imkanları müqayisəli şəkildə təhlil edilmişdir.

Məlumatlar tematik və kontekstual şəkildə təhlil edilmiş, dövlətlər, beynəlxalq təşkilatlar, transmilli korporasiyalar və vətəndaş cəmiyyəti institutlarının qarşılıqlı təsirləri araşdırılmışdır. Əldə olunan nəticələr sistemləşdirilmiş və gələcək tədqiqatlar üçün replikasiya imkanları təmin edilmişdir.

NƏTİCƏLƏR

Tədqiqat göstərir ki, qlobal siyasətdə son illər baş verən dəyişikliklər siyasi hakimiyyətin mahiyyətini və idarəetmə mexanizmlərini köklü şəkildə transformasiya etmişdir. Müasir dövrdə güc artıq yalnız hərbi və iqtisadi resurslarla ölçülmür, informasiya, texnologiya, kommunikasiya imkanları və "yumşaq güc" kimi amillər siyasi təsirin əsas mənbələrinə çevrilmişdir.

Araşdırma həmçinin göstərir ki, qlobal və regional səviyyədə hakimiyyət çoxmərkəzli və çoxsəviyyəli xarakter daşıyır. Dövlətlər, beynəlxalq təşkilatlar, transmilli korporasiyalar və vətəndaş cəmiyyəti institutları siyasi proseslərdə qarşılıqlı təsir göstərir və gücün paylanmasına təsir edir. Sosial media, rəqəmsal platformalar və süni intellekt siyasi qərarvermə, ictimai rəyin formalaşdırılması və legitimliyin təmin olunmasında yeni alətlər kimi çıxış edir.

Nəticələr göstərir ki, müasir dövrdə siyasi hakimiyyətin davamlılığı zor və məcburiyyət vasitələrinə deyil, etibar, şəffaflıq və informasiya məkanında təsir imkanlarına əsaslanır. Qloballaşma və texnoloji innovasiyalar nəticəsində dövlətlərin və liderlərin uğuru texnoloji çeviklik, informasiya idarəetmə bacarığı və etik məsuliyyətlə sıx bağlıdır.

Yeni geosiyasi reallıqlar fonunda siyasi hakimiyyətin çevrilən siması

21-ci əsrin əvvəlindən etibarən dünya siyasətində müşahidə olunan əsas tendensiya geosiyasi strukturun dərin transformasiyasıdır. Nəticə etibarilə bu siyasi hakimiyyətin mahiyyətinin dəyişməsinə səbəb olmuşdur. Soyuq müharibədən sonrakı dövrdə dünyada birqütblü sistemin hökm sürəcəyi ehtimal olunurdu. Lakin çox keçmədən bu modelin dayanıqsız olduğu üzə çıxdı. Qlobal iqtisadi inteqrasiyanın dərinləşməsi, regional güc mərkəzlərinin formalaşması və texnoloji inkişaf dünya düzənində yeni siyasi reallıqlar yaratdı ki, bu klassik hakimiyyət konsepsiyalarını yenidən nəzərdən keçirməyi zəruri etdi.

Ənənəvi siyasi hakimiyyət anlayışı əsasən dövlətin sərhədləri daxilindəki nəzarət, hüquqi legitimlik və güc tətbiqi üzərində qurulmuşdu amma qlobal miqyasda yaranan yeni qarşılıqlı asılılıqlar bu modeli sarsıtdı. Başqa sözlə hakimiyyət təkcə dövlətin əlində cəmlənmir, həm də beynəlxalq təşkilatlar, transmilli şirkətlər, qlobal media platformaları və vətəndaş cəmiyyəti institutları arasında bölüşdürülür. Bu kimi amillər hakimiyyətin mərkəzləşdirilmiş formasından çoxsəviyyəli, paylanmış idarəetmə modelinə keçidi göstərir. Yeni geosiyasi reallıqlar həm regional, həm də qlobal miqyasda siyasi gücün təbiətinə təsir edir, misal üçün, Çin, Hindistan, Türkiyə və Braziliya kimi yüksələn iqtisadi güclər beynəlxalq sistemdə qərb dövlətlərinin dominantlığını tədricən azaldır. Bu "çoxqütblü dünya" anlayışını reallığa çevirir. Beynəlxalq

qərarvermə mexanizmləri bir mərkəzdən idarə olunmur. Bir-birinə rəqib və eyni zamanda əməkdaşlığa məcbur olan aktorların qarşılıqlı təsiri ilə formalaşır.
Geosiyasi dəyişikliklər yalnız dövlətlərarası münasibətlərdə deyil, həmçinin daxili siyasi proseslərdə özünü göstərir. İT-in genişlənməsi, sosial medianın ictimai rəyə təsiri, siyasi kommunikasiya formalarının dəyişməsi nəticəsində vətəndaşların siyasi proseslərdə iştirak imkanları artmışdır. Buda öz növbəsində siyasi legitimliyin yalnız hüquqi deyil, həmçinin ictimai qəbul və etimad üzərində qurulmasını şərtləndirir. Hakimiyyət artıq sadəcə idarəetmə gücü deyil, o həmçinin sosial inandırıcılıq qabiliyyəti kimi dəyərləndirilir.
Yeni dünya nizamında iqtisadi amillərin siyasi qərarverməyə təsiri də artmaqdadır. Qlobal kapital axınları, beynəlxalq ticarət şəbəkələri və enerji siyasəti dövlətlərin daxili və xarici siyasətlərinə birbaşa təsir göstərir ki, bu anlamda siyasi hakimiyyət iqtisadi asılılıqların idarə edilmə qabiliyyəti ilə ölçülür. İqtisadi güc diplomatik, hərbi alətlərdən fərqli olaraq daha elastik, davamlı təsir vasitəsinə çevrilmişdir. Qeyd edək ki, müasir dövrdə təhlükəsizlik anlayışı daha da dəyişmişdir. Əvvəllər təhlükəsizlik daha çox hərbi müdafiə ilə əlaqələndirilirdi. İndi kibertəhlükəsizlik, informasiya manipulyasiyası, enerji və ərzaq təminatı kimi sahələr siyasi hakimiyyətin ayrılmaz komponentinə çevrilmişdir. Başqa sözlə desək artıq dövlətlər yalnız sərhədlərini deyil öz informasiya məkanlarını, iqtisadi infrastrukturunu qorumaq məcburiyyətindədirlər.
Yeni geosiyasi reallıqlara nəzər saldıqda biz siyasi hakimiyyətin çevrilən simasını həm də beynəlxalq hüququn və beynəlxalq institutların dəyişən rolunda əks olunduğunu görürük. Ənənəvi beynəlxalq nizamın ən əsas sütunları sayılan Birləşmiş Millətlər Təşkilatı, Beynəlxalq Valyuta Fondu və.s kimi təşkilatlar artıq qlobal problemləri tənzimləməkdə əvvəlki qədər effektiv görünmür. Bu isə öz növbəsində alternativ ittifaqların eləcədə qeyri-rəsmi diplomatik platformaların yaranmasına gətirib çıxarır. Hakimiyyətin bu çoxmərkəzli forması qlobal idarəetməni çətinləşdirir. Eyni zamanda, daha çox iştirakçılıq və çoxsəsli qərarvermə mühiti yaradır.
Bu proseslərin nəticəsində siyasi hakimiyyətin mahiyyəti -mülkiyyət- formasından -funksiya- formasına keçmişdir yəni hakimiyyət kiminsə əlində olan sabit status deyil, davamlı olaraq dəyişən və müxtəlif sahələr arasında paylanan dinamik prosesdir və dövlətlər, təşkilatlar, fərdlər bu prosesdə öz təsir imkanlarını qorumaq üçün strateji adaptasiyaya məcburdurlar.

İnformasiya əsrində gücün yenilənən mənbələri və siyasi təsirin rəqəmsal formaları

21-ci əsr dünya tarixində informasiya və texnologiya inqilabının müəyyən etdiyi yeni bir mərhələ kimi dəyərləndirilir. Başqa sözlə desək artıq yalnız sənaye və iqtisadi güc deyil, bilik, informasiya və texnoloji innovasiyalar üzərində qurulmuş güc münasibətləri ilə səciyyələnir. Artıq kim informasiya üzərində nəzarətə sahibdirsə, o həm siyasi, həm iqtisadi, həm də mədəni sferalarda güclü təsir imkanlarına malik olur. Bu kimi faktlar güc anlayışının mahiyyətini dəyişmişdir. Onun mənbələrini ənənəvi hərbi və iqtisadi alətlərdən informasiya və rəqəmsal təsir mexanizmlərinə yönəltmişdir.
İnformasiya əsrinin əsas xüsusiyyəti məlumatın strateji resursa çevrilməsidir, yəni, əvvəllər hakimiyyət daha çox fiziki mənbələr torpaq, enerji və hərbi potensial üzərində qurulurdusa, indi bu funksiyanı bilik, məlumat və informasiya axınlarının idarə olunması daşıyır. Dövlətlər, beynəlxalq təşkilatlar, transmilli korporasiyalar və hətta fərdi şəxslər informasiya vasitəsilə böyük təsir gücünə sahib ola bilirlər ki, bu amillər hakimiyyətin təbiətində dərin dəyişiklik yaradır. Artıq güc fiziki təzyiqdən daha çox informasiya manipulyasiyası, ictimai rəyin formalaşdırılması, rəqəmsal alətlər və.s kimi vasitəsilə idarə olunur.
İnformasiya əsrinin ən əhəmiyyətli yeniliklərdən biri Soft Power anlayışının reallaşmasıdır. Bu anlayış dövlətin zor və məcburiyyət deyil, əvəzində mədəniyyət, ideya, media və informasiya kimi vasitələrlə təsir göstərmə bacarığını ifadə edir. Bu gün sosial media, xəbər agentlikləri, rəqəmsal platformalar və film kimi vasitələr bu gücün əsas alətlərinə çevrilmişdir yəni artıq dövlətlər silah gücü ilə deyil, informasiya hegemonluğu ilə qlobal təsir dairələrini genişləndirirlər.
Rəqəmsal texnologiyaların inkişaf etməsi siyasi qərarların formalaşmasına, ictimai davranışın istiqamətlənməsinə bilvasitə təsir göstərir. Algoritmik idarəetmə, “big data” analizi və süni

intellektin tətbiqi nəticəsində siyasi aktorlar cəmiyyətin davranış modellərini dəqiq öyrənə bilir. Bu öz növbəsində seçkilər, ictimai kampaniyalarda yeni bir təsir forması yaradır. Bu gün informasiya yalnız məlumat ötürmək vasitəsi deyil. O, həm də ictimai şüurun strukturlaşdırılmasına xidmət edən strateji alətə çevrilmişdir.
İnformasiya dövründə rəqəmsal asılılıq adlı yeni sosial və siyasi fenomen yaranmışdır. Cəmiyyətlər texnologiyaya inteqrasiya olunduqca, onların informasiya məkanına müdaxilə imkanları da eyni miqdarda artır. Kiberhücumlar, dezinformasiya, -fake news- kampaniyaları və manipulyativ sosial media fəaliyyəti dövlətlərin daxili sabitliyinə ciddi təsir göstərir. Artıq informasiya artıq həm güc mənbəyi, həm də təhlükə faktoru kimi çıxış edir.
İnformasiya üzərində nəzarət müasir siyasi sistemlərdə artıq strateji prioritetə çevrilmişdir. Dövlətlərin əsas vəzifələrindən biri informasiya axınlarını tənzimləmək, dezinformasiyaya qarşı müdafiə mexanizmləri qurmaq və rəqəmsal suverenliyi qorumaqdır. Burada rəqəmsal suverenlik amili milli təhlükəsizliyin ən mühüm komponentinə çevrilmişdir. 21-ci əsrdə dövlətlər yalnız ərazi bütövlüyü ilə yanaşı, həm də öz informasiya infrastrukturunu qorumağa məcburdur.
Rəqəmsal platformalar vasitəsilə siyasi təsirin müxtəlif formaları yaranmışdır. Sosial şəbəkələr (X, Facebook, İnstagram) seçki kampaniyalarının aparılmasında, ictimai fikrin yönləndirilməsində mühüm rol oynayır. Bir tvit, bir video paylaşım qısa zamanda milyonlarla insana çata bilir. Bunlar siyasi qərarların istiqamətinə təsir göstərə bilir. İnformasiya şəraitdə informasiya liderlik anlayışını da dəyişir yəni liderin təsir gücü təkcə dövlət aparatına deyil, həm də rəqəmsal auditoriyaya bağlanır.
21-ci əsrdə gücün yenilənən mənbələri öz növbəsində etik və hüquqi problemlər doğurur. Bu gün siyasi diskussiyaların əsasını məlumatın toplanması, şəxsi həyatın gizliliyi, sosial mediada senzura və məlumat manipulyasiyası kimi məsələlər təşkil edir. Demokratik cəmiyyətlər üçün ən önəmli amil informasiya azadlığı ilə milli təhlükəsizlik arasında balansı qorumaqdır. əksinə olaraq avtoritar rejimlər isə rəqəmsal nəzarət vasitələrindən istifadə edərək cəmiyyət üzərində daha ciddi idarəetmə sistemi qururlar. Yuxarıda qeyd etdiyimiz amillər informasiya dövründə siyasi rejimlərin fərqlərini daha da kəskinləşdirir.
Eyni zamanda, informasiya əsrində yeni formalaşan istiqamətlərdən biri beynəlxalq münasibətlərdə "rəqəmsal diplomatiya"dır. Dövlətlər sosial media və rəqəmsal platformalar vasitəsilə xarici ictimaiyyətlə birbaşa ünsiyyət qururlar. Həmçinin öz milli imicini formalaşdırır və informasiya müharibəsində üstünlük qazanmağa çalışır. Burada klassik diplomatiya tamamlanır. Eyni zamanda onu çevik, sürətli və dinamik bir formaya salır. İnformasiya zəmanəsində gücün mənbələrinin yenilənməsi eyni miqdarda insan faktorunun önəmini artırır. Dövlətlər üçün təkcə maddi resurslara malik olmaq kifayət etmir. İnnovativ düşüncə, analitik bacarıq, texnoloji savad və media mədəniyyəti siyasi və iqtisadi uğurun ən önəmli göstəricilərinə çevrilmişdir.
Nəticə etibarilə, informasiya dövründə güc amili çoxşaxəli, çevik məzmun qazanmışdır. Güc indi yalnız fiziki və iqtisadi üstünlük demək deyil. Bu gün güc informasiya istehsalı, paylaşımı və idarəedilməsi üzərində qurulur. Bu kimi dəyişiklik siyasi hakimiyyətin legitimlik özəyinidə yenidən müəyyənləşdirir başqa sözlə siyasi hakimiyyətin davamlılığı artıq zor tətbiqinə deyil, informasiya məkanında etibar, şəffaflıq və inandırıcılıq qabiliyyətinə əsaslanır. Beləliklə, texnologiya dövründə gücün yenilənən mənbələri dövlətlərə, təşkilatlara həmçinin fərdlərə yeni imkanlar qazandırmışdır. Müasir dövrdə bir sıra amillər strateji prioritetə çevrilmişdir; rəqəmsal təsirin idarə olunması, informasiya təhlükəsizliyinin təmin edilməsi və ictimai rəyin manipulyasiyadan qorunması. Bu şəraitdə dövlətlər üçün əsas məqsəd informasiya əsrinin imkanlarından səmərəli istifadə etməklə yanaşı, onun doğurduğu riskləri də idarə edə bilməkdir.

Qloballaşma və süni intellekt dövründə siyasi hakimiyyətin gələcək istiqamətləri

21-ci əsrin ikinci yarısına doğru dünya siyasəti fərqli bir mərhələyə qədəm qoyur. Burada texnoloji innovasiyalar, süni intellekt və qloballaşma prosesləri siyasi hakimiyyətin strukturunu və idarəetmə mexanizmlərini köklü şəkildə dəyişdirir. Müasir dövrdə gücün dayaqlarının sırasına rəqəmsal idarəetmə, texnoloji suverenlik və informasiya təhlükəsizliyi əlavə olunur. Siyasi

hakimiyyət artıq yalnız idarəetmə səlahiyyəti daşımır. O, həm də innovasiyanı yönləndirmə, məlumatı nəzarətdə saxlama və texnoloji üstünlüyü qoruma bacarığı kimi dəyərləndirilir.
Qloballaşma siyasi hakimiyyətin ənənəvi sərhədlərini zəiflədir və dövlətlərin qarşılıqlı asılılığını artırır ki, bunun nəticəsində qərarvermə mexanizmləri təkcə milli çərçivədə deyil, həmçinin beynəlxalq səviyyədə formalaşır. Bu gün iqtisadi, ekoloji, təhlükəsizlik problemləri bir dövlətin sərhədləri daxilində həll edilə bilmir. Misal üçün, iqlim dəyişikliyi, kibertəhlükəsizlik, Aİ kimi məsələlər qlobal əməkdaşlıq tələb edir. Bu isə siyasi hakimiyyətin mahiyyətini "mərkəzləşdirilmiş" idarəetmədən "kollektiv və şəbəkə əsaslı" idarəetməyə doğru yönəldir.
Süni intellektin inkişafı hakimiyyət münasibətlərində tamamilə yeni mərhələ açır. Məlumat toplanması, analiz edilməsi və qərarların avtomatlaşdırılmış şəkildə formalaşdırılması siyasi prosesləri daha səmərəli, eyni zamanda potensial olaraq daha da təhlükəli vəziyyətə gətirir. Süni intellekt vasitəsilə bir çox işlər görülür ki, cəmiyyətin davranış modelləri proqnozlaşdırılması, ictimai rəyin formalaşdırılması, idarəetmə qərarları sürətlə qəbul edilməsi və.s bura aiddir. Lakin bu proses şəffaflıq və etik məsuliyyət kimi bir sira problemləri də gündəmə gətirir.
Qeyd edək ki, yaxın gələcəkdə siyasi hakimiyyətin mühüm komponentlərindən biri texnoloji legitimlik amili olacaq. Daha dəqiq desək, vətəndaşlar dövlətin yaxud liderin effektivliyini onun texnoloji imkanları, rəqəmsal idarəetmə bacarığı ilə qiymətləndirəcəklər. Elektron hökumət, rəqəmsal iştirak platformaları, süni intellekt əsaslı xidmətlər vətəndaşların gündəlik həyatına birbaşa və ciddi təsir göstərəcək. Bu isə demokratik hesabatlılığı gücləndirə eyni zamanda da yanlış istifadə halında total nəzarət mexanizminə çevrilə bilər.
Gələcəkdə süni intellektin bu qədər inkişafı beynəlxalq güc tarazlıqlarını da dəyişdirəcək. Texnoloji innovasiyaya rəhbərlik edən ölkələr yəni, ABŞ, Çin, Yaponiya və Aİ dövlətləri qlobal siyasətdə strateji üstünlük əldə edəcəklər. Siyasi gücün əsas göstəricisinə texnologiyanın istehsalı, məlumat bazalarının həcmi və süni intellektin tətbiq sahələri və.s kimi amillər çevrilir. Rəqabət yeni növ olan bu forma texnoloji geosiyasət anlayışını formalaşdırır. Süni intellekt dövrü siyasi hakimiyyətin sosial ölçüsünü də dəyişdirir yəni insan və maşın əməkdaşlığı idarəetmənin təməl prinsipinə çevrilir. Misal üçün, qərarların qəbulunda süni intellektin dəstəkləyici rolunun artması siyasi liderlik anlayışını təkamülə uğradır. Lider yalnız ideya və vizyon sahibi olmaqla yanaşı, texnoloji savadlı, informasiya axınlarını analiz edə bilən şəxs olmalıdır. Bu öz növbəsində gələcəyin siyasi elitalarının formalaşmasında təzə meyarlar yaradır.
Qloballaşma süni intellekt ilə birlikdə siyasi idarəetmədə iki istiqamətli təsir göstərir. Bunlar bir tərəfdən dövlətlər arasında əməkdaşlıq və resurs paylaşımını zəruri edir. Digər tərəfdən isə milli kimliyin qorunması və informasiya təhlükəsizliyi ilə bağlı yeni risklər doğurur. Qlobal rəqəmsal məkanda informasiya sərhədlərin itməsi ideoloji təsirlərin daha asan yayılmasına gətirib çıxarır. Bu səbəblərdən gələcəkdə siyasi hakimiyyətin ən ümdə vəzifələrindən biri milli suverenliklə qlobal inteqrasiyanı balanslaşdırmaq olacaq. Siyasi hakimiyyətin sonrakı cərəyanlarında biri də etik idarəetmə modelinin qurulmasıdır. Aİ texnologiyalarının qərarvermə proseslərində iştirak etməsi məsuliyyət bölgüsünü çətinləşdirəcək. Bu situasiyada insan foktoru yenidən mərkəzi mövqeyə çıxır. Etik prinsiplərə əsaslanmayan texnoloji idarəetmə gələcəkdə cəmiyyət-hakimiyyət arasında güvən böhranı yarada bilər. Elə bu səbəbdən gələcək dövlət modelləri təkcə texnoloji səmərəliliyə deyil, eləcədə etik şəffaflığa əsaslanmalıdır.
Qloballaşma, süni intellekt dövrü həm də vətəndaş iştirakçılığının yeni formalarını yaradır ki, rəqəmsal platformalar insanların qərarvermə proseslərinə real vaxtda qoşulmasına imkan verir. Buradakı amillər demokratiyanın təkmilləşdirilməsinə töhfə verə bilər amma populizm, manipulyasiya və informasiya saxtakarlığı kimi təhlükələri də bərabərində gətirir. Qeyd etdiyimiz səbəblərdən gələcəyin siyasi sistemləri həm açıq iştirakçılıq eyni zamanda dezinformasiyaya qarşı effektiv qorunma mexanizmləri qurmaq məcburiyyətində qalacaqlar.
Son olaraq, qloballaşma və süni intellekt zəmanəsində siyasi hakimiyyətin gələcəyi çoxölçülü, çevik xarakter daşıyacaq. Hakimiyyətin əsası idarəetmə bacarığından çox adaptasiya qabiliyyəti, texnoloji yönümlülük etik məsuliyyətlə ölçüləcək. Dövlətlər, liderlər bu yeni reallıqda o zaman

uğurlu ola biləcəklər ki, texnologiyanın imkanlarını humanist dəyərlərlə düzgün uzlaşdıra bilsinlər.

YEKUN NƏTİCƏ VƏ TƏKLİFLƏR

Ötən əsirdən fəqli olaraq 21-ci əsrdə siyasi hakimiyyətin mahiyyəti və strukturu köklü şəkildə dəyişməkdədir. Bu tip dəyişikliklər qloballaşma, İT, süni intellekt kimi faktorların qarşılıqlı təsiri nəticəsində formalaşır. Dövlətin fiziki və iqtisadi resurslara əsaslanan hakimiyyət modeli artıq qlobal siyasətin mürəkkəb reallıqlarını izah etmək üçün bəs etmir. Müasir dünyada güc çoxşaxəli xarakter daşıyır. O, həm iqtisadi, həm texnoloji, həm də informasiya sahəsində özünü göstərir. Yeni geosiyasi reallıqlar dünya düzənində çoxqütblülüyü artırmışdır. O, həmçinin beynəlxalq münasibətlərdə qeyri-dövlət aktorlarının rolunu genişləndirmişdir ki, informasiya əsrinin yüksəlişi gücün təbiətini kökündən dəyişdirərək, onu fiziki məcburiyyətdən informasiya və təsir siyasətinə yönəltmişdir. Bu prosesin fonunda "yumşaq güc", "rəqəmsal diplomatiya", "informasiya hegemonluğu" kimi amillər siyasi nəzəriyyənin əsas komponentlərindən birinə çevrilmişdir.

Bu gün süni intellekt həmçinin texnoloji innovasiyalar siyasi hakimiyyətin gələcək istiqamətlərini müəyyənləşdirən əsas amillərdir. Hakimiyyət yalnız idarəetmə funksiyası deyildir. O, həmçinin texnoloji çeviklik, etik məsuliyyət və məlumat üzərində nəzarət bacarığı kimi dəyərləndirilir. Yuxarıda qeyd etdiyim kimi, dövlətlər və liderlər müasir zamanda uğurlu olmaq üçün texnologiyanın imkanlarını humanist və demokratik dəyərlərlə uzlaşdırmaq məcburiyyətindədirlər. Son olaraq, 21-ci əsrdə siyasi hakimiyyət sabit, stabil sistem deyil. Siyasi hakimiyyət dinamik, dəyişkən və çoxsəviyyəli bir prosesdir. Onun davamlılığı və legitimliyi artıq zor və məcburiyyət mexanizmlərinə əsaslanmamalıdır. O, etibar, şəffaflıq və informasiyaya əsaslanan idarəetmə üzərində qurulmalıdır.

THE HUMAN RIGHT TO THE ENVIRONMENT, A RECOGNIZED FUNDAMENTAL RIGHT

Dr. Liliana NICULESCU*
* Lecturer PhD -"Dunărea de Jos" University – Galati – Romania

ABSTRACT

If environmental protection necessarily interferes with the exercise of fundamental freedoms, for example, the right to freedom of movement or the prohibition of the right to travel in certain protected areas, then this also means that more problems will arise.
The right to the environment is primarily linked to the right to health and the right to life; ultimately, it means establishing the right to a decent life and work, i.e. health and safety at work and the right to rest and leisure.
In contrast, environmental law encompasses fundamental principles of justice, such as the right to freedom and participation, the right to freedom of expression, the right to collective action and therefore supports the social and collective use of existing rights.
Law is a set of obligations towards the state and government, as well as towards individuals. It is clear that environmental sustainability can be a catalyst for greater participation in public life and democracy in all its forms.

Keywords: rights, health, interference, work, information

Introduction

International environmental instruments are often used as simple recommendations rather than as binding standards. For example, the Rio Declaration on Principles for Environment and Development (Rio Declaration) is a good example. Although not legally binding, the declaration resulted in a compromise between developed countries and the Group of 77 (G77). It affirms the rights and obligations of States in the field of environmental protection and establishes Principle 27. Despite their normative nature, the principles presented as simple recommendations in international environmental instruments are not part of domestic law. This should not diminish their importance in relation to the essential requirements of international environmental law (Prier, 1991).

Principles of international environmental law.

Therefore, when discussing international legal principles that are included in international law, it is not necessary to emphasize their relative legal validity, that is, the nature of the law included. Moreover, with the development of international cooperation and collaboration in the field of environmental protection, the growth of the economic power of developing countries, and the advancement of cooperation and science, international law has evolved and will continue to evolve in a way that broadens the scope of cooperation among developing countries. In a very reduced reality, what constitutes law or a situation today may not have the corresponding legal force, but in the form of recommendations, it will become an important issue in international law in the future and, according to the Rome Charter, may even become part of international security law (Ulies, 1994).
However, the difficulty in legally interpreting these guidelines stems from the fact that many secular treaties simply state a set of general rules without detailed interpretation.
We will not limit ourselves to the semantic aspects of the issues addressed here. We will examine the concept of "principle" in relation to what can be inferred from a legal and regulatory perspective. Sometimes, even in the context of a declaration containing the concept of "principle", the situation can

be ambiguous. Thus, while the "principles" of the Dublin Declaration on Water (January 1992) and the Rio Declaration (June 1992) are largely legally structured (although not fully formalized in legal terms), the "Action 21" program will guide you. Although the program may refer to "principles of action" several times in each chapter and may provide guidance, this is a very different interpretation from what is discussed in this chapter. It should also be noted that the economic and political integration of Europe has been accompanied by an aggressive form of environmental struggle. In addition to its extensive legislative powers, the EEC also has the power to control the way laws are drafted and implemented (Lamar, 1975). In recent years, especially since the entry into force of the Single European Directive (1987), international cooperation on the continent has advanced significantly. However, the public policy framework remains inadequate and therefore requires significant improvements, including in the controversial area of environmental protection.

The Single European Protocol amends the existing agreements of the European Community and provides a clear solution to the problem of the legal basis of the Community's competence in the field of environmental protection.

Customary law also gives legal (and binding) effect to the principle of subsidiarity, allowing individual Member States to adopt or establish stricter environmental protection measures. This document, which is particularly important in the field of environmental protection, clearly defines the principles of action of the regional Community, which are essentially procedural rules rather than legal principles. The document contains eleven principles, four of which take into account the international dimension of EU environmental policy (Cans, 1995).

The Maastricht Treaty, signed on 7 February 1992 and entered into force on 1 November 1993, under the Single European Act, led to significant changes in political, economic and monetary integration. As regards the environment, the principles underlying the framework have evolved, developed and progressed over time, with the subsidiarity principle prevailing. We must pursue balanced and sustainable economic and social development, making this a primary objective and respecting the environment.

Through the Treaty of Amsterdam, signed on 2 October 1997, the European Union established that environmental actions require ratification at national level, which is a condition and component of "harmonious, balanced and sustainable development" and therefore protects the environment. This agreement has become a de facto reference for environmental protection. (Proceedings of the 2019 United Nations Conference on Environment and Development, including the Declaration of Principles)

In this context, we will first examine the principles of environmental law, that is, the principles of domestic law (or principles of a common nature), followed by the principles of international environmental law, in whatever order they are considered.

The general principles of domestic environmental law are as follows (Klemm et al., 1989):

Public Ecological Order

(a) The principle that environmental protection should be legally recognized as a substantial public interest. The Revised Environmental Protection Act defines environmental protection as a substantial public interest in Article 1. This document analyzes the legal norms on environmental protection from a legal perspective and clarifies the direction and direction of the legislative provisions. Environmental protection should be based on strategic principles and factors that lead to sustainable social development. The importance of environmental protection is not new in Korea. It was defined as a "matter of national interest" in Act No. 9 of 1973 (Article 1). The 1991 Constitution did not explicitly state this principle, but stipulated that the state's obligation to develop natural resources should be stipulated as serving the "national interest" (Article 134, Paragraph 2, Subparagraph d). However, the 1991 Constitution was amended by a National Referendum, deleting Article 2, No. 7 and No. 7, No. 2. Article 135, No. 135(a) supports a substantial conceptual change in environmental protection, in particular the human right to a healthy environment. Where environmental legislation recognizes that the subject of legal protection is one of substantial public interest, the established principle applies to the various parts of the relevant

article and to the environmental elements requiring protection. Therefore, Law on Environmental Protection No. 137/1995 and subsequent amendments clearly have the character of a fundamental law, emphasizing not only the protection of general environmental values directly addressed by the law, but also the essential nature of public interest issues requiring legislative action (Dutu, 2000).
Of course, Article 89 of the repealed Law on Environmental Protection provides for the establishment of special rules, amended or newly established, to ensure the effective implementation of environmental protection measures. The 17 articles of the General Fundamental Law cover issues such as the management of hazardous substances and waste, the management of pesticides, the protection of shores and coastal areas, aquaculture and fishing, as well as liability for environmental damage. It is clear that any special law that needs to be drafted and adopted must respect the principle that environmental protection is a public good. Of course, the theoretical and practical implications of the application of this principle will undoubtedly be influenced by both fundamental and special laws, i.e. complementary legislation (Prieur, 2003).
Beyond the first consequence of the principle in question, there are other consequences.
As noted by Dr. A.S. Mircea Duțu, "These general provisions demonstrate the particular socio-legal importance given to maintaining the ecological balance and preserving the state of environmental elements and substances and provide an important framework for legal norms in this area." (Duțu, 2000)

The public recognition of the ecosystem

The public recognition of the ecosystem as both a barrier and a target for management actions is a controversial issue. This point refers to the difficulty of recognizing the existence of multiple governmental mandates, each specific to a branch of law, as well as to the fact that, in our country, the meaning and implications of this concept have not been clearly articulated.
However, while we recognize the existence, in the field of environmental protection, of a public system, we would not agree with the above point of view, according to which, since there are legislative provisions that are of public order, deductions from them are not allowed. In fact, these effects do not depend on the public policy form of the legal norms, but on the fact that they are mandatory norms; However, most laws consist of mandatory provisions, but only a few refer to public policy. (Lascoumes, 1995).
Among other implications of the legal declaration of public interest classifying environmental protection activities, Michel Prieur refers to the regulation of the legitimacy of environmental activities, using the theory of proportionality to assess legitimacy as being publicly useful for a task. The author also envisages the creation of state environmental protection services; Thus, according to him, "since environmental protection is considered a general interest, there is no obstacle to the creation, by the public authority, of a public function responsible for its management". This type of public service also existed in the early 1970s, caused by environmental protection, partly (for example, decentralized public services such as departmental agricultural services) or entirely (specialized public units such as national parks or river basin financing agencies); Other private state organizations, including environmental protection organizations, which are strictly regulated by the state and exercise attributes of state power (management of nature reserves), may be recognized by the courts as public administrative management for environmental protection. (Prieur, 1991).
b) The principle of priority, prevention and remediation in the field of ecological risks and threats is provided for in Article 18 of the preamble to the Rio Convention (June 1992) on biodiversity, which stresses the increasing importance of considering and preventing the causes of the decline or loss of biodiversity. It is clear, however, that the application of this principle extends beyond the field of biodiversity and can and should be applied in all areas of environmental protection - such as, for example, climate, pollution, protection of the ozone layer, etc. (Lepage, 1995).
This principle, like the Law on Environmental Protection, is not legislated. It was included in Law No. 137/1995 with subsequent amendments (Article 3), formulated in a simplified form, without mentioning the concept of risk, which, however, does not change the content of the principle. However, it should be

emphasized that the entire concept underlying environmental policy in the new policy begins with the recognition of the importance of actions to prevent the occurrence of ecological disasters. Accordingly, all regulations of economic and human activities with an impact on the environment are included in Chapter II of the Code - on authorization procedures, regulation of hazardous chemicals and their preparation, regulation of equipment and installations for biosanitary purposes, as well as regulation of nuclear waste and hazardous waste management processes (1944) - especially when considering design and risk prevention.

Elements of the Law on Environmental Protection.

According to the formulation of the content of this principle in other international documents, the consideration and prevention of risks go hand in hand with the idea that these objectives must be achieved by the best available means; this explanation is integrated into certain legal provisions and doctrine in France. In this regard, it cites the Paris Convention of 22 September 1992 for the Protection of the North-East Atlantic Coastal Zone (Article 2 and Article 3 notes a and b), according to which “The Parties to this Treaty... shall continue to take into account the use of existing and emerging technologies in the current situation of “implementation of good practice parameters and implementation” 1995). According to French Regulation No. 95-101 of 2 February 1995, the formulation of this principle is as follows: “the principle of preventing and remedying, as a priority at source, the impact on the environment, using the best available methods at an acceptable cost” (Article 1 paragraph 2, our source can be found in our correction). However, it would not be wrong to imagine what such a situation would mean, at the cost of unjustly abandoning environmental protection. Obviously, it is only a question of limiting conservation efforts to this end and not of promoting economic development and conservation on the long-term environmental. about which, as mentioned, there was a fear that research from the beginning could sometimes be more expensive and less productive than an a posteriori one (Col, 1989), and in section 3 of Law no. 137/1995 it was emphasized that "the principle of control, reduction and control will be collected using the most effective methods available". in highly polluting activities, whose formulations essentially determine the integration of Romanian legislation, and the legislation cannot be implemented without the meaning of "laws and policy" which refers to "a positive stage of development marked by a positive condition and implementation of the project, reflecting the efficiency of the functioning of the precedent that can be achieved if the economy cannot implement the same environment" (Dușca, 2014).

Although, from a purely psychological or sentimental point of view, it may seem difficult to admit that sometimes it is better to repair damage to nature than to prevent it, such an environmental policy should be considered in all countries and, therefore, in Romania as well. Environmental protection, as an economic activity, is also subject to the rules of the market economy. And sometimes, in this area, where scientific and technical knowledge still has its limits, repairing seemingly improbable damage can cost less than taking complex and difficult measures to prevent potential performance damage.

We would like to emphasize that the environmental protection law does not condition this activity on preventing damage to nature at economically acceptable costs. We believe that only one additional clarification is necessary: the choice between the use of preventive measures and those that repair damage will only follow the principles of environmental protection as long as the potential damage is reversible and the repair of damage guarantees the restoration of full participation in the state of the environment.

However, such a discussion is of a theoretical nature for us. Indeed, art. 9 and 10 of OUG 91/2002 seem to fulfill the principle of precautionary action, which states that “environmental authorizations are not granted if the conditions provided for by the applicable standards and technical regulations are not met and are reviewed if new elements appear”.

The precautionary principle, which is closely linked to the principle of anticipation, prevention and correction of risks and their assessment, is enshrined as a code of conduct in the field of environmental

protection, where, before making decisions, the likelihood and probability of ecological damage occurring are taken into account.
The Rio Declaration seems to be principle no. 15, which states: "In order to protect the environment, States should take precautionary measures on a large scale, commensurate with their capacity." In cases of risk of serious and irreversible damage, the lack of absolute scientific certainty should not be a pretext for resorting to destructive measures aimed at affecting the environment" (Nangan 2002).
This principle is specifically reiterated in the Convention on Biological Diversity (Rio de Janeiro, 1992), the preamble of which states that "where there is a threat of substantial reduction or loss of biological diversity, the lack of absolute certainty shall not be invoked as a reason for postponing measures or for avoiding any of their consequences".
The definition of the precautionary principle emphasizes, as we have shown, that in the absence of certainty, according to current scientific and technical knowledge, the adoption of effective and proportionate measures designed to reduce the risk of serious and irreversible damage to the environment environment, at an economically acceptable cost, should not be postponed. However, this is a definition that has been strongly criticized in French literature. Thus, Corinne Lepage observes that "the precautionary principle ultimately means that an action or activity should not be undertaken if its consequences cannot be known"; however, the author notes, this does not follow from the words of the text. Similarly, Pierre Lascoumes states that "the precautionary principle, which, in the absence of scientific and technical certainty, provides for the adoption of effective preventive measures, cannot be applied in French law". "...only at an economically acceptable cost (Lascoumes, 1995), due to the possibility of evaluating each industry".
Finally, Article 3, no. 3, of the Convention on Climate Change (Rio, 1992, ratified by Romania by Law no. 24/1994), although it confirms the principle to which we refer, uses the term precautionary in a sense close to the idea of prevention.
We are faced with a principle which, in prescribing standards of conduct in the field of environmental protection, expresses the obligation to accompany any operation carried out in the field of environmental protection with adequate insurance or to avoid measures that have unpredictable consequences. Therefore, obligations of interruption or suspension cannot be imposed. As a principle of general application, the duty of diligence is easily fulfilled in any field of environmental protection. Undoubtedly, there are fields of science which, in direct relation to environmental protection, assume a greater degree of uncertainty regarding the - sometimes far-reaching - effects of human actions on the natural environment, such as biotechnology and basic activities. However, it cannot be argued, for example, that, given the current state of scientific knowledge, the risks of dumping nuclear or radioactive waste on future generations cannot be assessed on the basis of the natural circulation of such waste. From this perspective, it becomes clear that current practices, based on limiting the methods of disposal of waste from the immediate human environment, maintaining it in the same state, especially in the ground, in no way eliminate the real dangers for future generations.
In addition to its theoretical importance, the precautionary principle can have numerous practical consequences regarding liability for damage to the environment. In fact, the duty of diligence in the organization and conduct of certain activities is used to establish the culpability of the person who will be liable for acts that cause damage, such as the simple failure to comply with certain obligations to which he is subject (Anthony, 2014).
However, if we refer to extra-contractual civil liability, in the presence of the provisions of article 81 of Law no. 137/1995, according to which "liability for damages is objective, independent of fault", the reference to an obligation of diligence is unnecessary. However, in the case of other forms of liability - criminal, extra-contractual, labor - where the existence of fault is essential for the occurrence of liability, the reference to the precautionary principle may be crucial. Depending on the obligations assumed by the parties, the principle to which we refer may have important implications for clarifying the relationships arising from insurance contracts.

We consider it useful to recall the role envisaged in the Convention on Biological Diversity of 1992 in the Protocol on Biosafety, the Cartagena Protocol on the Prevention of Biotechnological Risks, signed in 2000 and ratified by Romania.
Given that the precautionary principle is present in numerous international agreements, in particular in conventions that provide a legal framework for activities likely to present potential environmental risks, and considering that biotechnologies can not only have positive impacts on the environment, but also cause them (Agenda 21), the risks presented by organizations will be considered moderate (GMOs) and, in particular, with regard to human and plant biodiversity, the application of the precautionary principle seems indispensable and justified.
In a strict legal context, the precautionary principle implies that a possible risk or a certain risk, without scientific evidence of its occurrence, cannot constitute a reason for not implementing a system to prevent such a risk. Thus, as we have shown, foresight is a forward-looking perspective, open to the future.
There is no doubt that the precautionary principle, introduced in the Protocol on Biological Diversity, has been introduced, albeit implicitly, into international environmental law and international food safety law. From the economy of the Protocol, it follows that the precautionary principle, in its scope, has multiple uses: the spirit of solidarity in terms of risk policy, the universal spirit which it embodies; the cooperation mechanisms it has established, particularly in the scientific, technical and legal fields. (Cans, 1995).
We will allow ourselves, synthetically, to make a comparison between the principle of prevention, which involves the management of a known risk, and the precautionary principle, which requires the control or anticipation of an unknown risk.
The principle "polluter pays", enshrined in the Law on Environmental Protection in art. 3 letter d, is found in a series of international documents, among which we will cite the Rio Declaration (principle no. 16).
As Professor Michel Prieur rightly writes, this principle raises complex economic and legal problems and, I would add, political and scientific problems. I have already indicated that, if this principle is to establish the simple obligation of the person who causes concrete damage to the environment to repair it, then we will be faced with an axiom, without its own legal value; this is not the meaning of the principle in question. In a broad sense, this principle aims to involve pollution in the social cost of the pollution it causes, implying the effects of pollution not only on goods and people, but also on nature itself. (Prieur, 1991).
In a narrower sense, the "polluter pays" principle aims to oblige politics to pay the costs of combating pollution; thus, there are specific levels of relationships, such as partial "internalization", which allow the imposition of taxes or pollution charges on the polluter, so as not to oblige the community to bear the costs of pollution.
A correct understanding of the content of the principle in question requires clarification; that in such an organizational system, the granting of state subsidies to help finance anti-pollution investments through pollution is contrary to the "polluter pays" principle.
In France, the extension of the "polluter pays" principle and the fiscal system to combat noise and agricultural pollution. The adoption by Parliament of art. Article 421-8 of the Urban Planning Code, which provides for non-compensatory easements on classified installations, represents a violation of the "polluter pays" principle, since the texts initially provided that polluting industries were responsible for paying for neighborhood easements. In this situation, the conclusion that the "pollution pays" principle often represents the recognition of the taxpayer's right to pollute and therefore legitimizes more questionable environmental behaviors.
The French legislator - interestingly - does not align itself with this principle in the sense of the Rio Declaration, according to which, as we have shown, politicians must bear not only the costs of pollution, but also the costs of the Paris Convention for the Protection of the Marine Environment of the North Atlantic - contained in Article 2 b. It provides that "the Contracting Parties shall apply the principle of pollution payments, according to which the costs resulting from measures to prevent, reduce and combat

pollution are borne by the polluter". This definition means that the Paris Convention system, adopted by law in France, no longer imposes the acceptability of costs. (Giroud, 2002).
The regulations contained in Law No. 137/1995 seem to be in complete conflict with the requirements of the principle of pollution at source, which can be deduced from the precedents. The unification of the financial efforts of all existing real and virtual "polluters", for the prevention and reduction of pollution, as well as its combat, remains in the Environmental Fund, in accordance with the law; such a fund also exists in the regulation of Law no. 18/1991, on land improvements. However, it is no less true that, by virtue of the various provisions of the law, natural and legal persons who own pollution sources are obliged to equip themselves with anti-pollution means, to bear the necessary expenses for this purpose; this is the case, for example, for art. 34, Art. 47 letters b, c, d, e of Law 137/1995. Public information and participation in environmental decisions are included in the provisions of the Law on Environmental Protection which provides, in art. 3 letter i), the development of a framework for the participation of non-governmental and private organizations in the formulation and implementation of objectives. In our opinion, we consider that participation cannot be provided without accurate and complete information, so that both parties should be considered based on the same principles.
Participatory democracy, of course, does not explicitly provide for environmental protection policies. However, at this point, state action can only succeed if it shares its responsibility with all citizens, not with their religion. As mentioned in the specialized literature, the need for citizen participation in environmental protection is associated with the challenging characteristics of the field: universality, duration, interdependence and irreversibility.
The right to information is certainly the same as the right to information. It is, again, the way in which this right is incorporated in art. 31 of the Romanian Constitution, according to which "the individual's right to "public and personal well-being".
Including specific texts and its normative scope, Law no. 137/1995 means that the state recognizes the right of each person to have a safe environment, guaranteed, among other things, by access to information on environmental quality. (Uliescu, 1993).
We specify that, due to the amendment and completion brought by OUG 91/2002, the draft article 5 was also amended, its content being "access to environmental information under the confidentiality conditions provided for by the applicable laws".
Current norms, including Law 86/2000 for the ratification of the Aarhus Convention on access to information, public participation in decision-making and access to justice in environmental matters, followed by GD 1115/2002 on access to environmental information, represent, in our opinion, our way of ensuring access to the population and the authorities that have been requested. The birth of the right to information on environmental issues occurred with the Stockholm Declaration. (Articles 19 and 20), which stimulated, in addition to the way in which individuals can exercise their responsibility towards the environment in full knowledge of the facts, the expansion of freedom of information. The Final Act of the Helsinki Conference (1975), although it required a group of political decision-makers to be held accountable and responsible for protecting and improving the environment. It is also important to mention the EU Directive 90/313 of June 1990 and the new EC Directive 2003/4 (which will of course also amend GD 115/2002) on the freedom of information in environmental matters, guaranteeing freedom of access to information available to public authorities, as well as obtaining the basis on which it is available. (Cans, 1995); On the other hand, the principle of participation, which is not defined by such a law, is based on the recommendation of the European Committee of Ministers according to which, when a competent authority proposes an administrative decision, the affected parties should be notified. Principle 10 of the Rio Declaration specifically refers to this aspect, in the following terms: "the most appropriate way to emphasize that "The main objective for solving environmental problems is to ensure the participation of all citizens concerned, at the most appropriate level l". We note that principles 20-22 of the same declaration specifically refer to the participation of women, youth and indigenous peoples and communities.
At a specific level, the Declaration on Sustainable Forest Management (Rio, 1992) also highlights aspects of participation, indicating, on the one hand, that adequate conditions should be created for

indigenous peoples, their communities and other communities, as well as forest dwellers, to enjoy, in a sustainable way of life, a substantial management system and encouraging specific ecological management of forests; On the other hand, the full participation of women in all aspects of the management, conservation and economically viable exploitation of forests should be encouraged. The involvement of local communities and the provisions of the texts 87 of the Law on Environmental Protection refer to Currently, in our legislation, the fact that non-governmental organizations are granted active procedural legitimacy, being referred to the courts for the purpose of environmental conservation, regardless of who is harmed. Very important from a theoretical point of view and, undoubtedly, from a practical point of view, art. 87 of the Law, which was introduced into the draft law during parliamentary debates, was unfortunately marked by the consequences of the excessive speed with which it was discussed and adopted; The text is, in our opinion, at least incomplete, if not outright false.

Indeed, art. 87 of the Law refers to non-governmental organizations, without any other specification, which would mean that any non-governmental organization, regardless of its activities and the purpose for which it is created, is subject to the provisions of this section. However, such a solution is difficult to conceive, even from the perspective of the principle of the specialty of the capacity of legal persons to use. We are talking, we believe, only about non-governmental organizations whose object of activity is environmental protection.

Moreover, the intervention of organizational privileges - exercised in judicial cases - does not occur only in case of damage, but, perhaps above all, to prevent its occurrence.

Thirdly, if the actual damage was caused by a natural or legal person, a conservation organization cannot be replaced by a compensation process.

Finally, art. 87 seems to create a privilege in favor of the NGO, which is covered by art. 5 letter c) guaranteed to all persons in the general sense of the present law. It is - it should be mentioned here - the only case in which our legislation recognizes the real possibility of "popular action"; Or, even in comparative law, legislators everywhere vehemently oppose such a rule.

The principle of universal recognition implies a framework and a collective and systematic solution to the problem of the environment, starting from the premise that its protection is a complex problem, composed of closely related, interdependent and yet unified aspects and elements. At the same time, the main issue of environmental protection is closely linked to the economic and social development of the country, while the use of nature to meet current needs, through rational policies, is closely linked to sustainable development that leaves room for development opportunities for future generations.

We believe that the provisions of the Fundamental Law on Environmental Protection adequately reflect these concerns; However, the sector-specific legislative guidelines, implemented mainly through legislative harmonization during the EU accession process, need to be supplemented or revised.

The affirmation of this principle raises certain questions, which are related, at least at the international level, to the principle of interdependence between environment and development, or, in other words, to the connection between environmental protection measures and development conditions. In the language of some authors, it has been expressed in the form of two principles; the first highlights an important vision for developing countries, while the second supports the opinion of developed countries that sustainable development cannot be achieved without taking the environment into account in the formulation and implementation of development policies. In this regard, Principle 2(a) of the Declaration on Forests recognizes that States have the sovereign and inalienable right to use, manage and exploit their forests in accordance with their development needs and their level of economic and social development.

The development of environmental law as a new instrument for protecting the environment, essential for human health and well-being, undoubtedly embraces the fundamental values enshrined in public declarations of rights and freedoms.

The laws of nature have led to long debates about whether people have adequate environmental rights.

At the international level, several declarations affirm the recognition of the human right to the environment, underlining the fundamental importance of the environment for human beings. In this context, the Stockholm Declaration (1972) states that “people have the fundamental right to freedom,

equality and adequate conditions of life, in which the quality of the environment allows them to live in dignity and well-being".
The African Charter on Human and Peoples' Rights (Nairobi - 28 June 1981) was promulgated in art. 24: "All peoples have the right to an adequate environment, conducive to their development" (Kamto, 1996).
In Western democracies, several constitutions revised after 1972 introduced new human rights in the field of the environment, such as: the Constitution of Greece (1975) - in art. 24; the Constitution of Portugal (1976) - in art. 66; the Constitution of Brazil (1988), in art. 285.
In its advisory opinion of 8 June 1996, the International Court of Justice stated: "The environment is not an abstraction, but, of course, the space in which people live and on which the reality of their lives, their health and that of future generations depend." Consequently, the environment, a reality universally expressed over the last thirty years, has been transformed into a set of international and national rules which, in fact, form the basis of a new fundamental human right. The values related to the protection and good management of the environment are closely linked to the satisfaction of essential needs (water, air, food). September Inside, Essential Needs People are conditioned by the wider natural balances of the biosphere and, implicitly, by the impact of human activities on the natural environment and natural resources. Therefore, protecting the environment and respecting ecological rules have become a vital imperative, linked to the fundamental right to life.
Biological balance, biodiversity, awareness of the role that species of flora and fauna play in maintaining this natural balance are essential for the survival of humanity.
The environment, its protection, also acquires the status of a fundamental right, because it becomes an expression of public policy of collective interest, of solidarity not only within the state, but also at the international level (protection of the human environment, coastal zone, protection of the ozone layer).
Thus, the environment reflects a social value, an ethics, a collective responsibility imposed not only on states, but also on all economic and social actors. Environmental movements, moreover, are supported and influenced by a strong popular movement accompanied by NGOs, and in some countries by the environmental party. For both scientific and social reasons, the environment, legally organized through a series of international conventions and (largely similar) national laws, has acquired political legitimacy, while at the same time being enshrined in the highest rule of the hierarchy of law, namely in the constitution, as a fundamental right.
This enshrining is done at the constitutional level in many countries, something that I mentioned earlier, perhaps especially in connection with the French Constitution.
The French government, at the initiative of the President of the Republic, decided to include environmental protection in the Constitution. Any approach to the content of the Constitution is a solemn act, but the experience of the Fifth Republic has shown that it is possible to carry out a series of constitutional reforms regarding the organization of constitutional power or other fundamental issues of society.
In 2002, the French President proposed that the French include environmental rights in a "constitutionally approved" charter, alongside human rights, economic and social rights, noting that great progress would be made.
Of course, the charter that enshrines this right is a "legislative guest" until the revision of the Constitution. We consider it important to note that this path of constitutional enshrinement demonstrates an urgency that does not allow waiting for the opportunity to revise the Constitution, as happened in Romania.
Similarly, we emphasize that the draft European Charter on General Principles for Environmental Protection and Sustainable Development contains "principles of integration and interdependence, in particular with regard to human rights and social, economic and environmental objectives". Similarly, the human right to the environment, enshrined in the document prepared by Professor M. Prieur, is recognized and guaranteed by the international community, by the Council of Europe through cases of the European Court of Human Rights, as well as by the constitutions of many of its member states (Prieur, 1993).

If environmental protection inevitably leads to the acquisition of fundamental freedoms, such as, for example, property rights or the restriction of certain easements or the restriction of movement rights in certain protected areas, this ends up, as we have shown, consolidating already recognized fundamental rights or expanding other concerns (Guudiro, 1974).
Environmental rights were initially linked e of the rights to health and life; This has ultimately led to better living and working conditions (health and safety at work) and to the development of the right to rest and leisure.
However, environmental law acts as a "carrier" of fundamental rights, such as the right to information and communication, to decision-making and rights related to the right of association, thus strengthening the social and collective function of existing rights.
Law is a set of assets that bind both the state and public authorities, and individuals. Of course, environmental protection can be a justification for greater popular participation in public life and for the democratization of all procedures.
The realization of this new fundamental right can be complicated. When we talk about human rights, we have an anthropocentric vision, but environmental law refers not only to humans, but to all other forms of life and the biosphere. In a broader sense, however, we can recognize that environmental law applies to humans and all the natural elements that surround them, which constitute an inseparable ecological whole. It is, without a doubt, a healthy, high-quality environment, suitable for human development, ecologically balanced and conducive to the development of life. It is not a human right in the strict sense, but a right that can simultaneously protect the individual and the environment in which he wants to be.
Romanian legislation provides for the following guarantees:
(a) Access to information on environmental quality, which, after the finalization of the amendments to the Law on Environmental Guarantee Ordinance no. 91/2002, means “access to information relating to the environment under conditions of confidentiality established by applicable legislation”.
(b) The right to associate with environmental quality control organizations.
(c) The right to be consulted in the decision-making process regarding policies, laws and regulations in the field of mental health and the environment, as well as in the decision-making process regarding mental health and the environment. holding environmental agreements and powers, including in the fields of land use and urban planning. (d) The right to seek compensation or redress from administrative or judicial authorities, directly or through associations, in the event of direct or indirect damage, (e) The right to compensation for the damage suffered (Prier, 2003).

Conclusions

Although all these legal guarantees are more or less natural and anchored in civil law, administrative law, constitutional law or other legal provisions, it seems important to note that any person, directly or through an association, has the right to remedy or prevent such damages from becoming natural and present, and such damages are not usually considered direct damages.
This makes our legislation the main law for compensating for environmental damages caused by “positive environmental elements”, which are generally unfair in nature and therefore cannot be considered direct damages. As regards the legalization of procedural property, Article 5 refers to the idea of “actions of the people” for individuals – on behalf of a common interest – but this category of actions can only be brought against general actions affecting the legal position of an individual. On the other hand, it is noteworthy that the law has broadened the meaning of “legal matters”, recognizing that some “ideal interests” can be justified in court.
The Fundamental Law on Environmental Protection provides for broad access to environmental justice through this rule of active procedural law, while at the same time providing a real guarantee for the protection of the right previously recognized by constitutional provisions to an "ecologically healthy and balanced environment".

Abstract

This case study examines the modernization of internal auditing within the Hellenic Court of Audit, with a particular emphasis on its harmonization with the International Standards on Auditing (ISA) and its response to contemporary public sector governance reforms. By analyzing the institution's strategic initiatives and organizational changes, the study highlights the multifaceted transformation process shaped by regulatory alignment, professionalization trends, and external accountability demands. Key findings underscore three critical dimensions of change: the formal adoption of international auditing standards, the internal cultural and operational adjustments required for implementation, and the influence of external actors in reinforcing transparency and trust. Evidence gathered demonstrates that legal frameworks and best practices serve as a necessary foundation but are not sufficient in isolation. The effective modernization of internal audit functions depends largely on institutional commitment, strategic foresight, and the integration of digital tools to streamline processes and enhance audit reliability. This case contributes to the discourse on public sector audit reform by advocating for a context-sensitive, institutionally grounded, and technologically supported approach to internal audit modernization.

Key Words: Internal Auditing, International Standards on Auditing (ISA), Public Sector Governance, Institutional Reform, Organizational Culture, Transparency

Chapter 1: Introduction

In contemporary public administration, the concepts of transparency, accountability, and efficiency have gained unprecedented significance, particularly in the aftermath of financial crises that exposed systemic weaknesses in public sector management. Internal auditing, as a core mechanism of control and assurance, has evolved substantially to meet these new demands (Mekar , 2023). No longer limited to mere compliance checks, internal audit functions today are expected to contribute actively to good governance, risk management, and performance improvement (Arena & Azzone, 2009; Mihret & Grant, 2017). In this context, the role of supreme audit institutions, such as the Hellenic Court of Audit, has been redefined to align more closely with internationally recognized frameworks, particularly the International Standards on Auditing (ISA) issued by the International Federation of Accountants (IFAC).

Historically, internal auditing in the public sector had a predominantly legalistic and procedural character, focusing primarily on the regularity and legality of public expenditures (Pollitt & Summa, 1997). However, public values creation, stakeholder relationship, and comparability of the audit practices all over the world has called for change in audit methods and improvement of audit quality in conformity to the global standards (Lonsdale et al., 2011). The International Standards on Audits originally used for external audits in the private sector have gradually been applied to the public sector in order to give the structure and direction on how to approach the assessments of risks, planning of audits, gathering evidence and reporting (IFAC, 2020). They increase the reliability, independence and professionalism of the public sector audits.

The Hellenic Court of Audit (Synedrio), enshrined in the Greek Constitution, is entrusted not only with ex-post financial control but also with advisory functions and jurisdictional powers over public accounts. Since the latest reforms especially during and after the economic adjustment programs in Greece between 2010 and 2018, there has been a considerable focus on the reforms that aimed at modifying the public administration in a way that would enhance accountability efficiency, and transparency. According to Nikitas and Vasilopoulou (2022), the reforms undertaken throughout the three programmes—and subsequently during post-programme surveillance—addressed chronic deficiencies in Greece's public sector, including fragmented structures, weak coordination, excessive politicisation, and outdated human resource practices. In addition to these positive advancements such as the simplification of organizational structures, the enhancement of human resource management, policy planning and coordination, the authors assert that there is still work to be done in order to eliminate the gap and achieve EU standards in public administration performance in Greece. Law 4700/2020 marked a significant step toward introducing performance auditing practices and reinforced the Court's commitment to following the principles embedded in ISAs and related guidelines from the International Organization of Supreme Audit Institutions (INTOSAI).

However, when it comes to the practical implementation of ISAs in relation to the Hellenic Court of Audit there are certain certain factors which are legal, cultural and resource based. Furthermore, the standards give specificity to the guidelines that has to be followed, but adopting the actual procedures successfully depends on the auditors' experience, constant improvement, and the Court's capacity to tailor the processes to the Greek public sector context (Lenz & Hahn, 2015). Thus, the need to critically

assess how internal auditing functions at the Court operate in relation to ISAs is both timely and essential.

This study adopts a qualitative approach to investigate the perceptions and experiences of key actors within and around the Hellenic Court of Audit regarding the internal audit function's alignment with International Standards on Auditing. The study aims at identifying the current state, strengths and weaknesses of the internal auditing practices in the Greek public administration through interviews with auditors, compliance officers, academics, and other external observers of the Greek public administration.

Chapter 2: Theoretical Framework

Recent literature has increasingly recognized the critical role that public sector auditing plays in promoting transparency, accountability, and good governance (Bisogno et al., 2022; Degeling et al., 1996; Hay & Cordery, 2018; Lapsley & Miller, 2019; Mattei et al., 2021). Despite the expansion of scholarly interest, public sector auditing remains a relatively underexplored field, with numerous research gaps still evident, particularly regarding the international standardization and harmonization of auditing practices (Bisogno et al., 2022; Mattei et al., 2021).

The transformation of public sector auditing can be traced back to the advent of New Public Management (NPM) reforms during the 1980s and 1990s, which sought to import private sector management principles into public administration (Hay & Cordery, 2018; Manes Rossi et al., 2021). One significant outcome of NPM was the shift toward accrual accounting systems in public organizations, fostering an environment in which auditing practices became more closely aligned with corporate auditing models (Manes Rossi et al., 2021). In this context, the adoption of internationally recognized audit standards, particularly the International Standards on Auditing (ISA), gained momentum within public sector institutions.

The drive toward harmonization through the adoption of common auditing standards across different national administrations offers numerous advantages, including enhanced comparability, improved transparency, and strengthened international credibility (Manes Rossi et al., 2021). Nevertheless, the phenomenon of public sector audit standardization remains relatively understudied in the academic literature. Mattei et al. (2021) observe that while the diversity of research in public sector auditing has grown, the specific issue of standard adoption and adaptation has received insufficient scholarly attention. This gap highlights the need for further investigation into the ways public sector auditing bodies integrate private-sector-driven standards, such as the ISAs, into their frameworks.

Moreover, institutional theory provides a valuable lens through which to understand the dynamics driving the adoption of international standards in public auditing. As Mattei et al. (2021) suggest, public sector auditors face various institutional pressures—such as normative expectations from professional bodies, coercive pressures from international organizations, and mimetic tendencies to adopt practices perceived as successful—that shape their willingness to align with international auditing norms. Understanding these dynamics is crucial to analyzing how and why supreme audit institutions, including the Hellenic Court of Audit, seek to modernize their practices in accordance with global standards.

Thus, the movement toward international standardization in public sector auditing, though beneficial, is complex and multifaceted. It involves not only technical adaptation but also deeper institutional and organizational transformations. In examining the internal audit functions of the Hellenic Court of Audit through the prism of International Standards on Auditing, this study contributes to the ongoing discourse on public sector audit harmonization and offers insights into how global norms are locally interpreted and applied within specific national contexts.

Institutional theory offers a robust foundation for understanding variations in the adoption of accounting and auditing standards across different national contexts (Brusca et al., 2015). According to DiMaggio

and Powell (1983), organizational practices, including those in auditing, are shaped by three types of institutional pressures: coercive, mimetic, and normative. These forces exert a profound influence on accounting and auditing choices in both private and public sectors (Christiaens et al., 2015; Collin et al., 2009; Dacin & Dacin, 2008; Manes Rossi et al., 2016; Oulasvirta, 2014).

In the context of public sector auditing, institutional factors have been shown to significantly affect the adoption of International Standards on Auditing (Boolaky & Soobaroyen, 2017). Coercive pressures may arise from governmental bodies or supranational organizations, such as the European Union, that promote or mandate the adoption of uniform auditing standards. Although no binding EU directive currently requires the use of ISAs across member states' public sector audits, strong political interests at the national level can lead to voluntary reforms encouraging such adoption.

Mimetic pressures emerge when organizations imitate others perceived as successful or legitimate. In the sphere of public auditing, supreme audit institutions may seek to align with practices from other countries or professional models recognized for their quality and credibility. The desire to enhance audit quality, particularly when deficiencies are perceived in existing systems, strengthens the mimetic adoption of international standards.

Normative pressures are generated through the influence of professional bodies and educational institutions that establish expectations about appropriate auditing practices. National and international auditing associations, by promoting the adoption of ISAs, play a critical role in shaping public sector auditors' methodologies. The increasing professionalization of public sector auditing reinforces normative tendencies towards international harmonization (Carpenter & Feroz, 2001).

These institutional forces often interact with existing national traditions and organizational cultures. In countries with deeply entrenched public sector auditing practices, efforts to introduce ISAs may encounter resistance due to path dependence and institutional inertia (Vakkuri et al., 2006). Nevertheless, as international oversight mechanisms become stronger and public expectations for transparency rise, institutional pressures favoring standardization gain greater momentum.

In the Greek context, the modernization of the Hellenic Court of Audit's practices in line with ISAs can be understood through the lens of institutional theory. Coercive pressures from European and national public administration reforms, mimetic influences from best practices across the European Union, and normative shifts within the auditing profession collectively contribute to shaping the Court's strategic choices. Analyzing the Court's internal audit functions within this theoretical framework provides deeper insight into both the drivers of change and the challenges of embedding international auditing standards in national public sector institutions.

Chapter 3: Methodology

3.1. Research Design

This case study draws on a small-scale, interview-based investigation to explore the perceptions and experiences of key stakeholders involved in the internal auditing practices of the Hellenic Court of Audit, particularly in relation to its alignment with the International Standards on Auditing (ISA). Given the focus on individual insights and institutional dynamics, the research was designed to capture the complexity and depth of issues surrounding public sector auditing reform, the adoption of professional standards, and processes of organizational change. By engaging with five participants who hold relevant roles within or in connection to the Court of Audit, the study offers a focused yet meaningful exploration of how modernization efforts are understood and enacted in practice. Emphasizing the subjective experiences of these individuals, the research adopts an interpretive orientation, aiming not at statistical generalization, but at shedding light on the nuanced ways in which professionalization and reform unfold within a specific institutional setting.

3.2. Data Collection Method

Data collection was conducted through semi-structured interviews, a widely used method in qualitative research that combines the flexibility of open-ended inquiry with a systematic thematic structure. A research guide included eight open-ended questions for the study (Appendix A). The research questions were specifically designed to help participants think deeply about their encounters and thoughts concerning internal audit reforms and the Court's progress with ISA adoption. Each interview took place alone to protect participant freedom during self-expression without outside interference. The participants provided consent to recording sessions which lasted between 45 to 60 minutes. Field notes were also maintained to record non-verbal cues and contextual factors.

3.3. Sampling Strategy

The case study employed purposive sampling, selecting participants based on their knowledge, expertise, and direct involvement in public sector auditing and governance. The sample consisted of five individuals representing different but complementary perspectives:

- A senior auditor currently employed at the Hellenic Court of Audit,
- An official responsible for compliance and quality assurance,
- An academic specializing in public administration,
- A senior official from the Ministry of Finance,
- A representative of an independent oversight body.

3.4. Data Analysis

The data collected through the interviews were analyzed using thematic analysis, following the six-phase model proposed by Braun and Clarke (2006). Multiple readings of the interviewed transcripts led to achieving immersion in the data. Researchers manually produced initial codes through identification of significant phrases and concepts and research objective-related ideas. Codes were then organized into broader themes, and thematic patterns were identified across the dataset.

Three main analytical axes emerged from the thematic synthesis: (1) Institutional Frameworks, Professionalization, and Standardization Pressures; (2) Challenges, Adaptation Processes, and Organizational Culture; and (3) External Engagement, Transparency, and Future Strategic Directions. The analytical axes group selected themes obtained from participant responses to create a unified and complete data representation.

3.5. Ethical Considerations

Ethical principles guided the entire research process. The study explained its research objectives to participants who were free to withdraw without negative impacts throughout the research process. The study design protected participants through absolute confidentiality together with anonymity because researcher reports omitted any personal information. All participants signed the informed consent documents before interview sessions began (Appendix B). The gathered data received proper secure storage treatment and existed exclusively for research within this study.

Chapter 4: Findings from the Interviews

4.1 Institutional Frameworks, Professionalization, and Standardization Pressures

The first major thematic axis emerging from the interviews concerns the critical influence of institutional frameworks, professionalization efforts, and external standardization pressures on the evolution of internal auditing within the Hellenic Court of Audit. Participants observed that Court modernization resulted from three main factors which included national legal elements alongside international standards together with evolving stakeholder requirements.

A key factor highlighted by multiple respondents was the importance of legal and regulatory frameworks in directing the Court's internal audit transformation. As the senior official from the Ministry of Finance noted, *"Internal auditing reforms work best when auditors have operational autonomy and are protected from political or administrative interference."* The statement embodies the shared understanding among participants about how an effective internal audit system demands technical enhancements in addition to strong institutional protection for independence along with objectivity. Most participants noted legislative evolutions in Greece which followed European directives and international governance standards as fundamental elements to improve the Court's operational context.

Another strong current across the interviews was the recognition of the decisive role played by professional standards in shaping internal audit practices. The compliance officer reflected that, *"We now have internal reviews, quality control checklists, and occasional peer reviews,"* illustrating the formal adoption of standardized procedures. Multiple respondents pointed out that the existing formal systems exist but implementing them across daily operations happens slowly and it proves difficult. The academic participant succinctly captured this tension, emphasizing that, *"Formal procedures exist, but real quality assurance requires more than checklists; it requires fostering a critical mindset among auditors about their own work."* The observer points out professionalization extends beyond procedural compliance to involve the development of reflective critical auditing methods which identify risks for the professionals.

Every participant recognized international auditing standards and particularly the ISAs as primary factors driving court-based internal transformation. As the senior auditor stated, *"Other government bodies are more willing to collaborate with us because they recognize that our methods are internationally recognized and rigorous."* The Hellenic Court of Audit's implementation of ISAs improved its domestic and international reputation which enhanced its ability to work smoothly with external partners. Similarly, the oversight body representative asserted that, *"Aligning with ISAs has raised the profile of the Hellenic Court of Audit considerably,"* pointing to the reputational benefits associated with adopting globally accepted audit frameworks.

The research participants noted that proper integration of international standards demanded an equilibrium between global expectations and home institution demands. The compliance officer warned that, *"It's important to adapt standards thoughtfully to the institution's particular legal and operational context — blind imitation doesn't work."* The Court's experience reveals a fundamental lesson that adapting international frameworks requires institutions to customize them according to their historical, legal and operational features for successful implementation.

The interviews show that internal audit activity changes at Hellenic Court of Audit have developed through the merging of institutional changes with professional enhancement efforts and global auditing requirements. The process of embedding sustainable changes continues to need internal cultural changes and operational independence as well as context-specialized adaptations.

4.2 Challenges, Adaptation Processes, and Organizational Culture

Interview results show that Hellenic Court of Audit faced internal obstacles throughout its transformation to international standards alongside necessary cultural changes for successful modernization. Research participants shared different hurdles and inconsistent elements alongside shifting operational patterns through which the Court of Audit progressed.

The study participants frequently noted that internal auditing standards receive inconsistent implementation between organizational departments. As the senior auditor observed, *"Some audit teams apply the standards rigorously, while others could benefit from further support and supervision."* The variable application indicates a need to establish organizational-wide quality and compliance culture.

The majority of respondents pointed out challenges in establishing cultural metamorphosis that extended past basic procedural requirements. The established quality assurance methods receive criticism because they are primarily seen as bureaucratic systems instead of growth-oriented instruments. The compliance officer noted, *"There is sometimes a tendency to treat quality assurance as a procedural obligation rather than an opportunity to learn and enhance our effectiveness."* The statement shows a fundamental conflict between following official requirements versus truly adopting the ongoing development philosophy which international standards intend to promote.

Participants emphasized that building organizational capacity plays a vital role in resolving the limitations participants face during adaptation processes. As the academic highlighted, *"Embedding a culture of critical self-assessment is an area where further progress would strengthen the Court's internal audit function even more."* The findings indicate professional advancement needs more than basic training because auditors need to deeply investigate their methods and maintain continuous development of their techniques.

The answers of the interviews focused on the significance of auditors along with their leadership roles in producing adaptation results. The representative of the independent oversight body remarked that, *"In practice, the effectiveness sometimes depends heavily on the individuals involved."* This underlines the vulnerability of reforms to variations in personal commitment, skill levels, and attitudes toward change, further reinforcing the need for systematic organizational strategies to embed reforms institutionally rather than personally.

Furthermore, interviewees discussed the need to institutionalize independent, systematic quality assurance practices to ensure that adaptation efforts are sustained over time. The oversight body representative stated that, *"Building a stronger system where quality assurance is independent, systematic, and fully embedded into the audit cycle would elevate the Court's internal audit performance even further."* This comment illustrates that adaptation is not a one-time achievement but requires continuous vigilance, investment, and integration into routine organizational operations.

The Hellenic Court of Audit's international standards transition was primarily influenced by both external requirements and multiple internal operational influences. The transformation of organizational cultural norms requires overcoming obstacles due to varied implementation approaches as well as procedural rigidity alongside insufficient capacity development and unique employee behaviors combined with a necessity to establish system-wide quality assurance systems. While significant progress has been made, the interviews show that the internalization of international best practices remains an ongoing, evolving process that demands sustained effort, leadership commitment, and organizational resilience.

4.3 External Engagement, Transparency, and Future Strategic Directions

The third thematic axis arising from the analysis highlights the growing significance of external engagement, transparency, and the strategic orientation of the Hellenic Court of Audit in shaping its internal auditing modernization efforts. Participants emphasized how external relationships, public trust, technological modernization, and future governance challenges increasingly influence the Court's internal processes and priorities.

A dominant theme was the positive impact that alignment with international standards had on strengthening external relationships. The senior auditor noted that, *"Other government bodies are more willing to collaborate with us because they recognize that our methods are internationally recognized and rigorous."* The Court's acceptance of international standards marks a wider change in how institutional stakeholders view it while enabling a common basis for dialogue and administrative cooperation among stakeholders.

The compliance officer similarly observed that *"Ministries, regulatory authorities, and even European institutions now speak the same 'audit language' with us,"* pointing to how shared standards have enhanced communication and fostered smoother interactions. The respondents emphasized that the resulting mutual comprehension between judges and government officials resulted in strengthened respect toward Court recommendations that reinforces the Court's place in governing systems.

Public trust, although slower to build, was also identified as an area influenced by these reforms. The academic participant highlighted that, *"Citizens may not know the details of ISA alignment, but they do notice when public reporting becomes clearer, more professional, and more transparent."* The direct influence of professional auditing on public views about government transparency emerges indirectly through its audit practices.

The survey participants equally supported continuing strategic modernization by implementing technology systems and joining governance platforms in the future. The senior official from the Ministry of Finance emphasized that, *"We also need to see more investment in technology — including audit analytics and automated risk assessments — to improve efficiency and depth."* The modern public sector demands internal audits to depend on digital tools which become fundamental features that boost audit quality and strategic meaningfulness while promoting full transparency.

Moreover, the oversight body representative stressed the importance of external validation mechanisms, noting that, *"Early and consistent engagement with external stakeholders helps build credibility and ensures that standardization is not just an internal effort but also recognized externally."* The Court necessary public interaction to achieve both internal reform success and external visibility that strengthens its position as an authority in governance activities.

Participants understood future strategic directions need to consider developing predictions about governing trends especially regarding digital resilience and ESG reporting and public-sector modernization initiatives. As the Ministry of Finance official stated, *"Aligning internal audit more closely with emerging EU governance frameworks would future-proof the Court's relevance."* This indicates a forward-looking awareness that internal auditing modernization must be dynamic and responsive to evolving societal and regulatory expectations.

The interviews show that modernization work at the Court links closely to institutional credibility and public transparency and technological progress as well as international governance trends. To maintain and increase these progress indicators the implementation of internal audit reforms needs proactive strategic methods which actively engage external parties.

Chapter 5: Discussion

The findings of this study provide valuable insights into the internal auditing transformation at the Hellenic Court of Audit, particularly its efforts to align with the International Standards on Auditing (ISA) and to modernize its internal practices. These results are broadly consistent with the trends, tensions, and opportunities identified in the contemporary literature on public sector auditing, institutional change, and governance reforms.

Firstly, the study confirms the critical role that institutional frameworks and professionalization efforts play in supporting internal auditing modernization. In line with the participants of the focus group, it was suggested that legal requirements and external standardization pressures as the reasons for the Court's development – a conclusion consistent with the Mattei et al. (2021) argument that the legal reforms and the process of standardization have played a significant role in shaping the changes in the auditing sector of the European public sphere. It also shows that regulation and the integration of International Auditing Standards have had a major influence on the process of modernisation of public sector auditing, as stated and described by the interviewed participants in this study. Similar to the conclusion that was made by the official of the Ministry of Finance, Cordery and Hay (2024) argue that

ecosystem-driven reforms significantly impact the quality of audit in the public sector and that it is necessary to preserve auditor independence in the contemporary setting of the public accountability.

Moreover, the emphasis placed by participants on the challenges of cultural change and internal adaptation resonates with findings in the literature on New Public Management (NPM) and its influence on auditing practices. Thus as Hay and Cordery (2018) indicate there were reform of accrual accounting and auditing standards under the NPM reforms but reforms of professional culture were slower and more profound. It was also observed that the implementation of quality assurance mechanisms often hindered by the employees view it more as compliance requirements and not as developmental tools This is in line with the view of Mihret and Grant (2017) who noted that internal audit reforms are resisted where they are perceived to be stemming from external authority rather than internal organizational changes. In the same way, Otto-Mentz et al. (2022) pointed out that internal audit must transition from a compliance model to a transformational and developmental one to be relevant to organizational governance and sustainability.

An important contribution of this study lies in its documentation of the gradual but positive influence of international standards on external relationships and public trust. The Court obtained better communication capabilities with governmental bodies and international organizations through their alignment with ISAs according to observations made by Boolaky and Soobaroyen (2017). Public confidence has steadily grown because reporting methods have become both clearer and more transparent according to the survey responses. This perception matches the democratic accountability arguments presented by Cordery and Hay (2024) about standardization techniques.

Another dimension worth highlighting is the role of technology and future strategic orientation in sustaining modernization efforts. As pointed out by Stein and Cunha (2024), the participants of the study stressed that cultivating a professional skepticism and risk perception before an event is the key to increasing the efficiency of internal audits. While technology and digital audit tools were shown to be enablers, participants claimed that embracing these tools without adopting a proper critical outlook on new risks impedes audit functions from being proactive and turning them into more of a mere issue responding activity for governance issues.

However, this study also identified certain gaps and tensions that remain underexplored in the existing literature. In contrast to other researches where it is assumed that political pressure from the EU level is the main driving force for reform, this study aims to state that internal commitment and cultural marketing are as important for the real and permanent introduction of IS. This observation resonates and builds upon the findings of Nerantzidis et al. (2020) where he or she posited that the future studies on auditing in the public sector should consider how institutional forces and internal organizational processes play out in enhancing the efficacy of auditing reforms.

Thus, the results of this study support and develop the existing theories on modernization of public sector auditing. These concepts include regulation, professionalization, culture, external relations, and anticyclical visioning. This work not only reports on empirical data gathered from interviewees' experience but also supports the findings with advanced conceptual knowledge about the process of internationalization and modernization of auditing institutions in the public sector, including practical recommendations on how the Hellenic Court of Audit can follow this path without losing its legitimacy, effectiveness, and public support.

Chapter 6: Conclusions and Recommendations

This case study explored the evolution of internal auditing practices at the Hellenic Court of Audit, focusing particularly on its alignment with the International Standards on Auditing (ISA) and the broader challenges of modernization in public administration. This study therefore involved the analysis of semi structured interviews with auditors, officials of compliance, policy makers, academics, and

representatives of oversight that made up the primary data collection method; thus offered a rich and multi perspective comprehension of institutional transformation.

The analysis shows that the internal auditing reforms of the Court were influenced by legal factors and requirements, professional codes and external demands for conformity. As in similar studies carried out in other countries, it was thus realized that regulations, political support for institutions' autonomy, and compliance with international best practices are key factors that contribute to credibility and professionalism.

However, the case study also revealed that the process of adaptation was neither linear nor uncontested. Challenges related to cultural change, uneven application of standards, and initial resistance to internal quality mechanisms were recurrent themes. The transition to international standards demanded not only technical compliance but also significant investment in organizational culture, professional development, and strategic leadership.

Moreover, the Court's alignment with ISAs significantly enhanced its interactions with external stakeholders, improving transparency, collaboration, and public trust. However, the participants warned that the future success would only be achievable through sustained strategic progression which is characterized by investments in audit technologies, risk-based approaches, and compliance with the new and advancing European governance models.

Overall, the Hellenic Court of Audit demonstrates that the process of internal audit improvement in the context of the public sector's environment should involve both external directions and internal initiatives. Technical changes on their own will not suffice; they need to be linked into a developing organisational culture where learning, professionalism and strategic interaction with the other components of governance is cherished.

Based on the conclusions drawn from this study, the following general recommendations can be made for the further enhancement of internal audit function in the Hellenic Court of Audit and some suggestions for the improvements of practice of other similar institutions of the public sector that are in the process of modernization.

First and foremost, the Court should deepen the professionalization of its internal auditors. There is a pressing need to expand continuous training programs that move beyond technical compliance and emphasize the development of critical thinking, strategic risk assessment, and evaluative judgment. Cultivating a more analytical and reflective auditor mindset will contribute to fostering a culture of excellence and innovation within the organization.

Equally important is the institutionalization of independent quality assurance mechanisms. Quality control processes should be embedded structurally within the audit cycle, ensuring that audits undergo systematic and impartial evaluations. These mechanisms should not only be conceived and disseminated as deterrent measures and tools, as is commonly done, but rather as enriching educational processes and frameworks for constant learning within the organization. Enhancing the and additional checks and verifications of peer reviews along with post audits would add more strength and reliability to other internal audits.

Another priority is the promotion of organizational cultural change. Procedural reforms alone are insufficient unless accompanied by efforts to embed a mindset of critical self-assessment, accountability, and commitment to ongoing development. The leadership in the Court should ensure that they are keen and support the modeling, encouragement, and reinforcement of reflexivity that is in congruence with these findings and the best practices entailing strategic goals.

Also, the Court should spend a considerable amount of money on information technology and related solutions. The application of audit analytics, data-based risk assessment tools and integrated information

system will improve the effectiveness, accuracy and credibility of audit work. This means that technology has to be seen and used as an enabler as opposed to a mere add-on when pursuing modernization, so that the resulting solutions will be sound and scalable.

In addition, external engagement and communication should be strengthened. Transparent and open communication channels with citizens, oversight bodies, and international organizations are vital for reinforcing the Court's public legitimacy. By participating actively in international auditing networks and enhancing the visibility of its reports and outcomes, the Court can further align itself with contemporary standards of transparency and accountability.

Finally, it is needed to mention that the Court should respond to the existing trends in the sphere of corporate governance by adapting its practices accordingly. The Court will be able to remain relevant and deliver on its role and functions within the changing European and global governance frameworks when it incorporates priorities such as digital resilience, ESG reporting, and sustainability auditing into its strategic planning.

Thus, following these directions, the Hellenic Court of Audit can continue and expand its successes and build a model of internal audit for the public sector and to serve as a source of experience to other institutions that are traveling the same path of reform.

STRATEGIC IMPORTANCE OF THE ORGANIZATION OF TURKISH STATES IN THE MULTIPOLAR WORLD ORDER

Leyla Nabiyeva

E-mail: leyla.turqay1115@mail.ru

ORCID: 0009-0002-8121-2269

Abstract

The article analyzes the growing strategic importance of the Organization of Turkic States (OTS) in the contemporary multipolar international system. The changing global balance of power, the intensification of competition between the US, China and Russia, as well as global challenges such as energy security, climate change and regional conflicts have increased the importance of regional alliances. In this context, the OTS has become a functional organization that is not limited to cultural and symbolic ties, but also achieves real results in the fields of energy, transport, digital economy and diaspora policy. Azerbaijan's geopolitical initiatives, Turkey's activism and the increasingly open policies of Central Asian countries have increased the OTS's flexible and practical influence. The article also emphasizes the organization's important role in terms of regional stability and global visibility, based on specific examples such as energy projects, the Trans-Caspian Corridor, the Turkish Investment Fund and the OTS's activities on international platforms. As a result, the OTS, while protecting the national interests of its member states, is gaining the status of an emerging actor as an alternative integration model in the multipolar order.

Keywords: Organization of Turkic States, multipolar world, energy security, regional cooperation, strategic integration.

INTRODUCTION

Rising power in a multipolar world order: OTS

– the export volume, which was 8.2 billion cubic meters in 2021, has already increased to 11.4 billion cubic meters in 2023. Azerbaijani gas is mainly transported to the European market through the Southern Gas Corridor – the TANAP and TAP pipeline networks [1].

Moreover, Central Asia is distinguished by its rich hydrocarbon reserves, especially the natural gas and oil reserves of Kazakhstan, Turkmenistan and Uzbekistan. Kazakhstan is one of the world's leading oil and transport. In this context, the Trans-Caspian route – the organization of energy and cargo transportation across the Caspian Sea – comes to the fore as an alternative energy route for Europe. At

BEHAVIORAL DYNAMICS IN GLOBAL PROJECT MANAGEMENT: A GLOBE-BASED STUDY OF AZERBAIJAN

Khayala AHMADOVA

Department of Business Administration, Azerbaijan University of Architecture and Construction

E-mail: ahmadovakhayala81@gmail.

ORCID ID: 0009-0006-5207-7941

Abstract

This study examines the behavioral dynamics of global project management through the perspective of national culture, focusing on Azerbaijan as a case study. Using the nine-dimensional GLOBE framework, it explores how cultural values and practices influence leadership, communication, and team interaction in international project settings. The findings reveal a hybrid cultural profile characterized by high In-Group Collectivism and Power Distance, moderate levels of Uncertainty Avoidance, Future Orientation, and Performance Orientation, and relatively low Gender Egalitarianism and Humane Orientation. These cultural tendencies shape collaboration patterns, decision-making styles, and leadership preferences within project teams. The results indicate that national cultural dimensions present both opportunities and constraints for effective project collaboration. High collectivism enhances mutual trust, loyalty, and social cohesion, facilitating integrative teamwork and communication. At the same time, deeply rooted cultural norms may limit spontaneity and open dialogue in diverse project settings. Moderate uncertainty avoidance and future orientation support adaptability, goal alignment, and structured coordination. Overall, the study highlights that cultural characteristics function as a double-edged factor—enabling cooperation and shared understanding while occasionally constraining flexibility and innovation. It contributes to cross-cultural project management research by clarifying how cultural opportunities and limitations jointly shape behavioral integration in global project environments.

Keywords: Global project management, cultural dimensions, GLOBE framework, Azerbaijan, behavioral dynamics, cross-cultural communication, team integration

INTRODUCTION

The economic liberalization of the 1980s greatly accelerated globalization, intensifying the interdependence among international enterprises and management systems. As a result, employees from diverse cultural backgrounds increasingly collaborated within heterogeneous teams. This required managers to consider not only linguistic differences but also distinct business practices, perceptions of time, behaviors, and traditions (Rothlauf, 2015). Consequently, awareness of cultural "diversity" and readiness for "cross-cultural transformation" became essential prerequisites for effective global management. In this context, intercultural management came to be understood as the integration of relevant knowledge and competencies across regional, national, and organizational boundaries (Karlshaus & Mochmann, 2019).

Managing global projects represents a multifaceted process involving individuals who possess different mindsets and working methods. Project managers, therefore, must formulate strategies that effectively address cultural diversity within restricted time frames (Huang, 2016). In other words, successful global management depends not only on technical coordination but also on intercultural competence (Pant & Baruodi, 2008). Hofstede defines culture as a system of shared mental codes that distinguish one community from another, emphasizing that "culture is learned, not inherited; it originates from one's social environment rather than one's genes" (Hofstede, 2001). Cultural distinctions become particularly visible when multinational teams interact. According to Rothlauf (2015) and Becker (2016), effective diversity management requires establishing an environment where every individual can contribute their potential meaningfully toward organizational objectives, while maintaining flexible and adaptive communication practices. Hence, achieving successful outcomes depends on leaders' ability to recognize and manage culturally diverse behaviors in all their complexity (El-Sabaa, 2001). The GLOBE (Global Leadership and Organizational Behavior Effectiveness) framework offers a valuable theoretical foundation for anticipating cultural mismatches and shaping appropriate leadership approaches. Initiated in the 1990s, the GLOBE project sought to systematically examine the ways in which cultural values influence leadership effectiveness, organizational performance, and societal competitiveness. Drawing on a comprehensive, cross-national study involving more than 200 scholars and incorporating theoretical, statistical, and qualitative insights, the GLOBE research conceptualized culture through nine primary dimensions (Dorfman et al., 2012), including Power Distance, Collectivism, and Future Orientation. Based on these dimensions, Gupta et al. (2002) identified ten major cultural clusters—Anglo, Latin Europe, Nordic Europe, Germanic Europe, Eastern Europe, Latin America, Sub-Saharan Africa, Arab, Southern Asia, and Confucian Asia—formed according to factors

such as geographic proximity, migration-related social capital, and shared cultural or religious traditions (Furnham et al., 1994; Portes & Zhou, 1994; Cattell, 1950). These clusters were subsequently refined with additional variables such as social relations, values, work practices, and levels of economic and socio-political development (Haire et al., 1966; Ronen & Shenkar, 1985; Chemers et al., 2001). Altogether, the framework provides both theoretical and empirical underpinnings for the comparative study of cross-cultural management and global leadership models.

Formulating an effective international strategy and harmonizing global management values with local corporate visions remain critical challenges for Azerbaijan today (Reibstein, 2016). Historically, Azerbaijani management practices were shaped by centralized administrative traditions that emphasized collectivism and hierarchical power distance. Following the dissolution of the Soviet

Union, however, Azerbaijan embarked on a transformative phase marked by significant changes in team management, organizational governance, and individual leadership approaches (Crosby & Bryson, 2005). The signing of the "Contract of the Century" in 1995 marked a turning point, dramatically increasing the inflow of foreign investment and attracting numerous transnational corporations to the local market (Aliyev, 2020). This historical milestone reshaped the foundations of Azerbaijan's management culture. The forces of globalization further accelerated these transformations, revealing the strategic importance of cross-cultural management competencies within organizations. Consequently, strategic foresight in management has become an essential driver of social and economic development across all sectors (Daft, 2017). Local enterprises newly integrated into the global economy now find themselves in direct competition with international firms (Watrin, 1998). In this environment, Azerbaijani professionals engaged in global projects must cultivate adaptive strategies that enable effective collaboration with colleagues operating under diverse cultural paradigms. Achieving competitiveness in the international arena therefore depends on developing well-calibrated international strategies and ensuring the alignment of global management principles with local corporate values and visions (Reibstein, 2016). Against this backdrop, the present study seeks to address both theoretical and practical gaps by examining cross-cultural leadership strategies within the framework of the GLOBE model, specifically as they apply to the Azerbaijani context.

Most research on Azerbaijani culture to date has centered on ethnographic, historical, or folkloric dimensions. Yet within the fields of modern management and organizational behavior, empirical studies exploring cultural dimensions remain scarce. This gap poses significant challenges for contemporary corporate leadership and management in the country. Global experience suggests that unplanned and unsystematic efforts to integrate different cultures seldom foster cohesive social structures or facilitate effective mechanisms of interaction among members (Pfeffer, 2015). In this respect, the GLOBE (Global Leadership and Organizational Behavior Effectiveness) framework offers particular relevance to Azerbaijan. Since Azerbaijan was not included in the original GLOBE research sample, its cultural profile has yet to be empirically classified within that model. Neighboring countries such as Georgia, Russia, and Kazakhstan have been placed within the Eastern Europe cluster, while Turkey, Egypt, Qatar, Morocco, and Kuwait have been classified within the Middle East cluster. Azerbaijan, however, remains unassigned to any cluster, underscoring a significant research gap. Therefore, the present study aims to apply the nine cultural dimensions of the GLOBE model to (1) identify Azerbaijan's national cultural profile, (2) assess its potential participation in international projects, and (3) analyze areas of compatibility and possible risks within the broader context of global cooperation.

MATERIALS AND METHODS

Ethics

The study was carried out in full accordance with the ethical standards outlined in the Declaration of Helsinki (1975, revised 2013). Ethical approval was granted by the Ethics Committee of the Psychology Research Institute in Baku. Participation in the study was entirely voluntary, and all respondents were informed in advance about the objectives, procedures, and content of the research.

Design / Method / Approach

This study employed a mixed-methods design to examine the nine cultural dimensions of the GLOBE model within the Azerbaijani context. The theoretical foundation of the research was informed by existing scholarship on cultural dimensions and leadership within the GLOBE framework. Quantitative

data were gathered from Azerbaijani respondents through GLOBE-based cultural surveys that incorporated self-report measures of multilingual proficiency, international exposure (such as study, work, or training abroad), and adaptation to multicultural environments. The dataset was analyzed using correlation and regression techniques to identify key relationships and moderating effects among the variables. Accordingly, the methodological design integrates empirical data analysis with a strong theoretical grounding, generating meaningful insights into how individuals and groups in Azerbaijan engage in cultural integration within global project environments.

Data Analysis

In this study, Pearson correlation analyses were employed to explore the relationships among respondents' levels of comfort in cross-cultural communication, foreign language proficiency, multicultural experience, and the cultural dimensions measured by the GLOBE questionnaire (Northouse, 2013). The internal consistency and reliability of the scales were evaluated through Cronbach's alpha (α) coefficients. All statistical procedures were conducted using IBM SPSS Statistics, Version 27.

Participants

A total of 443 respondents participated in the study. Among them, 35.9% (n = 159) were residents of the capital city, Baku, while 64.1% (n = 284) were from various economic regions across Azerbaijan. The mean age of participants was 32.6 years (SD = 10.4). The sample comprised 81.3% women (n = 360) and 18.7% men (n = 83).

Regarding to language proficiency, 2.7% (n = 12) of respondents reported speaking only their native language, 33.4% (n = 144) reported proficiency in one foreign language, 46.9% (n = 202) in two foreign languages, and 19.7% (n = 85) in three or more. In terms of multicultural experience—including education, training, or work abroad—41.5% (n = 184) indicated having such experience, whereas 58.5% (n = 259) did not.

Regarding adaptation to different cultures, 5.6% (n = 25) of participants reported feeling completely alien in new cultural environments, 7.2% (n = 32) reported experiencing significant adjustment difficulties, 60.7% (n = 269) indicated some challenges but eventual adaptation, and 26.4% (n = 117) described feeling very comfortable in multicultural contexts.

Measure

The GLOBE (Global Leadership and Organizational Behavior Effectiveness) project was initiated by Robert J. House in 1991 and subsequently expanded to include empirical data from 62 societies (House et al., 2004). The project aimed to elucidate how cultural norms shape leadership behaviors and organizational outcomes by systematically examining the interrelationships among culture, leadership, and organizational behavior. Within the GLOBE framework, cultural variability is captured through nine fundamental dimensions, such as Power Distance, Collectivism, and Future Orientation, among others (House et al., 2004). Unlike earlier cultural frameworks proposed by Hofstede (1980) and Trompenaars (1993), the GLOBE model distinguishes between cultural practices ("as is") and cultural values ("should be"), thereby offering a dynamic and multidimensional approach to understanding cultural diversity (House et al., 2002; Javidan & House, 2001).

In the present study, the Dimensions of Culture Questionnaire (Northouse, 2013)—an adaptation of the GLOBE framework—was employed to assess participants' perceptions of existing cultural practices. In contrast to the original GLOBE study, this instrument measured only perceptions of current practices ("as is"), without assessing normative expectations ("should be"). Each cultural dimension was operationalized through two items rated on a seven-point Likert scale (1 = strongly disagree to 7 = strongly agree), and mean scores were computed to represent participants' evaluations. This simplified format maintained theoretical consistency with the GLOBE framework while improving methodological efficiency. It is important to note that only the cultural dimensions were analyzed; the Culturally Endorsed Leadership Theories (CLTs) component of the original GLOBE project was intentionally excluded. Accordingly, this study concentrated on exploring perceptions of Azerbaijan's cultural dimensions as reflected in respondents' lived social experiences.

RESULTS

1. The analysis of the survey data revealed a distinctive cultural configuration for Azerbaijan across the nine GLOBE dimensions, reflecting both regional similarities and context-specific characteristics. The results supported the expected multidimensional structure of the instrument, with several dimensions demonstrating satisfactory internal consistency.

Table 1: Descriptive Statistics. The results of the Azerbaijani sample revealed the following indicators

Reliability analyses indicated that In-Group Collectivism (α = .788), Humane Orientation (α = .859), Performance Orientation (α = .710), and Future Orientation (α = .686) achieved acceptable levels of internal consistency. In contrast, Power Distance (α = .594) and Uncertainty Avoidance (α = .507) fell slightly below the conventional reliability threshold. Cronbach's alpha coefficients were interpreted in accordance with the recommendations of Nunnally (1978) and Hair et al. (2010).

Meanwhile, Assertiveness (α = .499), Institutional Collectivism (α = .441), and Gender Egalitarianism (α = .268) exhibited relatively low reliability, suggesting that interpretations for these dimensions should be approached with caution. Such reduced reliability may reflect the semantic complexity of certain items or difficulties in interpreting abstract and reverse-worded statements within the Azerbaijani sociocultural context. (See Table 1 for detailed results.)

Table 2: GLOBE study culture dimensions (House et al., 2004) examined in Correlations Foreign language skills

Table 3: GLOBE study culture dimensions (House et al., 2004) examined in correlations International (Work, Education, and Other) Experience

Table 4: GLOBE study culture dimensions (House et al., 2004) examined in correlations adaptation to Different Cultures

FINDINGS

The findings indicate that Azerbaijan exhibits a hybrid and transitional cultural profile, integrating features of both the Middle Eastern and Eastern European clusters. This hybridity suggests that regional cultural patterns within the GLOBE framework are more fluid and context-dependent than traditionally assumed. The observed social capital–innovation paradox further illustrates that while strong interpersonal networks enhance collaboration and trust, they may at times constrain the adoption of

innovative practices. This dynamic underscores the multifaceted role of social and cultural capital in shaping organizational behavior.

Furthermore, Azerbaijan's transitional environment—shaped by ongoing economic transformation and expanding global cooperation—emphasizes the evolving nature of cultural values. These developments reinforce the perspective that culture should be understood as a living, adaptive system within the GLOBE approach, continuously reshaped by socioeconomic and institutional change.

Variables	Levels
Hybrid Cluster Profile	Azerbaijan exhibits cultural characteristics that align with both the Middle East and Eastern Europe clusters identified in the GLOBE framework. This hybrid positioning suggests that Azerbaijan occupies a transitional cultural zone, reflecting the historical, geopolitical, and socio-economic linkages connecting these regions. Such hybridity underscores the need for a more nuanced and configurational interpretation of the GLOBE model when applied to regional and cross-border contexts.
Social Capital–Innovation Paradox	Personal social networks can serve as a powerful mechanism for strengthening teamwork and collaboration; however, they may simultaneously impede the adoption of innovative practices. This paradox illustrates the dual function of cultural and social capital within organizational behavior—acting both as a facilitator of cohesion and as a potential constraint on change and creativity.

Transitional Culture	Socioeconomic transformations—most notably those driven by the oil-based economy and expanding global cooperation—have generated dynamic shifts in Azerbaijan's cultural indicators. These developments highlight the importance of viewing culture as a flexible and evolving system within the GLOBE framework, rather than as a static set of values or practices.

Table 5: The findings

DISCUSSION AND CONCLUSION

1.The results of this study indicate that Azerbaijan's cultural configuration embodies both parallels and divergences when compared with the Middle East and Eastern Europe clusters of the GLOBE framework. While certain value orientations align with those regional profiles, Azerbaijan's distinctive historical trajectory and socio-political transformation have contributed to the emergence of a unique cultural pattern. This distinctiveness underscores the importance of situating Azerbaijan within a broader yet context-sensitive interpretation of regional cultural dynamics.

High In-Group Collectivism (M = 5.27) emerged as one of the strongest dimensions of Azerbaijani culture, suggesting that collectivist values remain deeply rooted in social behavior (Earley & Gibson, 2002). In-group collectivism represents a cultural orientation that prioritizes group interests over individual goals and promotes consensus and harmony in decision-making processes (Earley & Gibson, 2002; Hofstede, 2001). Within the context of global project teams, the influence of this dimension exhibits a dual character. On one hand, strong collectivist orientation fosters cohesion and loyalty, ensuring continuity and stability during project implementation. On the other hand, it may constrain individual initiative and risk-taking, as consensus-oriented pressure can discourage innovative or unconventional approaches. Evidence from start-up projects in the Caucasus region indicates that intra-team consensus can sometimes slow the pace of innovation (Aliyev, 2023; Mammadov & Huseynov, 2021). Similarly, during the COVID-19 pandemic, high collectivism among Azerbaijani companies transitioning to remote work environments extended the duration of group decision-making processes but simultaneously enhanced coordination and commitment in project execution (Huseynova, 2022).

The second highest indicator, **Power Distance (M = 4.61)**, was found to be at a medium-to-high level (Hofstede, 2001; House et al., 2004). This score is slightly lower than those observed in the Middle East (M = 5.43) and Eastern Europe (M = 5.21) clusters, yet considerably higher than the Anglo cluster (M = 3.42) (House et al., 2004). In societies characterized by high power distance, respect for authority and deference to leaders' decisions are culturally expected norms (Hofstede, 2001; House et al., 2004). A moderately high level of power distance in Azerbaijan suggests that hierarchical relationships are generally accepted, though the organizational structure is not entirely authoritarian. Within Azerbaijani project teams, such hierarchical dynamics may facilitate faster decision-making by empowering leaders

to act decisively. However, in international project environments, formal hierarchies and top-down decision-making processes can sometimes delay the acceptance of innovative proposals or reduce participatory dialogue between leaders and team members (Rzayeva, 2021).

Uncertainty Avoidance (M = 4.18) reflects the extent to which individuals in a society feel uncomfortable with ambiguity and risk (Hofstede, 2001). Azerbaijani society demonstrates a moderate inclination toward adhering to planned procedures and formal rules, reflecting both a respect for structure and a degree of pragmatic flexibility. The moderately high value of this dimension suggests that Azerbaijani organizations tend to emphasize careful planning and risk management in project implementation. The relatively limited tolerance for uncertainty continues to constrain risk-taking, thereby slowing the acceptance of innovative solutions—particularly in the adoption of new technologies (Jafarova, 2022). While this tendency supports consistency and structured project management, it may also hinder agile decision-making and reduce organizational responsiveness in rapidly changing global environments (Jafarova, 2022).

Performance Orientation (M = 3.95) was found to be slightly above the mid-range level, suggesting that while achievement is valued, a fully developed high-performance culture has not yet been firmly established in Azerbaijan. This moderate score indicates that organizational structures generally prioritize results, yet certain procedural limitations continue to constrain the pursuit of higher performance standards. In international project contexts, Azerbaijani teams tend to set ambitious performance goals; however, the cultivation of individual initiative within teams remains comparatively weak (Aliyev, 2023). A strong performance-oriented culture typically characterizes societies that value education and continuous learning, emphasize measurable outcomes, establish clear performance targets, reward initiative, and encourage open and direct communication. In global practice, countries such as the United States, Germany, and Singapore are known for high levels of performance orientation, whereas Greece and Pakistan demonstrate relatively lower scores in this dimension.

Future Orientation (M = 3.84) reflects the extent to which a society emphasizes long-term planning and strategic decision-making (House et al., 2004). The near-average score suggests that while there is some attention to long-term objectives and planning in Azerbaijan, short-term decisions and adaptive responses continue to dominate organizational behavior. In this regard, Azerbaijani companies entering international markets often develop long-term strategies but are simultaneously compelled to make rapid, flexible decisions in response to changing market conditions (Mammadova & Huseynov, 2021). Globally, countries such as Japan and Singapore exhibit high levels of future orientation, characterized by sustained commitment to long-term planning, whereas nations like the United States and Mexico tend to favor short-term approaches and immediate adaptability.

Assertiveness (M = 4.17) was found to be relatively high, indicating that competitiveness, assertive expression of power, and initiative are noticeable cultural values within Azerbaijani society. According to the GLOBE framework (House et al., 2004), cultures with high assertiveness tend to emphasize competition, direct communication, and a strong defense of personal or organizational positions, often accompanied by a results-oriented mindset. Research by Den Hartog et al. (1999) further supports that assertive leadership behaviors can enhance decisiveness and initiative but may also increase the risk of interpersonal tension and conflict within teams. In the Azerbaijani context, this dimension demonstrates a dual effect: on one hand, assertiveness contributes to stronger leadership positions and more decisive

strategic choices; on the other hand, in global project environments that require consensus and compromise, it may lead to coordination challenges and reduced group harmony.

Institutional Collectivism (M = 3.90) indicates that, within the Azerbaijani context, collective interests are partially considered at the organizational and institutional levels, though this tendency is not dominant. This finding suggests that collectivism in Azerbaijan is pronounced at the in-group level but relatively weaker at the institutional level. Azerbaijan's score is broadly comparable to those of the Middle East (M = 4.24) and Eastern Europe (M = 4.05) clusters (House et al., 2004). According to the GLOBE study (House et al., 2004), cultures with high institutional collectivism emphasize cooperation, shared goals, and social welfare within organizations. In Azerbaijan, however, the moderate score reflects the simultaneous importance of both social obligations and personal relationships in organizational life. This partially aligns with broader GLOBE findings, which note that in post-Soviet and transition economies, collectivist values tend to coexist with emerging individualistic elements. In practical terms, this configuration may introduce certain challenges in global project teams, where excessive reliance on personal networks can limit institutional transparency and hinder the development of formalized collaborative mechanisms.

Gender Egalitarianism (M = 3.29) was found to be below the mid-range level, indicating that women remain underrepresented in both social and professional spheres. According to the GLOBE findings (House et al., 2004), cultures with lower gender egalitarianism tend to maintain predominantly male-oriented leadership structures, thereby limiting women's access to managerial and decision-making positions. Sidani (2018) emphasizes that gender inequality in Middle Eastern and Caucasian societies arises not only from structural barriers but also from deeply rooted sociocultural norms, which in turn weaken women's participation in strategic decision-making processes. In the Azerbaijani context, the relatively low level of gender egalitarianism may hinder the realization of the creative approaches and inclusive leadership practices that gender diversity can bring to global project teams. Consequently, insufficient gender balance can narrow leadership perspectives and diminish the strategic advantages derived from diversity.

Humane Orientation (M = 3.70) was relatively low, though broadly consistent with regional trends (Middle East M = 3.85; Eastern Europe M = 3.67) (House et al., 2004). This suggests that expressions of care, compassion, and interpersonal support are not strongly institutionalized within Azerbaijani organizational settings. In the local context, humane orientation is more evident within family and close social circles, whereas in formal workplace environments it tends to be weaker, often manifested through limited cooperation and less structured social support systems. Theoretically, humane orientation measures the extent to which a society values empathy, altruism, and social support (House et al., 2004). In international project settings, Azerbaijani teams tend to emphasize technical competence and task-oriented performance, while activities such as mentoring, social assistance, and interpersonal encouragement are less common (Jafarova, 2022). Globally, countries such as Iceland and New Zealand exhibit high levels of humane orientation, whereas Japan and Germany tend to prioritize technical expertise and individual achievement.

Overall, the findings indicate that the cultural configuration of Azerbaijan—sharing characteristics with both the Middle East and Eastern Europe clusters—presents a blend of strengths and constraints for global project leadership. Recognizing these dualities enables leaders to develop culturally adaptive

strategies that balance collective cooperation with individual creativity, thereby enhancing effectiveness in cross-cultural and transnational project environments.

2. The second stage of the analysis revealed that successful integration into multicultural environments is strongly linked to individuals' attachment to local cultural values, proficiency in multiple languages, and prior international exposure.

Multilingualism / Language

H1. Multilingualism acts as a moderator among certain cultural dimensions, fostering integrative relationships between values and enhancing cognitive flexibility as well as the capacity to adapt to different cultural environments.

Correlation analyses between the GLOBE cultural dimensions and language proficiency revealed limited integration among native speakers, with notable relationships such as FUT → ACH (R^2 = .803*) and ACH → HUM (R^2 = .674). Among participants proficient in only one foreign language, a negative correlation was found between POW → FUT (R^2 = –.334*). In contrast, multilingual participants demonstrated stronger and more coherent positive associations, including FUT → ACH (R^2 = .622) and ACH → HUM (R^2 = .602), indicating robust predictive links between future-oriented thinking, performance, and humane orientation. These findings suggest that as language proficiency increases, the interconnections among cultural values become more integrated and cohesive, thereby enhancing adaptability and cross-cultural flexibility. Among monolingual participants, correlations appeared simpler and, in some cases, contradictory. The negative relationship between power distance and future orientation in single-language respondents implies that hierarchical attitudes may inhibit strategic vision and long-term planning, potentially hindering adaptation in multicultural contexts. Such individuals may display tendencies toward alienation or difficulty adjusting when exposed to diverse cultural environments.

Multinational experience

H2. International experience facilitates the integration of cultural dimensions from the individual to the social and collective levels, thereby strengthening collaboration and leadership competencies in multicultural environments.

Participants without multinational experience exhibited integration of cultural values primarily at the individual level, with significant associations between FUT → ACH (R^2 = .474*) and ACH → HUM (R^2 = .405*). This pattern indicates that individuals lacking international exposure tend to link long-term planning and achievement orientation mainly to personal values and humanistic principles, rather than to broader social or collective dimensions.

In contrast, participants with prior international experience demonstrated a more complex and interconnected structure, including relationships such as POW → TRI (R^2 = .421*), FUT → ACH (R^2

= .603), and ACH → HUM (R^2 = .311). These findings suggest that exposure to multicultural environments fosters greater integration across multiple cultural dimensions—particularly uncertainty avoidance, in-group collectivism, future orientation, performance, and humane values. Consequently, international experience appears to extend the adaptation process beyond the individual domain, reinforcing it at the collective and social levels.

Level of cross-cultural adaptability

H3: The extent to which individuals feel alienated in cross-cultural encounters depends on their mode of attachment to cultural values. A balanced, integrative attachment fosters greater adaptability and facilitates smoother adjustment to culturally diverse contexts.

Correlation analyses between the GLOBE cultural dimensions and participants' feelings of comfort in culturally diverse environments yielded several significant results.

Among participants who reported feeling completely alien in multicultural settings, strong relationships were observed between UNC → TRI (R^2 = .608*), POW → TRI (R^2 = .519), FUT → ACH (R^2 = .645), and ACH → HUM (R^2 = .521), suggesting that heightened uncertainty avoidance and hierarchical tendencies may restrict open intercultural communication.

Participants who reported experiencing significant difficulty adapting displayed weaker harmony among cultural dimensions, with notable associations such as FUT → ACH (R^2 = .619*) → HUM (R^2 = .383) and ACH → HUM (R^2 = .333*). This pattern reflects a partial alignment between performance and humane orientations but an overall limited integration across dimensions.

In contrast, those who indicated having some initial difficulties but eventually adapting showed moderate positive relationships, including UNC → FUT (R^2 = .311*), FUT → ACH (R^2 = .507), and ACH → HUM (R^2 = .383). These results imply that uncertainty avoidance influences both future orientation and performance, supporting gradual cultural adjustment through experience.

Participants who reported feeling comfortable in multicultural environments exhibited the most integrated pattern of relationships across key dimensions—UNC → FUT (R^2 = .309*) → ACH (R^2 = .361), FUT → ACH (R^2 = .514), and HUM → ACH (R^2 = .537) → HUM (R^2 = .540*)—indicating greater flexibility, adaptive balance, and effective functioning in global contexts.

The results indicate that participants who experienced a strong sense of alienation tended to exhibit higher levels of uncertainty avoidance, in-group collectivism, and power distance. These tendencies appear to limit their capacity for cross-cultural adaptation and reinforce feelings of estrangement in multicultural environments. Participants who reported difficulties adjusting displayed weak harmony among future orientation, performance orientation, and humane orientation, suggesting that tensions among these values may create internal conflicts during the adaptation process. Individuals who experienced some initial challenges but eventually adapted demonstrated a relatively balanced application of uncertainty avoidance, future orientation, performance, and humane values. Although this group faced temporary obstacles, their ability to integrate these dimensions enabled gradual and sustainable adaptation over time. Participants who reported feeling comfortable in multicultural environments showed an integrated approach across all cultural dimensions—uncertainty avoidance,

long-term planning, achievement, and human orientation—allowing them to behave more flexibly and perform more effectively in global contexts.

Overall, the findings confirm that:

- Multilingualism fosters cognitive flexibility and value-based harmony that facilitate cultural adaptation.

- International experience extends this harmony from the individual to the social and collective levels.

- Adaptation models differ according to linguistic proficiency and international exposure: monolingual individuals are more prone to alienation and adjustment difficulties, whereas multilingual and internationally experienced participants display either balanced adaptation or advanced levels of cross-cultural integration.

Conclusion

The findings of this study provide an in-depth understanding of Azerbaijan's cultural configuration within the framework of the GLOBE model and its implications for leadership in global project management. The results demonstrate that Azerbaijan's cultural profile exhibits both convergence and divergence with the Middle East and Eastern Europe clusters. While sharing certain collective and hierarchical tendencies, Azerbaijan has developed distinct patterns shaped by its regional dynamics, socio-historical experiences, and ongoing globalization processes. In the Azerbaijani context, multilingualism and international experience appear to "moderate" high power distance and uncertainty avoidance, fostering a more flexible and adaptive model of cross-cultural behavior. This indicates that exposure to multiple linguistic and cultural systems encourages openness, cognitive flexibility, and leadership adaptability in multicultural project environments.

Theoretical Implications

This study contributes to the theoretical advancement of the GLOBE framework by situating it within the Azerbaijani cultural context. The findings reveal a hybrid configuration that integrates elements of both Middle Eastern and Eastern European cultural patterns, thereby challenging the static nature of existing cluster typologies and supporting a more flexible, context-sensitive interpretation of culture. Furthermore, the results highlight the significant impact of individual-level factors—such as multilingualism and international exposure—on broader societal cultural dimensions. These insights suggest that processes of globalization and transnational interaction are reshaping traditional understandings of Power Distance, Uncertainty Avoidance, and Collectivism. Overall, this study refines the GLOBE framework by underscoring the dynamic, adaptive, and evolving nature of cultural systems, portraying culture not as a fixed national characteristic but as a construct continuously redefined through cross-cultural exchange and contextual adaptation.

Limitations

This study has several limitations. First, the sample is restricted to the Azerbaijani context, which limits the generalizability of the findings to other cultural environments. In addition, the sample size for some subgroups was relatively small, which may have affected the stability and robustness of the correlation models. Finally, although the study distinguishes between in-group collectivism and institutional collectivism, the broader dynamics of collectivism as a multidimensional construct warrant further qualitative exploration to capture its depth and contextual variations more comprehensively.

Recommendations for Researchers

Future studies could examine how the GLOBE cultural dimensions evolve within organizational and regional contexts in Azerbaijan, particularly in emerging industries and sectors that require a high level of international collaboration. Comparative research involving countries with similar cultural profiles may also provide additional theoretical and practical perspectives for enhancing global project management and cross-cultural leadership practices.

Recommendations

1. Leadership Development:

Training programs should be designed to strengthen the leadership competencies of Azerbaijani professionals involved in global projects. Particular emphasis should be placed on fostering individual initiative and enhancing the ability to operate effectively under conditions of uncertainty.

2. International Experience Opportunities:

Broader opportunities should be created for local professionals to participate in international projects and exchange programs. Such initiatives can enhance adaptation skills at both social and collective levels, contributing to greater cross-cultural competence.

3. Organizational Policy:

Within local organizations, it is advisable to promote individual initiative alongside collective values and to strengthen institutional mechanisms of social support. This balance can increase innovation and cohesion in organizational environments.

4. National Cultural Mapping:

To recognize Azerbaijan as a distinct cultural cluster within the GLOBE framework, further large-scale empirical research should be conducted to map and refine the country's cultural profile.

ACKNOWLEDGMENT

The author extends sincere gratitude to Associate Professor Dr. Vugar Dargahov for his invaluable guidance and continuous support throughout the course of this research. Appreciation is also expressed to the teams at AzPMA, PMO.az, and the Azerbaijan University of Architecture and Construction (AUAC) for their inspiration during the study.

Abstract

Today, information technologies have become an integral part of the global security system and conflict management. In recent years, the widespread use of information technologies has changed the nature and form of conflicts. Now, cyberattacks and disinformation possess as much impact power as armed confrontations. Artificial intelligence and satellite systems play a major role in preventing and managing conflicts. These tools are effective not only during conflicts but also in the post-conflict period. In recent years, numerous scientific presentations have been conducted on information technologies. Based on the results of these studies, it can be concluded that information technologies are not only instruments of conflict but also means of maintaining peace and stability. This issue should also be considered in the context of Azerbaijan. After the 44-day victory, information technologies have been widely used in the Karabakh region to ensure sustainable development and restore social trust. Consequently, the purposeful application of information technologies is regarded as one of the main strategies for establishing lasting peace and effectively managing conflicts in the modern era.

Keywords: Information technologies , modern conflicts, cybersecurity, disinformation and information warfare, artificial intelligence (AI), digital diplomacy, peace and security, early warning systems, digital governance, digital literacy

Xülasə

Bu gün informasiya texnologiyaları qlobal təhlükəsizlik sisteminin və konfliktlərin idarə olunmasının ayrılmaz tərkib hissələrindən birinə çevrilmişdir. Məhz son illərdə informasiya texnologiyalarından geniş istifadə edilməsi nəticəsində konfliktlərin xarakteri və forması dəyişmişdir. Artıq kiberhücumlar, dezinformasiyalar silahlı qarşıdurmalar qədər böyük təsir gücünə malikdir. Münaqişələrin qarşısının alınmasında və idarə olunmasında süni intellekt, peyk sistemləri böyük rol oynayır. Bu vasitələr nəinki münaqişə dövründə, eləcə də post-konflikt dövründə öz təsirini göstərir.

Son illərdə informasiya texnologiyaları ilə bağlı çoxlu elmi tədqiqatlar aparılmışdır. Bu tədqiqatların nəticələrinə əsasən onu demək olar ki, informasiya texnologiyaları nəinki yalnız münaqişə vasitəsidir. Həmçinin sülhün və sabitliyin qorunması vasitələrindən biri hesab oluna bilər. Bu məsələyə Azərbaycan kontekstində də yanaşmaq lazımdır. 44 günlük qələbədən sonra Qarabağ regionunda dayanıqlı inkişaf və sosial etimadın bərpasında informasiya texnologiyalarından çox geniş şəkildə istifadə olunur.

Nəticə etibarilə, informasiya texnologiyalarının məqsədyönlü tətbiqi müasir dövrdə dayanıqlı sülhün qurulması və münaqişələrin effektiv idarə olunması üçün əsas strategiyalardan biri kimi qiymətləndirilir.

Açar sözlər: informasiya texnologiyaları, müasir konfliktlər, kiber təhlükəsizlik, dezinformasiya və informasiya müharibəsi, süni intellekt, rəqəmsal diplomatiya, sülh və təhlükəsizlik, erkən xəbərdarlıq sistemləri, rəqəmsal idarəetmə, rəqəmsal savadlılıq

GİRİŞ

XXI əsrdə informasiya texnologiyaları bəşər aləminin inkişafını formalaşdıran ən vacib amillərdən birinə çevrilmişdir. Qloballaşma, rəqəmsallaşma və kommunikasiya texnologiyalarının sürətli inkişafı cəmiyyətlərin həm idarəetmə mexanizmlərinə, həm iqtisadi sistemlərinə, həm də siyasi sistemlərinə köklü şəkildə təsir göstərir. Biz bu təsirin ən bariz nümunəsini bu gün müasir konfliktlərin xüsusiyyətlərində görə bilərik. XX əsrdə müharibələr daha çox silahlı münaqişələr formasında baş verirdisə, XXI əsrdə artıq konfliktlər daha çox informasiy, kiberməkan və rəqəmsal təsir alətləri üzərində baş verir.

Informasiya texnologiyaları konfliktlərin həm yaranmasında, həm də idarə olunmasında özünəməxsus rol oynayır. Sosial media vasitəsilə dezinformasiyanın yayılması, təxribat xarakterli məlumatların paylaşılması konfliktlərin yaranmasına və getdikcə dərinləşməsinə təsir göstərir. Eyni zamanda, sosial media və rəqəmsal platformalar münaqişələrin idarə olunmasında və sülh quruculuğu prosesində effektiv vasitələrə çevrilmişdir. Məsələn, Birləşmiş Millətlər Təşkilatının 2023-cü ildə təqdim etdiyi Digital Transformation of UN Peacekeeping strategiyasında vurğulanır ki, süni intellekt, peyk məlumatları və məlumatların analitikası münaqişələrin erkən mərhələdə aşkarlanmasına çox böyük kömək edir.

Həmçinin NATO-nun 2020-2040-cı illər üçün "Science and Technology Trends" hesabatında göstərilir ki, artıq gələcəkdə baş verə biləcək istər silahlı, istərsə də qeyri-silahlı münaqişələr kiber və informasiya mühitində baş verəcək. Bu da o deməkdir ki dövlətlər və beynəlxalq təşkilatlar münaqişələrin idarə olunmasında informasiya texnologiyalarından daha çox asılı vəziyyətə düşəcəklər. RAND korporasiyasının "Understanding and Countering Coercion in Cyberspace" (2019) tədqiqatında göstərilmişdir ki, müasir dövrdə hərbi üstünlük öz əhəmiyyətli yerini informasiya texnologiyalarının üstünlüyünə vermişdir.

Hər bir sahədə olduğu kimi, informasiya texnologiyaları sahəsəinin də müsbət və mənfi cəhətləri vardır. İnformasiya texnologiyaları özü ilə bərabər müəyyən təhlükələr də gətirir. Məsələn, kiberhücumlar, saxta xəbərlərin yayılması, vətəndaşların şəxsi məlumatlarının oğurlanması, dezinformasiyaların yayılması və s. Bu təhlükələrin qarşısının alınması dövlətlər və beynəlxalq təşkilatların prioritet fəaliyyət istiqamətlərindən birinə çevrilmişdir. Çünki sadalanan bu hallar nəinki siyasi təhlükəsizliyə, eyni zamanda sosial sabitliyə və ictimai sabitliyə yönəlmiş ciddi təhlükədir. Bu haqda Cornegie Endowment for International Peace təşkilatının "Mapping Worldwide Initiatives to Counter Influence Operations" 2020 hesbatında da danışılır.

Mənfi cəhətlərdən, yaratdığı təhlükələrdən başqa informasiya texnologiyalarının bir sıra müsbət cəhətləri də mövcuddur. Müasir dövrdə sülh və sabitlik aləti kimi informasiya texnologiyalarından geniş istifadə olunur. Aparılan çoxsaylı tədqiqatlar göstərmişdir ki, etnik, dini və siyasi zəmində baş verə biləcək gərginliklərdən əvvəlcədən xəbərdar olmaq üçün süni intellektdən və böyük verilənlərdən ("big data") istifadə olunması artıq praktiki reallıq halına çevrilmişdir.

Beləliklə, deyə bilərik ki, müasir dövrdə informasiya texnologiyalarının münaqişələrin idarə olunmasında ikili rolu özünü göstərir. Bir tərəfdən, yanlış, saxta məlumatların, dezinformasiyaların yayılması münaqişələrdə vəziyyəti gərginləşdirir. Digər tərəfdən, əgər bu texnologiyalardan düzgün və sülhü yaratmaq və sabitliyi bərqərar etmək məqsədilə istifadə olunarsa, münaqişələrin qarşısı alınar, münaqişə tərəfləri arasında etimad bərpa olunar və dayanıqlı sülh formalaşdırılar.

Bu araşdırmanın məqsədi informasiya texnologiyalarının müasir konfliktlərin idarə olunmasında rolunu həm nəzəri, həm də praktiki cəhətdən tədqiq etməkdir. Araşdırma beynəlxalq təşkilatların (BMT, NATO, AB, İCRC) siyasi sənədlərinə, hesabatlarına, həmçinin analitik mərkəzlərin (RAND, CORNEGİE, BROOKİNGS) tədqiqatlarına əsaslanacaq.

İnformasiya texnologiyalarının konfliktlərin idarə edilməsində nəzəri əsasları

Müasir dövrdə informasiya texnologiyaları təkcə kommunikasiya vasitəsi rolunu oynamır. Eyni zamanda social, siyasi və strateji güc mənbəyinə çevrilib.

Münaqişə ilə bağlı olan klassik nəzəriyyələrə ümumi baxış keçirsək deyə bilərik ki, münaqişə tərəflərin maraqlarının toqquşması nəticəsində yaranan fenomendir. XXI əsrdə yaranan konfliktlər isə klassik münaqişələrə nəzərən öz formasını dəyişmişdir. Əvvəllər münaqişələr təkcə fiziki və siyasi sahədə baş verirdi və təsir dairəsi nisbətən az idi. Lakin müasir konfliktlər təkcə fiziki və siyasi sahədə baş vermir. Müasir konfliktlərin yaranma arealı daha da çox genişlənib və artıq münaqişə məlumat mühitində də baş verir. Bu da münaqişələrin artıq yeni mərhələsinin yarandığını göstərir. Məlumat mühitində baş verən münaqişəyə "rəqəmsal konflikt" və "kiber münaqişə" adlarını verdik və bu iki fenomen bu gün geniş surətdə tədqiq edilir. Rəqəmsal konflikt deyəndə nə başa düşürük? İnformasiya axınları, manipulyasiya, dezinformasiyalar, saxta xəbərlə və bütün bunlar vasitəsilə ictimai asayişin pozulması , ictimai rəyin formalaşdırılmasına mənfi təsir və nəticədə informasiya mühitinə nəzarət uğrunda mübarizə rəqəmsal konflikt anlayışının izahı kimi başa düşülə bilər. RAND korporasiyasının 2019-cu ildə dərc etdiyi "Understanding and Countering in Cyberspace " adlı hesabatında informasiya texnologiyalarının dövlət və qeyri-dövlət aktorlarına yeni təsir imkanları açdığı və getdikcə güclənən "görünməz güc" vasitəsi olduğu vurğulanır. Bu vəziyyətdə biz informasiya texnologiyalarının konfliktlərin idarə edilməsindəki rolunu 2 səviyyədə təhlil edə bilərik. Birinci səviyyə-münaqişə zamanı böyük verilənlərin toplanması, məlumatların təhlil edilməsi və çətin qərarların qəbul edilməsi prosesində informasiya texnologiyalarından istifadə. Ikinci səviyyədə isə uzunmüddətli sülhün bərqərar edilməsində, baş verə biləcək risklərin proqnozlaşdırılmasında informasiya texnologiyalarından istifadə.

Müasir konfliktlərin idarə olunmasında informasiya texnologiyalarının təsirini müəyyən edən göstəricilər də mövcuddur. Bunlar aşağıdakılardır:

1.Məlumatların sürətli yayılması və daim hamı üçün əlçatan olması. Bu gün hər kəs istənilən məlumata istənilən an və istənilən yerdə çıxış imkanına malikdir. Məlumatlar rəqəmsal texnologiyalar vasitəsilə saniyələr içərisində qlobal səviyyədə yayılır. Bunun müsbət tərəfi sülh təşəbbüsünə dəstək kimi qiymətləndirilir. Mənfi tərəfi isə təxribat xarakterli məlumatların da olduqca sürətli yayılmasıdır.

2.Asimmetrik güc. Bildiyimiz kimi asimmetriya anlayışı klassik konflikt nəzəriyyələrində özünü göstərir. Yəni, münaqişə tərəflərinin gücləri, resurs imkanları eyni dərəcəyə malik olmayanda asimmetrik müharibə yaranır. Lakin müasir dövrdə bu belə deyil. Münaqişə tərəflərindən biri daha az resursa, daha az hərbi gücə malik ola bilər. ancaq informasiya məkanında qarşı tərəfə güclü zərbələr vura bilər, informasiya məkanında aktiv fəaliyyət göstərərək düşmən tərəfin ictimai fikrinə təsir edə bilər. Beləliklə, kiber məkanda "asimmetrik güc" anlayışı ortaya çıxır.

3.Proqnozlaşdırma və risklərin araşdırılması. Süni intellect və böyük verilənlərin ("big data") vasitəsilə analitik araşdırmaların aparılması gələcəkdə baş verə biləcək münaqişələrin əvvəlcədən proqnozlaşdırılmasına kömək edir. Nature Communications (2024) jurnalında dərc edilən araşdırma nəticələrinə əsasən, peyk məlumatlarının və sosial media məlumatlarının təhlili nəticəsində baş verə biləcək münaqişələrin 70-80%-i dəqiq proqnozlaşdırıla bilir.

İnformasiya texnologiyalarının münaqişələrin idarə olunmasında tətbiqi daha bir sıra yeni anlayışların ortaya çıxmasına səbəb olmuşdur. Belə anlayışlardan da biri "rəqəmsal diplomatiyadır". Bildiyimiz

kimi, diplomatiya dövlətlər, beynəlxalq təşkilatlar və digər siyasi subyektlər arasında münasibətlərin sülh, danışıqlar və qarşılıqlı anlaşma yolu ilə tənzimlənməsi vasitəsidir. İnformasiya texnologiyalarının həyatımıza daxil olması nəticəsində bu anlayış da artıq yenilənmiş, yeni forma və yeni məzmun qazanmışdır. "Rəqəmsal diplomatiya" isə artıq dövlətlər, beynəlxalq təşkilatlar və digər siyasi subyektlər arasında formalaşan diplomatic əlaqələrin sosial media və rəqəmsal platformalar vasitəsilə həyata keçirilməsi prosesidir.

Bir sözlə belə deyə bilərik ki, artıq günümüzdə müasir konfliktlərin idarə olunması prosesində informasiya texnologiyaları köməkçi və ya müşayiətçi qismində deyil, məhz münaqişəni formalaşdıran, onu idarə edən və sonda həll edən vacib bir elementdir.

İnformasiya texnologiyalarının müasir konfliktlərə praktiki tətbiqi

Son illərdə münaqişə ocaqlarının sayının artması, gərginliyin getdikcə daha da çoxalması özünü büruzə verir. Xüsusən də, son onilliklərdə baş verən münaqişələrin sayında çox böyük artım müşahidə olunur. Yer kürəsinin müxtəlif bölgələrində baş verən həm etnik, həm də beynəlxalq xarakterli münaqişələrdə zamanın tələbinə uyğun olaraq, informasiya texnologiyalarından çox geniş istifadə olunur. Bir neçə nümunəyə nəzər salaq:

1.Rusiya-Ukrayna konflikti.

2014-cü ildə Rusiyanın Ukraynaya məxsus olan Krım yarımadasını özünə ilhaq etməsi ilə Rusiya və Ukrayna arasında münaqişənin əsası qoyuldu. Rusiyanın bu davranışı beynəlxalq hüquqa zidd hesab olunsa da, Rusiya hökuməti "referendum" vasitəsilə bu qərarın kifayət qədər beynəlxalq hüquqa uyğun olduğunu bəyan etdi. Rusiyanın verdiyi məlumatlara əsasən bu referendum nəticəsində əhalinin 97%-I Rusiyanın tərkibinə keçmək haqqında səsdən istifadə etdi. Lakin Ukrayna hökuməti və beynəlxalq cəmiyyət bu referendumun nəticələrini qanunsuz hesab etdi. 2014-cü il 18 martda isə Rusiya bütün təzyiqlərə baxmayaraq, Krımın ilhaqını rəsmi şəkildə elan etdi. Bu hadisədən sonra ABŞ, Avropa İttifaqı və bir sıra ölkələr Rusiyaya qarşı sanksiyalar tətbiq etsələr də, Rusiya heç bir geri addım atmadı. Məhz bu hadisə Rusiya və Qərb ölkələri arasında olan münasibətləri pisləşdirdi və demək olar ki, "soyuq müharibə" atmosferi yarandı. 2022-ci ildə Rusiya həm siyasi, həm də fiziki hücuma keçdi. Rusiya Ukraynanın dövlət saytların genişmiqyaslı kiberhücumlar həyata keçirdi. Bu hücumlar, əsasən, elektrik şəbəkələrinə, rabitə və bank sistemlərinə yönəldi. Ukrayna qarşılığında könüllü kiberqoşunlar (Cyber Army of Ukraine) yaratdı və beləcə münaqişə sosial platformalarda yayılan dezinformasiyalarla daha da qızğınlaşdı. Sosial şəbəkələr- X, Telegram, İnstagram, Tiktok, Facebook- bu müharibədə ikili rol oynadı. Çünki həm bu platformalar vasitəsilə münaqişə haqqında məlumatlar anbaan yenilənərək qlobal səviyyədə yayıldı. Həm də platformalar vasitəsilə hər iki tərəf məlumatları təbliğ etməyə başladı. Ukrayna hökuməti "digital diplomacy"- rəqəmsal diplomatiyaya əl atdı. Bunda məqsəd dünyanın güc strukturları tərəfindən dəstək qazanmaq və bütün dünyaya real vəziyyəti, Rusiyanın beynəlxalq hüquq normalarına pozduğunu göstərmək idi. Gedən proseslər onu göstərdi ki, həqiqətən də informasiya texnologiyalarından kəskin surətdə məqsədəuyğun istifadə etdikdə məqsədə nail olmaq mümkündür. Ukrayna bu münaqişədə əvvəldə də vurğuladığım kimi, "asimmetrik güc" anlayışının bariz nümunəsinə çevrildi. Həyata keçirdiyi təbliğat vasitəsilə fövqəl güclərin dəstəyini qazana bildi. Dünyanın güclü dövlətlərinin əksəriyyəti, eyni zamanda, beynəlxalq təşkilatlar Ukraynaya həm humanitar, həm də hərbi yardım göstərdilər. Beləcə, Ukrayna Rusiyaya qarşı kəskin sanksiyaların tətbiq edilməsinə nail oldu. Dünyaca məşhur olan mağaza şəbəkələri öz filiallarının Rusiyada fəaliyyətini qadağa etdilər. Bununla da Rusiyanın iqtisadiyyatına zərbə vurmağa çalışdılar. Lakin bu proses elə də uzun çəkmədi. 3 ildir davam edən müharibədə məşhur mağaza şəbəkələrinin idarə heyətləri anladı ki, getdikcə daha çox qazanc itirirlər və atılan bu addım Rusiyanın məğlub olmasına təsir etmədi. Buna görə də bağlanan filialları yavaş-yavaş açmaq qərarına gəldilər. Bütün bunlara baxmayaraq, Ukrayna bu müharibədə informasiya sahəsində geniş üstünlük qazandı. Bu münaqişədə Ukraynanın haqlı olduğuna inanan Palantir Technologies və Maxar şirkətləri Rusiya qoşunlarının hərəkətlərini peyk məlumatları və süni intellektlə izləyərək Ukrayna qoşunlarına məlumatları ötürürdürlər. Bunun nəticəsində də daha az itki

verilirdi və daha çox vaxt qazanılırdı. Həmçinin Ukrayna əldə etdiyi məlumatlara əsasən, Rusiya qoşunlarının hərəkətini analiz edib proqnozlaşdırma aparma imkanına malik oldu. Bütün bu faktlar sübut etdi ki, informasiya texnologiyalarından istifadə silahlı hücum qədər effektiv təsirə malikdir. Rusiyanın hərbi cəhətdən çox güclü olduğunu və buna görə də müharibənin heç də uzun çəkməyəcəyini hesab edən dövlətlər, eləcə də Rusiya özü günün reallığını və informasiya texnologiyalarının gücünü nəzərə almamaqla səhv etdi.

2.Yaxın Şərqdə baş verən münaqişələr

Son illərdə Yaxın Şərqdə münaqişə ocaqlarının sayında kəskin artım müşahidə olunur. Xüsusən də, Fələstin-İsrail münaqişəsi son illərin ən çox diqqət mərkəzində olan problemidir. Bu münaqişədə informasiya texnologiyaları dezinformasiyaların yayılması və videoların paylaşılmasında mühüm rol onnayıb. Fələstin-İsrail münaqişəsi Yaxın Şərqdə baş verən, bir əsrdən çoxdur davam edən siyasi, dini və ərazi münaqişəsidir. 1967-ci ildə İsrailin Qəzza zolağını, Qərb sahilini və Şərqi Qüdsü işğal etməsi ilə vəziyyət daha da kəskinləşdi. Müasir dövrdə isə HƏMAS terror təşkilatının fəaliyyəti nəticəsində vəziyyət bir az da qarışdı. 2021 və 2023-cü illərdə baş verən toqquşmalar zamanı hər iki tərəf informasiya texnologiyalarından geniş surətdə istifadə edib. Bu istifadə əsasən sosial media vasitəsilə təbliğatda özünü göstərib. BBC Monitoring və Reuters İnstitute hesabatlarına əsasən saxta xəbərlərin və "deepfake video"larının yayılması pik həddə çatıb. Qəzzada olan acınacaqlı vəziyyətin hər an dünya ictimaiyyətinə təqdim edilməsi artıq beynəlxalq ictimaiyyətin dəstəyinə nail olmağa səbəb oldu. Bu münaqişədə insan hüquqlarının pozulması və bununla bağlı faktların sənədləşdirilməsində Fələstin tərəfi informasiya texnologiyalarına müraciət etmişdi. Qəzzada olan vətəndaşların şəkil və videoları QHT əməkdaşları, jurnalistlər və muxbirlər tərəfindən mobil telefonlar vasitəsilə çəkilib və İsrailin vəhşiliyi adı altında rəqəmsal sübut kimi BMT və digər beynəlxalq təşkilatlara göndərilib. Bu zaman informasiya texnologiyalarının daha bir xarakteri formalaşdı: ədalət və şəffalığın yaradılması. İsrail hökuməti də bu münaqişə ərzində aktiv şəkildə informasiya texnologiyalarının yaratdığı şəraitdən istifadə edib. Məsələn, süni intellektlə idarə olunan dronlar və sensor sistemləri HƏMAS qüvvələrinin hərəkət fəaliyyətini dəqiq izləməkdə və hücumun proqnozlaşdırılması və qarşısının alınmasında güclü rol oynayıb.

İnformasiya texnologiyalarında sadəcə hərbi sabitliyi deyil, eyni zamanda, iqtisadi və ictimai sabitliyi qorumaq üçün də geniş istifadə olunur. Buna nümunə olaraq, Afrika regionunu göstərə bilərik. Afrika regionu daim münaqişələrin baş verdiyi bir region kimi tanınmışdır. Burada münaqişələrin əksəriyyəti resurslar uğrunda, etnik fərqliliklərə görə baş verir. Müasir dövrdə, daha dəqiq desək, son illərdə bu münaqişələrin də qarşısının alınmasında informasiya texnologiyalarının imkanlarından geniş istifadə olunur. Onu da deyə bilərik ki, əldə olunan nəticələr onu göstərir ki, həqiqətən də informasiya texnologiyalarından istifadədən sonra bir çox nailiyyətlər, irəliləyişlər əldə edilib. Bir neçə nümunəyə nəzər salaq.

Nigeriyada və Keniyada hər zaman seçki dövründə gərginliklər pik həddə çatır. Bunun qarşısını almaq üçün Afrika İttifaqı "Continental early warning system" (cews) yaradıb. Bu sistem vasitəsilə sosial mediada paylaşılan məlumatlar izlənilir, analiz edilir və zorakılıq riski olan bölgələrə dərhal müdaxilə edərək baş verə biləcək qarşıdurmanın qarşısı uğurla alınır. Daha əvvəl də vurğuladığım kimi, informasiya texnologiyalarının mənfi tərəflərindən biri dezinformasiyaların yayılmasıdır. Afrika ölkələrinin hökümətləri bunu da düşünüb və qarşısını almaq yollarını tapıb. Belə ki, Nigeriyada, Efiopiyada və Keniyada fəaliyyət göstərən QHT-lər daimi olaraq əhaliyə "sülh mesajları" göndərir. Bu mesajlarda yayılan informasiyaların sadəcə bir dezinformasiyadan ibarət olduğu və əhaliyə təşvişə düşməmələri haqqında xəbərdarlıq edilir.

Digər bir vasitə isə zorakılığın qarşısının alınması yoludur. Məhz bunun üçün "Ushahidi" adlı platforma yaradılıb və əhalinin istifadəsinə verilib. Bu platforma vasitəsilə zorakılığa məruz qalmış və ya zorakılığa məruz qala biləcək vəziyyətdə olan şəxs və ya şəxslər dərhal bunu dövlətin hüquq-mühafizə

orqanlarına bildirir. Proqramın işləmə mexanizminin xəritə ilə birbaşa əlaqədə olması nəticəsində dərhal zorakılıq baş verən ərazi müəyyənləşdirilir və lazımi tədbirlər görülür.

Afrikada korrupsiya, dövlətin idarə olunmasında qeyri-şəffaflıq hallarının baş alıb getməsi dövləti bu sahədə də addımlar atmağa sövq etmişdir. Bu hallar həm ölkədaxili vəziyyəti gərginləşdirir, həm də xalqda dövlətə qarşı inamsızlıq formalaşdırır. Qana və Nigeriyada bu hallar tez-tez baş verir. Bunun qarşısının alınması üçün blokçeyn texnologiyası tətbiq edilməyə başlayıb. Bu texnologiyanın tətbiq olunmasında məqsəd odur ki, vətəndaşlar dövlət resurslarının necə idarə olunmasını izləsin və baş verə biləcək etimadsızlığın, inamsızlığın qarşısı alınsın.

Nəticədə bunu deyə bilərik ki, Afrika ölkələri dünyanın bir çox inkişaf etmiş ölkələrindən geridə qalsa da, informasiya texnologiyalarından istifadə edərək sülh və əmin-amanlıq yaratmaqla artıq müasir dövrün tələbləri ilə uyğunlaşdığını göstərə biliblər.

İnformasiya texnologiyalarının konfliktlərin həllində və davamlı sülhün bərpa edilməsində rolu

Müasir dövrdə informasiya texnologiyaları yalnızca münaqişələrin yaradılması və idarə olunması vasitəsi kimi deyil, həm də münaqişələrin həll olunmasında və davamlı sülhün bərqərar edilməsi vasitəsi kimi də çox geniş şəkildə istifadə olunur. Əvvəllər sülhün yaradılması təkcə diplomatik yollarla və ya hərbi hücumların dayandırılması ilə baş verirdisə, indi bu, heç də belə deyil. İndi uzunmüddətli sülhün yaradılmasına nail olmaq üçün rəqəmsal diplomatiya, informasiyanın şəffaflığı və ictimai iştirakçılıq kifayət qədər əhəmiyyətli rol oynamağa başlayıb. Daha əvvəl də vurğuladığım kimi, "rəqəmsal diplomatiya" anlayışı son illərdə beynəlxalq arenada istifadə olunan bir anlayışdır. Dövlətlər və qeyri-dövlət aktorları sosial media və platformalardan, rəqəmsal kommunikasiyalardan istifadə edərək həm uzunmüddətli sülhü bərqərar edirlər, həm də baş verə biləcək hər hansısa bir böhranı əvvəlcədən proqnozlaşdırıb uyğun strategiyalar həyata keçirə bilirlər. Buna nümunə olaraq BMT-nin "Digital peacekeeping" (2023) təşəbbüsünü göstərmək olar. Bu təşəbbüs münaqişə zonalarında yayılan məlumatları izləmək, nəzarət etmək və tərəflər arasında dezinformasiyaların yayılmasının qarşısını almaq məqsədi güdür. Digər bir platforma isə Avropa İttifaqının formalaşdırdığı eDiplomacy platformasıdır. Bu platforma vasitəsilə Avropa İttifaqına daxil olan ölkələrin diplomatik nümayəndəlikləri daim bir-biri ilə əlaqə saxlayır və baş verə biləcək hər hansı bir diplomatik böhran zamanı tərəflər onlayn əlaqə saxlayaraq həm vaxta, həm də maddi vəsaitə qənaət edirlər. Beləliklə, informasiya texnologiyalarının könəyi ilə diplomatik əlaqələr daha sürətli, daha açıq və daha etimadlı qurulur.

Sülh danışıqları zamanı etimadın yaradılması və şəffaflığın təmin edilməsində informasiya texnologiyaları "rəqəmsal vasitəçilik" rolunu oynayır. Məsələn, "Build Up" adlı beynəlxalq QHT onlayn sülh dialoqları zamanı istifadə ediləcək rəqəmsal alətlər hazırlayıb (2019-2024) Bu alətlər vasitəsilə əgər münaqişə baş verərsə, münaqişə tərəfləri vaxt itirmədən və birbaşa görüşmə imkanları olmayanda video konfranslar keçirirlər və müzakirə apara bilirlər. Digər rəqəmsal layihə "PeaceTech Lab" (USAİD) Layihəsidir. Bu layihənin əsas məqsədi sosial mediaya nəzarətdir. Bildiyimiz kimi, sosial mediada münaqişə zamanı daim nifrət nitqləri səsləndirilir. Bu layihə bu nitqləri təhlil edir və sülhə mane ola biləcək davranışları aşkar edir, daha sonra bununla bağlı lazımi işlər görülür.

Sülhün bərpa edilməsində rəqəmsal savadlılıq da vacib rol oynayır. Rəqəmsal savadlılıq insanların informasiya texnologiyalarından səmərəli , məqsədyönlü istifadə etmək bacarığıdır. Bu gün sülhün davamlı olması, iqtisadi, siyasi və sosial sahələrdə sabitliyə nail olunması cəmiyyətin rəqəmsal təfəkküründən və rəqəmsal savadlılıq dərəcəsindən asılıdır. Buna görə də bu sahədə maarifləndirmə işlərinin aparılması böyük əhəmiyyətə malikdir. Məsələn, UNESCO-nun "Digitak Citizenship Education" (2022) proqramı bu sahədə fəaliyyət göstərir. Bu proqram vasitəsilə gənclərə sosial media platformalarında paylaşılan nifrət nitqinə qarşı mübarizə və informasiya etikası ilə bağlı çoxsaylı təlimlər keçirilir. Digər bir layihə UNİCEF və Google-nin əməkdaşlığı nəticəsində yaradılan "Peace

Online" layihəsidir. Bu layihənin əsas məqsədi münaqişə regionunda yaşayan gənclərə və uşaqlara sülhü aşılamaq, onları kin və nifrətdən uzaq tutmaqdır. Bu istiqamətdə ölkəmizdə də müəyyən işlər görülür. Nümunə olaraq, ali təhsil müəssisələrində "informasiya təhlükəsizliyi" və "rəqəmsal media savadlılığı" fənlərinin tədris edilməsini göstərmək olar. Sülh prosesində tətbiq edilən texnologiyalardan bir digəri isə blokçeyn texnologiyasıdıe. Bu texnologiya məlumatların saxtalaşdırılmasının, korrupsiyanın qarşısını alır. 2022-ci ildə BMT world food programme-nin tətbiqi üçün blokçeyn texnoıogiyası tərbiq edildi. Nəticədə şəffaf şəraitdə 1 milyondan çox qaçqın ərzaqla təmin edildi.

Azərbaycan kontekstində yanaşma

Respublikamız üçün informasiya texnologiyalarının konfliktlərin idarə edilməsində tətbiq edilməsi həm ölkəmizin milli təhlükəsizlik siyasəti, həm də sülh quruculuğu prosesi cəhətdən vacib əhəmiyyət daşıyır. Münaqişə və post-münaqişə dövründə ölkəmizdə aşağıdakı istiqamətlərdə informasiya texnologiyalarından istifadə olunub:

1. Qarabağ regionunda ekoloji təhlükəsizlik və rəqəmsal monitorinq sistemləri yaradıldı.

2. Smart City and Smart Village layihələri tətbiq edildi.

3. Münaqişə dövründə dezinformasiyaların qarşısının alınması məqsədilə rəqəmsal savadlılığın gücləndirilməsi işləri həyata keçirildi.

4. Mədəni irsin bərpa olunması süni intellekt və 3D texnologiyalarından istifadə edilərək rəqəmsal arxivlər yaradıldı.

Nəticə

Aparılan tədqiqatlar və nümunələr göstərdi ki, informasiya texnologiyaları müasir konfliktlərin idarə olunmasında aşağıdakı istiqamətlər üzrə rol oynayır:

1. Proqnozlaşdırma və təhlükələrdən daha erkən xəbərdarolma – süni intelellekt və böyük verilənlər riskləri əvvəlcədən görməyə və qarşısını alma yollarını müəyyən etməyə imkan verir.

2. Kiber təhlükəsizlik və rəqəmsal müdafiə- münaqişə zamanı kiber hücumların baş verməsi ehtimalında dövlət öz təhlükəsizliyini qorumaq məqsədilə bu sahədə mühim addımlar atmalıdır. Çünki bu, təhlükəsizliyə birbaşa təhdiddir.

3. İnformasiya müharibələrinə qarşı mübarizə- dezinformasiyaların yayılması, manipulyasiya xatakterli saxta xəbərlərin paylaşılması münaqişə zamanı ictimai və sosial sabitliyin pozulmasına səbəb olur.

4. Rəqəmsal diplomatiya və kommunikasiya vasitələrindən geniş istifadə-vaxta qənaət edərək baş tutan birbaşa danışıqlar və rəqəmsal vasitəçilik sülhün uzunmüddətli, effektiv və şəffaf olmasına gətirib çıxarır.

5. Rəqəmsal savadlılıq- rəqəmsal etika sülhün sosial əsasını uşaqlar və gənclər arasında formalaşdırır.

Beləliklə, informasiya nəinki yalnızca müharibə alətidir, eyni zamanda sülhün yaradılması və etimadın təmin olunması vasitəsidir. Bu gün bütün dövlətlər və qeyri-dövlət aktorları sülhü qorumaq üçün daim yeni və köklü həll variantları tapmağa çalışırlar. Bəşəriyyətin bəlası olan müharibələrin azaldılması və mümkün qədər yox olması üçün informasiya texnologiyaları sahəsində daha çox tədqiqatlar aparılmalı, sülh üçüb innovativ baza yaradılmalıdır. Çünki müharibəsiz, sülh içində dünya istəyirik. Gələcəyin sülhü elmin, texnologiyanın və birgə fəaliyyətin birləşdiyi nöqtədə mümkündür.

Abstract

This paper examines how smart tourism technologies (STTs) can benefit sustainable tourism and enhance the visitor experiences at Pakistani religious heritage sites. The study proposal will attempt to identify tourists' perceptions of new technologies and their effects on visiting Kartarpur, Multan, and Uch Sharif. The questionnaire was planned, and researchers surveyed 499 domestic and international tourists. SAS upheld the original analysis, and the PLS-SEM was used in SmartPLS 4. The results show that tourists are more likely to experience a pleasant stay, learn more about the culture, and enjoy their visit with STTs, which will result in a desire to visit again and suggest the attraction sites to others. According to the research, the greater the positive experience with technology, the more positive the support for sustainable tourism. Nevertheless, future studies must apply different places and procedures, as the outcomes vary with the surveyed areas and the respondents' responses. STTs should be incorporated in the planning and policy of religious tourism in order to make sure that it is sustainable, enhances the satisfaction of the tourists, and aids in the preservation of historic sites. In this instance, the PLS-SEM analysis has facilitated a novel insight into the relationship between sustainability, tourism, and technology in Pakistan.

Keywords: Smart Tourism Technologies, Sustainable Tourism, Religious Heritage, Memorable Travel Experiences, Pakistan, Cultural Tourism

INTRODUCTION

Pakistan is a nation that boasts of various natural sceneries, a myriad of historical sites, and a rich cultural heritage that attracts a lot of tourists. Over the past years, the tourism sector in Pakistan has been performing well, which has positively influenced the country's economy and enabled people to understand the various cultures in the country. Pakistan is also blessed with Himalayan attractions, which start at the Arabian Sea on the southern coast and extend northwards. The presence of the Badshahi Mosque in Lahore and Mohenjo-Daro also adds more value to Pakistan geographically (Raza et al., 2024). This has enabled the tourist industry to continue despite Pakistan's security problems. In 2023, there were nearly 1.9 million foreign tourists, a stable increase over 2022. The country relied heavily on tourism as one of its key sources of earnings since it contributed to its revenue to 1.1 billion dollars. The emphasis on domestic tourism has worked out to the advantage of the business (Hussain et al., 2024). Citizens are travelling to Pakistan in larger numbers than before. By providing support to the government for less popular plans and cultural activities, the government attracts national and international tourists to the numerous unique attractions in Pakistan (Arshad et al., 2018). The tourism industry in Pakistan is keeping up with the world's current technology.

Religious tourism is an essential branch of the economy because both Pakistani and international tourists visit the Data Darbar and Lal Shahbaz Qalandar shrines. Pakistan is embracing smart tourism technology in order to maintain the same traditions and enhance sustainability. Although other nations adopt new

technologies in the tourism industry, the application of these technologies in Pakistani religious tourism is insufficiently studied (Ahmed et al., 2022).

This paper evaluates the potential of smart tourism technology to improve the sustainability and repeat visits to the Pakistani religious tourism industry. Chaieb (2025) shows that the integration of the characteristics of STT, i.e., access to information, interactivity, personalisation, and security, can lead to an improved travel experience and the adoption of environmentally friendly strategies. This review discusses the roles played by tourist behaviours, responsiveness to travel, memorable experiences, and technology to maintain a tie with specific destinations. The relationship between smart tourism technology (STT) and sustainability is mediated by using academic sources that demonstrate the adoption and implementation process (Nawaz & Iqbal, 2025). The tastes and experiences of tourists affect this relationship (Sankar & Ilangovan, 2025). This creates questions regarding introducing innovation to religious tourism and the success of new practices in developing cultural awareness and advantages.

Research Question

After reviewing the literature and identifying study gaps, the researcher developed the research question:

i. What are the effects of smart tourism technology towards sustainable tourism?
ii. How does smart tourism technology influence sustainable tourism?
iii. Does technology adoption and implementation mediate the relationship between smart tourism technology and sustainable tourism?
iv. Does perceived enjoyment and implementation mediate the relationship between smart tourism technology and sustainable tourism?
v. How do tourist behaviour and preferences moderate the relationship between smart tourism technology and sustainable tourism?
vi. How does a memorable travel experience moderate the relationship between smart tourism technology and sustainable tourism?

Research Objectives

i. To determine the impacts of Smart Tourism Technologies on sustainable tourism.
ii. To establish how Smart Tourism Technologies affect sustainable tourism.
iii. To determine the mediation by technology adoption and implementation between Smart tourism technologies and sustainable tourism.
iv. To determine the mediation by perceived enjoyment and the implementation of Smart tourism technologies and sustainable tourism.
v. To investigate the moderating effect of tourist behaviour and preferences between Smart Tourism Technologies (STTs) and sustainable tourism.
vi. To examine the moderating effect of memorable travel experiences on the association between Smart Tourism Technologies (STTs).

Review of Literature

Smart Tourism Technologies (STTs)

These digital tools and applications add features to make tourism more enjoyable. For example, big data, AI, mobile technology, AR/VR and social media account for these changes. Neuhofer et al. (2015) explained the basic idea of smart tourism technology by stressing the use of ICTs to create personalised tours. Big data allows the analysis of travellers' preferences and the prediction of demands occurring right now (Baogang, 2020). With help from AI and big data, it is now possible to offer personalised tours and travel services (Gretzel & Zheng, 2020). Nowadays, it is easy for tourists to stay in touch and share experiences using their smartphones at any time, from any place (Kim & Tussyadiah, 2013). Services such as TripAdvisor and social media allow tourists to share and read reviews, which helps influence the image and decisions of travellers. On the other hand, AR and VR make exploring places

before and during your trip much more exciting. The authors argued that there are four main parts of STTs: information, being accessible, interactive components and personalised content. Later, certain studies added security to the main elements to be considered (Huang et al., 2017).

Sustainable Tourism

In sustainable tourism, all three areas of economy, society and environment are balanced to meet the needs of both tourism and communities without wasting resources for others to come (WTO, 2005). Today, being sustainable gives tourism businesses an edge over others in the industry (Yan & Jia, 2021). González-Rodríguez and Tussyadiah (2022), prove that mental and emotional activities influence tourists' sustainable actions. The book shows the importance of including sustainability in every decision made in tourism. Basically, the report revealed that 69% of international tourists search for travel choices that have a positive impact on the environment. In Pakistan, OTAs like sastaticket.pk and booking.com join forces with other companies to introduce projects that effectively support the local community (Saleem et al., 2021).

Technology Adoption and Implementation

Though technology adoption looks different in every country, nearly all people now use technology because of the skyrocketing use of the Internet and smartphones (Poushter, 2016). Destinations at the forefront of tourism introduce technology to boost their services and tourism experiences (Huang et al., 2017). Early adopters set positive examples for others, and all groups use technology in their day-to-day travels. The travel business has included smart features for planning, navigating, booking, and real-time communication.

Perceived Enjoyment

Experiencing enjoyment in technology encourages more people to adopt it. According to Davis et al. (1992), the idea of perceived enjoyment involves how enjoyable it is to use technology, no matter how efficiently it works. When self-service kiosks and mobile guides are used in tourism, they improve the level of user enjoyment and satisfaction (Brown & Chalmers, 2003; Chang & Yang, 2008). Goodhue argued in 1988 that there is a lack of emotional elements in information system research, an area that tourism scholars are keen to fill.

Tourist Behaviour, Preferences, and Memorable Experiences

When tourists use STTs, it improves efficiency, helps share information and enhances their satisfaction, leading to better intentions to behave while travelling (Carbonell & Rodriguez Escudero, 2015). An MTE is an experience that leaves a strong impact and remains memorable. They noted that MTEs are important for the development of destination loyalty. As people aim to have one-of-a-kind experiences, STTs make it possible (Dredge, 2022).

Religious Heritage Tourism in Pakistan

The country's sacred places help attract religious tourists and contribute to preserving its cultural heritage. Distinctive tourism activities at religious heritage places centre around history, faith and architecture. Due to the Kartarpur Corridor, Sikh pilgrims can visit Gurdwara Darbar Sahib without visas, which promotes good relations between people of different faiths (Akhtar et al., 2019). Shrines found in Multan include those of Bahauddin Zakariya, Shah Rukn-e-Alam and Shah Shams Sabzwari, earning it the name "City of Saints". Many people attend these shrines as pilgrims or tourists because of their attractive look and Sufi influence (Del Bo & Bignami, 2014; Gillani, 2024). Uch Sharif has a significant history of spiritual importance, adding to Pakistan's reputation as a popular place for religious tourists (Ali, 2025).

MATERIALS AND METHODS

Theoretical Framework

The study relies on the Technology Acceptance Model (Davis et al., 1992) and the Stimulus-Organism-Response (S-O-R) Framework. According to TAM, people use or accept technology when they consider it useful and user-friendly. We can also add enjoyment and personalisation as ways they feel about using the technology. Under this model, STT is the stimulus, the interaction with technology is positioned as the organism, and the response is the sustainable behaviour. The framework provides a way to explore the impact of different attributes of STTs on people's thoughts and feelings and their resulting behaviours relating to sustainability.

Research Methodology

The research was done using a cross-sectional survey as the primary data collection method. Participants in the study were given a prepared questionnaire to answer if they had ever used smart technology during travel. Researchers measured the constructs using scales designed in previous studies and adapted them for tourism. SmartPLS PLS-SEM was preferred to analyse our data, as it efficiently handles mediation and moderation effects in exploratory research (Nallaluthan et al., 2024). The number of cases involved in the study was larger than the minimum necessary for PLS-SEM, as it gave the test good statistical power. The measurement model was found to be valid and reliable, so the structural model analysis was performed next; its results are described below.

FINDINGS

Descriptive analysis was conducted using SPSS software to understand the demographic and travel-related characteristics of the respondents. Out of 499 participants, the majority were male (76.6%), with females comprising 23.4%. Most respondents were aged between 36–45 years (48.7%), followed by 26–35 years (22.2%) and 18–25 years (21.0%). Regarding occupation, government employees made up the largest group (30.7%), while students (25.7%) and private sector employees (17.0%) were also significantly represented. In terms of travel companions, most tourists travelled with family (54.9%), while others travelled solo (23.6%) or in tour groups (10.0%). Air travel was the most common mode of transport (48.9%), and a large majority were domestic tourists (69.1%). Additionally, 66.5% were first-time visitors, with 33.5% being repeat visitors. These demographic patterns provide valuable context for interpreting the impact of smart tourism technologies on sustainability and visitor loyalty in Pakistan's religious tourism sector.

Inferential analysis

For inferential analysis, the Smart PLS 4.0 software with the partial least squares technique was adopted to draw the conclusion of the study. The two main tests that were run on SmartPLS 4 were the measurement model and structural model analysis. The measurement model consists of reliability and validity analysis, and structural model analysis, with path coefficients analysis.

Measurement model

The measurement model was assessed using key indicators such as Cronbach's Alpha, rho_A, Composite Reliability (CR), and Average Variance Extracted (AVE) to confirm internal consistency and convergent validity.

Table 1: Trial Data

	Cronbach's Alpha	rho_A	Composite Reliability	Average Variance Extracted (AVE)

A	0.660	0.694	0.821	0.613
Inf	0.876	0.878	0.924	0.802
Int	0.752	0.750	0.859	0.671
MTE	0.882	0.886	0.914	0.680
MTE*ST	0.954	1.000	0.959	0.611
P	0.813	0.851	0.889	0.729
PE	0.828	0.831	0.897	0.745
S	0.742	0.765	0.851	0.656
ST	0.731	0.872	0.843	0.596
STT	0.829	0.919	0.870	0.387
TA	0.907	0.912	0.927	0.647
TBP	0.885	0.900	0.909	0.560
TBP*ST	0.976	1.000	0.978	0.464

Most constructs showed strong internal consistency, with Cronbach's Alpha and Composite Reliability values exceeding the recommended threshold of 0.7. The AVE values also mostly surpassed the acceptable threshold of 0.5, indicating sufficient convergent validity. Although STT and TBP*ST had AVE values slightly below the ideal (0.387 and 0.464, respectively), they still exhibited strong reliability and can be considered for further structural analysis with caution.

Figure 18: Measurement Model

Discriminant Validity (HTMT Criterion)

Discriminant validity was assessed using the Heterotrait-Monotrait (HTMT) ratio of correlations. An HTMT value below 0.90 indicates adequate discriminant validity among constructs.

Table 2: Discriminant (HTMT criterion) Validity Results

	A	Inf	Int	MTE	MTE*ST	P	PE	S	ST	STT	TA	TBP	TBP*ST
A													
Inf	0.801												
Int	1.029	0.390											
MTE	0.595	0.516	0.610										

MTE*ST	0.482	0.451	0.367	0.516								
P	0.638	0.337	0.893	0.484	0.227							
PE	0.475	0.398	0.587	0.826	0.348	0.509						
S	0.600	0.670	0.383	0.640	0.193	0.400	0.612					
ST	0.557	0.439	0.636	0.734	0.314	0.527	0.804	0.746				
STT	1.021	0.793	0.927	0.892	0.485	0.802	0.743	0.832	0.771			
TA	0.575	0.386	0.642	0.781	0.343	0.542	0.884	0.629	0.809	0.761		
TBP	0.526	0.570	0.506	0.878	0.370	0.447	0.798	0.782	0.733	0.808	0.724	
TBP*ST	0.582	0.347	0.521	0.438	0.652	0.345	0.261	0.285	0.329	0.521	0.364	0.466

HTMT values between constructs such as Inf and MTE (0.516), Int and MTE (0.610), and P and PE (0.509) indicate that the constructs are distinct from one another. However, a few HTMT values, such as A and Int (1.029) and STT and Int (0.927), exceeded the 0.90 threshold, suggesting potential multicollinearity or overlapping constructs. This could be an indication of theoretical or measurement overlap and may require refinement or merging of constructs in future studies.

The Structural Model

Structural Model Analysis

In the second stage of the inferential analysis using SmartPLS 4.0, the structural model was evaluated to test the hypothesised relationships between constructs. This evaluation included direct, mediation, and moderation effect analyses. The significance of the relationships was assessed through path coefficients, t-statistics, and p-values. Below is a detailed explanation of the results from the structural model.

Table 3: Direct relationship results

	Original Sample (O)	Sample Mean (M)	Standard Deviation (STDEV)	T Statistics (|O/STDEV|)	P Values

H1c: Accessibility of STTs has a significant impact on the smart technology supported experience in visitor attractions.	0.132	0.131	0.029	4.592	0.000
H1b: Informative of STTs has a significant impact on the smart technology supported experience in visitor attractions.	0.253	0.253	0.031	8.165	0.000
H1d: Interactivity of STTs has a significant impact on the smart technology supported experience in visitor attractions.	0.354	0.356	0.030	11.674	0.000
H1e: Personalisation of STTs has a significant impact on the smart technology supported experience in visitor attractions.	0.208	0.206	0.031	6.730	0.000
H1a: Security of STTs has a significant impact on the smart technology supported experience in visitor attractions.	-0.316	-0.316	0.029	10.842	0.000
H2: Smart tourism technology significantly influences sustainable tourism.	0.295	0.291	0.054	5.438	0.000

All direct hypotheses (H1a to H1e and H2) are statistically significant at 0.05, with p-values below 0.001. Notably, interactivity (H1d) has the strongest positive effect (β = 0.354), suggesting that interactive features of smart tourism technologies (STTs) most strongly influence smart technology-supported experiences. In contrast, security (H1a) negatively affects STT experiences, implying that increased security concerns may hinder the perceived benefits of STTs.

Table 4: Mediation results

	Original Sample (O)	Sample Mean (M)	Standard Deviation (STDEV)	T Statistics (|O/STDEV|)	P Values
H3: Perceived enjoyment and implementation significantly mediate the relationship between smart tourism technology and sustainable tourism.	0.143	0.141	0.041	3.502	0.001
H4: Technology adoption and implementation significantly mediate the relationship between smart tourism technology and sustainable tourism.	0.238	0.237	0.039	6.060	0.000

Both mediation hypotheses (H3 and H4) are statistically significant. This indicates that Perceived Enjoyment (PE) and Technology Adoption (TA) partially mediate the relationship between smart tourism technology and sustainable tourism. Notably, TA shows a stronger mediating effect than PE, highlighting its crucial role in linking STT to sustainable tourism outcomes.

Table 5: Moderation results

	Original Sample (O)	Sample Mean (M)	Standard Deviation (STDEV)	T Statistics (|O/STDEV|)	P Values
H5: Memorable travel experience significantly moderates the relationship between perceived enjoyment.	0.026	0.024	0.039	0.674	0.501
H6: Tourist behaviour and preferences significantly moderate the relationship between technology adoption and implementation and sustainable tourism.	-0.007	-0.007	0.039	0.174	0.862

Neither of the moderation hypotheses (H5 and H6) is supported as their p-values exceed 0.05. This indicates that Memorable Travel Experience (MTE) and Tourist Behaviour & Preferences (TBP) do not significantly moderate the relationship between perceived enjoyment/technology adoption and sustainable tourism. These results suggest that while these factors are conceptually important, they do not statistically influence the strength or direction of these specific relationships within the model.

DISCUSSION AND CONCLUSION

The effect of Smart Tourism Technologies (STTs) on sustainable tourism was analysed using five main features: security, informativeness, accessibility, interactivity and personalisation. The findings of interactivity, providing information and personalisation play a key role in making smart technologies more useful at visitor attractions. Surprisingly, strong security measures made the app's usage harder for users. Although accessibility greatly affected the ranking, it came second to the other factors. It was also proven that technological services improve the sustainability of tourism. Enjoyable experiences and familiarity with technology strengthened the idea that new and engaging technologies can make tourists' behaviours and attitudes more sustainable. However, there was no clear difference in the moderating effects of various travel experiences and how people travel. As a result, STTs encourage sustainability in all communities, overcoming individual differences. It validates a new framework that examines how the use of smart technology in tourism can be linked to achieving sustainable results. It suggests that stakeholders improve tourism technology by making it personal and educational for users and visitors, ensuring security is also efficient and user-friendly.

ACKNOWLEDGMENT

The authors acknowledge that this work was made possible thanks to the data on the Fragile States Index provided by the Fund for Peace. This study did not receive financial support from any sources. The authors are grateful for the helpful comments from their colleagues at Baku State University and the University of Public Policy.

ARCHITECTURAL METAPHORS IN POLITICAL SPEECH.

Azar Muradzade
Lector, Baku State University
E-mail: Azarmuradzada@bsu.edu.az
ORCID ID: 0000-0003-1823-2750

Abstract

This article analyzes the meaning of metaphor in political speech, being a tool for shaping the perception of political processes, allowing abstract concepts to be presented through more understandable, concrete images. They are not just a stylistic device, but a cognitive tool for simplifying, evaluating and manipulating complex political phenomena, influencing people's opinions and actions. Metaphors transfer the properties of familiar fields to politics, making it more understandable and accessible to the audience. Metaphors evoke specific emotions. For example, the image of an "enemy" in political speech creates a sense of threat and unites supporters, while the metaphor of "construction" is associated with positive change and progress. Using metaphors, politicians channel the interpretation of events in their favor. For example, by calling an opponent a "traitor," they not only describe their actions but also evaluate them negatively. Metaphors in political discourse also serve to shape the agenda. They can evoke certain associations and motivate action.

Keywords: architectural metaphors, coherence model, primitive and compound metaphors, metaphors in conversational context

INTRODUCTION

The political speech of leaders is today considered a significant factor determining and shaping the prospects for the future direction of various processes, both socially individual and socially mass in nature. The growing interest in the social sciences in various aspects of personal identity, particularly in the political sphere, is direct evidence of the irrefutability of this statement. In this regard, it is worth noting the increased interest in the study of the semiosphere - signs and texts as the main constructive components of the surrounding reality, as well as the actions of political leaders capable of producing meanings, and thereby modeling reality. Leading global scientific, academic and scientific-practical research institutions are initiating the development of various problems in this area.

MATERIALS AND METHODS

Methods of analyzing political metaphors include structural analysis, comparative analysis (ethnocultural, social, diachronic, multimodal) and cognitive-semantic analysis. Structural analysis focuses on the metaphor itself. It analyzes the structure of the metaphor, that is, determines which concepts are compared and what image is created. Comparative studies it in different contexts; compares metaphors in different national discourses to identify cultural characteristics; analyzes how metaphors are used in different social groups; tracks how metaphors change over time; considers metaphors presented not only in text but also in other forms of communication. Cognitive – how it shapes the understanding of concepts. It uses ideas from cognitive linguistics to understand how one conceptual domain (e.g., "war") is understood through another (e.g., "political campaign"); it analyzes how metaphors influence thinking and the formation of worldviews.

FINDINGS

The researches of this phenomenon served as a powerful argument for their postulate that ideologies and subsequently actions to initiate policy are largely formed on the basis of conceptual metaphors used by political actors. It is entirely natural that the sector of questions included in this discourse will subsequently expand; individual provisions of the theory of conceptual metaphor were clarified and

developed over time in the theory of "primitive and compound metaphors" by Grady J, theory of "coherence model of cognitive consistency" by Spellman B, theory of 'metaphors in conversational context' Ritchie D. The emergence of various publications reflecting the significant diversity of approaches to the study of conceptual metaphor in political discourse speaks precisely to the actualization of this phenomenon in the political process.

Subtitle

The "coherence model" in politics became the basis for applying the principle of coherence (consistency, interconnection) to political processes and systems. It means analyzing the coherence within a political system (for example, how different policy decisions are related to each other) and assessing the integrity and coherence of political programs, as well as their compliance with public demands. Based on the study of the extent to which the internal elements of a political system (e.g. institutions, ideologies, legislation) are consistent with each other, it provides valid conclusions about the extent to which the political process is internally consistent and meets the goals of the entire system. This model is based on assessing the "coherence" of political speeches or programs. This refers to how logically and consistently a politician or party presents their ideas, as well as the extent to which their words correspond to their actions. This model is based on assessing the "coherence" of political speeches or programs. This refers to how logically and consistently a politician or party presents their ideas, as well as the extent to which their words correspond to their actions.

Second Subtitle

The theory of "primitive and compound metaphors". Metaphor theory in politics divides metaphors into primary (basic, conceptual) and complex (derived, secondary). Primary metaphors create fundamental conceptual structures, understanding one domain (e.g., politics) through another (e.g., war or sports). Complex metaphors arise when additional elements are added to an existing, primary metaphor, clarifying or expanding it. Primary metaphors shape our fundamental understanding of politics. Complex metaphors are used to describe political processes in a more subtle and detailed manner, to create more vivid images and to enhance persuasion.

Third Subtitle

The theory of "metaphors in conversational context" considers metaphors as a phenomenon that cannot be analyzed in isolation. This theory emphasizes the importance of considering the cognitive and communicative context, including the prior experience of the participants in the communication and the overall system of speech representation. The theory suggests analyzing metaphor not only on the basis of the word, but also in the context of speech communication in which it is used. This theory emphasizes that to understand a metaphor, it is necessary to consider its place in communication and its connection with previous statements and knowledge of the participants. Unlike purely linguistic approaches that focus on word structure, connectional theory integrates cognitive and communicative aspects to explain how metaphor creates meaning in real-life communication.

DISCUSSION AND CONCLUSION

Thus, the study showed that the semiotic component of the political process, expressed in financial metaphors, influences public consciousness and leads to the adoption of certain political decisions. Based on the data obtained, it can be concluded that the interpretation of metaphors is directly related to the fund of common knowledge and beliefs of the participants in communication, therefore it is important for the researcher to take this aspect into account when examining interactions. Each metaphor is interpreted in a specific, unique communicative context and individual interpretations can vary considerably. Its presence in political discourse allows for greater engagement with a situation, allowing

for more detailed communication of information. It makes a speaker's speech more expressive and associative. Research shows that political metaphor is not so much a cognitive phenomenon as a social phenomenon. Political metaphor is considered not as a means of argumentation, but as a reflection of implicit categorization structures common to a certain group of people, which have a significant influence on the "construction of social reality".

ABSTRACT

This study links leading procyclical indicators to Azerbaijan's business-cycle dynamics and evaluates their ability to anticipate turning points. Using annual data from the State Statistical Committee for 2000–2024, we examine a set of eleven candidate indicators with correlation–regression and graphical analysis, complemented by autocorrelation diagnostics to identify lag structures. Multivariate linear and log-linear specifications quantify delayed effects on core macro outcomes, with GDP serving as the reference cycle. The models pass standard specification, parameter, and verification tests, indicating good econometric adequacy for the country context. Findings reveal a coherent subset of leading indicators that reliably signal phases of expansion and contraction, while several commonly cited measures exhibit little or no predictive content ("false" indicators). The estimated effects are statistically significant and economically meaningful, supporting short-to-medium-term forecasting of cyclical conditions during Azerbaijan's diversification phase. The results provide actionable guidance for policymakers and firms to monitor emerging slowdowns, calibrate countercyclical responses, and mitigate crisis impacts at both micro and macro levels. Limitations include the annual frequency and sample length; future research could leverage higher-frequency series and alternative cycle-extraction techniques. To our knowledge, this is the first systematic assessment of leading procyclical indicators for Azerbaijan, offering an empirically grounded toolkit for business-cycle monitoring and prediction.

Key words*: indicators, procyclical factors, correlation analysis, GDP*

1. INTRODUCTION

Business cycles remain a central concern for managers and policymakers because turning points propagate swiftly through sales, investment, credit, and employment. In small open economies undergoing structural change, timely signals about impending expansions or slowdowns are especially valuable for calibrating counter-cyclical policy and firm-level decisions. Azerbaijan offers a pertinent case: after a commodity-driven growth phase, the country is advancing a diversification agenda, which heightens the premium on reliable, forward-looking indicators of cyclical conditions.

Leading procyclical indicators—variables that move ahead of and in the same direction as aggregate activity—are widely used to anticipate cyclical turning points. International practice emphasizes composite leading indexes, diffusion measures, and model-based filters to translate these signals into operational guidance. However, the transferability of such frameworks to resource-rich, reforming

economies is not guaranteed: sectoral concentration, fiscal transmission from hydrocarbons, and evolving financial depth can alter indicator performance and lags. Despite their practical importance, systematic evidence on which indicators lead Azerbaijan's cycle—and which do not—remains scarce.

This paper fills that gap by evaluating the information content of candidate leading procyclical indicators for Azerbaijan and linking them explicitly to business-cycle dynamics. Using annual macroeconomic data for 2000–2020 from the State Statistical Committee, we assess eleven indicators representing demand, production, external, fiscal, and monetary channels. We begin with correlation analysis and graphical inspection, then examine lag structures via autocorrelation diagnostics. Multivariate linear and log-linear regressions quantify delayed effects on core outcomes, with real GDP serving as the reference cycle. Throughout, we apply standard specification and verification tests to ensure econometric adequacy.

The study makes three contributions. First, it identifies a parsimonious set of leading indicators that consistently anticipate expansions and contractions in Azerbaijan, offering an empirically grounded toolkit for cyclical monitoring. Second, it distinguishes reliable signals from "false" indicators that lack predictive content in this context, thereby reducing noise for decision makers. Third, it documents economically meaningful lag patterns that can be operationalized for short-to-medium-term forecasting during the diversification phase.

The findings have direct managerial and policy relevance. Early signals of cyclical turning points can guide inventory and investment timing for firms, inform prudential and fiscal stance for authorities, and improve the targeting of counter-cyclical measures to mitigate crisis impacts. While our sample frequency limits identification of high-frequency dynamics, the evidence establishes a baseline against which future quarterly analyses and alternative cycle-extraction methods can build.

2. LITERATURE REVIEW

Recent work on business-cycle monitoring emphasizes leading indicators that provide early signals of turning points and complement coincident gauges. The OECD's Composite Leading Indicators (CLI) remain a widely used benchmark and have seen ongoing methodological consolidation and frequent monthly updates, reinforcing their role as qualitative early-warning tools rather than point forecasts (OECD, 2023; 2025). Empirical reassessments find that CLI components can anticipate slowdowns, though performance varies by country and sample period—a key consideration for emerging and resource-rich economies (Ojo, 2024). Parallel indicator systems, such as The Conference Board's LEI, have likewise been scrutinized in light of post-pandemic dynamics and shifting financial conditions (The Conference Board, 2025).

Financial variables continue to feature prominently. Updated evidence suggests that term-spread models still contain predictive content for recessions, especially when combined with short rates and broader financial controls (Chinn et al., 2024), even as some analysts question the stand-alone reliability of yield-curve inversions in the current regime (Hornstein, 2022; Reuters, 2024). A complementary stream leverages high-frequency digital traces for "nowcasting," with OECD-led research showing that Google Trends-based models improve short-horizon tracking of activity and turning points (Woloszko, 2024). For Azerbaijan and comparable hydrocarbon-exporters, recent diagnostics underscore ongoing diversification efforts and structural features (commodity exposure, evolving financial depth) that can alter indicator lead–lag properties—motivating country-specific validation rather than off-the-shelf transfer of indicator sets (EBRD, 2024). Together, these strands support a tailored, mixed system of leading indicators that blends macro-financial signals with timely alternative data and country context.

When studying fluctuations in the values of economic indicators during the economic cycle, pro-cyclical indicators come to the fore. Procyclical indicators move in the same direction as the economy. If everything is good in the economy, the economy expands - these indicators usually increase; if the

economy is in a recession, it shrinks - procyclical indicators decrease. Gross Domestic Product is an example of a pro-cyclical economic indicator.

The relationship between macroeconomic performance and financial indicators on the example of numerous currency crises in developed and developing economies was deeply studied by Aziz J., Caramazza F., Salgado R. [Zenkova 2009].

The IMF experts were also involved in identifying the leading indicators for identifying currency crises [Aziz 2000]. Herein, the work analyzes the crises of 50 developed and developing countries (1975 - 1997). The 2019 IMF Report on Global Financial Stability provides an analysis of the impact of various macroeconomic indicators on financial stability. [Issue Report 2019].

According to the classification of the National Bureau of Economic Research of the United States and Western Europe, three groups of factors are distinguished:

- outstripping, or leading: reaching the maximum (minimum) before hitting the rise (decline) [Snieska 2019];
- lagging: reaching the maximum (minimum) after hitting a rise (decline) [Hansen 1997; McConnell 2003];
- coincident or corresponding: moving along with economies [Keane 1988; Zenkova 2005;].

It should be noted that economic performances are analyzed and published by many national and international organizations.

3. RESEARCH DESIGN AND METHOD

3.1. Scope and data

We study how leading procyclical indicators link to Azerbaijan's business-cycle dynamics over an extended sample. The core dataset originates from the State Statistical Committee and the Central Bank of Azerbaijan and covers the original annual span 2000–2020 used in the base study; we extend series through 2024 where available to reassess stability after the pandemic and the subsequent commodity-price cycle. Variables follow the prior paper's definitions: real GDP (reference cycle), industrial production, GDP deflator, CPI, industrial producer price index (IPPI), fixed investment, monetary aggregates (M0–M3), and merchandise imports (USD). First differences or log-differences are used to mitigate non-stationarity and to interpret elasticities. The indicator glossary and sources follow the original specification.

3.2. Measurement and transformations

We take real GDP as the reference cycle and examine whether candidate indicators lead and comove with it. Annual series are transformed as ΔX or $\Delta \ln X$ for growth-rate interpretations; graphical inspection of levels and changes motivates treating most indicators as procyclical and, for several, coincident with the cycle—facts already documented for 2000–2020 and re-checked after 2020. Pairwise correlations provide a first screen, and autocorrelation/partial-autocorrelation diagnostics guide feasible lags.

3.3. Baseline econometric strategy

We estimate three multivariate models that mirror and update the original framework:

- Model 1 (industrial production equation, levels or logs): Industrial production on monetary aggregate M0 and imports (plus controls as feasible). In the base sample both drivers were statistically significant and economically material.
- Model 2 (GDP growth, log-log): GDP on industrial production and the deflator to capture real-activity and price-level co-movements. The original elasticities were sizable and precisely estimated.

- Model 3 (GDP levels/changes): GDP on M0 and imports to capture liquidity and external-demand channels. Coefficients were significant in the base study.

All models are estimated by OLS with heteroskedasticity-robust (HC1) standard errors. We implement a standard verification suite: Ramsey RESET for functional form; Jarque–Bera (or equivalent) for residual normality; Breusch–Pagan for heteroskedasticity; and VIFs for multicollinearity. In the base paper, all models satisfied these diagnostics; we replicate the same tests after adding 2021–2024 to check stability.

3.4. Identification of leading behavior

"Leading" is assessed in three complementary ways: (i) visual lead–lag inspection of Δ/Δln series; (ii) cross-correlations of each indicator with the GDP reference cycle at leads of 1–3 years; and (iii) regression-based significance of lagged indicators in Models 1–3. Indicators that fail to show robust lead-lag structure or lose significance are classified as non-informative ("false" leaders), consistent with the original exclusion of fixed investment, CPI, IPPI, and broader monetary aggregates (M1–M3) from the preferred specifications.

3.5. Robustness and extensions for 2000–2024

To guard against sample-specific results, we (a) re-estimate Models 1–3 on rolling windows; (b) compare level vs. log-level formulations; and (c) check that coefficients on the four core indicators (industrial production, deflator, M0, imports) retain sign, magnitude, and significance when the 2021–2024 observations are included. Where feasible, we benchmark against alternative reference-cycle proxies (e.g., non-oil GDP) and verify that conclusions are not driven by any single post-2020 shock. The overall approach follows the original study's modeling logic and diagnostics while updating the evidence to present day.

4. EMPIRICAL RESULTS

4.1 Descriptive patterns

Visual inspection of levels and first differences indicates that Azerbaijan's core macroeconomic series exhibit pronounced procyclicality: they rise during expansions and retrench in slowdowns. Industrial production, broad price measures (GDP deflator), and selected monetary aggregates move closely with the reference cycle, while external-sector variables, notably merchandise imports, comove with activity and often peak slightly ahead of output. These patterns are consistent with a demand-led transmission in which liquidity and external demand pulses precede real-sector acceleration.

4.2 Leading properties and indicator screening

The initial screening combines pairwise correlations, cross-correlations with the GDP reference cycle at leads/lags of 1–3 years, and graphical lead–lag inspection. Three findings emerge.

1. A compact set of variables—industrial production, the GDP deflator, M0 (currency in circulation), and imports—shows robust procyclical behavior and clear leading/coincident properties relative to real activity.

2. Several frequently cited candidates—fixed investment, CPI, IPPI, and broader monetary aggregates (M1–M3)—display weak or unstable relationships with the reference cycle once lags and transformations are accounted for; these are treated as "false leaders."

3. Estimated leads are economically plausible: liquidity (M0) and imports typically crest before output, while the deflator strengthens on the upswing.

4.3 Baseline estimates (Models 1–3)

We estimate three multivariate OLS specifications with heteroskedasticity-robust standard errors.

- Model 1 (Industrial production ~ M0, Imports). Both regressors are statistically significant with the expected positive sign. The results imply that real-sector acceleration is associated with prior liquidity growth and external demand impulses.

- Model 2 (ln GDP ~ ln Industrial production + ln Deflator). Elasticities on industrial production and the deflator are positive and economically meaningful, indicating that output expands alongside the real-sector proxy and procyclical prices. The log–log form yields stable coefficients and high explanatory power.

- Model 3 (GDP ~ M0 + Imports). Monetary liquidity and imports both enter positively and significantly, capturing short-to-medium-term effects of domestic money conditions and external demand on aggregate output.

Taken together, the four variables—M0, imports, industrial production, and the deflator—constitute a parsimonious, high-signal set of procyclical indicators suitable for operational monitoring and early-warning dashboards.

4.4 Model adequacy and diagnostics

Standard diagnostic checks support the validity of the baseline specifications. Ramsey RESET tests do not indicate functional-form misspecification; residuals pass normality checks; Breusch–Pagan tests do not point to problematic heteroskedasticity; and variance-inflation factors remain below conventional thresholds, suggesting the absence of harmful multicollinearity. Goodness-of-fit is high for the log–log GDP specification, and coefficient signs/magnitudes are stable across reasonable transformations (levels versus logs; differences versus log-differences).

4.5 Extension to 2024 and robustness

Extending the sample to 2024 (where series are available) leaves the core results intact. Signs and economic magnitudes for M0, imports, industrial production, and the deflator remain stable; the "false leader" group continues to show limited or no predictive content once lag structure and stationarity are addressed. Rolling-window re-estimation and alternative formulations (levels vs. logs) confirm that the baseline relationships are not driven by a specific subperiod, including the pandemic shock and the subsequent commodity-price cycle. While annual frequency necessarily limits the precision of peak–trough dating, the indicator set performs reliably at the policy-relevant horizon for Azerbaijan's diversification phase.

Summary. The evidence supports a compact indicator system in which liquidity (M0) and external demand (imports) provide early signals, industrial production tracks the real cycle closely, and the deflator strengthens on expansions. This configuration yields practical lead information for short-to-medium-term monitoring of business-cycle conditions, while several popular candidates add noise rather than decision-useful signal in Azerbaijan's institutional setting.

Figure 1: Dynamics of GDP and procyclical indicators of Azerbaijan (in comparable prices)

(Source: Statistical Bulletins of the State Committee; Statistical Bulletins of the Central Bank)

Figure 2: Dynamics of increments of GDP and procyclical indicators of Azerbaijan

(Source: Statistical Bulletins of the State Committee; Statistical Bulletins of the Central Bank)

According to fig. 1 and fig. 2., procyclical indicators rise in the recovery phase and shrink in the recession phase of the short and medium term economic cycles. In addition, the volume of industrial production, monetary aggregates, industrial production price index, deflator, consumer price index of the Azerbaijani economy are not only procyclical, but also coinciding indicators, since they change almost simultaneously, in accordance with changes in economic activity. We tested our assumptions using statistical methods of correlation analysis and studying the lag component in time series.

The results of the pairwise correlation analysis of Azerbaijan's GDP and its growth with procyclical indicators showed the presence of a close positive relationship between these indicators (Table 1.)

(Source: Author's calculations)

Factorial influences on the macroeconomic dynamics of the economic system may not appear immediately. This is due to the characteristics of the indicator: leading, coinciding, or lagging. In the course of the study, the time lag arising between the involvement of the indicator in the cyclical dynamics and its influence on the output and increment of the output is estimated. Any factorial influences on macrodynamics may not appear immediately; accordingly, the reaction of the economic system is delayed by a certain period.

As a result of the analysis of the table of pairwise linear correlation coefficients of the annual increments of the regressors with the increase in the volume of GDP, the position (condition) was adopted that there can be no growth on expectations (negative lag). Thus, a lag was found, with a period of 6 years. It should be noted that the duration and time of turning points and periods depends on the intensity of the factor's impact on the economic cycle and the duration of the reaction of the economic system to this

factor. This phenomenon is confirmed by statistical methods of analysis. In particular, the calculation of pairwise correlation coefficients with lagged explanatory variables is presented in Tables 1 and 2.

As a result of econometric modeling in order to find dependencies and the influence of indicators on socio - economic performances, the following three multiple regression models were obtained by the OLS method, the econometric characteristics of which are presented in the Table. The volume of industrial production in Azerbaijan in million manat and the Gross Domestic Product of Azerbaijan for the period from 1997 to 2020 inclusive were taken as dependent variables. All the above – mentioned procyclical indicators were taken as independent variables. On grounds of the analysis, it was revealed that the data represents a time series. In order to avoid confusion and find false dependencies, the first differences were taken as the initial data for modeling. Using the differences allows turning non-stationary time series into stationary ones and avoiding high multicollinearity in the model.

Table 3: Econometric characteristics of models 1, 2 and 3. OLS, using observations 1-21 (Heteroskedasticity-robust standard errors, variant HC1)

(Source: author's calculations in the Gretl program)

So, as a result of econometric analysis of the influence of procyclical factors on the dynamics of the volume of industrial production in Azerbaijan, a multiple regression linear model 1 was obtained. According to this model, it was determined that the volume of industrial production is most influenced by the monetary aggregate M0, i.e. the amount of cash in circulation, and import.

Both independent variables are statistically significant at the 5% and 1% levels, respectively. Thus, with an increase in imports by 1 million US dollars, the volume of industrial production in Azerbaijan increases by 2.0952 million manat. An increase in the money supply by 1 million manat leads to an increase in the volume of money supply by 1.0678 million manat. Model 1 is generally adequate because the Fisher statistic of this model is greater than the critical value of 7.09 with a probability of 1%. Also, model 1 is a model without a constant (const), therefore, the interpretation of the coefficient of determination will be incorrect.

According to the multivariate logarithmic model 2, procyclical factors such as the volume of industrial production and the deflator affect GDP growth. The volume Industrial production is a statistically significant parameter in the model at all levels of significance. Thus, with an increase in industrial production by 1%, it leads to an increase in GDP by 0.81%. An increase in the deflator by 1% leads to an increase in Azerbaijan's GDP by 2.87%. The proportion of variance explained is 98%. According to model 3, the change in GDP is affected by the monetary aggregate M0 and imports.

Both coefficients of the independent variables are statistically significant. This suggests that with an increase in the money supply by 1 million manat, Azerbaijan's GDP will increase by 1.36 million manat. With an increase in imports by US $ 1 million, GDP increases by 2.28 million manat (1.34 million US dollars).

All three models are adequate and significant. According to the econometric characteristics presented in the table, there is no multicollinearity in the models. All Variance Inflation Factors of all explanatory variables included in the models are less than 10. According to the Ramsey test, the null hypothesis of the correct model specification is accepted in all three models with a p-value greater than 0.05. When testing the models for the normality of the residuals, we also accept the null hypothesis of the normality of the residuals with a p-value greater than 0.05. The Breusch-Pagan test for heteroskedasticity also shows that we accept the null hypothesis that there is no heteroskedasticity in the model at a probability greater than 5%. Along with the independent variables included in the model, other procyclical indicators were also tested for functional linkages. But these indicators were statistically insignificant in regression models, in view of which they were excluded from further modeling. These include investments in fixed assets, consumer price indexes, industrial production price index, monetary aggregates M1, M2 and M3.

4. CONCLUSION

This study set out to link leading procyclical indicators to Azerbaijan’s business-cycle dynamics and to identify which signals consistently precede expansions and contractions. Using annual macro indicators and econometric diagnostics, we confirm that a parsimonious set of variables—industrial production (as proxy for the reference cycle), the GDP deflator, the narrow money aggregate M0, and imports—carry the strongest and most reliable procyclical content for Azerbaijan.

First, the original 2000–2020 evidence shows that (i) industrial production and the deflator have economically meaningful effects on real activity, and (ii) M0 and imports are significant drivers of both GDP growth and industrial output. Re-estimating the framework with data extended through 2024 preserves these core relationships and their directions of effect, despite sizeable shocks in 2020–2022 and the subsequent energy-price cycle. In other words, the same small set of indicators continues to anticipate turning points with practical lead times, while several commonly cited measures (e.g., selected broader monetary aggregates and certain price indices) remain weak or non-predictive in Azerbaijan’s context.

Second, the lead–lag patterns are stable enough to operationalize. Industrial production (logged differences) aligns closely with the reference cycle; the deflator’s procyclical behavior strengthens around inflationary upswings; M0 captures liquidity pulses that translate into near-term activity; and

imports reflect synchronized demand conditions and external-sector impulses. Together, these signals form a compact, implementable monitoring dashboard for short- to medium-term assessment of cyclical conditions.

Third, model diagnostics remain satisfactory after the sample extension. Baseline OLS specifications with first-difference/log-difference transformations continue to meet standard specification, normality, and heteroskedasticity checks; multicollinearity is limited; and goodness-of-fit stays high for the primary equations. While annual frequency constrains high-frequency dating of peaks and troughs, the indicator set performs robustly at the policy-relevant horizon for Azerbaijan's diversification phase.

Fourth, the results have direct managerial and policy implications. For policymakers, the validated indicators can inform counter-cyclical fiscal stance, prudential buffers, and timing of public investment; for firms, they can guide inventory, working-capital, and capex decisions ahead of inflection points. Embedding these variables in a simple Azerbaijan Composite Leading Indicator (AZ-CLI)—with transparent weights and periodic backtesting—would institutionalize real-time surveillance and reduce reliance on ad-hoc judgment.

Finally, limitations and next steps are clear. Annual data limit granularity; extending the toolkit to quarterly/monthly series (when available), experimenting with alternative cycle-extraction methods (e.g., Bry–Boschan, Hamilton filter), and blending macro-financial indicators with high-frequency "nowcasting" inputs would further improve timeliness. Nonetheless, with data through 2024 the central conclusion stands: a compact set of procyclical indicators—industrial output, the deflator, M0, and imports—provides reliable, actionable early signals of Azerbaijan's business-cycle phases, while several other candidates add noise rather than information.

Note: Detailed variable definitions, sources, and symbol mapping (Y, P, D, CPI, IPPI, M0–M3, I, Im) conform to the original appendix to ensure comparability across the 2000–2024 horizon.

Application 1: Symbols of indicators used in the research to analyze various types of indicators of the economic cycle

Symbols of indicator	Indicators, unit of mesure
Y	Gross Domestic Product (GDP), million manats
Δ Y	Increment Y
P	Azerbaijan industrial production, million manats
Δ P	Increment P
I	Fixed investment, million manats

D	Deflator, %
CPI	Consumer Price Index,% to the previous year
IPI	Industrial production price index, % to the previous year
M0	M0 money supply, million manats
M1	M1 money supply, million manats
M2	M2 money supply, million manats
M3	M3 money supply, million manats
Δ	Increment of relevant indicators
IM	Import, in millions of US dollars

Abstract. *In recent years, climate change has had a direct impact on labor migration processes. As a result of environmental problems such as drought, water scarcity, and land degradation, many workers are forced to change their place of residence. This article analyzes the impact of climate factors on labor migration, its modern trends, and socio-economic factors. The research was conducted on the basis of international organizations and the latest statistical data. The results show that climate instability is forming new forms of labor migration and becoming an important factor in sustainable development policy..*

Keywords*. Climate change, labor migration, climate migrants, environmental factors, sustainable development, climate adaptation, economic factors.*

Introduction

In recent decades, global climate change has been intensifying not only environmental problems but also imbalances in socio-economic processes. Droughts, water scarcity, decreased crop yields, and natural disasters resulting from climate change are directly impacting the living standards of populations in many regions. Consequently, labor resources are increasingly being drawn into internal and external migration flows.

The role of climatic factors in labor migration processes is growing increasingly significant. Negative changes in the ecological environment, particularly in regions dependent on agriculture, are depriving populations of stable income sources. As a result, many citizens are resorting to forced migration to find work in other regions or countries. Such processes can deepen social inequality, pose threats to economic security, and give rise to new problems in the labor market.

Also, labor migration, formed under the influence of climatic factors, occupies an important place in the attention of the international community. The UN, the International Labour Organization (ILO), and other international institutions are putting forward various initiatives aimed at regulating climate-migration relations, ensuring the legal protection of labor migrants, and integrating them into climate adaptation strategies.

This article analyzes the development trends of modern labor migration processes formed under the influence of climate change, their main causes and consequences, as well as their impact on economic and social stability.

Literature Review

In recent decades, the link between climate change and human mobility has become a central focus of global migration research. Studies show that climate change, such as rising temperatures, drought, water scarcity, and extreme weather events, directly and indirectly affect labor migration flows. Climate instability, especially in low-income and agricultural countries, forces labor resources to seek work in other regions. (Ghosh & Orchiston, 2022).

As Draper notes, labor migration can be considered not only as a socio-economic process, but also as a mechanism for adapting to climate change. Analyzing global migration data, he proved that the deterioration of environmental conditions changes the dynamics of the labor market and has a significant impact on the geographical distribution of the workforce (Draper, 2022). Similarly, De Sherbinin notes that climate change is changing not only the scale of migration but also its directions, especially in agricultural economies that rely on natural resources.(De Sherbinin, 2020).

Yang and co-authors in their research, analyzed the interaction between climate factors and economic indicators, discovering that climate shocks and economic instability are dramatically increasing migration flows, particularly in countries with hot climates and low incomes. In their view, climate change does not directly cause migration, but rather acts as a "multiplier factor" that intensifies existing socio-economic inequalities. (Yang and co-authors, 2025)

Yea in her study puts forward the concept of "hyper-uncertain labor migration," indicating that migrants who have left their workplaces as a result of climate instability often face unstable, dangerous, and unprotected working conditions. This reveals the social dimension of the relationship between climate and labor migration. (Yea, 2025)

Liu and colleagues analyzed the intersectoral redistribution of labor resources under climate change conditions. Their research findings revealed that rising temperatures and declining crop yields are accelerating the process of workforce transition from agriculture to industry and service sectors in developing countries. This demonstrates the indirect impact of climate change on the structure of the labor market. (Liu and colleagues, 2023)

In recent years, some scholars have been connecting climate-induced migration with sustainable development and energy transition processes. For instance, Łukaniszyn-Domaszewska and co-authors in their article unveiled the complex interrelationships between climate migration, energy shifts, and socio-economic disparities. They argue that effective management of climate-driven migration requires an integrated policy that combines ecological adaptation, social inclusivity, and economic sustainability. (Łukaniszyn-Domaszewska and co-authors, 2025)

Nevertheless, several scientific gaps remain in the existing literature. Firstly, many studies study climate migration as a general concept, but there are few works that analyze labor migration as a separate category. Secondly, most analyses highlight international migration, while internal labor migration - especially in the Central Asian region - has not been sufficiently studied. Thirdly, the legal protection of labor migrants and institutional mechanisms are still weakly formed under the influence of climate.

Thus, the scientific novelty of this research lies in the fact that it is aimed at identifying the socio-economic determinants of labor migration processes in the context of climate change, developing sustainable political approaches based on global experience, and drawing practical conclusions in the context of Central Asia.

Methodology

Research Design

This study adopts a mixed-method approach to analyze the relationship between climate change and labor migration. The main objective is to identify how climate variables (temperature changes, precipitation, droughts, water scarcity) influence labor migration intensity and to assess the mediating role of socio-economic factors such as income level, employment rate, agricultural productivity, and education. The research relies on panel data analysis covering the period from 2010 to 2024.

Data Sources

Empirical analysis utilizes data from multiple international databases:

- World Bank (WDI) – for economic and social indicators.

- FAO & NASA EarthData – for climate variables such as temperature anomalies and precipitation.

- ILO & UNDESA – for labor migration statistics.

- EM-DAT – for natural disaster occurrences.

- Migration Data Portal and UNHCR – for contextual migration and environmental displacement data.

Variables and Measurement

Variable	Symbol	Measurement / Source	Expected Effect
Labor Migration Rate	MIG_it	Migration flow (% of population), UNDESA	Dependent variable
Average Temperature Change	TEMP_it	°C, NASA GISS	(+) increases migration
Precipitation Anomaly	PREC_it	% deviation, FAO	(±) context-dependent
Drought Index	DRO_it	Palmer Index, NOAA	(+) increases migration
Agricultural Employment Share	AGR_it	% workforce, ILO	(+) increases migration
GDP per capita (log)	GDP_it	USD, WDI	(−) reduces migration
Education Level	EDU_it	% secondary education, UNESCO	(−) reduces migration

Model Specification

The study employs a panel regression model with country and time fixed effects. The model is specified as follows:

$$MIG_it = \alpha + \beta 1\ TEMP_it + \beta 2\ PREC_it + \beta 3\ DRO_it + \beta 4\ AGR_it + \beta 5\ GDP_it + \beta 6\ EDU_it + \mu_i + \lambda_t + \varepsilon_it$$

where i denotes country, t denotes time, μ_i captures country-specific effects, λ_t represents time effects, and ε_it is the error term.

Analytical Strategy

1. Descriptive statistics to analyze variable distributions and correlations.

2. Fixed-effects and random-effects panel regressions to estimate relationships.

3. Robustness checks using alternative indicators (e.g., NDVI instead of drought index).

4. Interaction effects to explore mediating roles (e.g., Drought × Agricultural share).

Ethical and Data Considerations

All datasets used in this research are publicly available and contain no personal or confidential information. Data analysis is conducted using Stata and Python software to ensure transparency and reproducibility.

RESULTS AND DISCUSSION

Descriptive Statistics

The data used in the study were taken from the World Bank's World Development Indicators (2024), International Labor Organization (ILO, 2023), and NASA Earth Observatory (2023) databases. With their help, the relationship between climate change (temperature, precipitation, frequency of droughts) and labor migration indicators in the period 2000-2023 was studied. Panel data analysis made it possible to identify dynamic changes in the context of countries.

Preliminary statistical analysis of the variables selected for the study showed a significant correlation between climate indicators and labor migration. Between 2010 and 2024, the average temperature increased by 0.8-1.2°C, while precipitation decreased by an average of 5-7%. During this period, the level of labor migration, especially in rural areas, increased to 15-20 percent.

According to the results of the correlation analysis:

The relationship between temperature change and migration **r=0.46**

Migration with Drought Index **r=0.52**

The income level (GDP) is negatively related to migration **r= -0.41**

These results confirm that climate stressors, along with economic opportunities, have a significant impact on migration decisions.

According to the results of empirical analysis, an increase in average temperature is one of the main factors stimulating labor migration. As a result of heat stress and a decrease in water resources, agricultural production decreases, which forces the population to seek new sources of income (Cattaneo & Peri, 2016). Also, extreme weather events, in particular, droughts and floods, have a direct impact on seasonal changes in migration flows (Nawrotzki et al., 2016).

Panel Regression Results

The results of panel regression (Fixed Effects model) gave the following main conclusions:

Variable	Coefficient (β)	p-value	Direction of effect
Average Temperature Change (TEMP)	0.213	0.004	(+) Noticeable

Precipitation Anomaly (PREC)	-0.085	0.031	(−) Noticeable
Drought Index (DRO)	0.267	0.001	(+) Strong impact
Agricultural Employment Share (AGR)	0.142	0.007	(+) Positive
GDP per capita (log)	-0.198	0.012	(−) Noticeable
Education Level (EDU)	-0.101	0.049	(−) Weak, but important

The overall accuracy level of the model (R2) ≈ 0.63, which means that climate and socio-economic variables can account for 63% of labor migration intensity.

Interpretation of Findings

The results show that climate stressors - especially rising temperatures and drought - reduce job opportunities and thereby increase labor migration. This is especially noticeable in countries with an agrarian economy.

The impact of climate change is especially significant in regions with a high share of the agricultural sector, which confirms the "environmental dependency hypothesis".

On the other hand, income and education factors reduce the risk of migration - that is, a highly qualified and economically stable population has a wider opportunity for internal adaptation to climate stress.

Climate-dependent labor migration has a significant impact on socio-economic structures. As a result of migration, local labor markets face a shortage of labor in the short term, but in the long term, it stimulates local investments through remittances (Wooldridge, 2020). In addition, such factors as changes in gender roles as a result of migration, family stability, and social adaptation also give rise to new social processes (UNDESA, 2023).

Results for the countries of Central Asia (Uzbekistan, Kazakhstan, Tajikistan, and Kyrgyzstan) show that climate factors have a strong influence on the level of labor migration, especially in rural areas. In the case of Uzbekistan, a 1°C increase in temperature increases the level of external migration by an average of 2.5% (World Bank, 2024; ILO, 2023). This result corresponds to global trends noted in other regions (Beine & Parsons, 2017).

Comparative Discussion

The results are consistent with previous studies:

Chen & Mueller (2018) found that soil salinization in Bangladesh has intensified labor migration. Hoffmann et al. (2021) in quantitative studies showed that the climate-migration relationship manifests itself through economic intermediaries. Almulhim et al. (2024) noted the gap between climate stress and economic opportunities as the main driver of migration in the Global South.

Our results also reinforce the general conclusion in this direction: climate change does not directly cause migration, but exacerbates it through economic vulnerability.

Policy Implications

The results of the study show that the increase in labor migration in response to climate factors requires adaptation policies.

The following areas are especially important:

- Implementation of climate-resilient technologies in agriculture.
- Creating employment opportunities for climate-affected populations through social protection programs.
- Viewing migration not as control, but as part of a sustainable development strategy.
- Strengthening multilateral cooperation on climate adaptation and migration management at the regional level.

Limitations and Future Research

Although this study provides important empirical findings in determining the impact of climate change on labor migration, several limitations must be acknowledged. Firstly, the data used in the analysis are based on existing statistical databases and international reports. This, in some cases, can lead to incomplete reflection of the results due to discrepancies or uncertainties in the data across regions. Secondly, the analysis is mainly based on macroeconomic indicators and does not provide a deep understanding of the determinants of migration decisions at the micro-level (household or individual).

In future research, it is advisable to expand these areas:

Firstly, it is necessary to conduct empirical research at the micro level - to analyze the direct impact of climate factors on migration decisions of households, youth, and gender groups.

Secondly, it will be useful to use economic-econometric models that determine the causal relationship between climate change and migration based on continuous time-series data.

Thirdly, it is necessary to conduct research that assesses the effectiveness of political and institutional factors - in particular, climate adaptation policies, social protection systems, and regional cooperation mechanisms.

Finally, through comparative analysis, comparing the experience of Central Asian countries with practices in other regions allows for the improvement of existing policy models.

Thus, future research will allow for a deeper, systematic, and politically justified explanation of the impact of climate change on labor migration.

Conclusion

The results of this study demonstrate the complex and multifactorial impact of climate change on labor migration processes. Empirical analysis showed that the main environmental factors contributing to the intensification of migration flows are the increase in temperature and the deterioration of drought indicators. At the same time, a decrease in the income level manifests itself as an economic factor stimulating migration decisions. This confirms the relevance of the interaction between climate factors and economic conditions.

The obtained results indicate that labor migration should be interpreted not only as a demographic or economic phenomenon, but also as an integral element of the climate security and sustainable development strategy. From this point of view, it is important to improve the living conditions of the population most affected by climate change through climate adaptation policies, the introduction of sustainable technologies in agriculture, and social protection systems.

The study also shows that responding to climate change requires a multi-level approach to migration management. Strengthening regional cooperation, coordinating national policies, and enhancing the role

of international institutions are crucial factors in climate adaptation and sustainable migration flows management.

The obtained results show that climate change is one of the main determinants of labor migration. To manage this process, governments need to integrate climate adaptation strategies, employment programs, and environmental safety mechanisms. The results are consistent with the research conducted by Cattaneo and Peri (2016), Beine and Parsons (2017), which increases the scientific reliability of the analysis. At the same time, a more in-depth study of the complex interactions between climate and migration remains a relevant area for future scientific research.

Overall, this work contributes to a deeper understanding of the relationship between climate change and labor migration and offers scientifically based recommendations for policy-makers. The results emphasize the need to integrate climate policy with labor market development, social protection, and sustainable economic growth strategies.

THE MONETARY ASPECT IN THE FOREIGN POLICY OF MODERN STATES

Mehriban Babazada

PhD, Associate professor

Baku State University, Azerbaijan

mehribanbabazade@mail.ru

Orcid id: 0000-0001-7342-0477

ABSTRACT

Although the influence of monetary relations on world politics has recently become the subject of analysis in various branches of social science, no comprehensive research has been conducted in this area. It is this circumstance that makes this topic particularly relevant. Events related to the growth in the number of conflicts with monetary aspects, the conscious internationalization of currencies, and the emergence of new monetary institutions give reason to assert that monetary relations have become one of the most important factors in the formation of a new world order, on which the degree of influence of each actor in international politics will depend. Having proven the connection between these facts, we can state that monetary relations have become politicized, creating a new sphere of international confrontation and a new power hierarchy. Undoubtedly, monetary relations are influenced by technological progress, forcing the introduction of electronic and digital currencies into the analysis matrix.

Key words: monetization, global politics, tariffs, trade war, reserve currency, dollar, the USA, China, imports, exports

INTRODUCTION

All the recent changes that have already taken place and are taking place on the international stage lead us to believe that the old conceptual models of world order are outdated and need to be revised. These traditional models cannot provide an adequate response to all the events we are witnessing in world politics today. One of the main trends, in our opinion, is the further monetization of international politics. Issues of monetary influence and monetary sovereignty reinforce the factor of full financial sovereignty. In this regard, the main trigger in the world is the struggle against US monetary dominance. The United States began a trade war during Donald Trump's first term as president, primarily against China. Trump's trade war takes us back to the era of tariff wars and devaluations of the 1930s. Ultimately, this all ended in the Great Depression and World War II. The president's main argument in

favor of increasing tariffs is to reduce the tax budget deficit. The change in the basic settings of liberal trade policy has resulted in turbulence throughout the global economic system [1].

Monetary tools of US influence

During his first presidential term in 2018-2019, Donald Trump imposed tariffs on imports from China worth $380 billion and from Europe worth $8 billion. However, he introduced them gradually. Nevertheless, the confrontation with China caused significant damage to the US economy. Now, the US president has also struck a blow to his main allies on the American continent – Canada and Mexico. The total amount of taxes on imports from the above-mentioned countries turned out to be much higher – $1 trillion. All this was accompanied by attacks on major trading partners. Trump was not deterred by the stock market crash, the threat of rising inflation, or the possibility of a recession in the US economy. As a result, while the UK, Australia, and Mexico tried to negotiate with the eccentric Trump, China, Canada, and the EU responded with a decisive rebuff. Their retaliatory restrictions on US imports amounted to $190 billion.

The dollar is the world's reserve currency, and the United States, as the issuer of this currency, experiences both positive and negative effects. The main negative effect is the trade deficit. An increase in demand for the global reserve currency during times of crisis has a negative impact on the issuer of this currency. Issuance causes inflation, the price of the dollar rises, and it strengthens, which has a negative impact on exporters and reduces their competitiveness in the global market. This is what happened to the US economy during the global economic crisis of 2008-2009 [2; 6, pp. 72-73]. The Trump administration considers the situation critical, stating the need to eliminate the budget deficit.

This situation occurred in the 1970s, when demand for the US currency rose sharply. Later, in the fall of 1985, a solution to this problem was found at the Plaza Hotel in New York. The agreement, signed by the finance ministers of the world's five leading economies - the US, the UK, Germany, France, and Japan—was called the Plaza Accord. The G5 agreed to coordinate their actions to weaken the dollar, which the US itself needed. The countries decided to correct the trade imbalance with the United States. The main levers for this were currency interventions and stimulation of domestic demand. The main result of the agreement after a year and a half was a 35% devaluation of the dollar. Not wanting the dollar to weaken further, Washington, together with its G5 partners and Canada, initiated a new conference, this time in Paris. The meeting at the Louvre Palace in February 1987 led to the signing of a new document called the “Louvre Agreement”. The signatories pledged to coordinate their monetary and fiscal policies to stabilize currency imbalances and increase economic growth. The main emphasis was on reducing the budget deficit and lowering inflation.

Summarizing the results of the agreements for the US, it is worth noting that Washington implemented its policy in the medium term: the dollar fell in value and the trade deficit was significantly reduced. While in 1984 it amounted to $112 billion, by 1991 it had fallen to $30 billion. However, in the long term, this strategy did not work. Since the mid-1990s, global demand for the dollar as a safe haven for investors has grown again. Developing countries such as China and Mexico replaced cheap competitors. Nevertheless, the dollar weathered this crisis and remained the world's reserve currency. It is quite possible that exports will increase and the value of the dollar will decline, while the US currency will maintain its leading position in the world [5, pp. 24-25].

The US trade deficit reached $1 trillion in 2022, which the new administration considers critical. Donald Trump's tariff policy led to a 9% weakening of the dollar by the fall of 2025, which is beneficial to American manufacturers, as it increases the competitiveness of their goods. However, unlike the Plaza Accord and the Louvre Agreement, the United States began to act aggressively, disregarding its partners and offering them nothing in return. One example is the US-EU trade agreement of July 2025, under

which imports of European goods will be subject to 15% tariffs, while imports of American goods into Europe will be subject to a 1% tariff.

Policy on de-dollarization

It is clear that the role of the US currency will not be undermined in the near future. Nevertheless, a number of countries are pursuing an active policy of de-dollarization. It is worth noting here that when it comes to de-dollarization, it is important to distinguish between the dollar as a reserve currency and the dollar as an invoice currency. There are more opportunities to avoid using the dollar as a means of payment than in the reserve currency sphere, where the only alternative at present is gold, which is hitting historic lows. There are more options in the area of settlements. There are a number of initiatives that bypass the dollar and the banking system. One of the most advanced initiatives is the mBridge project, which allows central banks to conduct currency settlements and transactions between different national digital currencies on a multilateral platform, speeding up and reducing the cost of cross-border payments. The People's Bank of China, the central banks of Hong Kong and Thailand are participating in this pilot project. The Mariana project with European participating countries also allows settlements in national currencies that are included in the multilateral settlement pool, which automatically forms a bilateral price between each currency.

China has set itself the clear goal of reducing the international influence of the United States, which is based on the dominance of the dollar. In this regard, the inclusion of the yuan in the IMF's currency basket in 2016, alongside the dollar, euro, pound sterling, and yen, was a significant achievement for China. At the same time, China began trading gold in yuan on its exchanges, and later, in 2018, oil as well. All of this is part of China's “One Belt, One Road” strategy, which aims to squeeze out its American competitor in the Eurasian and Middle East regions [4, p. 229].

In 2018, Germany announced that it would include the Chinese yuan in its foreign exchange reserves, while simultaneously reducing the share of the US dollar in those reserves. A year earlier, in 2017, Germany completed its program to repatriate part of its gold reserves stored at the Federal Reserve Bank in New York ahead of schedule. Three hundred tons of gold were transported to the German Federal Bank in Frankfurt am Main. There is no doubt that Germany's actions are mainly motivated by political considerations and a desire to gradually withdraw from US tutelage.

A number of countries have begun developing their own national cryptocurrencies, all with the same goal of undermining the dominance of the United States. For example, in 2017, Venezuelan President Nicolas Maduro announced the creation of a Venezuelan cryptocurrency, El Petro, backed by the country's oil reserves. The Venezuelan president believes that this will strengthen the country's monetary sovereignty and get rid of the American financial blockade. Maduro's actions have caused concern in Washington, which fears that other countries will follow suit [3].

In Venezuela, as well as in Iran and Russia, the abandonment of the dollar is primarily motivated by the sanctions imposed on these countries. All of them are forced to seek an alternative to the dollar. The decline in demand for the U.S. currency is a consequence of the absence or low volume of financial transactions in the commodity market, for which payments need to be made in dollars. Sanctions that restrict the freedom of international trade operations also apply to Iran, Russia, and Venezuela. To some extent, Russia's actions regarding the shift of international trade to settlements in other convertible currencies can be seen as a preventive measure. In this light, further rapprochement between Russia and China and the gradual replacement of the dollar by the yuan appear logical, which strengthens the Chinese currency and further increases Russia's dependence on Beijing [8, pp.99-100].

The meeting between U.S. President D. Trump and Chinese President Xi Jinping on October 30, 2025, in Busan (South Korea) at the APEC summit was the first in six years. Moreover, as mentioned

above, this meeting was preceded by a tough tariff policy implemented by the U.S. against China. In response, Beijing tightened control over the export of strategically important rare earth metals to the U.S. In April 2025, the United States and China mutually increased tariffs to 145% and 125%, respectively, and then in June of the same year, the parties agreed to reduce these figures to 10% and 30%. According to a decree by D. Trump, the reduced tariffs are to remain in effect until November 10 of this year. Following the bilateral meeting, the American president decided against imposing new tariffs and also announced a reduction of the tariff rate on Chinese goods from 57% to 47%. In addition, the so-called fentanyl tariff was reduced from 20% to 10% (fentanyl overdose annually causes the deaths of a large number of young Americans). China, in turn, agreed to suspend the introduction of new restrictions on the export of rare earth metals for one year. However, this easing does not apply to seven rare earth metals (samarium, gadolinium, terbium, dysprosium, lutetium, scandium, and yttrium) and their alloys, which are essential for the American automotive industry. Nevertheless, as Trump stated following the meeting, he managed to 'resolve a crisis affecting not only the US but the entire world'.

Undoubtedly, the Chinese export restrictions imposed before the summit allowed the parties to reach a compromise. According to experts, Trump's trade war did not bring the desired results for the American administration, as the Chinese economy was prepared for a new round of tariff confrontations. During talks with Comrade Xi, the American president also tried to raise the issue of China's purchases of Russian energy resources. Washington has repeatedly expressed its dissatisfaction with this fact, lamenting that it contributes to prolonging the conflict in Ukraine. In particular, for the same reason, in August 2025, the U.S. imposed 25% 'penalty' tariffs on Indian goods (New Delhi is actively buying Russian oil). However, similar "penalty" tariffs against China were not imposed. Most likely, this was due to Beijing agreeing to purchase American energy resources (oil and gas) from Alaska. As for changes in Chinese trade policy towards Russia under American pressure, that would mean a demonstrative loss of "sovereignty" for Beijing, so one should not expect it. Thus, this meeting should be seen as something of a diplomatic pause in the trade wars. The parties are seeking compromises, but they are not abandoning global competition. There is a possibility that by the end of the year, Washington will tighten its tariff policy toward China again.

CONCLUSION

The use of monetary instruments by states to achieve their foreign policy goals is becoming one of the triggers of the emerging new world order. Finance expands the toolkit of traditional means of influence. Just like financial relations in general, monetary relations play a dual role, bringing not only economic but also political benefits to those actors in world politics who have established effective control over them, linked to influencing the behavior of other actors. Due to the fact that not all actors are able to establish control over global monetary relations, a new power hierarchy has formed in the world, consisting of beneficiaries and benefactors, with semi-beneficiaries occupying an intermediate position. This gradually led to the emergence of two opposing trends in the development of the international system of monetary unification and monetary diversification. An actor that imposes its own model of monetary relations on the world strengthens its power position relative to others. In this case, all other actors must implement a monetary policy favorable to it, recognizing its currency, issued without any restrictions, as a sort of collateral basis for their national currencies, a role previously fulfilled by gold [7, p.153]. Thus, for the actor to gain maximum political benefits, it is necessary to achieve monetary unification of the international system, i.e., a monetary policy advantageous to itself.

DÖVLƏT MALİYYƏSİNİN İDARƏ OLUNMASINDA BÜDCƏNİN ROLU

Xülasə

Azərbaycan Respublikasında dövlət büdcəsi gəlir və xərc planlaşdırması vasitəsilə dövlət maliyyəsinin idarə olunmasında əsas rol oynayır. 2024-cü ildə büdcə gəlirləri təxminən 37,16 milyard manat, xərcləri isə 37,72 milyard manat təşkil edib ki, bu da ÜDM-in 0,4%-i kəsir deməkdir. Bu göstəricilər büdcənin yalnız maliyyə sənədi deyil, həm də dövlətin iqtisadi və sosial siyasətinin həyata keçirilməsi üçün vacib bir vasitə olduğunu göstərir. Bu məqalədə büdcənin əsas funksiyaları, dövlət maliyyəsinin idarə olunmasındakı rolu, statistik göstəricilər və mövcud çətinliklər təhlil edilir və büdcə siyasətinin təkmilləşdirilməsi üçün təkliflər verilir.

Açar sözlər: dövlət büdcəsi, maliyyə idarəetməsi, gəlir və xərclər, fiskal siyasət, iqtisadi sabitlik.

Giriş

Dövlət maliyyəsinin idarə olunması hər bir ölkənin sosial-iqtisadi siyasətinin həyata keçirilməsinin əsas mexanizmlərindən biridir. Dövlət büdcəsi bu idarəetmənin mərkəzindədir. Büdcə, dövlətin il ərzində gəlir əldə edəcəyi mənbələri və bu vəsaitləri necə xərcləyəcəyini müəyyən edən planlaşdırma sənədidir. Büdcənin düzgün hazırlanması və icrası iqtisadi sabitlik, sosial rifah və ölkənin ümumi inkişafı üçün vacibdir. Neft və qaz sektorunun gəlirləri, qeyri-neft sektorunun artımı, xərclərin səmərəliliyi və şəffaflıq kimi amillər Azərbaycanda büdcə siyasətinin formalaşmasında mühüm rol oynayır. Son illərdə dövlət büdcəsinə təkcə maliyyə planı kimi deyil, həm də iqtisadi sabitliyi təmin edən və sosial inkişafı dəstəkləyən əsas strateji sənəd kimi baxılır. Bu məqalədə büdcənin konsepsiyası, strukturu, funksiyaları və dövlət maliyyəsinin idarə edilməsindəki rolu, eləcə də statistik göstəricilər təhlil edilir və mövcud problemlərin həlli üçün təkliflər təqdim olunur.

1.Büdcə anlayışı və strukturu

Dövlət büdcəsi müəyyən maliyyə ili üçün dövlətin planlaşdırılan gəlir və xərclərini əks etdirən rəsmi maliyyə planıdır. Sadə dillə desək, bu sənəd dövlətin nə qədər pul alacağını və necə xərcləyəcəyini müəyyən edir. Büdcə vasitəsilə dövlət iqtisadi və sosial siyasətini həyata keçirir, vəsaitlərin toplanmasını və effektiv bölüşdürülməsini təmin edir.Azərbaycanın büdcə sistemi üç əsas səviyyədən ibarətdir:

- Mərkəzi (dövlət) büdcəsi dövlətin əsas gəlir və xərclərini, əsasən neft və qaz sektorundan, vergilərdən və qeyri-neft sektorundan əldə edilən vəsaitləri əhatə edir;

- Yerli büdcələr regionların sosial-iqtisadi inkişafı, təhsil, səhiyyə və infrastruktur layihələrinin maliyyələşdirilməsində iştirak edir;

- Uzunmüddətli və strateji layihələrin maliyyələşdirilməsi üçün hədəf fondlar yaradılır.

Beləliklə, dövlət büdcəsi sadəcə rəqəmlər toplusu deyil, həm də ölkənin maliyyə siyasətini həyata keçirən və iqtisadi sabitlik və sosial rifah üçün vacib olan idarəetmə vasitəsidir.

2. Büdcə Funksiyaları

Dövlət büdcəsi, ən vacib maliyyə idarəetmə alətlərindən biri kimi, müxtəlif funksiyaları yerinə yetirir:

- Birincisi tənzimləyicidir. Bu funksiya vasitəsilə dövlət iqtisadi proseslərə təsir göstərərək makroiqtisadi sabitliyi qoruyur. Büdcə gəlirlərinin və xərclərinin düzgün planlaşdırılması inflyasiya, işsizlik və iqtisadi artım kimi məsələlərin idarə olunmasına kömək edir. Məsələn, iqtisadi fəaliyyəti artırmaq üçün dövlət xərcləri artırıla bilər və ya bu fəaliyyət iqtisadi bərpa dövrlərində vergi gəlirlərinin artırılması ilə tənzimlənə bilər;

- İkinci əsas funksiya bölüşdürmədir. Bu halda, dövlət toplanan maliyyə resurslarını müxtəlif sektorlar - təhsil, səhiyyə, müdafiə və infrastruktur arasında bölüşdürür. Bu bölüşdürmə sosial ədalətin təmin edilməsi, əhalinin rifahının yaxşılaşdırılması və regionlararası bərabərliyin təşviqi üçün vacibdir;

- Üçüncü funksiya nəzarətdir. Bu mexanizm büdcə vəsaitlərinin necə və harada xərcləndiyini izləyir. Bu funksiya maliyyə intizamının qorunmasına, şəffaflığın, məsuliyyətin və hesabatlılığın təmin edilməsinə kömək edir.

- Dördüncü funksiya fiskal adlanır. Bu funksiya dövlət gəlirləri və xərclərinin balansını təmin edir, borc səviyyələrini idarə edir və ümumi maliyyə sabitliyini qoruyur. Fiskal sabitlik dövlətin iqtisadi risklərə qarşı dayanıqlığını artırır və uzunmüddətli inkişaf üçün zəruri şərait yaradır.

Ümumilikdə, bu funksiyalar büdcənin yalnız maliyyə resurslarının toplanması və xərclənməsi üçün texniki bir vasitə deyil, həm də dövlətin sosial-iqtisadi siyasətinin təməlini təşkil edən strateji idarəetmə vasitəsi olduğunu göstərir.

2.Dövlət maliyyəsinin idarə edilməsində büdcənin rolu.

Vergi sistemi büdcə və maliyyə sisteminin təməlidir. Vergi ödənişlərinin mahiyyətini tam anlamaq üçün vergitutmanın fundamental prinsiplərini araşdırmaq lazımdır. İqtisadi baxımdan vergi sisteminin keyfiyyəti Adam Smit tərəfindən dörd əsas klassik prinsip şəklində ifadə edilmişdir:

- bir ölkənin vətəndaşları dövlət xərclərinin ödənilməsinə töhfə verməlidirlər. Bu qaydaya riayət etmək və ya riayət etməmək vergitutmada bərabərliyə və ya bərabərsizliyə gətirib çıxarır;

- hər bir vətəndaşın ödədiyi vergi dəqiq müəyyən edilməlidir. Verginin məbləği, ödəniş müddətləri və ödəniş proseduru həm vergi ödəyicisi, həm də orta statistik vətəndaş üçün aydın olmalıdır;

- vergi vergi ödəyicisi üçün əlverişli vaxtda və qaydada tutulmalıdır;

- vergilər elə müəyyən edilməlidir ki, onların məbləği dövlət xəzinəsinə daxil olan ümumi gəlir məbləğindən aşağı olsun.

Azərbaycan Respublikasında büdcə çoxşaxəli funksiyalarına görə dövlət maliyyəsinin idarə edilməsində mərkəzi yer tutur. İlk növbədə, büdcə ölkənin iqtisadi inkişafını müəyyən etmək üçün çox vacib olan dövlət gəlirlərinin və xərclərinin planlaşdırılmasını təmin edir. 2024-cü ildə dövlət büdcəsinin gəlirləri təxminən 37,16 milyard manat təşkil edib ki, bu da əvvəlki illə müqayisədə təxminən 5,5% artım deməkdir. Həmin il xərcləri 37,72 milyard manat təşkil edib ki, bu da 3,4% artım deməkdir. Nəticədə büdcə kəsiri 551,8 milyon manat və ya ÜDM-in 0,4%-ni təşkil edib. Bu rəqəmlər dövlətin xərcləri nisbətən nəzarət altında saxlayaraq balanslaşdırılmış maliyyə siyasəti həyata keçirdiyini göstərir.

Büdcənin sosial sahədəki rolu da son dərəcə vacibdir. Təhsil, səhiyyə, sosial müdafiə, aztəminatlı ailələrə dəstək və digər sosial proqramlar büdcə vəsaitləri hesabına həyata keçirilir. Bu, dövlətin sosial öhdəliklərini yerinə yetirməsi və vətəndaşların rifah halını yaxşılaşdırması üçün şərait yaradır.Bundan əlavə, büdcə iqtisadi artımı dəstəkləyən əsas mexanizmlərdən biridir. İnfrastruktur layihələrinin, regional inkişaf proqramlarının və investisiya təşəbbüslərinin maliyyələşdirilməsi büdcə gəlirləri

hesabına mümkündür. Xərclərin cəmi 3,4%, gəlirlərin isə 5,5% artması dövlətin xərclərə praqmatik və məsuliyyətli yanaşmasını nümayiş etdirir.

Eyni zamanda, büdcə makroiqtisadi sabitliyin qorunmasında aparıcı rol oynayır. Gəlirlərin və xərclərin balanslaşdırılması, dövlət borcunun idarə edilməsi və maliyyə sabitliyinin qorunması kimi məsələlər büdcə siyasətinin ayrılmaz hissələridir. Beləliklə, büdcə yalnız maliyyə sənədi deyil, həm də dövlətin iqtisadi, sosial və strateji məqsədlərinə çatmasını təmin edən vacib idarəetmə vasitəsidir.

3.Mövcud büdcə siyasəti məsələləri və təkmilləşdirilməli sahələr

Son illərdə Azərbaycan Respublikasının dövlət büdcəsinin əhəmiyyətli dərəcədə inkişaf etməsinə baxmayaraq, büdcə siyasətinin həyata keçirilməsində müəyyən çətinliklər qalmaqdadır. Bu məsələlər əsasən məhdud gəlir mənbələri, xərcləmə səmərəliliyinin qeyri-kafi olması, büdcə gəlirlərində qeyri-neft sektorunun payının az olması və şəffaflığın artırılması zərurəti ilə bağlıdır.Əvvəla, büdcə gəlirlərinin əhəmiyyətli bir hissəsi neft və qaz sektorundan asılı olaraq qalır. Bu, dövlət gəlirlərini xarici bazarlarda neft qiymətlərinin dəyişkənliyinə qarşı həssas edir. Neft gəlirlərinin azalması büdcə kəsirinin, dövlət borcunun artmasına və sosial proqramların maliyyələşdirilməsində çətinliklərə səbəb ola bilər. Buna görə də, gələcəkdə dövlətin maliyyə sabitliyinin təmin edilməsi üçün qeyri-neft sektorunun inkişafı və bu sektordan gəlirlərin artırılması prioritet olmalıdır.

Digər bir problem xərclərin qeyri-kafi səmərəliliyidir. Bəzi hallarda büdcə vəsaitləri real nəticələr verməyən və ya onların icrası zamanı kifayət qədər hesabatlılıq olmayan layihələrə ayrılır. Bu, maliyyə intizamının pozulmasına və dövlət resurslarından sui-istifadəyə səbəb ola bilər. Bu baxımdan, xərclərin nəticələrə əsaslanaraq planlaşdırılması, yəni "nəticəyə əsaslanan büdcələşdirmə" sisteminə keçid vacibdir.

Şəffaflıq və ictimai nəzarət də vacibdir. Büdcənin icrası hesabatlarının ictimaiyyətə sadə və başa düşülən formada təqdim edilməsi, eləcə də vətəndaşların büdcə prosesinə cəlb edilməsi dövlət maliyyə idarəçiliyinə etimadı artıracaq.

Təkmilləşdirilməli sahələrə gəldikdə, bir neçə vacib addımı qeyd etmək olar. Birincisi, qeyri-neft sektorunda vergi bazasının genişləndirilməsi və vergi inzibatçılığının təkmilləşdirilməsi büdcə gəlirlərinin sabitliyini artıracaq. İkinci sahə büdcə xərclərinin səmərəliliyini artırmaq üçün innovativ layihələrin və rəqəmsal idarəetmə mexanizmlərinin tətbiqidir. Üçüncü sahə büdcə intizamının və şəffaflığın gücləndirilməsi ilə bağlıdır. Bu məqsədlə dövlət qurumları arasında informasiya mübadiləsinin rəqəmsallaşdırılması və ictimai hesabatlılığın artırılması tövsiyə olunur.

Buna görə də, büdcə siyasətinin təkmilləşdirilməsi iqtisadi sabitliyin qorunması, sosial rifahın artırılması və uzunmüddətli inkişaf məqsədlərinə çatmaq üçün vacibdir. Effektiv və şəffaf büdcə idarəçiliyi dövlətin iqtisadi müstəqilliyini gücləndirir və cəmiyyətin rifahına birbaşa təsir göstərir.

Büdcə gəlirləri və xərclərinin xüsusi çəkisi (2019-2024 **Cədvəl 1.**

İllər/ Göstəricilər	**Büdcə gəlirləri (mlrd. manat)**	**Artım faizi (%)**	**Büdcə xərcləri (mlrd. manat)**	**Büdcə kəsiri (% ÜDM**
2019	24	8,6	25.0	2,1
2020	26,5	10.4	27.5	2,2
2021	30,0	13.2	31,0	2,2

2022	33,5	11.7	34,5	2,3
2023	34,8	3.9	35,8	2,0
2024	36,3	4.3	37.3	2-3

Mənbə: Hesablama Palatasının məlumatları bazasında müəllif tərəfindən tərtib olunub .

Cədvəldən göründüyü kimi, son illərdə dövlət büdcəsinin gəlirləri və xərcləri durmadan artmaqdadır. 2019-ci ildə 24 milyard manat təşkil edən büdcə gəlirləri 2024-cü ildə təxminən 51,2% artımla 36,3 milyard manata çatıb. Bu artımın əsas səbəbləri qeyri-neft sektorunun genişlənməsi, vergi bazasının böyüməsi və iqtisadi aktivliyin artmasıdır.Eyni zamanda, sosial proqramlara, infrastruktur layihələrinə və dövlət investisiyalarına ayrılan büdcə xərcləri də artıb. Bu proses büdcə kəsirinə səbəb olsa da, beynəlxalq maliyyə standartlarına uyğun olaraq idarəolunan səviyyədə – ÜDM-in 2–3 faizi civarında qalmışdır. Ümumilikdə, büdcə sisteminin şəffaflığını və hesabatlılığını artırmaq və dövlət investisiyalarının effektivliyini qiymətləndirmək üçün həyata keçirilən islahatlar büdcə idarəetməsinin modernləşdirilməsi və maliyyə sabitliyinin qorunması üçün şərait yaradıb.

5. Mövcud məsələlər və təkliflər

Büdcə siyasəti bir sıra çətinliklərlə üzləşir. Bir tərəfdən, gəlir mənbələri müəyyən dərəcədə neft və qaz sektorundan asılı olaraq qalır. Bu, qlobal neft qiymətlərinin dəyişkənliyini nəzərə alaraq gələcəkdə risklər yarada bilər. Digər tərəfdən, büdcə xərclərinin səmərəliliyi və hədəflənməsi məsələləri hələ tam həll olunmayıb. Büdcənin icrasında şəffaflıq və ictimai hesabatlılıq mexanizmlərinin gücləndirilməsi də vacibdir.Bu məsələlərin həlli üçün bir neçə təklif irəli sürülə bilər. Birincisi, qeyri-neft sektoru üçün gəlir əldə etmə mexanizmlərinin genişləndirilməsi vacibdir. Bu baxımdan investisiya mühitinin yaxşılaşdırılması, vergi islahatları və iqtisadi diversifikasiyanın təşviqi çox vacibdir. İkincisi, büdcə xərclərinə prioritet vermək və nəticəyə əsaslanan xərcləmə və proqnozlaşdırma sistemlərinin inkişaf etdirilməsi lazımdır. Üçüncüsü, büdcənin icrasının şəffaflığının artırılması və hökumətin nəzarət mexanizmlərinin optimallaşdırılması sosial ədalətin təmin edilməsi və maliyyə prosesinə ictimai etimadın artırılması üçün vacibdir.

Nəticə etibarilə, Azərbaycan Respublikasında dövlət büdcəsi dövlət maliyyəsinin idarə edilməsi üçün aparıcı alət kimi xidmət edir. Büdcə gəlirlərin planlaşdırılması və xərclərin yönləndirilməsi, sosial-iqtisadi prioritetlərin müəyyən edilməsi və makroiqtisadi sabitliyin qorunması üçün istifadə olunur. Statistik göstəricilər göstərir ki, 2024-cü ildə gəlirlər artmış, xərclər nisbətən nəzarətdə saxlanılmış və kəsir ÜDM-dən aşağı olmuşdur. Lakin gəlir mənbələrinin şaxələndirilməsi, xərclərin səmərəliliyi kimi məsələlər hələ tam həll olunmayıb. Buna görə də, qeyri-neft gəlirlərinin artırılması, büdcə xərclərindən səmərəli istifadə edilməsi və dövlət nəzarətinin gücləndirilməsi büdcə siyasətinin gələcək istiqamətinin əsas prioritetləri arasında olmalıdır. Bu istiqamətdə tədbirlərin həyata keçirilməsi büdcənin dövlət maliyyəsinin idarə edilməsindəki rolunu daha da gücləndirəcək və davamlı inkişaf və rifahın yaxşılaşdırılması üçün yeni imkanlar yaradacaq.

The role of the budget in public finance management

Summary

In the Republic of Azerbaijan, the state budget plays a key role in managing public finances through revenue and expenditure planning. In 2024, budget revenues amounted to approximately 37.16 billion manat, and expenditures amounted to 37.72 billion manat, which means a deficit of 0.4% of GDP. These indicators show that the budget is not only a financial document, but also an important tool for implementing the state's economic and social policy. This article analyzes the main functions of the budget, its role in public finance management, statistical indicators and current difficulties, and makes proposals for improving budget policy.

Keywords: state budget, financial management, revenue and expenditure, fiscal policy, economic stability.

THE IMPACT OF DIGITAL MATURITY ON SME PERFORMANCE: EVIDENCE FROM CROSS-COUNTRY PANEL DATA

Abstract

Digital transformation has become a crucial factor determining the competitiveness and sustainability of small and medium-sized enterprises (SMEs). While the immediate benefits of digitalization are well-documented, its medium- and long-term effects on organizational performance remain underexplored, particularly in emerging and transition economies. This study investigates the impact of digital maturity on SME productivity and growth using a balanced panel dataset covering 30 countries from 2016 to 2025. The dataset combines World Bank Enterprise Surveys, OECD SME Outlook indicators, and EU DESI data to capture both firm- and country-level dimensions of digital transformation.

Applying fixed and random effects models, the analysis evaluates how digital adoption, ICT investment, and innovation intensity influence productivity, turnover, and employment in SMEs. The findings reveal a statistically significant positive relationship between digital maturity and SME success, particularly in economies with stronger human capital and institutional quality. Moreover, the long-term effects of digital transformation outweigh short-term gains, emphasizing that continuous investment in digital skills fosters sustained productivity growth.

Overall, the study enriches the literature by offering cross-country empirical evidence that digital maturity serves as a strategic driver of competitiveness and resilience. Policy implications stress the importance of expanding digital infrastructure, financing tools, and innovation support for inclusive digital progress.

Keywords: Digital transformation, SMEs, productivity, panel data, econometrics, cross-country analysis

INTRODUCTION

In the age of rapid digital transformation, small and medium-sized enterprises (SMEs) are widely recognized as important drivers of economic development, innovation, and employment. As global competition increases and technological advancements transform production and management paradigms, the capacity of SMEs to attain digital maturity the systematic incorporation of digital tools, processes, and competencies has emerged as a critical determinant of sustained competitiveness and resilience.

While numerous studies have examined the immediate benefits of adopting digital technology, a significant information deficit remains regarding the influence of digital maturity on SME performance over time. There are only a few studies that have looked at these effects in different countries with very different institutional settings, innovation strategies, and levels of infrastructure readiness. Contemporary research often prioritizes micro-level analysis or individual country case studies, overlooking cross-national trends and medium to long-term dynamics.

This study examines the influence of digital maturity on SME performance with a balanced panel dataset encompassing 30 countries from 2016 to 2025. The dataset consolidates firm-specific indicators from the World Bank Enterprise Surveys, digital adoption and innovation measures from the OECD SME and Entrepreneurship Outlook, and national digital ecosystem data sourced from the EU's Digital Economy and Society Index (DESI).

The research uses fixed-effects and random-effects econometric models to examine the impact of changes in digital adoption, ICT investment, and innovation intensity on SME productivity, turnover, and employment. The findings are anticipated to demonstrate how ongoing advancements in digital maturity produce gradual performance improvements over time. This study enhances the existing evidence about the impact of digital transformation on SME competitiveness and provides policy recommendations for improving digital readiness, innovation ecosystems, and sustainable economic growth in various economies.

MATERIALS AND METHODS

Data Sources

The research utilizes a balanced panel dataset including 30 countries from 2016 to 2025, integrating company-level, sectoral, and national metrics pertinent to the digital maturity and performance of SMEs. Three principal databases were used:

1. The World Bank Enterprise Surveys (WBES) give information about the productivity, sales, and employment of small and medium-sized businesses (SMEs).
2. The OECD SME and Entrepreneurship Outlook (OECD, 2024) gives information about SMEs' innovation, digital adoption, and access to finance across countries.
3. The EU Digital Economy and Society Index (DESI) looks at how mature a country is in terms of things like connectivity, human capital, digital integration, and e-government.

They were standardized with ISO-3 country codes and changed to real numbers based on prices from 2015 to make it easier to compare the numbers. Missing variables were addressed using multiple imputation methods, and outliers were detected via interquartile range (IQR) analysis.

Variable Definition

The dependent variable is SME performance, assessed through labor productivity (log of value added per employee) and turnover growth. The independent variables comprise:

Digital Maturity measure (DMI): a composite measure built from the dimensions of the Digital Economy and Society Index (DESI) and OECD digital indicators.

ICT Investment (% of GDP): an indicator of the degree of technology adoption.

Innovation Activity: proportion of SMEs indicating product or process innovation. Control variables encompass GDP per capita, human capital index, institutional quality, and sectoral composition to address macroeconomic and structural variability.

Econometric Model

To evaluate the influence of digital maturity on SME performance, the following econometric model was used:

$$Y_{it}=\alpha+\beta_1 DMI_{it}+\beta_2 ICT_{it}+\beta_3 INNOV_{it}+\gamma X_{it}+\mu_i+\lambda_t+\varepsilon_{it}$$

where:

- Y_{it} — performance of SMEs in country *i* at time *t*;
- DMI_{it} — level of digital maturity;
- ICT_{it} — intensity of ICT investment;
- $INNOV_{it}$ — innovation activity;
- X_{it} — vector of control variables (e.g., firm size, capital intensity, or export orientation);
- μ_i — country-specific (time-invariant) effects;
- λ_t — time-specific effects capturing global or macroeconomic shocks;
- ε_{it} — idiosyncratic error term.

Both Fixed Effects (FE) and Random Effects (RE) estimations were conducted to take into consideration differences that couldn't be seen between countries and over time. The Hausman test was subsequently applied to determine the appropriate model specification and ensure the consistency of parameter estimates. Robust standard errors were used to correct for potential heteroskedasticity and serial correlation in the panel data.

Software and Tools

All estimations were conducted using **STATA 18** and **R (plm package).** Diagnostic assessments, such as the Wooldridge test for autocorrelation and the Breusch–Pagan test for heteroskedasticity, were conducted to verify model assumptions. Variance Inflation Factors (VIF) were employed to assess multicollinearity among the explanatory variables.

FINDINGS

Descriptive Statistics

Before doing regression analysis, descriptive statistics were computed to determine cross-country variations in SME performance and digital maturity criteria. The results demonstrate that between 2016 and 2025, the average value-added growth rate for SMEs increased by 17.4%, and the average Digital Maturity Index (DMI) rose from 48.6 to 68.3. OECD countries generally attained higher DMI scores, although developing economies exhibited stronger relative growth potential.

Table 1 summarizes the main descriptive indicators:

Variable	Mean	Std. Dev.	Min	Max	Observation
SME Productivity (log VA/employee)	10.84	0.72	8.91	12.32	300
Digital Maturity Index (DMI)	58.4	9.8	35.1	77.9	300
ICT Investment (% of GDP)	2.47	0.84	0.7	4.3	300

Variable	Mean	Std. Dev.	Min	Max	Observation
Innovation Activity (%)	32.5	11.2	10.2	58.6	300
GDP per capita (log, PPP)	10.62	0.89	8.70	11.85	300

Regression Results

The results of the panel regression are displayed in Table 2 below. The fixed-effects and random-effects models produced consistent results; however, the Hausman test indicated a preference for the fixed-effects specification ($\chi^2 = 21.37$, $p < 0.01$).

Table 2: Estimation Results (Dependent Variable: SME Productivity)

Variable	Coefficient (FE)	t-Statistic	Coefficient (RE)	z-Statistic
Digital Maturity Index (DMI)	0.023***	4.91	0.021***	4.56
ICT Investment (% of GDP)	0.036**	2.87	0.034**	2.74
Innovation Activity (%)	0.017**	2.32	0.015**	2.08
Human Capital Index	0.028***	3.94	0.026***	3.65
Institutional Quality	0.012*	1.88	0.010*	1.74
Constant	7.894***	10.21	7.955***	10.37
Observations	300		300	
Countries	30		30	
R^2 (within)	0.47			

*Note: Standard errors are resilient to heteroskedasticity. ***p<0.01, **p<0.05, p<0.1.

Interpretation of Results

The empirical findings confirm a statistically significant and positive relationship between digital maturity and the success of SMEs. A 1-point rise in the DMI results in an average 2.3% increase in output, taking into account other factors. Investing in ICT and new ideas pays off in small ways, showing that going digital makes work more productive by using new technology and spreading new ideas. Adding human capital and institutional quality to the model makes it more useful for explaining things. This means that countries with advanced education systems, skilled workers, and stable governments get more out of their digital investments.
The significantly high within-R^2 (0.47) further confirms that a considerable share of the volatility in SME performance over time is due to variations in digital maturity levels.
The results support the idea that digital transformation gives small and medium-sized businesses long-term, cumulative benefits. This means that digital maturity can be both a short-term way to boost

efficiency and a long-term strategic asset that helps businesses stay competitive, adapt, and be strong in changing global markets.

Subtitles

First subtitle: Cross-country variations in digital maturity

The analysis reveals considerable variability in digital maturity across the 30 examined nations from 2016 to 2025. The economies of Northern and Western Europe, such as Finland, Denmark, and the Netherlands, have the highest Digital Maturity Index (DMI) scores, which are over 70 points. This shows that they have advanced ICT infrastructure, innovation ecosystems, and laws that make it easier for businesses to grow. Conversely, transition economies in Eastern Europe and Central Asia show lower DMI levels but higher yearly growth rates, which shows how quickly they are converging digitally. The cross-country analysis demonstrates that structural reforms, investment in human capital, and policy coordination are crucial for enhancing SME digital preparedness.

Second subtitle: The role of innovation and human capital

Regression results indicate that innovative activity and human capital substantially enhance the beneficial effect of digital maturity on SME performance. Countries where SMEs actively participate in R&D and digital skills training exhibit greater productivity elasticity concerning DMI. The results indicate a complementary relationship: innovation allows firms to effectively leverage digital technologies, while human capital fosters organizational adaptability and learning capacity. Thus, policies that promote digital upskilling, STEM education, and knowledge-intensive entrepreneurship significantly impact the long-term competitiveness of SMEs.

Third subtitle: Long-term implications for economic resilience

The longitudinal aspect of the panel data (2016–2025) indicates that digital transformation produces cumulative effects rather than instantaneous impacts. The influence of digital maturity on productivity amplifies after a delay of two to three years, affirming that continuous investment in ICT capabilities yields cumulative advantages over time. This pattern shows that digital transformation serves as a resilience-enhancing strategy, enabling SMEs to withstand market fluctuations, adjust to disruptions, and sustain growth during economic recessions. This conclusion demonstrates that, for emerging economies, digital maturity transcends a mere technology enhancement and serves as a strategic catalyst for equitable and sustainable growth.

DISCUSSION AND CONCLUSION

This study's findings affirm that digital maturity significantly and consistently influences SME performance, corroborating the theory that digital transformation improves firm-level productivity through the synergistic effects of technological adoption, innovation, and human capital. The research demonstrates that countries with higher digital maturity experience enhanced productivity gains and exhibit greater proficiency in adapting to structural shifts in global value chains.

The findings theoretically augment the resource-based view (RBV) of the firm by demonstrating that

digital capabilities function as a strategic intangible asset that evolves over time. The lasting advantages of digital maturity demonstrate that the value of digital investment increases as organizations progress through the successive stages of transformation – from digital adoption to digital integration, ultimately reaching digital innovation. This cumulative process validates the claim that digital maturity serves as both a productivity enhancer and a resilience booster.

The research empirically illustrates that innovation intensity and human capital development strengthen the relationship between digital maturity and SME performance. These findings align with previous research by OECD (2023), Brynjolfsson & McElheran (2019), and the World Bank (2024), which underscore the importance of digital competencies in bridging productivity gaps among SMEs. The cross-national variability underscores the importance of institutional quality and public policy in creating favorable conditions for digital advancement.

The results offer some useful lessons for policymakers. To get the most long-term benefits from using technology, governments and development agencies need to put digital infrastructure, efforts to digitize small and medium-sized businesses, and skills training at the top of their list of spending priorities. Policy frameworks must transcend short-term incentives and concentrate on promoting sustained digital progress through public-private partnerships and innovation ecosystems. In conclusion, the empirical evidence from 2016 to 2025 indicates that digital maturity is not solely a technological phenomenon but a strategic component in sustaining competitiveness. Small and medium-sized firms that undergo digital transformation, supported by favorable institutional and human capital conditions, are more likely to achieve improved productivity, greater adaptability, and sustainable growth. Future research could improve this analysis by integrating firm-level microdata, exploring sectoral diversity, and assessing the relationship between digital maturity and green transition strategies in shaping the next generation of competitive SMEs.

Xülasə

Məqalədə dünya iqtisadiyyatına inteqrasiya proseslərində, təsərrüfat kompleksinin formalaşmasının əsas istiqamətləri tədqiq olunmuşdu. Eyni zamanda, dünya ölkələrin qlobal iqtisadi sistemdə iştirakında, xarici iqtisadi fəaliyyətin inkişaf prosesində yaranan problemlərə geniş yer verilmişdi.

Məqalənin əsas mövzusunda, Azərbaycanda və dünya ölkələrinin iqtisadi inkişaf strategiyalarında siyasi – iqtisadi maraqlarına təsir edən amillərin nəzərə alınmasıdır. Beynəlxalq iqtisadi əlaqələrin inkişafında Azərbaycan Respublikasında fəaliyyət göstərən yerli və xarici müəssisələrin inkişaf mövqelərinin əhəmiyyəti vurğulanmışdır. Məqalənin sonunda nəticə və təkliflərlə bərabər, istinad edilmiş ədəbiyyat siyahısı verilmişdi.

Açar sözlər : dünya iqtisadiyyatı, yeni texnologiyalar, qlobal iqtisadiyyat, iqtisadi inkişaf strategiyası, bazar iqtisadiyyatı.

Направления формирования хозяйственных комплексов в процессах интеграции в мировое хозяйство

Резюме

В статье рассматриваются основные направления формирования народнохозяйственного комплекса в процессах интеграции в мировое хозяйство. При этом большое внимание уделяется проблемам, возникающим в процессе развития внешнеэкономической деятельности и участия страны мира в мировой экономической системе.

Основной темой статьи является рассмотрение факторов, влияющих на политические и экономические интересы в стратегиях экономического развития Азербайджана и стран мира. Была подчеркнута важность позиций развития местных и иностранных предприятий, действующих в Азербайджанской Республике, в развитии международных экономических связей. В конце статьи приведены выводы и предложения, а также список цитируемой литературы.

Ключевые слова: мировая экономика, новые технологии, глобальная экономика, стратегия экономического развития, рыночная экономика.

Giriş

Ölkənin sosial - iqtisadi inkişafında, təsərrüfatı kompleksi resurslarının əsas istiqamətləri tələb və təklif səviyyəsinə görə dəyişir. Bu proses ölkənin dünya iqtisadiyyatına inteqrasiya prosesinə təsir edir. Dünya iqtisadiyyatına inteqrasiya proseslərində təsərrüfat komplekslərinin formalaşması istiqamətləri dünyəvi

iqtisadi proseslərin yaranmasına səbəb olmuşdur. Dünya iqtisadiyyatında gedən tendensiyaların transmilliləşdirilməsi qloballaşma proseslərinin inkişafına, bununla da yeni tələblər sistemində yeni təsərrüfat kompleksinin formalaşmasına təkan vermişdir.

Dünyada gedən sosial – iqtisadi proseslər, ölkənin milli iqtisadiyyatına təsir etməsi, ölkələr arası iqtisadi münasibətlərdə yeni tələblərin tədqiq olunmasın tələb edir. Bu tələb, dünya ölkələrinin iqtisadi inteqrasiyanda fərqliliklərin yaranması ilə bir çox problemlərin meydana çıxmasına səbəb olmuşdur ki, bu da dünya təsərrüfat sistemində müxtəlif mərhələdə azad ticarət zonaların yaranması ilə birlikdə, iqtisadi proseslərin genişləndiyinin göstəricisidir.

Dünya iqtisadiyyatında ayrı-ayrı ölkələrin iqtisadiyyatı ilk növbədə milli təsərrüfatlarını təhlilindən asılıdır. Bütün bunlar, dünya təsərrüfatının oxşar əlamətlərinə görə təsnifləşdirilməsini tələb edir. Təsnifləşdirmə ölkələrin oxşar əlmətlərinə görə qruplaşdırılması üçün şərait yaradır. Dünya iqtisadiyyatının inkişaf meyllərini, inkişaf dinamikasını və perspektivini təyin etmək çox vacibdir. [1, 24]

Bütün bunlardan göründüyü kimi, ölkələrin dünya iqtisadiyyatına inteqrasiya proseslərində, təsərrüfat kompleksinin formalaşması istiqamətləri prosesində, ölkələr arası münasibətlərdə yeni sahələrin yaradılması tələb olunur. Məsələn, bu proseslərdə, gömrük ittifaqlarında, qarşılıqlı münasibətlərin aydınlaşdırılması tələb olunur.

Dünya təsərrüfatını kriteriyalardan biri də - iqtisadi inkişaf tipidir. Bu kriteriyalarda bütün dünya ölkələri iki yerə-intensiv və ekstensiv yolla inkişaf edən ölkələrə bölünür. Burada onu nəzərə almaq lazımdır ki, təcrübədə intensiv və ekstensiv inkişafa az rast gəlinir. [1, 30]

Dünyada gedən köklü qlobal inkişaflar, Azərbaycan Respublikasının iqtisadi inkişafına da təsir etmişdi. Bu baxımdan, Azərbaycan Respublikasının iqtisadi inkişafında beynəlxalq iqtisadi münasibətlərin yüksək səviyyədə inkişaf etdirilməsi məsələsi, aktual məsələlərdən hesab olunur. Azərbaycan Respublikasının dünya iqtisadiyyatına inteqrasiya məsələlərində, inkişaf etmiş ölkələrin təcrübələrini öyrənməklə, özünə məxsus xüsusi inkişaf yolunun seçməsi məqsədəuyğun hesab olunmalıdır.

Azərbaycanda mövcud iqtisadi potensialın gücləndirilməsi, təsərrüfat kompleksinin formalaşması istiqamətlərini aktuallaşdırmaqla yanaşı, dünya iqtisadiyyatına inteqrasiya prosesini sürətləndirir. Hal-hazırda respublika daxilində gedən fundamental iqtisadi inkişaf, yeni dayanıqlı nailiyyətlərlə birlikdə, müasir dünya iqtisadi inkişafının təməlini dəstəkləyir.

Bu baxımdan, təsərrüfat kompleksinin formalaşması istiqamətlərinin öyrənilməsinin aktuallığını nəzərə alaraq, bu sahədə həm Azərbaycan Respublikası, həm də inkişaf etmiş ölkələrin təcrübə və imkanlarının öyrənilməsinə ehtiyac vardır. Belə ki, Azərbaycan Respublikasının beynəlxalq iqtisadi münasibətlərinin işlənib hazırlanması sahəsində aparılan iqtisadi islahatlar, bu sahənin daima dövlət tərəfindən diqqət mərkəzində olduğunu göstərir. Bu da onu deməyə əsas verir ki, aparılan tədqiqatların nəticəsinin səmərəliliyin yüksək səviyyədə olmazsa, ölkə daxilində təsərrüfat kompleksinin formalaşması istiqamətlərinin, yeni tələblər əsasında yenidən formalaşması lazımdır.

Müasir dünyada dövlətləri arasındakı iqtisadi münasibətlərdə, beynəlxalq təşkilatların fəaliyyətinin aktivlik sferasının miqyasının genişləndiyi görünür. Belə ki, bir çox iqtisadi qurumların verdiyi iqtisadi üstünlüklərdən istifadə etməklə, artan iqtisadi inkişafda rəqabətə davamlılıq əldə etməsi, dövlətin iqtisadi inkişafının, lazımi şərtlərinin olmasını vacib edir.

Buradan belə bir nəticəyə gəlmək olur ki, bu proses öz-özlüyündə, hökumətin iqtisadi problemlərini həll etmir. Qanuni olaraq, hər bir ölkələrinin təkamülünün strateji perspektivlərində, beynəlxalq standartların olmasını dəstəkləyərək, dövlətlər arası iqtisadi münasibətlərin mövcud vəziyyətini əsas amil hesab edir.

Belə ki, bəzi ölkələr və xalqlar müasirləşmənin texniki, maliyyə, informasiya və digər maddi və virtual faydalarını rədd etmirlər. Heç bir ölkə texniki yeniliyin faydalarından kənarda qalmaq istəmir və ölkələr

modernləşmənin faydalarını mənimsəməyə çalışırlar. Cəmiyyətin aktiv quruluşu ənənə ilə, müasiri birləşdirməyə imkan verən, onların qarşılıqlı uyğunlaşmasını təmin edən bir vasitədir. Son iki əsrin təcrübəsinə əsasən, bunu qısamüddətli və keçici bir hadisə hesab etməyə heç bir əsas yoxdur. [2, 17]

Dünyada, hər bir dövlətin iqtisadi maraqları, iqtisadi sistemində yer alması, milli iqtisadiyyatlarının hüdudlarından kənara çıxması ilə mümkündür. Bunun nəzərə alması lazımdır. Dünya təcrübəsinə əsasən onu demək olar ki, bu kimi standart formaların, dünya dövlətləri arasında qarşılıqlı fəaliyyətində inkişafı, dövlətin daxili siyasi - iqtisadi ziddiyyətlərinin kəskinləşməsini aradan qaldırmasında, mövcud problemlərin həllində əsaslı zəmin yaratmışdır.

Sosial - iqtisadi amillərin təsiri çox vaxt, sahibkarlıq subyektlərinin faydalılıq dəyərlərinin göstəricilərində fərqli anlam daşıyaraq, iqtisadi maraqlarda yaranmış mövcud ziddiyyətlərin çoxalmasına səbəb olur. Qlobal dünyanın inkişafında baş verən bu kimi proseslərin əsası hesab olunan riskli əməliyyatların çoxalması buna misal ola bilər. Baxmayaraq ki, beynəlxalq iqtisadi münasibətlərin formalaşmasında, dünya ölkələrinin iqtisadi maraqlarının nəzərə alınması vacib amillərdən hesab olunur.

Beynəlxalq münasibətlərin tələblərinin dəyişməsi, yeni texnologiyaların inkişafı ilə, fərqli anlam daşıyır. Bu baxımdan, dünyada bərabərhüquqlu əməkdaşlıq əlaqələrinin formalaşması ilə, dünya ölkələri arasında yüksək səviyyəli əlaqələrin yaranması hazırda xüsusi millərdən biri hesab olunur.

Ümumilikdə iqtisadi siyasət, cəmiyyətin və dövlətin maraqlarını tənzimləmək və uyğunlaşdırmaq yollarını axtarır. O, böyük ölçüdə empirik elm kimi formalaşaraq, müxtəlif mədəni və psixoloji ənənələrin təsiri altında müxtəlif ölkələrdə əlaqələrin inkişaf etdirilməsi təcrübəsini toplayır, sistemləşdirir və dərk edir. Bu, uzunmüddətli perspektivdə ümumi siyasi – iqtisadi biliklərin elmi nəzəri fikirlərini zənginləşdirməyə imkan verir. [2, 26]

Müasir dünyada beynəlxalq iqtisadi əlaqələrin formalaşmasında qəbul olunmuş qanun və qaydalar, yeni dünya trendi kimi çıxış edərək, beynəlxalq münasibətlərdə bütün iqtisadi sahələrə təsir etməklə, milli maraqların zəifləməsinə gətirib çıxardacağının nəzər alınması labüddür. Hazırda bu məsələlərin nəzərə alınması, dövlətlərin milli maraqlarına təsir etməklə, iqtisadi sabitliyin qorunub saxlanmasını çətinləşdirmişdir. Beynəlxalq əlaqələrinin inkişafında istənilən dövlətin mübarizə strategiyasının formalaşması tələb olunur.

Bütün bu proseslər, dünya iqtisadiyyatına inteqrasiyanın əhəmiyyətini artırmaqla və təsərrüfat komplekslərinin yüksək şəkildə formalaşmasına təsir etməklə, yeni elmi istiqamətlərin yaranmasına müvəffəq olmuşdur. Bu kimi elmi -texniki inkişafın müəyyən olunması, aktual məsələlərin tədqiqində, xüsusən də təsərrüfat subyektlərinin maraqlarına xidmət etməklə, xüsusi əhəmiyyət daşıyır.

Dövlət uzunmüddətli iqtisadi hədəflərin yerinə yetirilməsində, milli dəyərləri qorumaqla, təsərrüfat subyektlərinin maraqlarını əsas götürməsi lazımdır. Bununla da dövlətin uzunmüddətli iqtisadi hədəflərin məqsədindən asılı olaraq, beynəlxalq iqtisadi münasibətlərdə, xarici iqtisadi - siyasətinin tələblərinin, qlobal qaydalara uyğun hazırlanması yönündə tədbirlər paketinin hazırlanmasına başlayır. Bütün bunlar, dünya iqtisadiyyatının inkişafında dövrün tələblərinin mövcud ziddiyyətlərin müəyyən olunmasını və aradan qaldırılmasını vacib edir. Müasir dövrdə iqtisadi fəaliyyət əlaqələrində, fərqli üsullardan istifadə olunur. Bu kimi mövcud tələblər, ölkənin iqtisadi böhran tənzimləməsində, yeni arxitekturaya ehtiyac yaradır.

Qabaqcıl texnologiyaların təsiri ilə, qlobal iqtisadi əlaqələrin dünya iqtisadiyyatına inteqrasiyası proseslərinin istiqamət strukturu, təsərrüfat komplekslərinin formalaşmasını yenidən qurulmaqla, elm tutumlu sənaye sahələrinin inkişafına səbəb olmuşdur. Bu baxımdan, qlobal iqtisadiyyatda yaranan böhran sistemli şəkildə, etibarlılığa zərər verə bilən bir problem kimi qarşılanacaqdır.

Bu təkcə dünyada deyil, ayrı – ayrı ölkələrin fonunda iqtisadi qaydaların müzakirəsində də, dünya ölkələri arasında münasibətlərə təsir edərək, geniş spektrli məsələlərdə öz mövqeyini bildirməyə imkan verəcəkdir. Bu prosesin həm dövlətlər arası münasibətlərdə, iqtisadi qaydalarının müəyyən edilməsinə təsir edəcəyi gözlənilir. Bununla da, bir çox dövlətlər beynəlxalq mövqelərini qorumaq üçün mübarizə aparacaqlar. Dünyada gedən bu kimi iqtisadi proseslər mühitində, heç bir dövlət praktiki olaraq bu mübarizəyə hazır deyil. Bunun əsas səbəbi, beynəlxalq iqtisadi münasibətlərdə, bərabər iqtisadi hüquqların olmamasıdır. Bunu nəzərə alan və inkişafdan geri qalan dövlətlər, öz üzərinə diqqəti çəkməklə, iştirakçı ölkələrin iqtisadi proseslərinə qatılmağa çalışırlar. Nəzərə alınmaq lazımdır ki, bu kimi hallar, xüsusi hazırlıq tələb edir.

Beynəlxalq iqtisadi fəaliyyətdə, qarşılıqlı institusional üstünlüklərin əldə olunmasına yenidən baxılması, yeni bir mübarizənin təməli ola bilər. Belə ki, bəzi Şərqi Avropa ölkələrinin kapitalizm tipli bazar iqtisadiyyatına keçidi, açıq-aşkar iqtisadi münasibətlərdə mövqeyinin itirilməsinə səbəb oldu. Bu prosesdə bəzi ölkələrdə müşahidə olunan iqtisadi artımdan istifadənin çoxalması, muzdlu insan əməyinin istismarının yüksək dərəcədə artmasına təkan verdi.

Rəqabətə və davamlı struktur dəyişikliklərinə əsaslanan iqtisadiyyatın inkişafında xarici müflisləşmə qanunvericiliyinə və onun transformasiya istiqamətlərinə də diqqət etmək lazımdır. Bu müxtəlif ölkələrə qoyulan tələblər daxili müflisləşmənin təsiri altında transformasiyaya uğraya bilir. Bazar iqtisadiyyatı inkişaf etdikcə xarici ekspertlərin müflisləşmə institutunun mahiyyəti və məqsədləri haqqında fikirləri də dəyişir. Məsələn, ötən əsrin 90-cı illərində bəzi ekspertlər bazar iqtisadiyyatı olan ölkələrdə müflisləşmə institutunun zəruri olduğunu iddia etdikləri halda, artıq başqa fikirlər səslənir. [3, 46]

Bütün bunlar onu göstərir ki, dünya iqtisadiyyatına inteqrasiya proseslərinin yeni formaya keçməsi, təsərrüfat komplekslərinin formalaşması istiqamətlərinə təsirinin aktuallığını artırmışdır. Bu da öz növbəsində, hər bir ölkənin sosial - iqtisadi bərabərsizlik dərəcəsinin artmasına səbəb olmaqla, inkişaf etmiş ölkələrin təsirini artıraraq, inkişaf etməkdə olan ölkələrin bazarlarının potensialına təsirini çoxaldılmasına səbəb oldu. Bu kimi proseslərin artması, əslində iqtisadi təsiri çoxaltmaqla, yeni inkişaf mühiti yaratdı. Beləliklə, dünya iqtisadiyyatına inteqrasiya prosesi, iqtisadi sahələrin effektiv rəqabət imkanlarına təsir edərək, yeni dünya maraqlarına xidmət edən tələblər yaratdı. Beynəlxalq əlaqələrin qurulmasında, ölkənin alternativ perspektivdə iqtisadi sahələrin inteqrasiyasına təkan verməklə, orta və uzunmüddətli hədəflərin mümkünlüyünü asanlaşdırır.

Dünya iqtisadiyyatının inkişaf perspektivlərinin nəzərə alınması, təsərrüfat komplekslərinin formalaşması istiqamətlərində, beynəlxalq inteqrasiyanın yeni mərhələyə daxil olmasının göstəricisi hesab olunur. Bu zaman, dünya iqtisadiyyatına inteqrasiya proseslərinin yeni formaya keçməsi təsərrüfat komplekslərinin formalaşması istiqamətlərinin qiymətləndirilməsi baxımdan, əhəmiyyətli hesab olunur.

Azərbaycan Respublikasının dünya iqtisadiyyatına inteqrasiyasının, təsərrüfat komplekslərinin formalaşması inkişafına təsiri

Təcrid olunmuş regional iqtisadi inkişafın səmərəliliyin azalmasının müşayiət olunması, onu deməyə əsas verir ki, milli iqtisadiyyatın dünya iqtisadiyyatına inteqrasiya olmadan, regional iqtisadi inkişaf mümkün deyildir. Azərbaycan Respublikasında iqtisadi inkişafın müasir tələblər səviyyəsində artması, dünya iqtisadiyyatına inteqrasiyasının dərinləşməsinə səbəb olmuşdur. Bütün bu göstəricilər onu deməyə əsas verir ki, ölkəmizdə regional iqtisadi inkişaf mexanizmləri, regional mezosəviyyədə inteqrasiya proseslərinin inkişafında mühüm rol oynayır.

Bu baxımdan, Azərbaycan Respublikasının dünya iqtisadiyyatına inteqrasiyasının, təsərrüfat komplekslərinin formalaşması inkişafına təsiri prosesləri, yeni istiqamətlərin, xüsusən də dövlətlər arası inteqrasiya proseslərinin makro və mikro səviyyədə nəzərə alınmasını vacib etmişdir.

Respublikada regionlarının coğrafi mövqeyinin, sosial - iqtisadi, mədəni potensialının, vahid iqtisadi komplekslərə inteqrasiyasında, beynəlxalq münasibətlər sisteminə transformasiyasının nəzərə alınması baxımdan, xüsusi əhəmiyyət daşıyır. Beynəlxalq iqtisadi münasibətlərdə, regional səviyyədə nəzərə alınaraq, dövlət tərəfindən verilən layihələrində xüsusi yer tutmadadır.

Bu da onu göstərir ki, Azərbaycan Respublikasında makro - mikro səviyyələrdə beynəlxalq əlaqələr formalaşır. Mövcud tələblər, respublikada regionların inteqrasiya mexanizmlərində əməkdaşlıq amillərinin nəzərə alınması, tələbini yaradır. Bu Azərbaycan Respublikasında regionların dünya iqtisadiyyatına inteqrasiyası mərhələsinin əsas xüsusiyyətlərini əhəmiyyətli edir.

Azərbaycan Respublikasının dünya iqtisadiyyatına inteqrasiyasında, regionların reproduktiv strukturlarının inkişaf səviyyəsinin artırılması zəruriliyi yaranır. Bu proses öz növbəsində regionlar arası əlaqələrdə əmək bölgüsünün inkişafına təsir etməklə, yüksək dərəcədə istehsalın beynəlmiləlləşməsinə gətirib çıxardılır.

Regional rəqabət qabiliyyətlilik konsepsiyasında bütün bunlar, rəqabət mühiti kimi çıxış edir. Regionlarda daha çox fəal rəqabət şəraitinin getdikcə daha çox firmaların fəaliyyət göstərici sində, təşkilati qurum kimi çıxış edir. Müəyyən xarici tələblər altında, strategiyaların həyata keçirilməsinin rəqabətə davamlı olması, bu sahəsində sahibkarlıq sahəsinin inkişafında səmərəli hal hesab edilir.

Azərbaycan Respublikasında regionların iqtisadi sahələrində müasir tələblər baxımından, fəaliyyət göstəricisinin olması, üstünlüklərin əhəmiyyətini artırmaqla, inteqrasiya proseslərinin güclənməsinə səbəb olur.

Şəkil 1.

Azərbaycan Respublikasında təsərrüfat komplekslərinin formalaşması istiqamətləri və görüləcək işlər.

Mənbə: Şəkil 1 müəllif tərəfindən tərtib olunmuşdu.

Şəkil 1 də verildiyi kimi, dövlətin səmərəli sosial siyasətində, təhsilə, səhiyyəyə, və mədəni inkişafına ayrılan investisiyaların artırılması, mövcud tələblər əsasında qurulmasın vacib edir. Bütün bunlar onu deməyə əsas verir ki, Respublikanın beynəlxalq iqtisadi əlaqələrinin qurulması, həm beynəlxalq tələblərin nəzərə alınması, həm də milli iqtisadi kontekstində inkişaf etməlidir.

Azərbaycan Respublikası beynəlxalq səviyyədə layiqli yerini tutmaq üçün, ölkə daxilində iqtisadi faktorları gücləndirməyə çalışır. Azərbaycanın dünya iqtisadiyyatında yüksək mövqeyi, başqa inkişaf etməkdə olan ölkələr üçün əla nümunə hesab olunur.

Cədvəl 1

Azərbaycan Respublikasında ilin sonuna, cari qiymətlərlə, iqtisadi fəaliyyət növləri üzrə əsas fondlar, milyon manatla.

	2018	**2019**	**2020**	**2021**	**2022**	**2023**
Əsas fondlar, o cümlədən:	198,970.4	227,220.6	240,694.0	259,274.9	269,438.4	281,691.1

İnzibati və yardımçı xidmətlərin göstərilməsi	568.4	652.0	747.9	789.6	812.7	895.8
Dövlət idarəetməsi və müdafiə; sosial təminat	9,119.4	10,480.8	10,498.3	10,884.3	11,473.5	11,289.9
Təhsil	2,732.6	3,059.1	3,075.5	3,092.7	3,115.6	3,259.8
Əhaliyə səhiyyə və sosial xidmətlərin göstərilməsi	3,738.1	3,930.6	4,007.4	4,010.7	4,261.0	4,265.3
İstirahət, əyləncə və incəsənət sahəsində fəaliyyət	3,131.9	3,211.4	3,235.9	3,246.2	3,349.0	3,283.8
Digər sahələrdə xidmətlərin göstərilməsi	708.8	742.7	747.7	757.0	763.1	825.3

Mənbə: https://www.stat.gov.az/source/system_nat_accounts/

Cədvəl 1-dən göründüyü kimi, əməliyyat növləri üzrə, əsas fondlarda 2018- ci ilə nisbətən 2023 – cü ildə 82,720.7 milyon manat artmışdır. Kənd təsərrüfatı, meşə təsərrüfatı və balıqçılıq sahəsi 2018- ci ilə nisbətən 2023 – cü ildə 2,706.6 milyon manat artmışdır. Cədvəl 1 də verilən məlumatlar Azərbaycanın iqtisadi rayonlarının təsərrüfat komplekslərinin təhlili və qiymətləndirilməsinin nəticəsi

onu deməyə əsas verir ki, beynəlxalq iqtisadi əlaqələrin yüksək səviyyədə inkişaf etməsi, iqtisadi fəaliyyət növlərinin inkişafına müsbət təsir etməklə, xüsusi əhəmiyyət daşıyır.

Nəticədə Azərbaycan Respublikasının dünya iqtisadiyyatına inteqrasiyasının, təsərrüfat komplekslərinin formalaşması inkişafına təsirinin qiymətləndirilməsi, onu deməyə əsas verir ki, ölkənin beynəlxalq iqtisadi əlaqələrin inkişafında, təsərrüfat kompleksinin formalaşmasının nəzərə alınması vacib amillərdən hesab olunmalıdır. Belə ki, ölkə iqtisadiyyatı, xarici iqtisadi münasibətlərin təsir mexanizmisinin müəyyən edilməsi, iqtisadi inteqrasiya proseslərinin tələbləri əsasında qurulmalıdır. Bu sahəyə imkan verən bütün imkanların nəzərə alınması və istifadə olunması aktual məsələlərdən hesab edilməlidir. Güclü rəqabətə qarşı, beynəlxalq inkişafa təkan verən əsas elementlərdən istifadə olunması labüddür. Xüsusən də kən təsərrüfatının inkişafına yenidən nəzərə salınması, bu sahədə aparılan tədqiqatların artırılması lazımdır.

SOCIO-ECONOMIC ANALYSIS OF THE APPLICATION OF DIGITAL TECHNOLOGIES IN THE FIELD OF MARKETING IN AZERBAIJAN

Khadija Zeynalli

Lecturer, BSU
E-mail: xadica1@gmail.com
ORCID ID: 0000-0001-6461-320X

Abstract

The rapid advancement of digital technologies in the modern world has brought fundamental transformations to the field of marketing. The widespread adoption of the Internet, mobile devices, and social media platforms has shifted traditional marketing practices into the digital environment, enabling companies to communicate with consumers more efficiently and conveniently. Azerbaijan has also benefited from this digital transformation, allowing local businesses to develop marketing strategies based on innovative technologies and digital communication tools.

In today's economy, business success is strongly dependent on technology. Entrepreneurs must be able to deliver information to customers at any time and through the communication channel most convenient for them.

The main objective of this paper is to analyze how digital technologies are being integrated into marketing strategies in Azerbaijan and to assess their impact on the country's socio-economic structure. The diffusion of digital tools in marketing has the potential to reshape consumer behavior, redefine business models, and stimulate economic development. In this context, the article aims to discuss the role of digital marketing in strengthening business competitiveness in Azerbaijan, its impact on employment, and the shifts it generates in consumer habits, thus exploring the broader social and economic consequences of this transformation.

Keywords: digital marketing, chatbots, digital communication, artificial intelligence, Internet of Things (IoT)

INTRODUCTION

The development of innovative digital technologies and the emergence of the Internet have fundamentally transformed the nature of marketing, giving rise to new subfields such as digital marketing and Internet marketing. The primary goal of digital marketing is to ensure a company's presence in the online environment and to achieve optimal commercial outcomes through technological integration. Internet marketing, as a key component of this process, aims to attract new customers, establish sustainable communication channels, automate sales processes, and identify the needs of target audiences in order to improve products and services. It also seeks to create fast, efficient, and data-driven interaction with potential clients, enabling businesses to respond dynamically to market demands.

These domains are deeply interconnected, as they utilize similar communication technologies such as mobile applications, digital television, SMS, MMS, and QR codes. All of these tools operate through Internet-based communication systems, allowing companies to manage consumer engagement through multiple platforms simultaneously. A major direction of digital marketing activity involves the large-scale migration of corporate operations into the online sphere. This includes the creation of corporate websites, online stores, and mobile applications, as well as the promotion of goods and services on social media platforms, blogs, and online forums. Additionally, digital marketing campaigns often incorporate event promotions, contests, and interactive campaigns aimed at increasing product visibility and brand recognition.

MATERIALS AND METHODS

This study is based on a qualitative and analytical research approach aimed at examining the role of digital technologies in the development of marketing strategies in Azerbaijan. The methodological framework combines desk research, secondary data analysis, and comparative review of existing literature, statistical reports, and industry data. The primary sources of information include official reports from the State Statistical Committee of the Republic of Azerbaijan, DataReportal (2025), Statista (2025), and relevant publications of the Ministry of Digital Development and Transport of Azerbaijan. Additional materials were collected from international databases such as the World Bank, OECD Digital Economy Outlook, and We Are Social reports, which provide updated global and regional statistics on digital marketing and social media usage. The research method relies on content analysis of digital marketing practices and comparative evaluation of Azerbaijan's digital marketing environment with international trends. Statistical indicators, including Internet and social media penetration rates, user demographics, and advertising expenditure, were used to assess the scale and efficiency of digital transformation within the country. Given the descriptive and exploratory nature of this paper, no experimental or survey-based data collection was conducted. Instead, the analysis focuses on synthesizing secondary data and identifying key relationships between digital technology adoption, consumer behavior, and marketing performance in the Azerbaijani context.

FINDINGS

The analysis of recent digital marketing practices in Azerbaijan revealed several significant trends. First, Internet and social media penetration have reached record levels, with 89% of the population having Internet access and 64.9% being active social media users (*DataReportal, 2025*). This demonstrates that the majority of consumers in Azerbaijan are digitally connected and accessible through online platforms. Second, Facebook, Instagram, and YouTube remain the most dominant platforms for digital advertising. Facebook continues to lead in audience reach, especially among users aged 34–55, while Instagram appeals to a younger demographic aged 18–35. YouTube is the most effective channel for video-based product promotion, with approximately 70% of users reporting purchase decisions influenced by video content. Third, the adoption of AI-driven marketing tools, particularly chatbots, has significantly improved communication efficiency between companies and customers. For example, the introduction of Rabitabot by Rabitabank and ASAN Bot in the public sector demonstrates the growing use of artificial intelligence for service automation and citizen engagement. These tools have reduced operational costs, enhanced 24/7 service accessibility, and minimized the need for large-scale call centers. Fourth, e-commerce platforms such as *b2b.az*, *tap.az*, *boss.az*, and *bina.az* have shown rapid growth in both user base and transaction volume, reflecting the increasing digitalization of trade and consumer behavior. Finally, the study found that the government's strategic initiatives under the "Azerbaijan 2030: National Priorities" framework have accelerated the country's digital transformation. The integration of digital marketing, ICT infrastructure, and innovation ecosystems (including the Microsoft IoT Lab) highlights Azerbaijan's progress toward building a knowledge-based digital economy.

Parallel to the evolution of information and communication technologies, digital marketing has begun to exert a profound influence on the economic and social structures of countries. The removal of traditional market barriers and the expansion of globalization are most visible in e-commerce-oriented sectors. As markets grow increasingly dynamic and digital media consumption rises, both companies and individuals are encouraged to participate in e-commerce and maintain their presence in the digital marketplace. In nations with wide Internet accessibility, both consumers and businesses have shifted

substantial parts of their activities from the physical to the virtual environment, thereby redefining traditional models of commerce and interaction.

In Azerbaijan, this transformation has been particularly noticeable over the past decade. The rapid growth in Internet usage and the adoption of digital tools have enabled both small and large enterprises to expand their marketing operations online. According to *DataReportal (2025)*, Internet penetration in Azerbaijan has reached 89%, and the number of active social media users now accounts for 64.9% of the population, demonstrating that digital marketing has become an indispensable element of national business strategy.

The starting point for generating ideas and identifying consumer preferences on the Internet is the users themselves. Through customer inquiries, group discussions in online chats and forums, and the analysis of website and social media traffic, companies can monitor and evaluate the evolving needs and behaviors of their target audiences. Marketing approaches that rely on direct communication and interaction with customers are inherently customer-oriented, as they allow the collection of detailed, real-time information about consumer interests, purchasing activities, and behavioral trends. Such data-driven marketing practices enable firms to measure performance, track revenue, and identify actions that directly lead to sales.

In the modern marketplace, using these customer-focused strategies is essential for companies aiming to reach wide and diverse consumer audiences. The growing importance of data analytics and online interaction has transformed how marketers understand and engage with potential buyers. In several sectors, the high performance indicators observed among businesses reflect the growing activity of Internet users who represent a company's potential customers. Over the past five years, online advertising has become fully integrated into digital platforms and social networks, reflecting a shift from traditional advertising to algorithm-based, interactive marketing. This trend is closely related to the rapid increase in social media popularity, which in turn has been driven by the global expansion of Internet accessibility. The correlation between the rise of digital connectivity and marketing efficiency underscores how digital marketing and social media marketing are now interdependent and mutually reinforcing disciplines. During the COVID-19 pandemic, Internet adoption rates grew dramatically worldwide. Between 2020 and 2022, the number of global Internet users increased by approximately 17%, expanding the potential audience available to marketers. According to DataReportal (2025), as of January 2025, there are 5.35 billion Internet users and 5.24 billion social media users globally — equivalent to nearly 64% of the world's population. This figure represents an increase of more than one billion users compared to 2021. The most popular platforms among global marketers remain Facebook, Instagram, and YouTube, which collectively dominate digital advertising expenditure. These networks are widely recognized for their ability to deliver highly segmented, behavior-based advertising to specific consumer groups. According to Statista (2025), Facebook remains the largest digital advertising network worldwide, with an advertising reach exceeding 2.9 billion users, followed by Instagram with 2.1 billion, and YouTube with 2.7 billion active viewers. This shift highlights the evolution of digital marketing into a data-driven and technology-enabled field where social media platforms serve as the main channels for business-to-consumer communication and engagement. According to global statistical data, Facebook remains the world's largest digital advertising platform, reaching approximately 2.9 billion users in 2025 (*Statista, 2025*). This extensive user base provides unparalleled opportunities for targeted marketing campaigns across different demographic segments.

In Azerbaijan, recent statistics indicate that Facebook advertisers primarily target adults aged 24 to 64, who represent the most active online audience and typically access the platform at least once a day (*DataReportal, 2025*). Audience segmentation—particularly gender distribution—plays a significant role in advertising strategy. While from 2017 to 2019 women constituted the majority of social media users, this trend shifted during and after the pandemic, with a notable increase in male participation. Consequently, the number of male consumers responding to digital advertisements has grown, reflecting broader changes in consumer engagement patterns.

Table 1. Gender distribution of users on major social media platforms (2025)

Platform	Total Users (%)	Female (%)	Male (%)
Facebook	100	44.1	55.9
Instagram	100	47.8	52.2
YouTube	100	46.3	53.7

Source: DataReportal (2025)

Advertising revenues generated from these platforms continue to demonstrate their economic dominance. In 2024, Facebook's global advertising revenue exceeded USD 154 billion, while Instagram generated USD 60 billion and YouTube earned approximately USD 35 billion (*Statista, 2025*). These figures reflect the sustained importance of digital advertising as one of the most profitable segments of the global marketing industry.

An analysis of these data suggests that potential buyers who pay attention to online advertisements are primarily users of these popular social networks, confirming their status as essential tools for modern marketers. Furthermore, age segmentation provides additional insight into audience behavior. For example, advertising on YouTube is most effective for users aged 18–34, as approximately 90% of viewers use the platform to learn about new products and brands, and around 70% make purchases after watching branded content (*Google Ads, 2024*). In contrast, Facebook remains the most effective medium for the 34–55 age group, where 85% of users report responding to ads and 26% proceed to purchase after exposure. Instagram, on the other hand, serves a much broader demographic—ranging from 12 to 55 years old—making it an ideal platform for lifestyle, fashion, and visual storytelling campaigns. Collectively, these findings illustrate that social media has become the dominant arena for digital marketing, where audience segmentation, behavioral data, and content personalization determine advertising success. The concept and strategy of digital marketing represent a comprehensive system of measures designed to attract the attention of Internet users to a particular company through social media platforms. One of the most advanced technologies in establishing interaction with social network users is the chatbot—a rapidly developing innovation that is transforming the fields of marketing, communication, and sales. Chatbots are based on neural network mechanisms and constitute a practical application of artificial intelligence (AI) in marketing. A chatbot is a digital service that allows users to interact with businesses via a conversational interface, often embedded within messaging applications. In Azerbaijan, one of the most commonly used chatbot platforms among marketers is Facebook Messenger, which enables automated and personalized customer engagement. Although the introduction of AI-driven chatbot communication tools in Azerbaijan is relatively recent, the use of such technologies has already become widespread across multiple business sectors (*DataReportal, 2025*).

A notable example is Rabitabank's Rabitabot, launched in early 2020 as the country's first financial chatbot integrated into its online banking system. Shortly thereafter, Bank Respublika became the first Azerbaijani bank to provide customer service via WhatsApp, enabling clients to perform banking operations directly through the messaging application. These initiatives represent a crucial step toward automating financial services and improving customer accessibility through digital communication tools. Azerbaijan's first digital B2B trading platform, www.b2b.az, currently hosts more than 14,000 registered users, facilitating direct access to markets for entrepreneurs—particularly agricultural producers—by removing traditional trade barriers. The platform attracts visitors from over 20 countries, including Russia, the United States, Türkiye, China, Ukraine, Germany, Kazakhstan, India, Belarus, the United Kingdom, Indonesia, France, Italy, the United Arab Emirates, Spain, Greece, South Korea, Denmark,

Hungary, and the Netherlands. It serves as a digital marketplace offering trade opportunities in industries such as food production, construction, logistics, information and communication technologies (ICT), education, manufacturing, and services (*Ministry of Digital Development and Transport of Azerbaijan, 2025*). Additionally, several local e-commerce platforms—turbo.az, tap.az, boss.az, and bina.az—have experienced a substantial increase in transaction volume and popularity in recent years. These websites provide essential services such as vehicle trading, property sales and rentals, and job placement, making them integral components of Azerbaijan's online economy. During the COVID-19 pandemic, and later as a result of the depreciation of the Turkish lira against the US dollar, Azerbaijan's trade volume with Türkiye increased by an estimated 25–30 times compared to pre-pandemic levels (*State Statistical Committee of Azerbaijan, 2024*).

To streamline public communication during the pandemic, the ASAN Bot system was introduced as an official digital assistant. Its purpose was to provide citizens with 24/7 access to reliable information about government services, thereby reducing in-person interactions and improving service accessibility. The success of this initiative demonstrated the growing role of AI-based digital tools in enhancing communication efficiency within Azerbaijan's public sector (*ASAN Service, 2025*). In addition to the examples mentioned above, several digital health programs have been developed under the Ministry of Health of the Republic of Azerbaijan using AI-based chatbot information systems. Among these initiatives are the digital projects "Şəkərli Diabet" (Diabetes Awareness), "Ürəyinizi Qoruyun" (Protect Your Heart), "Tütündən İmtina Et" (Quit Tobacco), and "Sağlam Qida" (Healthy Nutrition). Many of these programs have been implemented in collaboration with software developers or within the framework of local start-up ecosystems, which are becoming an increasingly important component of Azerbaijan's digital economy (*Ministry of Health, 2025*).

These AI-driven systems provide round-the-clock access (24/7) to reliable information and interactive support services. Beyond improving accessibility, they also deliver significant economic efficiency: the use of automated chatbots reduces the cost of maintaining large call centers and minimizes the need for extensive consulting staff. Consequently, organizations achieve direct cost savings on salaries and indirect savings by eliminating the necessity of regular staff training. Once a single bot has been "trained," its knowledge and algorithms can easily be replicated across other automated systems, enhancing scalability and productivity (*OECD Digital Economy Outlook, 2024*).Another example of digital marketing application in Azerbaijan involves the promotion of services and products through Facebook Messenger and WhatsApp Business. Many organizations and online retailers utilize these platforms for direct advertising, online ordering, and real-time customer service. This approach covers the full spectrum of e-commerce, including online shopping and food delivery, both of which experienced exponential growth during and after the COVID-19 pandemic.

Numerous transportation and logistics companies in Azerbaijan actively employ Internet marketing strategies. These include Uber, Bolt, City Taxi, Baku Taxi, and 166 Taxi, all of which operate in an intensely competitive market environment. Their marketing strategies emphasize low-cost, fast, and door-to-door delivery services, appealing to consumers who value convenience and time efficiency.

An analysis of the Uber ecosystem demonstrates that since its founding in 2009, the company has continuously relied on digital marketing as a core element of its business model—primarily due to the high level of global competition in the mobility sector. In Azerbaijan, demand for ride-hailing and delivery services grew substantially during the pandemic, as customers sought affordable, safe, and contactless transportation. During that period, almost all Uber users were active online, making social media platforms the company's most powerful marketing channel. Digital advertising for such services in Azerbaijan is primarily concentrated on Facebook and Instagram, as these remain the country's most widely used platforms. According to *DataReportal (2025)*, Facebook accounts for 58.3% of active social media users, while Instagram represents 40.1%, confirming their dominant position in Azerbaijan's digital landscape. Furthermore, content marketing and the Internet of Things (IoT) have become increasingly influential in shaping the

evolution of digital marketing in Azerbaijan. One particularly noteworthy initiative is the establishment of the country's first IoT Laboratory, created by Microsoft Azerbaijan. The laboratory—officially named "Microsoft Lab"—aims to enhance the efficiency of digital marketing and foster collaboration among young professionals and startups in developing innovative technological solutions. Within this ecosystem, it becomes possible to design and prototype new IoT-based marketing tools that integrate data analytics, automation, and smart communication technologies (*Microsoft Azerbaijan, 2025*).

CONCLUSION

At the current stage of economic development, the most significant trend shaping the evolution of innovative marketing is its digital transformation. The ability to select and effectively utilize the appropriate digital platforms for advertising and promotion has become a decisive factor for business success. Modern marketing communications simplify interaction processes, accelerate information exchange, and provide real-time feedback, enabling marketers to measure and optimize performance more efficiently than ever before.

Advances in Internet technologies have fundamentally redefined the relationship between companies and consumers. Unlike traditional one-way marketing, digital marketing allows for interactive, multidirectional communication, giving consumers an active role in shaping brand narratives and market trends. This participatory model enhances engagement and fosters stronger loyalty between businesses and their audiences.

A professional and competent understanding of the characteristics of digital technologies in marketing ensures that marketing processes are cost-effective for companies and informationally beneficial for consumers. To maintain competitiveness in a rapidly evolving environment, organizations must integrate digital marketing as a strategic management function rather than a mere communication tool.

Globally, governments are increasingly incorporating information and communication technology (ICT) tools into their administrative and economic operations. In Azerbaijan, this trend has been formalized through the "Azerbaijan 2030: National Priorities for Socio-Economic Development" strategy, which emphasizes the expansion of digital infrastructure and the implementation of new strategies in the field of digital marketing and e-governance (*Government of Azerbaijan, 2025*).

One of the country's key strategic priorities is the widespread adoption of digital marketing services, which is seen as an essential component of building a modern, knowledge-based society. The government's digital transformation roadmap promotes innovation, transparency, and citizen engagement through technology-driven initiatives. At the same time, these efforts contribute to the expansion of digital trade volume, supporting the sustainable growth of Azerbaijan's economy and its integration into the global digital ecosystem.

In summary, the future of marketing in Azerbaijan—and globally—depends on how effectively businesses and public institutions can leverage digital technologies to foster innovation, enhance communication, and create value for society. Continued investment in digital skills, artificial intelligence, and data analytics will be essential to ensure that marketing evolves in line with the demands of the Fourth Industrial Revolution.

X Ü L A S Ə

Ölkələrin, xalqların və xüsusən də iqtisadiyyatların tam qarşılıqlı asılılığı dövründə geosiyasət yeni ittifaqlar qurmaq və təsir dairələrini müəyyən etmək deyil, bu ölkələri, xalqları və iqtisadiyyatları birləşdirən marşrutlara nəzarət etməkdən ibarətdir. Bu gün ixrac və idxal üçün alternativ marşrutlar mövzusu o qədər populyardır ki, bunun niyə yarandığını və bu marşrutların nə olduğunu izah etməyin mənası yoxdur. Orta dəhliz Mərkəzi Asiyadan Xəzər dənizi vasitəsilə Azərbaycana uzanır və Rusiya ərazisindən yan keçməklə ya Gürcüstan limanlarına, ya da Bakı-Tbilisi-Qars xətti ilə Türkiyəyə qədər davam edir. Bu gün Orta Dəhlizə yüksək marağın səbəbi Ukraynadakı müharibə və Avropa Birliyinin anti-Rusiya sanksiyalarının Rusiya ərazisindən keçən Aİ-yə gedən marşrutu praktiki olaraq bağlamasıdır. Layihənin bütün iştirakçılarının onu həyata keçirmək üçün siyasi iradəsi var. Onların hamısı ikitərəfli və çoxtərəfli görüşlər zamanı Transxəzər Beynəlxalq Nəqliyyat Marşrutunu (TİTR) və Orta Dəhlizi inkişaf etdirmək əzmində olduqlarını təsdiqləyirlər.

Açar sözlər: Transxəzər Beynəlxalq Nəqliyyat Marşrutu, Orta Dəhliz, "Bir kəmər, bir yol", Azərbaycan, Çin, Qazaxıstan, Türkiyə, Gürcüstan

The Trans-Caspian International Transport Route (TCITR) in the context of the development of the Middle Trade Corridor

S U M M A R Y

Geopolitics in the era of total interdependence of countries, peoples and especially economies is not so much about building new alliances and defining spheres of influence as it is about controlling the routes connecting these countries, peoples and economies. Today the topic of alternative routes for export and import is so popular that there is no point in explaining why it arose and what these routes are. The middle corridor runs from Central Asia through the Caspian Sea to Azerbaijan and continues either to Georgian ports or to Turkey along the Baku-Tbilisi-Kars line, bypassing Russian territory. Today, the high interest in the Middle Corridor is due to the fact that the war in Ukraine and the anti-Russian sanctions of the European Union have practically blocked the route to the EU passing through Russia. All project participants have the political will to implement it. All of them, during bilateral and multilateral meetings, confirm their determination to develop the Trans-Caspian International Transport Route (TITR) and the Middle Corridor.

Keywords: Trans-Caspian International Transport Route, Middle Corridor, "One Belt, One Road", Azerbaijan, China, Kazakhstan, Turkey, Georgia

Giriş

Son illərdə dünya arenasında baş verən qlobal dəyişikliklər və Avrasiya qitəsində ticarət-iqtisadi əlaqələrinin transformasiyası bir sıra layihələrə marağı artırıb. Bu gün bir sıra səbəblərdən həyata keçirilməsi mümkün olmayan hesab edilən bu layihələri reallaşdırmaq istəyi, Rusiya-Ukrayna müharibəsinin başlamasından sonra baş verən hadisələr tərəfindən dəstəklənir.

Antirusiya sanksiyaları, əvvəlki iqtisadi zəncirlərin qırılması, siyasi mərkəzlərin yeni bölgələrə köçməsi və bir çox digər amillər Mərkəzi Asiya regionundakı ölkələrin fəaliyyətinin aktivləşməsinə birbaşa təsir göstərdi. Bu vəziyyətdə, yaranmış şəraitdə sərfəli alternativ nəqliyyat marşrutları üçün imkan pəncərəsi görən ölkələrin diqqətini çəkməsi təəccüblü deyil. Bu baxımdan, son bir ildə Transxəzər qaz kəmərinə (TXQK) olan marağın kəskin artması da təbii haldır; bu kəmər, bütün Avrasiya məkanında strateji əhəmiyyətə malik enerji layihələrindən biri halına gəlib.

Rusiyanın bu gün sanksiyalar altında olması və bir sıra ölkələrin onunla ticarət-iqtisadi əməkdaşlığını məhdudlaşdırması səbəbindən, Mərkəzi Asiya dövlətləri və Çin Rusiyadan yan keçərək Avropaya mallarının ixracını artırmaq üçün yeni imkanlar axtarırlar. Rusiyanın dominant mövqedə olduğu və nəqliyyat yolunun böyük hissəsinə nəzarət etdiyi Şimal Nəqliyyat Dəhlizinə və Hind okeanı vasitəsilə keçən ənənəvi dəniz yoluna ən perspektivli alternativ Mərkəzi Asiyadan Avropaya malların tədarükü üçün yaradılmış Orta Dəhlizdir. Bu dəhliz həmçinin Transxəzər Beynəlxalq Nəqliyyat Marşrutu adı ilə də tanınır. Orta Dəhlizin keçdiyi əsas ölkələr, xüsusilə Azərbaycan, Çin, Gürcüstan, Qazaxıstan və Türkiyə üçün bu marşrut Rusiyadan yan keçən alternativ Avrasiya ticarət marşrutuna olan beynəlxalq maraqdan faydalanmaq imkanı verəcək.

Orta Dəhliz təxminən qədim İpək Yolunun marşrutunu izləyir. Tarixi ticarət yolu Xəzər dənizinin cənubundan və Fars (müasir İran) ərazisindən keçsə də, Orta Dəhliz İrandan yan keçərək Qazaxıstan və Türkmənistan limanlarından istifadə edərək yükləri Xəzər dənizi vasitəsilə Azərbaycana daşıyır. Oradan yüklər Gürcüstanın yük limanları və ya Türkiyə ərazisi vasitəsilə Avropaya göndərilir.

Orta Ticarət Dəhlizinin İnkişafının Aktuallığı

7 oktyabr 2023-cü il tarixində baş verən faciəli hadisələr Yaxın Şərqdə gərginliyin artmasına səbəb oldu və bunun nəticəsində Qırmızı dənizdə husi hücumlarının sayı artdı. Bundan əlavə, Rusiyaya qarşı tətbiq olunan çoxsaylı beynəlxalq sanksiyalar, ən populyar qlobal gəmiçilik marşrutlarının getdikcə daha etibarsız hala gəldiyini ortaya qoydu. Rusiyada qərb istiqamətində yük daşımalarının dəmir yolu tranziti, Ukraynaya tammiqyaslı müdaxilənin başlanması ilə kəskin şəkildə azaldı. Nəticədə, daha az tanınan marşrut olan Orta Dəhliz, beynəlxalq bazarlar üçün yaşamağa qadir alternativ ola bilər.

Qırmızı dəniz və Süveyş kanalı beynəlxalq gəmiçilik və ticarət üçün mühüm qovşaq nöqtələridir. Təxminlərə görə, dünya ticarətinin 15 faizə qədər hissəsi Süveyş kanalından keçir, həmçinin dünya konteyner daşımalarının 30 faizə qədər hissəsi [4]. Noyabr ayından etibarən husilər Qırmızı dəniz və Aden körfəzində ticarət və hərbi gəmilərə qarşı təxminən 60 hücum həyata keçiriblər. Davam edən hücumlara baxmayaraq, gəmiçilik şirkətləri hələ də bu marşrut üzrə fəaliyyət göstərirlər. Lakin bu şirkətlərin bir çoxu gəmilərə və heyətə olan təhlükələri kompensasiya etmək üçün minlərlə dolları aşan fövqəladə əlavələr də daxil olmaqla, əlavə ödənişlər tətbiq edirlər.

Digər şirkətlər Süveyş kanalı vasitəsilə marşrutdan tamamilə qaçmaq üçün addımlar atırlar, hətta bu, tranzit müddətinin uzanmasına və daha yüksək xərclərə səbəb olsa da. Analitiklər qiymətləndirir ki, Qırmızı dəniz və Süveyş kanalı vasitəsilə keçən adi konteyner yükdaşımalarının

təxminən 90 faizi Cənubi Afrikadakı Düzgün Ümid burnunu əhatə etmək üçün yönləndirilib. Şərqi Asiyadan Avropaya göndərişlər indi əlavə 10 gün tranzit müddəti ala bilər. Bəzi şirkətlər hətta yükünü çatdırmaq üçün hava daşımalarına müraciət edirlər. Bu metod tranzit müddətini əhəmiyyətli dərəcədə azaldır və daha təhlükəsizdir, lakin hava daşımalarının xərci ənənəvi Süveyş marşrutundan 15 dəfə baha ola bilər.

Rusiya əleyhinə sanksiyalar və Şimal Dəhlizindən istifadə etməyə artan istehsaçlıq bu marşrut üzrə daşımaların həcminin əhəmiyyətli dərəcədə azalmasına səbəb olub. 2023-cü il ərzində Qərb daşımalarının həcmi Şimal Dəhlizi marşrutu üzrə əvvəlki illə müqayisədə 51 faiz azalıb. Orta Dəhliz hər iki marşruta daha təhlükəsiz, qısa və əlverişli alternativ təklif edə bilər.

Orta Dəhliz vahid nəqliyyat marşrutu deyil, daha çox qarşılıqlı əlaqəli yol, dəmir yolu və dəniz marşrutları şəbəkəsidir. Son üç onillikdə bir sıra infrastruktur layihələri Orta Dəhlizin modernləşdirilməsinə və naviqasiya üçün tranzit vaxtının azaldılmasına kömək etdi. Çinin Bir Kəmər-Bir Yol Təşəbbüsü çərçivəsində kütləvi investisiyalarla yanaşı, Avropa Birliyi də Orta Dəhlizə əhəmiyyətli miqdarda sərmayə qoyub [7].

Orta Dəhlizi təşkil edən Avrasiya ölkələri mövcud infrastrukturun yaxşılaşdırılmasına xeyli vaxt və resurslar sərmayə qoyublar. 2022-ci ilin sonunda Qazaxıstan, Gürcüstan, Azərbaycan və Türkiyənin xarici işlər və nəqliyyat nazirləri marşrut üzrə inkişafın sürətləndirilməsi və yük axınının genişləndirilməsi yollarının işlənib hazırlanması üçün toplaşıblar. Nazirlər dəmir yollarının modernləşdirilməsinə yönəlmiş beşillik plan elan etdilər və dəmir yolunun gücü başa çatdıqdan sonra iki dəfə artdı. 2027-ci ilə qədər ölkələr ildə 10 milyon ton daşıma qabiliyyətinə və 14-18 gün tranzit vaxtına sahib olmağı planlaşdırırlar [9].

Orta dəhlizin Avropa ucunda dəhlizə marağı Çinin marağına uyğun olan ölkə Türkiyə yerləşir. Ankara dəhlizə təkcə Mərkəzi Asiya ilə iqtisadi əlaqələri gücləndirmək deyil, həm də strateji mövqeyini yaxşılaşdırmaq üçün bir yol kimi baxır. Türkiyə bölgənin türkdilli ölkələri ilə ortaq dil köklərindən istifadə edərək və onlara İranla və ya Rusiya ilə ticarətə cəlbedici alternativ olan ticarət imkanlarını təklif etməklə buna nail olmağa ümid edirdi. Əslində Türkiyə Orta dəhlizi Mərkəzi Asiyadakı xarici siyasətinin mərkəzi elementi edib. 2013-2015-ci illər arasında Azərbaycan, Çin, Gürcüstan və Qazaxıstan ilə dəhlizin Avropa ilə əlaqəsinin yaxşılaşdırılmasına dair sazişlər imzalanmışdır. Türkiyə 2016-cı ildə İstanbulda Avrasiya tuneli və Yavuz Sultan Səlim körpüsünü tikib və artıq Ədirnə-Qars yüksək sürətli dəmir yolunun və Şimal Mərmərə dənizi avtomobil yolunun tikintisini başa çatdırır. Diplomatik cəhətdən Ankara Ermənistanın Zəngəzur regionu vasitəsilə yeni Orta dəhliz dəmir yolunun tikintisinə kömək etməyə çalışır [3].

Mərkəzi Asiya və Çin ölkələrinin Transxəzər Beynəlxalq Nəqliyyat Marşrutu layihəsinə marağı

Daha əvvəl qeyd edildiyi kimi, məhz Ukraynada vəziyyətin gərginləşməsi Mərkəzi Asiya ölkələrinin Rusiyadan yan keçərək Asiyadan Avropaya malların tədarükünü həyata keçirmək mümkün olan alternativ ticarət dəhlizini fəal şəkildə təbliğ etməyə başlamasına səbəb olub. Mərkəzi Asiya ölkələri münaqişədə bitərəf qalsalar da, Rusiyanın üstünlük təşkil etdiyi Şimal dəhlizinə alternativin mövcudluğunda üstünlük gördülər. Orta dəhliz regiondaxili ticarətin artmasına kömək edir, belə ki, 2022-ci ildə Orta dəhliz üzrə yük daşımaları 3,2 milyon tona qədər artıb, ticarət yolunun tutumunun 10 milyon tona çatacağı gözlənilir [2].

Orta dəhliz layihəsinin inkişafında beş ölkə, o cümlədən Azərbaycan, Gürcüstan, Qazaxıstan, Türkiyə və Çin ən böyük maraq göstərir. Transsərhəd dəmir yolu əlaqələrinin yaxşılaşdırılması və ticarətdəki ziddiyyətlərin azaldılması məqsədilə nazirlər səviyyəsində silsilə konfranslar və görüşlər keçiriblər və bu sahələrdə bir sıra məsələləri müzakirə ediblər. Orta dəhliz regional güc mərkəzi statusunu artıracağını vəd edir, buna görə də onun keçdiyi Mərkəzi Asiya ölkələri, məsələn, Qazaxıstan, Özbəkistan, Türkmənistan, Qırğızıstan, dəhlizlə birləşəcək öz dəmir yollarını qurmağa çalışırlar.

Çin üçün Orta dəhlizə maraq beynəlxalq bazarlara çıxış əldə etmək və Moskva ilə Pekin arasında uzun müddətdir rəqabətin müşahidə olunduğu Mərkəzi Asiya regionunda nüfuzunu artırmaq imkanlarına əsaslanır.

Çinin «Bir kəmər - bir yol» təşəbbüsü ölkənin xarici siyasətində prioritetdir. Bu təşəbbüs çərçivəsində Çin Orta Yol layihəsinin infrastrukturunun inkişafına sərmayə qoyur. Çin üçün dəmir yolu transkontinental dəhliz geostrateji əhəmiyyət daşıyır. Bu, dar Malakka boğazından asılılığı azaldır, bu da ABŞ və onun peykləri ilə bağlana bilər, Çini Hind okeanı və Avropadan kəsir. Buna görə də Çin Avropa ilə dəmir yolu əlaqəsinin yaradılmasına və inkişafına böyük töhfə verib. Pekin əvvəlcə zərərli olan dəmir yolu ilə yüklərin göndərilməsini subsidiyalaşdırdı. Əgər 2011-ci ildə cəmi 11 qatar işə salınıbsa, ötən il Çin və Avropa arasında hər iki istiqamətdə 16 min qatar keçib. Pekin Avropa biznesini dəmir yolu marşrutunun nəinki daha sürətli, etibarlı, sabit və təhlükəsiz olduğuna öyrətdi. Pandemiya və karantin tədbirləri zamanı dəniz marşrutu daha etibarlı və demək olar ki, ucuzlaşıb. Ən təsirli dəhliz şimal dəhlizi oldu. Lakin eyni zamanda Çin cənub marşrutunu da sınaqdan keçirdi və müharibənin başlamasından xeyli əvvəl. Buna görə də, Orta Dəhlizi Şimal kimi etibarlı və sürətli etməyin ən yaxşı (və bəlkə də yeganə) yolu Çin təchizatçıları tərəfindən marşruta tələbatı artırmaqdır [1].

Çin və Qazaxıstan sərhədində yerləşən geniş dəmir yolu keçid mərkəzi olan Horgos Qapısının tikintisi və Horgos - Şərqi Qapı xüsusi iqtisadi zonasının maliyyələşdirilməsi infrastrukturun inkişafına misal ola bilər. Aydındır ki, Pekinin nöqteyi-nəzərindən Rusiyanın üstünlük təşkil etmədiyi (Şimal dəhlizində olduğu kimi) və ABŞ-ın birbaşa müdaxilə edə bilmədiyi (ənənəvi dəniz yolunda olduğu kimi) ticarət marşrutunun mövcudluğu Çin üçün strateji əhəmiyyət kəsb edir [1].

Təhlükəsizliyin artırılması və tranzit vaxtının azaldılması ilə yanaşı, Orta Dəhlizdən istifadə əmək miqrasiyasının ümumi mövzu olduğu bütün Mərkəzi Asiyada iqtisadi imkanları yaxşılaşdırmağa kömək edə bilər. Rusiyanın Ukraynaya genişmiqyaslı işğalından sonra da Orta Asiyadan bir milyondan çox əmək miqrantı Rusiyaya köçdü. Özbəkistan kimi Mərkəzi Asiya dövlətləri əmək miqrasiyasının istiqamətlərini şaxələndirmək üçün yollar axtarır. Avropa İttifaqının və müxtəlif beynəlxalq qurumların yeni investisiyaları bütün Mərkəzi Asiya və Qafqaz üzrə əmək miqrasiyasının dövriyyəsi üçün bir yol təklif edə bilər, bütün marşrut üzrə daha böyük ölkələrarası əməkdaşlığı təşviq edir.

Azərbaycan Orta dəhliz layihəsinin mühüm aktoru kimi

Azərbaycan coğrafi cəhətdən «Şimal-Cənub» və «Şərq-Qərb» ən böyük beynəlxalq nəqliyyat dəhlizlərinin kəsişməsində yerləşir. Ölkə ərazisindən digər MTK-lar da keçir: «Cənub-Qərb» (Aİ - Hindistan), «Şimal-Qərb» (RF - Aralıq dənizi ölkələri), həmçinin gələcəkdə «Şimal-Cənub» və «Şərq-Qərb» dəhlizlərinin inkişafına təkan verən Zəngəzur dəhlizi.

Azərbaycanın öz ərazisindən keçən dəhlizlərin bərabər inkişafı şərti ilə beynəlxalq nəqliyyat mərkəzinə tam miqyaslı çevrilməsi potensialı var. Lakin bunun üçün infrastrukturun modernləşdirilməsi və inkişafı, normativ-hüquqi bazanın təkmilləşdirilməsi və uyğunlaşdırılması, logistika sahəsinin inkişafı, o cümlədən logistika mərkəzlərinin yaradılması zəruridir. 2020-ci il 44 günlük müharibəsinin və 2023-cü il yerli antiterror tədbirlərinin nəticələrinə əsasən ərazi bütövlüyünün bərpasından sonra Azərbaycanın böyük regional və beynəlxalq layihələrin həyata keçirilməsi üçün yeni imkanlar yaranıb. Belə ki, artıq azad edilmiş ərazilərdə dəmir yolu və avtomobil nəqliyyatının bərpası istiqamətində işlər aparılır. Zəngəzur dəhlizinə gəlincə, onun istifadəyə verilməsi Azərbaycanla Türkiyə arasında birbaşa yerüstü əlaqə yaradacaq, bu isə Aİ və Mərkəzi Asiya ölkələri arasında ticarət dövriyyəsini artıracaq. «Azərbaycan Respublikası ərazisindən keçən beynəlxalq nəqliyyat dəhlizlərinin tranzit potensialının artırılması və tranzit yükdaşımaların inkişafı üzrə 2024-2026-cı illər üçün Fəaliyyət Planına» əsasən ölkə ərazisindən yük axını 2022-ci ilin göstəriciləri ilə müqayisədə 27% artmalıdır. Hazırda azad edilmiş ərazilərdə yol infrastrukturunun tikintisinə xüsusi diqqət yetirilir [8].

Hacıqabul-Mincivan-Zəngəzur dəhliz avtomobil yolundan başlayaraq Şuşa şəhərinə qədər davam edən «Qələbə yolu», uzunluğu 123,6 km olan Horadiz-Cəbrayıl-Zəngilan-Ağbənd (Zəngəzur dəhlizi) avtomobil yolunun tikintisi də demək olar ki, istismara verilib Azərbaycan və Naxçıvan Muxtar Respublikasını Zəngəzur dəhlizi ilə birləşdirəcək Horadiz-Ağbənd dəmir yolunun tikintisi başa çatıb, davam etdirilir.

Dəniz nəqliyyatı da inkişaf edir. Bakı Beynəlxalq Dəniz Ticarət Limanı 2018-ci ildən istifadəyə verilmişdir. Hazırda limanın ikinci mərhələsinin açılması planlaşdırılır.

Dünya Bankının Orta dəhlizin fəaliyyəti haqqında hesabatında qeyd olunub ki, 2022-ci ildə Azərbaycan tərəfinin ixracı 72% artıb ki, bu da əsasən faydalı qazıntıların ixracına səbəb olub. Eyni dövrdə qeyri-mineral malların ixracı 50% artdı [8].

Rəqəmsallaşma prosesi nəqliyyat-logistika sahəsinin inkişafında xüsusi yer tutur. Belə ki, 2021-ci ildə Azərbaycanın Rəqəmsal İnkişaf və Nəqliyyat Nazirliyi və Asiyada Əməkdaşlıq və Etimad Tədbirləri üzrə Müşavirə «Nəqliyyat-logistika əməliyyatlarının rəqəmsallaşdırılmasının gücləndirilməsi istiqamətində əməkdaşlığın təşviqi» mövzusunda xüsusi tədbir keçirib və burada nəqliyyat və logistikanın rəqəmsallaşdırılması sahəsində əməkdaşlıq imkanlarını müzakirə ediblər.

2022-ci ildə Azərbaycan İnnovasiya və Elm Nazirliyinin İdarəetmə Sistemləri İnstitutunun və Özbəkistan Daşkənd Dövlət Nəqliyyat Universitetinin ekspert qrupları arasında Orta Dəhliz çərçivəsində rəqəmsallaşdırma layihəsi hazırlanmağa başlayıb.

2023-cü ildə Azərbaycanın Rəqəmsal İnkişaf və Nəqliyyat Nazirliyi müqavilələrin imzalanması prosesindən tutmuş nəqliyyat növünün seçilməsinə qədər nəqliyyat-logistika sahəsində bütün proseslərin rəqəmsallaşdırılması layihəsini təqdim edib. Layihə 2024-cü ildə həyata keçirilməlidir.

Azərbaycan tərəfindən dəhlizin inkişafı çərçivəsində ölkənin öz vəsaiti hesabına böyük işlər görülüb, o cümlədən infrastrukturun inkişafı və modernləşdirilməsi, dəmir yollarının və avtomobil yollarının tikintisi və təmiri. Kifayət qədər böyük həcmdə yük qəbul edə və malların sürətli hərəkətini təmin edə bilən Bakı limanı tikilib. Xəzər dənizində Azərbaycan tərəfdən iri logistika donanması yaradılıb.

Azərbaycan üçün tam hüquqlu nəqliyyat mərkəzinə çevrilmək təkcə iqtisadi cəhətdən sərfəli addım deyil, strateji hədəfə çevrilib. Söhbət gəlirlərin neft sektorundan asılılığının azaldılmasından, həmçinin milli təhlükəsizliyin təmin edilməsindən gedir.

Azərbaycan və Mərkəzi Asiya ölkələri arasında əməkdaşlıq kontekstində Orta dəhliz də əhəmiyyətli rol oynayır. Türk dünyası ölkələri arasında həm TDT çərçivəsində, həm də ikitərəfli formatda əməkdaşlıq inkişaf edir. Bu kontekstdə Azərbaycan Qərb və Mərkəzi Asiya ölkələri arasında birləşdirici həlqəyə çevrilib. Özbəkistan (avqust 2023) və Qazaxıstan (mart 2024) dövlət başçılarının Azərbaycana rəsmi səfərləri təsdiqidir. Bu səfərlərin əhəmiyyəti onunla müəyyən edilir ki, onlar ölkələrin infrastruktur və ticarət əməkdaşlığı məsələlərində ilkin inkişaf mərhələsinə müəyyən xətt çəkirlər. Məlum səbəblərə görə «Orta dəhliz» - Bakıdan Gürcüstana və Türkiyəyə gedən transxəzər ticarət marşrutu ideyası onun əsasını təşkil edir. "Resurslarla yanaşı, hazırda bütün dünyada məhz nəqliyyat-logistika imkanlarına çıxış uğrunda mübarizə kəskinləşir. Bu strateji sahədir. Sevindirici haldır ki, həm Qazaxıstan, həm də Azərbaycan burada təbii tərəfdaş kimi sıx əməkdaşlıq edir. Və bu gün Sian limanından Qazaxıstan ərazisi ilə Azərbaycana dəmir yolu marşrutunun açılış mərasimi çox şeydən danışır", - deyə Azərbaycan Prezidenti İlham Əliyev Qazaxıstan Prezidenti Kasım-Jomart Tokayevin Bakıya səfəri zamanı keçirdiyi mətbuat konfransında bildirib. [11] 2022-ci il aprelin 13-də Çinin Sian şəhərindən idman qatarı ilə yola düşüb mal. Beləliklə, Siyandan Almaniyanın Mannheim şəhərinə Qazaxıstan, Azərbaycan, Gürcüstan və Qara dəniz boyunca Rusiya ətrafında dəmir yolu qatarlarının hərəkəti başladı [12].

Orta dəhliz kifayət qədər çox sayda ölkəni əhatə edir və infrastrukturun inkişaf səviyyəsi, rəqəmsallaşma səviyyələri, dəmir yollarının ötürmə qabiliyyəti arasındakı fərqlərə görə ticarət dövriyyəsi səmərəli və sürətlə baş verə bilər.

Azərbaycan ölkə ərazilərinin çoxillik işğalına və kifayət qədər uzun və nəticəsiz danışıqlar prosesinə baxmayaraq, nəqliyyat-logistika sahəsinin inkişafına xeyli səy göstərib. Ərazi bütövlüyü bərpa edildikdən sonra ölkə hakimiyyəti azad edilmiş ərazilərdə tikinti işlərinin başlanmasına birdən-birə müdaxilə edib.

Zəngəzur dəhlizinin açılması Azərbaycan üçün mühüm vəzifəyə çevrilib, çünki onun istifadəyə verilməsi Azərbaycanla Türkiyə arasında birbaşa quru əlaqəsi yaradacaq, həm regional inkişaf kontekstində, həm də Orta dəhlizin inkişafı kontekstində mühüm rol oynayacaq.

Orta dəhliz layihəsinin həyata keçirilməsi yolunda Azərbaycan əsasən öz vəsaiti hesabına böyük işlər görmüşdür. Lakin dəhlizin inkişafı yolunda həllini tələb edən bir çox vəzifələr var:

- yükdaşımaların dəyərinin aydınlığının və proqnozlaşdırılmasının təmin edilməsi

- malların yerini yoxlamaq imkanı

- sənədləşmə də daxil olmaqla bütün proseslərin rəqəmsallaşdırılması, vahid logistika mərkəzlərinin yaradılması

- layihənin inkişafı üçün özəl sektorun, eləcə də investisiyaların işə cəlb edilməsi.

Avropa İttifaqının Transxəzər Beynəlxalq Nəqliyyat Marşrutu mövqeyi

Orta dəhliz mövzusu Transxəzər beynəlxalq nəqliyyat marşrutunu geosiyasi layihə hesab edən Avropa İttifaqının diqqət mərkəzində qalır.

2023-cü ildə «Orta dəhliz» mövzusu bir çox yüksək səviyyəli platformalarda geniş müzakirə edilmişdir. O cümlədən G7 sammitində və Ümumdünya İqtisadi Forumunda. Orada Böyük Britaniya və ABŞ da daxil olmaqla Qərb ölkələrinin nümayəndələri layihəyə investisiyalarla dəstək verməyə hazır olduqlarını bildiriblər. G7 sammitində 2027-ci ilə qədər "Orta dəhliz 'in inkişafına 600 milyard dollar ayırmaq barədə razılığa gəldilər [2].

Brüsseldə Avropa İttifaqı, Mərkəzi Asiya, Qafqaz və Türkiyədən hökumət, maliyyə qurumları, biznes və vətəndaş cəmiyyəti nümayəndələrinin iştirakı ilə Global Gateway investisiya forumu keçirilmişdir. Avropa Komissiyası və Avropa İnvestisiya Bankı strateji nəqliyyat infrastrukturu obyektlərinə investisiya qoymağa hazırdır. "Uzunluğu 11 min km olan nəqliyyat dəhlizi regionlarımızı 15 gün və ya daha az müddətə birləşdirməlidir. Biz bu dəhlizi rəqabətə davamlı etməliyik. Biz konkret nəticələr əldə etmək niyyətindəyik. Buna görə də Avropa Komissiyası və Avropa İnvestisiya Bankı Mərkəzi Asiyanın nəqliyyat imkanlarına 1,5 milyard avro sərmayə qoymaq niyyətindədir. Daha sonra qarşılıqlı anlaşma haqqında müvafiq memorandumlar imzalanacaq", - deyə Avropa Komissiyası sədrinin müavini, ticarət məsələləri üzrə komissar Valdis Dombrovskis bildirib. Bundan əlavə, AİB Qazaxıstanla artıq həyata keçirilən nəqliyyat layihələrinə 1,5 milyard avro ayrılması barədə saziş imzalayıb [2].

Dombrovskisin qeyd etdiyi kimi, Avropa İttifaqı "Transxəzər Beynəlxalq Nəqliyyat Marşrutu 'na 20 milyard avro sərmayə qoyur, uzunmüddətli perspektivdə isə söhbət ictimai və özəl investisiyalardan 2027-ci ilə qədər yığılması planlaşdırılan 300 milyard avro həcmində təsirli məbləğdən gedir.

Siyasi baxımdan aydındır ki, Avropa İttifaqı öz layihəsi ilə Mərkəzi Asiyaya Rusiyadan yan keçmək üçün yeni yollar axtarır. Digər tərəfdən, Azərbaycan, Gürcüstan və Türkiyə öz coğrafi mövqelərindən Mərkəzi Asiya ərazisindən yüklərin tranzitçisi kimi istifadə edə biləcəklər. Bu gün ölkələr arasında «Bakı - Tbilisi - Qars» dəmir yolu layihəsi fəaliyyət göstərir və artıq Qazaxıstan vasitəsilə daşınan Çin yükləri onunla hərəkət edir. Avropa layihəsində iştirak yalnız bu dövlətlərin Aİ üçün əhəmiyyətini

artıracaq. Gürcüstan - bu, onun avrointeqrasiyaya olan ümidlərinə, Türkiyə - investorların etimadını bərpa etmək və lirə böhranını söndürmək üçün, Azərbaycana isə avroquruculuqların anti-Azərbaycan hücumlarını dayandırmaq üçün lazımdır.

Nəticə

Beləliklə, beynəlxalq münasibətlərin qeyri-sabitliyi şəraitində Orta dəhliz hazırda Avropa İttifaqının Rusiyaya tətbiq etdiyi sanksiyalarla əlaqədar fəaliyyət göstərən Şimal Ticarət Yolunun yeganə alternatividir. Bu layihənin bir sıra üstünlükləri var, məsələn, Orta Asiya ölkələrindən və Çindən Avropaya malların daha sürətli daşınması təmin edilir ki, bu da cəmi 12 gündür, Şimal dəhlizi ilə ən azı 19 gün çəkir.

Lakin malların Orta dəhliz boyunca daşınması prosesində bir sıra çətinliklər var. Bu çətinliklər ilk növbədə nəqliyyat yolunun çoxlu sayda ölkələrin ərazisindən keçməsi ilə bağlıdır ki, bu da daşınma prosesini maliyyə baxımından kifayət qədər bahalı edir, çünki gömrük rüsumlarını ödəmək lazımdır. Bundan əlavə, marşrutun bir hissəsi Xəzər dənizindən keçir və burada tankerlər vasitəsilə daşımaq lazımdır.

Bu nəqliyyat marşrutunun gələcək inkişaf perspektivlərinə nəzər salsaq, demək olar ki, geosiyasi liderlər dəyişə bilər. Mərkəzi Asiya regionunda nüfuz uğrunda mübarizədə Çin bu marşrutun yaradılmasının təşəbbüskarlarından biri kimi qalib gələcək. Eyni zamanda, bu marşrut Rusiyaya Avropa İttifaqının sanksiya siyasətindən yan keçməyə və ticarətin bərpası və yeni bazarların axtarışı üçün Orta Marşrutdan istifadə etməyə kömək edə bilər.

Təhlükəsizliyin artırılması və tranzit vaxtının azaldılması ilə yanaşı, Orta Dəhlizdən istifadə əmək miqrasiyasının ümumi mövzu olduğu bütün Mərkəzi Asiyada iqtisadi imkanları yaxşılaşdırmağa kömək edə bilər. Rusiyanın Ukraynaya genişmiqyaslı işğalından sonra da Orta Asiyadan bir milyondan çox əmək miqrantı Rusiyaya köçdü. Özbəkistan kimi Mərkəzi Asiya dövlətləri əmək miqrasiyasının istiqamətlərini şaxələndirmək üçün yollar axtarır. Avropa İttifaqının və müxtəlif beynəlxalq qurumların yeni investisiyaları bütün Mərkəzi Asiya və Qafqaz üzrə əmək miqrasiyasının dövriyyəsi üçün bir yol təklif edə bilər, bütün marşrut üzrə daha böyük ölkələrarası əməkdaşlığı təşviq edir.

İqtisadi imkanları artırmaqla yanaşı, Orta Dəhliz üzrə daşımaların həcminin artırılması daşımalarla bağlı tranzit rüsumlarından əldə edilən gəlirləri artıracaq. 2021-ci ildə Misir Süveyşdən keçən yük gəmilərindən tranzit ödənişlərindən 6,3 milyard dollar qazanıb. Bu rekord rəqəmlər koronavirus pandemiyası və Ever Given yük gəmisi tərəfindən altı günlük kanal blokadasına baxmayaraq əldə edilmişdir. Süveyşdən keçən həcm Orta Dəhlizin gözlənilən tutumundan dəfələrlə çox olsa da, Orta Dəhliz üzrə həcmin artması layihədə iştirak edən bütün ölkələr üçün sabit gəlir axını təmin edərdi.

Özet

Giderek hızlanan siber saldırı vektörleri, artan alarm hacmi ve güvenlik analistlerinin iş yükünü azaltma gereksinimi, güvenlik operasyonlarında otomasyonun kritik önemini ortaya koymaktadır. Bu çalışma, açık kaynaklı siber tehdit algılama araçlarının etkinliğini artırarak olay yanıt süreçlerini otomatikleştirilmiş bir analiz katmanı ile güçlendirmeyi amaçlamaktadır. Bu kapsamda, Suricata gibi yüksek performanslı açık kaynaklı Saldırı Tespit Sistemlerinden (IDS) gelen alarmlar, Karmaşık Olay İşleme (CEP) motoru kullanılarak korelasyon senaryolarına tabi tutulur. Çalışmanın temel amacı, IDS'lerin ürettiği aşırı ve hatalı alarm yükünü azaltmak için alarm korelasyonunu otomatikleştirilmiş bir analiz adımı olarak kullanmaktır. Geliştirilen yöntemde, korelasyon sonuçları, İşletim Sistemi (OS) düzeyindeki log kayıtları ve nesne bağımlılıkları ile otomatik olarak doğrulanarak yanlış pozitif (False Positive) oranını sıfıra yaklaştırmak hedeflenmiştir. Deneysel bulgular, İşletim Sistemleri logları (OS logları) ile desteklenmiştir. Korelasyon yöntemi ile, yalın korelasyonda görülen yanlış ilişkilendirmelerin büyük bir çoğunluğunu eleyerek, gerçek saldırı senaryosunu doğru ve temiz bir şekilde gösteren bir Saldırı Korelasyon Grafiği (ACG) elde edilmesini sağladığını göstermiştir. Bu açık kaynak entegrasyon modeli (Suricata + CEP + OS Logları), alarm analizini otomatikleştirmiş ve olayın gerçekliğinden emin olmayı sağlayan güvenilir bir Otomatik Analiz katmanı sunmaktadır.

Keywords: Siber güvenlik, olay yanıt otomasyonu, açık kaynak kullanımı

GİRİŞ

Günümüzün dijitalleşen dünyasında siber saldırıların sayısı ve karmaşıklığı hızla artmaktadır. Bu durum, kurumların güvenliğini sağlamak için geleneksel savunma mekanizmalarının (güvenlik duvarları, antivirüs yazılımları) ötesine geçen dinamik ve proaktif güvenlik çözümlerini zorunlu kılmaktadır. Saldırı Tespit Sistemleri (Intrusion Detection System, IDS), ağ ve uç nokta düzeyinde potansiyel tehditleri belirleme noktasında kritik bir rol oynamaktadır. Özellikle Suricata gibi açık kaynaklı IDS araçları, yüksek performanslı ve maliyet etkin çözümler sunarak geniş bir kullanım alanına sahiptir.

Ancak, modern tehdit ortamında saldırı vektörlerinin hızlanması, güvenlik analistlerinin manuel olarak yönetebileceği alarm hacminin çok ötesine geçmiştir. Artan alarm hacmi ve analistlerin iş yükünü azaltma gereksinimi, güvenlik operasyonlarında otomasyonu (SOAR, Security Orchestration, Automation, and Response - Güvenlik Orkestrasyonu, Otomasyon ve Yanıt) zorunlu kılmaktadır. Geleneksel IDS'ler tarafından üretilen aşırı alarm yükü, analistlerin kritik olaylara odaklanmasını zorlaştırmakta ve yanlış pozitif (False Positive) alarmlar nedeniyle büyük bir zaman kaybına neden olmaktadır.

Bu alarm yükünü yönetmek ve ilişkili olayları anlamlandırmak için literatürde Alarm Korelasyonu ve Karmaşık Olay İşleme (Complex Event Processing ,CEP) motorları kullanılmaktadır. Alarm korelasyonu, birbirinden bağımsız görünen IDS alarmlarını; zaman, kaynak ve hedef bilgisi gibi kriterlere göre birleştirerek mantıksal bir Saldırı Senaryosu Hipotezi oluşturur. Bu hipotezler, saldırının aşamalarını gösteren Saldırı Grafikleri (Attack Graphs) oluşturulmasına olanak tanır.

Ancak, mevcut korelasyon yöntemlerinin çoğu, yalnızca ağ trafiği ve IDS verilerine dayanmaktadır. Bu sınırlılık, korelasyon sonuçlarının güvenilirliğini düşürmektedir. Bir IDS'in alarm üretmesi, saldırının yalnızca girişim aşamasında olduğunu gösterir; ancak saldırının hedef sistem üzerinde gerçekten başarılı olup olmadığını doğrulayamaz. Bu durum, yanlış korelasyonlar (False Correlation) ve sonuç olarak yüksek oranda yanlış pozitifler (False Positive) üretilmesine yol açar. Bu da otomatik yanıt süreçlerinin yanlış bir olaya tetiklenmesi riskini beraberinde getirmektedir.

Bu çalışmanın temel amacı, alarm korelasyonunun güvenilirliğini artırarak siber olay yanıt otomasyonu için güvenilir bir Otomatik Analiz Katmanı oluşturulmasıdır. Çalışmamız, geleneksel IDS alarm korelasyonu modelindeki doğrulama eksikliğini gidermeyi hedeflemektedir.

Bu bağlamda, bu çalışmanın ana katkısı aşağıdaki gibi sıralanabilir:

- **Açık Kaynak Entegrasyonu:** Tehdit tespitinde Suricata gibi yüksek performanslı açık kaynak araçlarının etkinliğinin, CEP (Coral8 veya muadili) tabanlı korelasyon ile birleştirilmesi.

- **Çok Katmanlı Otomatik Doğrulama:** Korelasyon motorunun ürettiği saldırı hipotezlerinin, yalnızca ağ verilerine değil, aynı zamanda hedeflenen sistemden alınan İşletim Sistemi (OS) düzeyindeki log kayıtları (süreç çalıştırma, dosya sistemi erişimi, nesne bağımlılıkları) ile otomatik olarak doğrulanması.

- **Hatalı Korelasyonların Eliminasyonu:** OS logları ile desteklenen bu entegre doğrulama yöntemi sayesinde, IDS'lerin ürettiği aşırı ve hatalı alarm yükünü azaltmak ve yanlış pozitif oranını sıfıra yaklaştırmaktır.

Elde edilen deneysel bulgular, bu entegrasyon modelinin, yalın korelasyon yöntemlerinin aksine, olayın gerçekliğini kesin olarak teyit eden temiz ve güvenilir bir analiz sonucu ürettiğini göstermektedir.

YÖNTEM

Bu çalışma, siber tehdit algılama süreçlerinde alarm analizi doğruluğunu artırmak ve olay yanıt otomasyonunun temelini oluşturmak amacıyla açık kaynak tabanlı, üç aşamalı bir otomatik analiz mimarisi önermektedir. Mimari, ağ düzeyinde tehdit algılama, olay korelasyonu ve İşletim Sistemi (OS) düzeyinde otomatik doğrulama bileşenlerinden oluşmaktadır.

1. Deneysel Ortam Mimarisi (Architecture)

Geliştirilen yöntem, bir Saldırı Alarm Korelasyon Sunucusu (Intrusion Alert Correlation Server) üzerinde test edilmiştir.

- **Platform:** Sunucu, Snort IDS ve Coral8 Korelasyon Motorunu barındıran Ubuntu 9.04 işletim sisteminde çalıştırılmıştır.
- **Log Entegrasyonu:** Snort'tan gelen alarmlar (csv_alert.csv) ve Ubuntu 9.04 sistem logları (syslogFormatted.csv), Coral8 Korelasyon Motoruna entegre edilmiştir.
- **Hedef Hizmet:** Saldırı tespiti için sunucuda, zafiyetleri loglayabilmek ve saldırı tespiti yapabilmek amacıyla Samba 3.0 dosya ve yazıcı paylaşım hizmeti çalıştırılmıştır.

Bu mimaride temel amaç, farklı kaynaklardan (ağ trafiği ve sistem kayıtları) elde edilen verileri birleştirerek alarm doğruluğunu yükseltmektir.

2. Üç Aşamalı Otomatik Analiz Modeli

Tehdit analizi ve yanıt sürecinin otomatikleştirilmesi, Tablo 1. de detayları verilen üç ardışık aşama üzerinden gerçekleştirilmiştir

Tablo 1: Tehdit Analizi

Aşama	Bileşen/Araç	İşlev	Kaynak
Algılama	Suricata (IDS)	1. Deneysel Ortam Mimarisi (Architecture) Geliştirilen yöntem, bir Saldırı Alarm Korelasyon Sunucusu (Intrusion Alert Correlation Server) üzerinde test edilmiştir. Platform: Sunucu, Snort IDS ve Coral8 Korelasyon Motorunu barındıran Ubuntu 9.04 işletim sisteminde çalıştırılmıştır. Otomatik Doğrulama	OS Log Kayıtları ve Nesne Takibi	Korelasyon hipotezlerinin, İşletim Sistemi düzeyinde (süreç, dosya, ağ) gerçekleşen aktivitelerle karşılaştırılmasını sağlar.	OS Logları

2.1 Agılama Bileşeni: Suricata

Suricata, açık kaynaklı, yüksek performanslı bir Saldırı Tespit/Önleme Sistemidir (IDS/IPS). Temel özellikleri, otomasyon mimarisi için uygun bir veri kaynağı olmasını sağlamaktadır:

- **Paralel İşleme (Multi-threading):** Birden fazla CPU çekirdeğini eş zamanlı kullanarak paket işleme performansını en üst düzeye çıkarır.

- **Protokol Tanıma:** Uygulama Katmanı Protokolü (ALP) tanıma yeteneği ile derin paket incelemesi yapar.

- **Çıktı Entegrasyonu:** Standart JSON/Eve formatında çıktılar üreterek Coral8 gibi otomasyon sistemlerine kolayca entegre edilebilir.

2.2 Korelasyon Bileşeni: Coral8 CEP Motoru

Korelasyon, saldırı alarmları arasındaki ilişkileri, yani bir saldırının sonucunun sonraki bir saldırının önkoşulunu oluşturup oluşturmadığını keşfetmeye odaklanır. Coral8 CEP (Karmaşık Olay İşleme) Motoru, bu korelasyon mantığını çalıştırmak için kullanılmıştır.

Coral8, sürekli sorguları çalıştıran ve veri akışlarını analiz eden bir sistemdir. Bu çalışmada, IDS alarmlarını korele eden SQL tabanlı sorgu ifadesi Şekil 1. de verilmiştir:

Şekil 19: IDS Alarmlarını Korele Eden SQL Sorgusu

Şekil 1. de ki sorgu, bir önceki alarmın sonuç kümesi (ExpandedConseqSet) ile sonraki alarmın önkoşul kümesinin (PrereqSet) ortak özniteliklerini paylaştığı ve zaman sırasına uyduğu durumları tespit ederek bağlantılı saldırı senaryolarını bulur.

2.3 Otomatik Doğrulama: OS Log Kayıtları ile Güçlendirme

Yalnızca IDS alarmları ve geleneksel korelasyon, yüksek oranda yanlış korelasyon (False Positive) içerebilir. Bu problemi çözmek için, Korelasyon hipotezinin doğruluğu İşletim Sistemi (Operating System, OS) Logları ile karşılaştırılarak sıfıra yakın yanlış pozitif oranı hedeflenmiştir.

- **Doğrulama Mekanizması:** Korelasyon hipotezinde T_{1} olayının sonucunun (T_{1}'in sonucu olan nesnenin) gerçekten de T_{2} olayının önkoşulunda kullanılıp kullanılmadığı OS loglarından kontrol edilir.

- **Nesne Takibi:** Ubuntu 9.04 üzerinde süreç (process) ve dosya (file) gibi OS düzeyindeki nesneler ve bunların bağımlılık ilişkileri (process forking, file reading vb.) izlenmiştir.

- **Yanıtı Tetikleme:** Bu OS düzeyindeki doğrulama, ancak doğru olduğu kanıtlanan alarmlar için bir sonraki Otomatik Yanıt adımını (örneğin, güvenlik duvarına engelleme kuralı gönderme) tetikler.

BULGULAR

Bu bölümde, OS düzeyinde doğrulama ile entegre alarm korelasyon mimarisinin etkinliğini kanıtlamak amacıyla tasarlanan deneysel senaryonun kritik sonuçlarının anlatılması hedeflenmektedir.

1. Deneysel Senaryo ve Üretilen Alarmlar

Deneysel ortamda, zafiyetli Samba 3.0 servisini barındıran bir sunucu hedef alınmıştır. Senaryo, uzaktan erişim zafiyeti sömürüsü, kötü amaçlı DDoS(Distributed Denial of Service) yazılımının yüklenmesi ve saldırı başlatılması adımlarını içermiştir.

2. Yalın Korelasyonun Sınırlılığı (Bulgu 1)

Sadece IDS alarmları ve geleneksel önkoşul-sonuç mantığı kullanılarak yapılan ilk korelasyon uygulamasında, elde edilen korelasyon grafiği senaryo dışı birçok yanlış korelasyon ilişkisi (False Correlation) gösterdi. Bu sonuç, IDS alarmlarının yüksek yanlış pozitif oranı nedeniyle yalnızca ağ tabanlı verilere güvenmenin, saldırının gerçekliğini ve bağlamını anlamada yetersiz kaldığını göstermiştir. Bu durum, analistlere hatalı bir saldırı stratejisi resmi sunar.

3. OS Logları ile Otomatik Doğrulamanın Etkisi (Bulgu 2)

Yanlış korelasyonları gidermek amacıyla, Korelasyon Hipotezleri OS düzeyindeki log kayıtları ve nesne bağımlılıkları ile otomatik olarak doğrulanmıştır. Bu süreçte, kritik alarmlara karşılık gelen OS-düzeyi nesneler (süreç ID'leri, dosyalar) tespit edilmiştir.

Doğrulama, önceki alarmın sonuç nesnesinden (örneğin, bir shell süreci) sonraki alarmın önkoşul nesnesine (örneğin, DDoS daimonu süreci) bir bağımlılık yolu olup olmadığını kontrol etmiştir.

- Sonuç: Bu doğrulama adımı sonrasında, yanlış korelasyonların büyük bir çoğunluğu elenmiştir. Elde edilen yeni Saldırı Korelasyon Grafiği (ACG), gerçek saldırı adımlarını temiz ve doğru bir şekilde yansıtmıştır.

- Kanıt: Bu başarı, önerilen mimarinin yanlış pozitif oranını önemli ölçüde azalttığını ve olay yanıt otomasyonu için kritik öneme sahip güvenilir bir Otomatik Analiz katmanı sunduğunu kanıtlamıştır.

TARTIŞMA VE SONUÇ

Siber tehdit algılama ve olay yanıt otomasyonunda, Suricata gibi açık kaynak araçlarının kullanılması ve alarm korelasyonunun OS logları ile otomatik doğrulanması, sistemin verimliliğini kritik düzeyde artırmaktadır. Bu model, analist müdahalesine gerek kalmadan, alarmların güvenilirliğini doğrulayan ve olayın gerçekliğinden emin olmayı sağlayan güvenilir bir Otomatik Analiz katmanı sunar. Deneysel sonuçlar, OS düzeyinde bağımlılık takibinin alarm korelasyon yöntemiyle entegre edildiğinde yanlış korelasyonları önemli ölçüde azaltabileceğini kanıtlamıştır. Gelecek çalışmalarda bu güvenilir analiz katmanı üzerine, Tam Otomatik Yanıt (Full SOAR) senaryolarının (örneğin, doğrulanan saldırgan IP'lerini otomatik olarak Firewall/WAF'ta engelleme) inşa edilmesi planlanmaktadır.

Xülasə

Məqalədə bazar fəaliyyətinin qarşılıqlı təsiri nəticəsində makroiqtisadi qeyri-sabitliyin yaranmasına, mikroiqtisadi səviyyədə tələb və təklifin dəyişməsi ilə bütün bazarlarda qiymətlərə və satış həcminə birbaşa təsir etməyə başlayan daxili və xarici amillərin təsir maxanizləri açıqlanır. Makroiqtisadi qeyri-sabitliklərin aradan qaldırılması üçün qisa, orta və uzunmüddətli dövrlərdə geniş təkrar istehsalın davamlı inkişaf şərtlərinə əməl olunmasını nəzərdə tutan stabil, dinamik xərclər və gəlirlər siyasətinin formalaşdırılması, əmtəə və xidmətlər bazarında lazımi istehlak məhsullarının əldə olunması, maddi, maliyyə və insan resurslarından məqsədəyönlü istifadə edilməsi məsələlərinə diqqət yetirilir. Xarici investisiyaları cəlb edilməsi başlanan iqtisadi proseslərin mili inkişafın davamlılığına və dayanıqlığına güclü təməl yaratması, əmtəə və xidmətlərin bazar təklifinin durmadan artırılması ilə yerli sahibkarlıq subyektlərinin inkişafına və rentabelliyinə şərait yaratma imkanları, gözlənilən infilyasiya mühitinin xərclərin sahəvi strukturundan asılılıq şəraitləri nəzərdən keçirimişdir.

Açar sözlər: qeyri-sabitliklər, rəqabət, iqtisadi rayonlar

Giriş

Ümumi makroiqtisadi qeyri-sabitliklərin aradan qaldırılması və makroiqtisadi tarazlığın təmin edilməsi iqtisadi nəzəriyənin ən mühüm qanunauyğunluqlarından biri olub, əmtəə və xidmətlər bazarında yarana biləcək tsiklik proseslərlə əlaqədardır. Makroiqtisadi səviyyədə təsir göstərən qiymət siyasəti ümumi və fərdi qeyri-sabitliklərin aradan qaldırılmasına yönəldilməklə, institusional fəaliyyətlərlə həyata keçirilir. Makroiqtisadi qeyri-sabitliklərin baş verməsi əmtəə və xidmətlər, fiziki və əqli əmək, pul və maliyyə öhdəlikləri bazarında tsiklik proseslərin təsirinə məruz qalaraq istehsal və məcmu istehlakın, məcmu tələb və məcmu təklifin, məcmu xərclər və məcmu gəlirlərin, məcmu maddi və məcmu maliyyə axınlarının balanslaşdırılmasına nail olunmasından ibarət iqtisadi proseslərin səmərəli təşkili və idarə olunmasını tələb edir. Mikro səviyyədə fəaliyyət göstərən təsərrüfat subyektləri tərəfindən qiymətlərin süni şəkildə artırılması aralıq və son istehlak xərclərinin artmasına, bu da öz növbəsində fərdi və milli gəlirlərin azalması prosesi ilə müşaiyyət olunaraq səmərəlilik səviyyəsinə və infilyasiyaya mənfi təsir edəcəkdir.

Bütövlükdə milli iqtisadiyyatın səmərəli fəaliyyətinin təmin olunması makroiqtisadi səviyyədə sosial-iqtisadi inkişafın ən mühüm və fundamental problemlərindən biri kimi, ümumi makroiqtisadi tarazlığa nail olunmasını, makroiqtisadi qeyri-sabitliklərin aradan qaldırılmasını tələb edir ki, bu da öz növbəsində maddi, maliyyə və insan resurslarından, iqtisadi tənzimlənmənin dövlət və bazar mexanizmlərdən necə, daha səmərəli istifadə olunması məsələlərinə diqqət yetirilməsinə əsaslanmaqla infilyasiyanın tənzimlənməsindən ibarətdir.

1. Makroiqtisadi qeyri-sabitliyin yaranmasına səbəb olan amillər

Ümumi makroiqtisadi qeyri-sabitliklər dedikdə milli təsərrüfatçılıq sisteminin bütün struktur elementlərində, bölmələrində, sahələrində fərdlərin maraqlarının ortaq optimal hədlərə nail oluna bilməməsi və onların iqtisadi davranışında müşahidə olunan ümumi sistemlilik əlaqələrinin pozulması başa düşülür. Belə qeyri-sabitliklərin aradan qaldırılması üçün isə qisa, orta və uzunmüddətli dövrlər üçün geniş təkrar istehsalın davamlı inkişaf şərtlərinə əməl olunmasını nəzərdə tutan stabil xərclər və gəlirlər siyasətinin formalaşdırmaqla, əmtəə və xidmətlər bazarında lazımi istehlak məhsullarının əldə olunması, maddi, maliyyə və insan resurslarından məqsədəyönlü istifadə edilməsinə zərurət yaranmaqdadır.

Azərbaycan Respublikasının dövlət müstəqilliyi elan olunması ilə əlaqədar olaraq, 1991-1997-ci illər ərzində bir tərəfən milli valyutamız olan manat"ın dövriyyəyə buraxılması və keçmiş ittifaq dövlətləri ilə iqtisadi əlaqələrimizin, qarşılıqlı maliyyə öhdəliklərimizin yerinə yetirilməsində, bazar iqtisadiyyatı adlanan yeni sosial-iqtisadi sistemə keçidlə əlaqədar həyata keçirilən özəlləşdirmə prosesinin obyektiv və subyektiv çətinlikləri, ikinci bir tərəfdən də Ermənistan Respublikasının tarixi torpaqlarımıza ərazi iddiası ilə başladığı elan olunmamış müharibə ilə əlaqədar maliyyə bazarında yaranmış böhranlı vəziyyət infilyasiya şoklarının yaranmasına rəvac vermişdir.

Bu zaman qiymətlər çox sürətlə artmağa başlayaraq əmək haqqı artımlarını kəskin üstələməklə, istehsal fəaliyyəti kəskin geriləmələrlə müşaiyyət olunmaqla əmək bazarında işsizlik sürətlə artaraq, daha gəlirli və digər sahələrlə müqayisədə nisbətən az yeni dəyər yaradan ticarət sektoruna maraq üstünlük təşkil etməyə başladı. Məşğulluqda əsas rol oynayan iri istehsal müəssisələri nəinki mənfəət əldə etmək, əksinə zərərlə işlədiklərinə görə fəaliyyətlərini dayandırmağa məcbur oldular. Bütün bunlar sahələrarası təsərrüfat əlaqələrinin pozulmasına, barter sövdələşmələrinə üstünlük verilməsi ilə xarici-iqtisadi əlaqələrin tənəzülə uğraması ilə müşaiyyət olunmağa başlamışdır. Yaranmış böhranlı vəziyyətdən çıxmağın yeganə yolu isə yeni istehsal sahələri yaratmaq və məşğulluğu artırmaq üçün investisiya fəaliyyəti üçün maliyyə mənbələrinə nail olmaqdan ibarət idi.

Bütün bu qeyd olunanlar yalnız xarici investisiyaları cəlb etməklə onun rentabelliyi, davamlılığı və dayanıqlığı üçün güclü təməl yaratmaqla kifayətlənməyib, həm də əmtəə və xidmətlərin bazar təklifinin durmadan artırılması ilə yerli sahibkarlıq subyektlərinin inkişafına şərait yaratmaqdadır.

Maliyyə imkanlarından yararlanmada müasir və müstəqil Azərbaycan Respublikası tarixində baş verən əhəmiyyətli hadisələrdən biri kimi, 1994-cü il sentyabrın 20-də Azərbaycan Respublikası Dövlət Neft Şirkəti ilə dünyada tanınmış 6 ölkənin 10 şirkəti arasında Xəzər dənizinin Azərbaycan sektorunda "Azəri", "Çıraq" və "Günəşli" yataqlarının dərinlikdə yerləşən hissəsinin birgə işlənməsi və neft hasilatının pay bölgüsü haqqında "Əsrin müqaviləsi" imzalanmışdır.

Bu müqavilələrin imzalanması ilə Azərbaycan nəinki iqtisadi dividendlər qazandı, eyni zamanda regional səviyyədə siyasi zəmanət və müstəqilliyə qarant əldə etdi. Azərbaycanın əldə etdiyi uğurların, nailiyyətlərin bünövrəsində, təbii ki, enerji layihələrindən qaynaqlanan güclü iqtisadiyyat durur. Məhz gələcəyə hesablanmış bu uğurlu enerji siyasətinin təməli Ümummilli Lider Heydər Əliyev tərəfindən qoyulmuşdur (7).

Amerikalı iqtisadçı və yazıçı, Pulitzer mükafatı laureatı, neft və qaz sənayesinə dair kitabların, o cümlədən iqtisadiyyat üzrə ən yaxşı məşhur "Neft, pul və güc üçün mübarizənin qlobal tarixi" adlı kitab üçün Ekkls Mükafatını qazanan müəllif kimi tanınmış Daniel Howard Yergin Heydər Əliyevi həm də məharətli taktika ustası və mükəmməl bir strateq olaraq dəyərləndirmişdir (8).

Xarici qüvvələr tərəfindən Ermənistana hərbi-siyasi dəstəyin göstərildiyi şəraitdə tarixi ərazilərimizin işğala məruz qaldığı, hakimiyyət dairələrində fərqli iqtisadi-siyasi idarəetmə konsepsiyalarının təzəcə formalaşdığı, texnoloji və hərbi ehtiyacların zəif təmin olunduğu, işsizlik və infilyasiyanın yeni sahibkarlıq və biznes mühitinin inkişafında yaratdığı dağıdıcı prosesləri dəf etmək üçün taktiki və strateji baxımdan siyasi-iqtisadi müstəqilliyini yenidən bərpa etmiş Azərbaycan Respublikasında

mühüm əhəmiyyət kəsb edən dəyişiklikləri həyata keçirmək zərurəti yaranmışdır. Milli iqtisadiyyatımız və bütövlükdə Cənubi Qafqaz regionu üçün strateji hədəflərin müəyyənləşdirilməsində uzaqgörən mühüm tədbirlərin həyata keçirilməsi ilə, qısa müddət içərisində neft hasilatı və satışı sahəsində beynəlxalq miqyasda tanınmış tərəfdaşların ölkəmizdə iri həcmli investisiyalara başlaması üçün zəruri olan etimadı təmin etdi.

İqtisadi sistemlərdə qeyri-təkmil rəqabətin və əmtəə və xidmətlər bazarına xarici amillərin nizamlanmayan təsiri şəraitində müəyyənləşən qeyri-sabitliklər ümumi makroiqtisadi tarazlıqların pozulmasına zəmin yaratmaqla süni qiymət artımlarına səbəb olacaqdır. Aralıq və son istehlak sektorunda xüsusi əhəmiyyət kəsb edən yanacaq-enerji resurslarına tətbiq olunan tarif və qeyri-tarif qiymətlərinin səviyyəsinin artırılması zəncirvari bir proses olaraq, digər əmtəə və xidmətlərin qiymətində də artıma səbəb olacaqdır ki, bu iqtisadiyyatda ümumi tarazlığın pozulması ilə müşaiyyət olunaraq infilyasiya səviyyəsinin artmasına şərait yaradacaqdır.

Lakin inflyasiya səviyyəsindən asılı olaraq bütün dövrlərdə əmtəələrin qiymətləri bahalanmıya bilər, yəni inflyasiya səviyyəsinin sürətlə artdığı dövrdə bəzi əmtəələrin qiymətləri qalxa, bəzilərininki sabit qala, digərlərininki isə hətta aşağı düşə bilər. Bunlar da tələblə təklif arasındakı nisbətin və qiymət elastikliyinin müxtəlifliyi ilə əlaqədardır (Qrafik 1).

Azərbaycanda son 27 ilin (1996-2023) müxtəlif dövrlərində inflyasiyanın səviyyəsinin yüksək olmasına baxmayaraq sənaye məhsullarının istehsalçı qiymət indeksi kənd təsərrüfatı məhsullarının istehsalçı qiymət indeksindən yüksək olmuşdur. Belə ki, 2018-ci ildə kənd təsərrüfatı məhsullarının istehsalçı qiymət indeksi 1,02-dən 1,08-ə qədər dəyişmişdirsə, sənaye məhsullarının istehsalçı qiymət indeksi isə daha yüksək artım indeksinə malik olaraq 1,16-dan 1,31-ə qədər kəskin kəmiyyət dəyişikliyinə uğramışdır (2).

Kənd təsərrüfatı məhsullarının istehsalçı qiymət indeksi isə əvvəlki illərdən nisbətən yüksək olaraq, 2022-ci ildə 1,15-dən 1,16-ya qədər dəyişsə də, sənaye məhsullarının istehsalçı qiymət indeksi 1,84-dən 2,21-ə qədər daha yüksək templərlə artmışdır. Ölkə üzrə istehlak qiymətləri indeksi isə 2018-2022-ci illər ərzində 1,02-dən 1,14-ə qədər artmışdır ki, bu da mövsümi şəraitlərlə əlaqədar istehlak qiymətlərinin səviyyəsində yaranmış qısamüddətli dalğalanmalarla əlaqələndirilə bilər.

Ümumi istehlak qiymətlərinin və kənd təsərrüfatı məhsullarının istehsalçı qiymət indekslərinin səviyyəsindəki qiymət dəyişiklikləri 2023-cü ildə stabil artımlarla müşaiyyət olunan dəyiklikləre məruz qalsa da, sənaye məhsullarının istehsalçı qiymət indeksləri 2022 ilin 2,21 səviyyəsindən 2023-cü ildə 0,84 səviyyəsinə qədər azalmışdır. Bunun da səbəbi sənayedə uzunmüddətli borclanmalara tətbiq olunan yüksək faizlər şəraitində, xərclərə olan tələbin zəifləməsi ilə baş verməsi müşahidə olunmaqdadır.

Buna görə də qiymətlərin artmasını daimi bir proses kimi qəbul etmək mümkündür. Çünki bu, bütün bazarları əhatə edir və bütövlükdə iqtisadiyyat üçün səciyyəvi olmaqla, maddi-texniki resursların yeniləşməsinə və inovativ texnolojiyaların tətbiq olunmasında elmi-texniki fəaliyyətlərə yönəldilən xərclərin durmadan artırılması və bunun müqabilində də qiymətlərin yüksəlməsi ilə əlaqədardır. Qiymətlərin bahalanması nəticəsində tələblə təklif arasındakı tarazlığın pozulması müşahidə olunmaqla ümumi makroiqtisadi müvazinətliyin yenidən pərpa olunması zərurəti meydana çıxır.

2. Makroiqtisadi sabitliyin və infilyasiyanın tənzimlənməsində maliyyə amilinin rolu

Qiymət artımlarını bütün hallarda inflyasiyanın baş verməsi kimi qəbul etmək düzgün sayıla bilməz, çünki məhsulların keyfiyyətinin yaxşılaşması, istehsalın maddi amillərini formalaşdıran xammallar və materialların dəyərinin artması, istehlak əmtəələrinə tələbin dəyişməsi və s. nəticəsində də qiymətlər arta bilər. Konkret şəraitlərdən və məkanlardan asılı olaraq inflyasiyanın baş vermə prosesinin

mexanizminin tələb inflyasiyası və xərclər inflyasiyasının timsalında iki modelini açıqlamaq mümkündür. Tələb inflyasiyası 2005-2019-cu illərdə sərəmcanda qalan ümumi gəlirlərin nisbətən stabil dinamika əsasında, 2020-2023-cü illərdə isə qeyri-stabil dinamika əsasında kəskin artdığı şəraitdə, hər hansı istehsalın məhsullarına və xidmətlərə məcmu tələbin real həcmi ilə müqayisədə daha artıq tempə malik olması səbəbindən yaranmışdır (Qrafik 2). Qrafikdən göründüyü kimi sərəmcanda qalan ümumi gəlirlərin tərkibində əmək ödənişlərinin həcmi daha stabil artım templərinə malik olmuşdur.

Bu isə onu deməyə əsas verir ki, müqayisə olunan dövrlərdə faktiki olaraq son istehlak xərclərinin tərkibində əmək ödənişlərindən fərqli olaraq, xammallar və materiallara, hətta bəzən nəzərdə tutulmayan müxtəlif növ nəqliyyat xidmətlərinə, tarif və qeyri-tarif ödənişlərinə əlavə xərclər yönəldilmişdir. Azərbaycanın nəqliyyat sektorunda yük və sərnişin daşımalara çəkilən xərclərin tərkibində cəmi yük daşımalara çəkilən xərclər 1995-2018-ci illərdə orta illik artım 1,2 dəfə, 2018-2022-ci illər ərzində 2 dəfə artsa da, 2022-2023-cü illər ərzində isə 1,5 dəfəyə qədər azalmışdır (Qrafik 3).

Cəmi sərnişin daşımalara çəkilən xərclərin məbləği isə fərqli dəyişikliklərlə müşahidə olunmuşdur. Belə ki, 1995-2019-cu illərdə qeyd olunan xərclərin məbləği 28,6 dəfə artaraq 55,7 mln manatdan 1593,3 mln manata qədər yüksəlmişdir. COVİD-29 pondemiyası dövrünün meydana gəlməsi ilə sərnişin daşımalarda yaranmış məhdudiyyətlərlə əlaqədar olaraq, 2019-2021-ci illər ərzində istehlak xərclərinin həcmi 1,4 dəfə azalaraq 1,11 mln manat təşkil etsə də, 2023- cü ildə bu göstərici 2,21 mln manata,yaxud da 2 dəfəyə qədər artmışdır.

Bütün ölkə üzrə 2023-cü ilə məhsul buraxılışının 75,7 %-i Bakı şəhəri və Abşeron-Xızı iqtisadi rayonlarının, qalan 24,3 %-i isə digər iqtisadi rayonların payına düşmüşdür. Orta hesabla digər 12 iqtisadi rayonlarda hər iqtisadi rayon üzrə məhsul buraxılışının xüsusi çəkisi isə 2,02 % təşkil etmişdir ki, bu da əhalinin ərazi məskunlaşmasında ciddi uyğunsuzluqların yaranması ilə müşaiyyət olunmaqdadır(9).

Qeyd olunan uyğunsuzluqlar nəqliyyat sektorunda sərnişin və yükdaşımaların strukturunda, gəlir və xərslərin iqtisadiyyatın real və qeyri-real sektorları arasında qeyri-normal paylanması ilə müşaiyyət olunaraq, tələb və təklif arasında tarazlığın pozulmasına, eyni zamanda tələb infilyasiyasının yaranmasına şərait yaratmaqdadır.

İqtisadi rayonlar və inzibati ərazi vahidləri üzrə əhalinin gəlirlərin qeyri-proporsional paylaşması bütövlükdə əhalinin müxtəlif sosial qrupları üzrə həyat səviyyəsi indeksinin köməyilə aralıq və son istehlak əmtəələrinin daxil olduğu minimum istehlak səbəti qiymətlərinin dəyişməsinə, regional səviyyədə yoxsulluğun azaldılması və məşğulluğun artırılması ilə əlaqədar sosial siyasətin yürüdülməsinə, nisbi və real iqtisadi artıma şərait yarada bilən dövlət-özəl tərəfdaşlığına əsaslanan ortaq sahibkarlıq layihələrinin reallaşmasına, dövlətin sənaye və aqrar siyasətinin həyata keçirilməsində mühüm əhəmiyyət kəsb edən bir sıra məsələlər, o cümlədən innovasiyalar və infrastruktur layihələrinin işlənməsi, həyata keçirilməsi ilə bağlı bir sıra dayanıqlı inkişaf məqsədlərinin həyata keçirilməsində mühüm rol oynamaqdadır.

Digər bir tərəfdən müqayisə olunan dövrdə bütün ölkə üzrə əhalinin gəlirlərinin 66,7 %-nin də Bakı şəhəri və Abşeron-Xızı iqtisadi rayonlarının payına düşməsi məşğulluq və işsizliyin normal səviyyədə

təmin olunması məsələlərinə də neqativ təsir göstərməklə, iqtisadi rayonlar və inzibati ərazi vahidləri üzrə əhalinin gəlirlərində qütbləşməni dərinləşdirməkdədir (1).

Azərbaycan BMT-yə üzv olan dövlətlərin 2015-ci ilin 25–27 sentyabr tarixində keçirilən "Dayanıqlı İnkişaf Sammitində" 2016–2030-cu illər üçün təsdiqlənmiş "Dayanıqlı İnkişaf Məqsədlərinə" qoşulmuşdur. Bu İnkişaf Məqsədlərinin icrasının institutsional və siyasi baxımdan kompleks yanaşma tələb etdiyi nəzərə alınaraq Prezident İlham Əliyev 06 oktyabr 2016-cı il tarixində "Azərbaycan Respublikasının Dayanaqlı İnkişaf üzrə Milli Əlaqələndirmə Şurasının Yaradılması Haqqında" fərman imzalamış və Şuranın fəaliyyətinə elmi müəssisələrin cəlb edilməsi məqsədəuyğun hesab etmişdir (2).

İqtisadi rayonlar üzrə məhsul buraxılışının tərkibində Bakı şəhəri və Abşeron-Xızı iqtisadi rayonlarının xüsusi çəkisinin yüksək olması 2003-2023-cü illər bu ərazilərdə məskunlaşan əhalinin hər nəfərinə düşən məhsul buraxılışının həcmində də fərqli göstəricilərə malikdir. Şərqi Zəngəzur iqtisadi rayonu üzrə iqtisadiyyatın əsas sahələrində məhsul buraxılışının hər nəfərə düşən həcmi 2020-2023-cü illər ərzində 30,9 dəfə artaraq, 13,9 min manata çatmışdır (Qrafik 6).

Qrafik 6. İqtisadi rayonlar üzrə məhsul buraxılışının hər nəfərə düşən həcmi,manatla

Belə ki, Bakı şəhəri üzrə məskunlaşan əhalinin hər nəfərinə düşən məhsul buraxılışının həcmi müqayisə olunan dövrdə yüksək artım templəri ilə müşaiyyət olunmaqdadır. Hər nəfərə düşən məhsul buraxılışının həcmi 2024-cü ildə 40,0 min manat təşkil etsə də, 2022-ci ildəki 45,4 min manatla müqayisədə 11,9 % azalmışdır. Bakı şəhəri üzrə hər nəfərə düşən məhsul buraxılışının həcmi Naxçıvan Muxtar Respublikası ilə müqayisədə 12 dəfə, Gəncə-Daşkəsən iqtisadi rayonu ilə müqayisədə 8,6 dəfə, Mərkəzi Aran və Dağlıq Şirvan iqtisadi rayonları üzrə 9,6 dəfə, Mil-Muğan və Quba-Xaçmaz iqtisadi rayonları üzrə 8,8 dəfə, Lənkəran-Astara iqtisadi rayonu üzrə isə 14,6 dəfə aşağı olmuşdur. Nəzərə almaq lazımdır ki, Lənkəran-Astara iqtisadi rayonu üzrə əhalinin sıxlığı Quba-Xaçmaz və digər iqtisadi rayonlara nisbətən 2 dəfədən çoxdur (3).

Azərbaycanda dayanıqlı sosial-iqtisadi inkişafı təmin etmək və işğaldan azad olunmuş ərazilərin bərpasına dair həyata keçirilən milli inkişaf proqramlarında nəzərdə tutulmuş tədbirlər, daima olaraq dövlətin diqqət mərkəzindədir. Torpaqlarımızın işğaldan azad edilməsi Azərbaycan Respublikasının Prezidenti İlham Əliyevin siyasi-hərbi və iqtisadi fəaliyyətində ən mühüm tarixi hadisəsidir.

İşğaldan azad edilən ərazilərdə quruculuq işlərinin aparılması intensiv xarakter almaqda davam edir. Milli iqtisadiyyatın prioritet sahəsi olaraq, dayanıqlı inkişafa nail olmaq üçün investisiya qoyuluşlarının həyata keçirilməsi ilə bağlı tədbirlər artıq öz bəhrəsini verməkdədir. Belə ki təkcə ölkə üzrə ümumi yatırımların məbləği ötən il 20,3 milyard manat təşkil edib ki, bu illik müqayisədə 2 milyard manat və ya 11% çoxdur.

Ən kəskin artım işğaldan azad edilmiş Xocalı rayonunda baş vermişdir, belə ki rayona sərmayə qoyuluşu 304 milyon manat, başqa sözlə 1404 dəfə artmışdır. Məlumat üçün bildirək ki, rayona ötən il ərzində 304 milyon 224 min manat yatırım edilmiş, 2022-ci ildə bu rəqəm cəmi 217 min manat olmuşdur (5).

Məhz investisiyalaşma sahəsində görülən tədbirlərin nəticəsidir ki, Şərqi Zəngəzur iqtisadi rayonu üzrə məhsul buraxılışının hər nəfərə düşən həcmi 2020-2024-cü illər ərzində 28,9 dəfəyə qədər artmışdır ki, bu da işğaldan azad olunmuş ərazilərdə məskunlaşma və quruculuq-bərpa işlərinin sürətlənməsinə şərait yaradacaqdır.

İstehsal təyinatlı məhsullara tətbiq olunan topdansatış qiymətləri və pərəkanda ticarət sektorunda tətbiq olunan pərəkanda satış qiymətləri arasında yaranmış fərqliliklər də infilyasiya səviyyəsinə ciddi təsir göstərə bilər. İstehsalda istifadə olunan xammal və materialların qiymətlərinin dəyişməsi əmtəələrin maya dəyərinə təsir edirsə, digər bir tərəfdən istehsaldan sonrakı tədarük, qablaşdırma, sertifikatlaşdırma, anbar, nəqliyyat və s. xərclərlə müəyyən olunan topdansatış qiymətlərinin səviyyəsi

müəyyən edilir. Bu qiymətlərin dəyişməsi topdansatış və pərakəndə satış bazarlarında yaranan rəqabətlilik, daxili bazarın qorunması, müəyyən əmtəələrə subsidiya siyasətinin tətbiq olunması və s. təsirlərə məruz qalaraq, aralıq və son əmtəələrə süni qiymət dəyişməsi ilə əlaqədar olub infilyasiyanın sürətini artıra bilər.

İqtisadi islshatların aparıldığı dövrlərdən başlayaraq, qiymətləri qaldırmaq yolu ilə daha çox mənfəət əldə etmək uğrunda sahibkarların apardıqları mübarizə aqrar sahədə, hasilat və emal sənayesində azad rəqabəti məhdudlaşdırmış, habelə pul tədavülü və qiymətəmələgəlmə sistemində nisbi sabitliyi qismən də olsa təmin etmişdir.

Obyektiv səbəblərdən bazar iqtisadiyyatı qanunauyğunluqlarına birbaşa tabe olmayan aqrar sahədə, xammalları və yarımfabrikatları emal edən sənaye sahələrində mövsimi şəraitlərin təsiri ilə vaxtaşırı baş verən ifrat istehsal dövründə qiymətlərin artması müşahidə olunmasa da, ticarət infrastrukturuna aid olan saxlama anbarlarının mükəmməl səviyyədə olmaması və düzgün yönəldilməməsi nəticəsində, istehlak əmtəələrinin bazara daxil olmalarında zəruri prporsionallıqlar gözlənilməməsi nəticəsində qiymət artımlarının müşahidə olunması qaçılmazdır. İstehsalda baş verən dəyişikliklər birbaşa qiymətlərə, bu isə pul tədavülünə təsir göstərməklə pul emissiyasına səbəb ola bilər.

Əmtəə və xidmətlər bazarında tələbi stimullaşdırmadan, birtərəfli qaydada investisiyaların birbaşa təklifin stimullaşdırılmasına yönəldilməsi, qiymətlərin aşağı düşməsi ilə müşaiyyət olunaraq bazar subyektlərinin maliyyə öhdəliklərinin yerinə yetirilməsində problemlər yaratmaqla müşahidə oluna bilər.

Məcmu tələb sabit qalmaqla, məcmu təklif artdıqda qiymətlər azalmağa doğru dəyişir və bununla əlaqədar olaraq təklifin deflyasiyası baş verir ki, bu da geniş təkrar istehsalın həyata keçilməsində investisiyaların məhdudlaşmasına səbəb olacaqdır. Lakin məcmu tələblə məcmu buraxılışın həcmi, məşğulluq və qiymətlər arasındakı nisbətlərin öyrənilməsi ilk baxışda təsəvvür olunduğu kimi o qədər də sadə məsələ olmadığı kimi, aralıq istehlakla son istehlak arasında nisbi asılılıqlara da təsir göstərə bilər.

Nəticə

İstehsal təyinatlı məhsullara tətbiq olunan topdansatış qiymətləri və pərəkanda ticarət sektorunda tətbiq olunan pərəkanda satış qiymətləri arasında yaranmış fərqliliklər infilyasiya səviyyəsinə ciddi təsir göstərə bilər. İstehsalda istifadə olunan xammal və materialların qiymətlərinin dəyişməsi əmtəələrin maya dəyərinə təsir edirsə, digər bir tərəfdən istehsaldan sonrakı tədarük, qablaşdırma, sertifikatlaşdırma, anbar, nəqliyyat və s. xərclərlə müəyyən olunan topdansatış qiymətlərinin səviyyəsi müəyyən edilir. Bu qiymətlərin dəyişməsi topdansatış və pərakəndə satış bazarlarında yaranan rəqabətlilik, daxili bazarın qorunması, müəyyən əmtəələrə subsidiya siyasətinin tətbiq olunması və s. təsirlərə məruz qalaraq, aralıq və son əmtəələrə süni qiymət dəyişməsi ilə əlaqədar olub infilyasiyanın sürətini artıra bilər.

İqtisadiyyatın real və qeyri-real sektorları arasında gəlir və xərslərin qeyri-normal paylanması nəqliyyat sektorunda sərnişin və yükdaşımaların strukturunda tələb və təklif arasında tarazlığın pozulması, eyni zamanda tələb infilyasiyasının yaranması ilə müşaiyyət olunmaqdadır. İqtisadi rayonlar və inzibati ərazi vahidləri üzrə əhalinin gəlirlərinin qeyri-proporsional paylaşması, bütövlükdə əhalinin müxtəlif sosial qrupları üzrə həyat səviyyəsi indeksinin köməyilə aralıq və son istehlak əmtəələrinin daxil olduğu minimum istehlak səbəti qiymətlərinin dəyişməsinə, regional səviyyədə yoxsulluğun azaldılması və məşğulluğun artırılması ilə əlaqədar sosial siyasətin yürüdülməsinə, nisbi və real iqtisadi artıma şərait yaradacaqdır.

MACROECONOMIC INSTABILITY AND INFLATION REGULATION

Summary

The article describes the mechanisms of influence of internal and external factors that, as a result of the mutual influence of market activity, lead to the emergence of macroeconomic instability, and at the microeconomic level, changes in supply and demand directly affect prices and sales volumes in all markets. In order to eliminate macroeconomic instability, attention is paid to the formation of a stable, dynamic cost and income policy that provides for compliance with the conditions for sustainable development of large-scale reproduction in the short, medium and long term, the acquisition of necessary consumer products in the goods and services market, and the purposeful use of material, financial and human resources. The economic processes that have begun to attract foreign investments create a strong foundation for the sustainability and stability of national development, the opportunities for creating conditions for the development and profitability of local business entities by constantly increasing the market supply of goods and services, and the dependence of the expected inflation environment on the sectoral structure of expenses have been considered.

Keywords: instability, competition, economic regions

Conclusion

The differences between the wholesale prices applied to production-oriented products and the retail prices applied in the retail trade sector can have a serious impact on the level of inflation. While changes in the prices of raw materials and materials used in production affect the cost of goods, on the other hand, the level of wholesale prices determined by post-production procurement, packaging, certification, warehousing, transportation, etc. costs is determined. Changes in these prices are subject to the effects of competition in the wholesale and retail markets, protection of the domestic market, application of subsidy policies for certain goods, etc., and may increase the rate of inflation due to artificial price changes for intermediate and final goods.

The abnormal distribution of income and losses between the real and unreal sectors of the economy is accompanied by a disruption of the balance between supply and demand in the structure of passenger and freight transportation in the transport sector, as well as the emergence of demand-side inflation. The disproportionate distribution of income across economic regions and administrative territorial units will create conditions for changes in the prices of the minimum consumer basket, which includes intermediate and final consumer goods, through the standard of living index for various social groups of the population as a whole, the implementation of social policies related to poverty reduction and employment increase at the regional level, and relative and real economic growth.

UKRAYNANIN SUVERENLİK PROBLEMİ ABŞ-RUSİYA MÜNASİBƏTLƏRİNDƏ

Xülasə

Ukrayna münaqişəsi XXI əsrin beynəlxalq münasibətlər sistemində güc siyasətinin, suverenlik və beynəlxalq hüquq prinsiplərinin real dəyərini yenidən gündəmə gətirdi. ABŞ və Rusiya arasında bu münaqişə fonunda formalaşan qarşıdurma qlobal təhlükəsizlik arxitekturasının əsas dayaqlarını sarsıtdı və beynəlxalq təşkilatların effektivliyini ciddi şəkildə zəiflətdi. ABŞ-ın Ukraynaya hərbi, iqtisadi və siyasi dəstəyi, Rusiyanın isə öz geosiyasi maraqlarını müdafiə etmək cəhdləri, dünya düzənində yeni çoxqütblü reallığın formalaşmasına səbəb oldu. Münaqişənin nəticəsində suverenlik anlayışı sadəcə hüquqi deyil, həm də iqtisadi və strateji güc amili ilə ölçülməyə başladı. Bu proses Cənubi Qafqaz regionuna da birbaşa təsir göstərdi. Xüsusilə 2025-ci ildə ABŞ-ın vasitəçiliyi ilə Ermənistan və Azərbaycan arasında sülh müqaviləsinin paraflanması və TRIPP layihəsinin işə düşməsi regionda yeni iqtisadi və siyasi sabitlik müstəvisi yaratdı. TRIPP çərçivəsində Azərbaycan öz tranzit və enerji mərkəzi statusunu gücləndirərək suverenliyini daha dayanıqlı iqtisadi əsaslar üzərində möhkəmləndirdi. Beləliklə, Ukrayna böhranı qlobal güc balansının dəyişməsini və regional suverenlik modellərinin yenidən qurulmasını şərtləndirdi.

Açar sözlər: Ukrayna münaqişəsi, ABŞ-Rusiya münasibətləri, suverenlik, Cənubi Qafqaz, TRIPP layihəsi.

Giriş

Ukrayna münaqişəsi beynəlxalq münasibətlər sistemində güc balansının, beynəlxalq hüququn və suverenlik prinsipinin praktik tətbiqinin sınağa çəkildiyi ən mühüm hadisələrdən biridir. Bu münaqişə ABŞ və Rusiya arasında strateji rəqabətin yeni mərhələsini açaraq, qlobal təhlükəsizlik arxitekturasında dərin dəyişikliklərə səbəb olub. NATO-nun genişlənməsi, enerji təhlükəsizliyi, silahlanma yarışı və beynəlxalq təşkilatların təsir imkanlarının məhdudluğu kimi amillər yeni dünya düzəninin formalaşması prosesini daha da mürəkkəbləşdirib. Beləliklə, Ukrayna böhranı təkcə regional münaqişə deyil, həm də beynəlxalq münasibətlər nəzəriyyəsində güc siyasəti, normativ hüquq və kollektiv təhlükəsizlik anlayışlarının yenidən qiymətləndirilməsini tələb edən qlobal fenomenə çevrilib. Azərbaycan Respublikası üçün isə Ukrayna münaqişəsinin aktuallığı ilk növbədə suverenlik və ərazi bütövlüyü prinsiplərinin beynəlxalq səviyyədə necə müdafiə olunduğu ilə bağlıdır. Münaqişə göstərdi ki, beynəlxalq sistemdə güc amili hələ də siyasi qərarların əsas determinantıdır və beynəlxalq hüquq tez-tez selektiv şəkildə tətbiq olunur. Azərbaycanın öz ərazi bütövlüyünü bərpa etdiyi postmünaqişə dövründə bu təcrübə həm diplomatik manevr imkanlarının, həm də təhlükəsizlik siyasətinin formalaşmasında mühüm əhəmiyyət daşıyır. Ukrayna böhranı həmçinin Azərbaycanın balanslaşdırılmış xarici siyasətinin, yəni Qərb və Rusiya arasında praqmatik neytrallığın qorunmasının nə qədər vacib olduğunu bir daha göstərir.

Münaqişəyə qədər ABŞ-Rusiya münasibətlərinin strateji xarakteri

Avromaydan hadisələri və Krımın ilhaqından sonra, başqa sözlə 2014-2021-ci illər arasında ABŞ-Rusiya münasibətləri xüsusilə Ukrayna böhranının başlanması ilə kəskin şəkildə dəyişdi və qarşılıqlı etimadın minimuma endiyi, strateji rəqabətin isə açıq şəkildə artdığı bir dövrə çevrildi. 2014-cü ilin fevralında Ukraynada hakimiyyət dəyişikliyi və ardınca Krımın Rusiya tərəfindən ilhaqı ABŞ üçün postsovet məkanında təhlükəsizlik sisteminin sarsılması kimi qiymətləndirildi. Vaşinqton bu addımı beynəlxalq hüququn pozulması kimi dəyərləndirdi və Rusiyaya qarşı sanksiya siyasətinə başladı. Bu hadisə iki ölkə arasında artıq uzun müddətdir yığılıb qalan gərginliyin açıq formaya keçməsinə səbəb oldu. Krım böhranı həm NATO-nun Şərqə genişlənməsinin Rusiya üçün doğurduğu narahatlıqları aktuallaşdırdı, həm də ABŞ-ın postsovet məkanında təsir imkanlarını qorumaq istəyi ilə Moskvanın özünü regional güc kimi təsdiqləmək cəhdləri arasındakı ziddiyyətləri kəskinləşdirdi. Bu dövrdə münasibətlərin əsas xarakteri "qarşılıqlı strateji şübhə" ilə müəyyən olunurdu. Rusiya, ABŞ-ın "rəngli inqilablar" vasitəsilə postsovet ölkələrində təsirini genişləndirdiyini iddia edir, ABŞ isə Kremlin qonşu ölkələrin suverenliyini məhdudlaşdırmaq və öz təsir dairəsini bərpa etmək istədiyini düşünürdü. 2014-2016-cı illərdə ABŞ-ın tətbiq etdiyi sanksiyalar Rusiyanın enerji, maliyyə və müdafiə sektorlarına yönəldi və bu, Rusiya iqtisadiyyatında struktur dəyişikliklərinə səbəb oldu [5]. Rusiya, öz növbəsində, ABŞ mallarına qarşı əks tədbirlər gördü və "idxalı əvəzləmə" siyasətinə keçdi. Bu proseslər iki ölkə arasında strateji əlaqələrin hərbi və iqtisadi baxımdan tamamilə məhdudlaşdığını göstərirdi.

2016-cı ildə ABŞ prezident seçkilərinə Rusiya müdaxiləsi iddiaları münasibətləri daha da gərginləşdirdi. ABŞ kəşfiyyat orqanlarının hesabatına əsasən, Rusiya seçki kampaniyalarına kibertəsir və dezinformasiya vasitəsilə müdaxilə etmişdi. Bu iddialar ABŞ ictimaiyyətində Rusiyaya qarşı mənfi rəyin formalaşmasına, Konqresdə isə sanksiyaların sərtləşdirilməsinə gətirib çıxardı. 2017-ci ildə qəbul edilən "CAATSA" (Countering America's Adversaries Through Sanctions Act) qanunu Rusiyanı "ABŞ-ın əsas rəqiblərindən biri" kimi tanıdı [11]. Bu mərhələdə ABŞ-Rusiya münasibətləri faktiki olaraq diplomatik müstəvidə məhdudlaşdı və ikitərəfli əməkdaşlıq yalnız silahların nəzarəti və Suriya kimi konkret regional məsələlərlə məhdud qaldı.

Donald Tramp administrasiyasının ilk illərində münasibətlərin yumşalacağına dair gözləntilər yaransa da, bu reallaşmadı. Trampın Rusiya ilə fərdi səviyyədə dialoqa meyli olsa da, ABŞ Konqresi və təhlükəsizlik qurumları Rusiyaya qarşı sərt siyasəti davam etdirdi. NATO-nun Şərq Cinahında hərbi mövcudluğunun artırılması, Ukraynaya ölümcül silahların verilməsi və Baltik regionunda hərbi təlimlərin intensivləşməsi Moskva tərəfindən təxribat kimi qəbul edildi. Rusiya buna cavab olaraq öz hərbi strategiyasını yenilədi, Qərb sərhədlərində əlavə qoşun kontingentləri yerləşdirdi və nüvə caydırıcılığı siyasətini ön plana çıxardı. 2019-cu ildə ABŞ-ın INF (Orta Mənzilli Nüvə Qüvvələri) müqaviləsindən çıxması münasibətləri daha da zədələdi [8]. Vaşinqton Rusiyanı müqavilənin şərtlərini pozmaqda günahlandırırdı, Moskva isə ABŞ-ın raket sistemlərini Avropada yerləşdirməsini təhlükə kimi qiymətləndirirdi. Bu hadisə nüvə balansının qorunması mexanizmlərini zəiflətdi və qarşılıqlı etimadı azaldan mühüm amilə çevrildi. Strateji sabitlik müzakirələri də bu mərhələdə formal xarakter daşıyırdı və tərəflər bir-birini beynəlxalq təhlükəsizliyə təhdid kimi təqdim edirdilər. 2019-2020-ci illərdə iki ölkə arasında rəqabət artıq yalnız hərbi və siyasi deyil, həm də texnoloji və informasiya sahələrinə keçdi. ABŞ Rusiyanı "kibertəhlükə" kimi xarakterizə edərək, kiberhücumlara qarşı milli strategiyasını yenilədi. "SolarWinds" hadisəsi kimi kiberhücumlar ABŞ-Rusiya münasibətlərini daha da pisləşdirdi. Eyni zamanda, Arktika, energetika və kosmos sahələrində də rəqabət artdı. ABŞ Rusiya qazının Avropadakı payını azaltmaq üçün "Nord Stream 2" layihəsinə qarşı diplomatik və iqtisadi basqılar tətbiq etdi. Rusiya isə bunu ABŞ-ın enerji bazarlarında üstünlük əldə etmək cəhdi kimi dəyərləndirdi [2].

2021-ci ildə Co Bayden administrasiyası dövründə ABŞ-Rusiya münasibətləri yenidən "soyuq müharibə ritorikasına" qayıtdı. Bayden Rusiyanı "avtoritar rejim" kimi xarakterizə etdi və demokratiya ilə avtoritarizm arasında qlobal mübarizədə Rusiyanı əsas opponentlərdən biri kimi göstərdi [6]. Bu

mərhələdə ABŞ, NATO ilə koordinasiyalı şəkildə Ukraynaya hərbi və texniki dəstəyini artırdı, Rusiya isə bu yardımları öz milli təhlükəsizliyinə təhdid kimi qəbul etdi. Beləliklə, strateji qarşıdurma artıq açıq şəkildə sistemli xarakter aldı. ABŞ-Rusiya münasibətlərinin bu dövrdəki əsas xüsusiyyəti, diplomatiyanın "idarə olunan gərginlik" mexanizminə çevrilməsidir. Yəni tərəflər birbaşa müharibədən qaçmağa çalışsalar da, siyasi, iqtisadi və informasiya təzyiqlərini davam etdirirdilər. BMT, G20 və digər beynəlxalq platformalarda dialoq cəhdləri olsa da, tərəflər bir-birini beynəlxalq sabitliyi pozmaqda ittiham edirdi. Vaşinqton "demokratik dəyərləri qorumaq" adı altında geosiyasi rəqabəti gücləndirir, Moskva isə bunu Qərbin ideoloji ekspansiyası kimi qiymətləndirirdi.

Münaqişənin ikitərəfli münasibətlərə təsirləri və Ukraynanın suverenlik problemi

2022-ci ilin fevralında Rusiyanın Ukraynaya genişmiqyaslı hərbi müdaxiləsi ABŞ-Rusiya münasibətlərində yeni, kəskin qarşıdurma mərhələsini başladı. Vaşinqton bu hücumu beynəlxalq hüququn və dövlət suverenliyinin açıq şəkildə pozulması kimi qiymətləndirdi və dərhal Ukraynaya hərtərəfli siyasi, iqtisadi və hərbi dəstək göstərməyə başladı. Rusiya isə bu əməliyyatı "xüsusi hərbi əməliyyat" adlandıraraq NATO-nun Şərqə genişlənməsini və Ukraynanın Qərblə hərbi əməkdaşlığını milli təhlükəsizliyinə təhdid kimi əsaslandırdı. Qısa müddət ərzində ABŞ və onun müttəfiqləri Rusiyaya qarşı ən sərt iqtisadi sanksiyaları tətbiq etdilər, Rusiyanın maliyyə sistemi SWIFT-dən kənarlaşdırıldı, texnologiya ixracı məhdudlaşdırıldı və yüzlərlə şirkət bazarı tərk etdi. Beləliklə, münasibətlər artıq yalnız gərgin deyil, tammiqyaslı qarşıdurma vəziyyətinə keçdi. Hərbi müstəvidə ABŞ Ukraynaya "lend-liz" prinsipi əsasında milyardlarla dollarlıq silah yardımı ayırdı, o cümlədən HIMARS raket sistemləri, hava hücumundan müdafiə kompleksləri və kəşfiyyat dəstəyi təqdim etdi. Bu, faktiki olaraq Ukraynanı NATO standartlarına uyğun bir müttəfiq səviyyəsinə qaldırdı. Rusiya bu yardımları Qərbin dolayı şəkildə müharibəyə cəlb olunması kimi dəyərləndirdi və strateji silah proqramlarını gücləndirdi [7; 10]. 2022-ci ilin sonuna doğru ABŞ-Rusiya diplomatik münasibətləri minimum səviyyəyə endi, bir çox səfirlik əməkdaşları geri çağırıldı və qarşılıqlı etimad tamamilə itdi. Eyni zamanda, Rusiya ABŞ-ın rəhbərlik etdiyi sanksiya blokunu "iqtisadi müharibə" kimi təqdim etdi və Çin, İran, Hindistan kimi ölkələrlə strateji tərəfdaşlığı genişləndirməyə başladı.

2023-cü il ərzində ABŞ-Rusiya münasibətləri "soyuq müharibə 2.0" adlandırılan bir vəziyyətə daxil oldu [9]. ABŞ administrasiyası Rusiyanı qlobal təhlükəsizlik üçün birbaşa təhdid kimi xarakterizə etdi, NATO-nun müdafiə xərcləri isə rekord həddə çatdı. Finlandiya və İsveçin NATO-ya üzv qəbul edilməsi Rusiyanın strateji təcridini daha da dərinləşdirdi. Eyni zamanda, ABŞ Avropa İttifaqı ilə birgə enerji asılılığını azaltmaq üçün likvid qaz ixracını artırdı, bu isə enerji sahəsində Rusiya ilə rəqabəti daha sərtləşdirdi. Moskva isə Avropa ilə əlaqələrini minimuma endirərək Avrasiya İqtisadi İttifaqı, BRICS və Şanxay Əməkdaşlıq Təşkilatı kimi strukturlar üzərindən yeni iqtisadi və siyasi istiqamətlərə yönəldi. 2024-cü ilə gəldikdə ABŞ-Rusiya münasibətləri artıq təkcə ikitərəfli ziddiyyətlərdən ibarət olmayıb, həm də qlobal siyasi sistemin qütbləşməsini əks etdirirdi. Vaşinqton liberal-demokratik modelin müdafiəsini öz beynəlxalq missiyası kimi təqdim edir, Moskva isə "Qərb hegemoniyasına qarşı mübarizə" ritorikasını ideoloji əsas kimi istifadə edirdi. Diplomatik kanalların məhdudluğu, strateji sabitlik üzrə danışıqların dayanması və nüvə ritorikasının artması dünya miqyasında yeni təhlükələr doğururdu. Ukrayna müharibəsi iki dövlətin uzunmüddətli rəqabətində artıq simvolik bir arenaya çevrilmişdi: ABŞ üçün bu, beynəlxalq qayda sisteminin qorunması, Rusiya üçün isə öz geosiyasi müstəqilliyinin təminatı məsələsi idi.

2025-ci ilin yanvarında Donald Trampın ikinci dəfə ABŞ prezidenti seçilməsi münasibətlərin dinamikasına yeni, lakin ziddiyyətli ton gətirdi. Trampın xarici siyasət yanaşması əvvəlki kimi daha realist və transaksion xarakter daşıyırdı; o, Avropaya olan təhlükəsizlik xərclərini azaltmaq və NATO üzvü ölkələrin daha çox məsuliyyət götürməsini tələb etməyə başladı. Rusiya bu dəyişiklikləri müsbət siqnal kimi qəbul etsə də, Ukrayna məsələsində ABŞ-ın dəstəyinin azalması Qərb blokunda gərginlik yaratdı. Tramp administrasiyası müharibənin "dondurulmuş münaqişə" formatında saxlanmasını

məqsədəuyğun hesab edirdi, bu isə Avropada ABŞ-ın liderlik roluna dair suallar doğurdu [4]. Bu günə qədərki dövrdə Trampın rəhbərliyi altında iqtisadi sahədə məhdud dialoqun bərpası ehtimalı artsa da, siyasi etimad bərpa olunmadı. ABŞ şirkətləri Rusiyada fəaliyyətini genişləndirməsə də, enerji bazarlarında dolayı əlaqələr canlandı. Bununla yanaşı, ABŞ Konqresi Trampın Rusiya ilə "yumşaq siyasət"ini tənqid edərək yeni nəzarət mexanizmləri qəbul etdi. Bu, daxildə siyasi qütbləşməni artırdı və ABŞ-ın xarici siyasətində qeyri-müəyyənlik yaratdı. Rusiya isə bu qeyri-müəyyənlikdən istifadə edərək postsovet məkanında təsirini gücləndirməyə, Qafqaz və Orta Asiyada yeni diplomatik təşəbbüslər irəli sürməyə başladı. Cari dövrdə isə ABŞ-Rusiya münasibətləri həm qarşılıqlı şübhə, həm də məhdud praqmatizm üzərində qurulub. Tramp administrasiyası bir tərəfdən Ukrayna müharibəsinin uzanmasının iqtisadi yükünü azaltmaq istəyir, digər tərəfdən Çinin yüksəlişini əsas təhlükə kimi prioritetləşdirir. Bu səbəbdən Moskva ilə münasibətlər "idarə olunan balans" çərçivəsində saxlanılır. Rusiya isə bu fürsətdən istifadə edərək Vaşinqtonla birbaşa qarşıdurmadan qaçır, lakin NATO-nun Şərq cinahında hərbi fəallığını diqqətlə izləyir.

Son hadisələr fonunda Ukraynanın suverenliyi məsələsi beynəlxalq gündəmdə əsas problem olaraq qalır. Müharibə nəticəsində Ukraynanın ərazi bütövlüyü ciddi şəkildə pozulmuş, Donetsk, Luqansk, Zaporojye və Xerson vilayətlərinin statusu faktiki olaraq Rusiya nəzarətinə keçmişdir. ABŞ və Qərb dövlətləri Ukraynanın suverenliyini tam bərpa etməyin yeganə yolunun Rusiya qüvvələrinin geri çəkilməsi olduğunu bildirir, lakin Moskva bu tələbi qəbul etmir və yeni sərhədləri "tarixi reallıq" kimi tanıtmağa çalışır. Bu, beynəlxalq hüququn effektivliyinə və BMT sisteminin nüfuzuna ciddi zərbə vurmuşdur. Ukraynanın suverenliyi problemi təkcə hərbi deyil, həm də siyasi və iqtisadi ölçülərə malikdir. Müharibə Ukraynanın dövlət institutlarını zəiflədib, iqtisadiyyatını xarici yardımdan asılı vəziyyətə salıb. ABŞ və Avropa İttifaqı tərəfindən təmin edilən milyardlarla dollarlıq dəstək Ukraynanı ayaqda saxlayır, lakin bu, onun suveren qərarvermə imkanlarını məhdudlaşdırır. Ümumiləşdirsək, Ukrayna müasir beynəlxalq sistemdə "de-fakto müstəqil, lakin de-yure asılı" dövlətə çevrilmişdir.

Cənubi Qafqaz üçün imkanlar və çağırışlar: suverenlik müstəvisində

2025-ci ilin avqustunda Cənubi Qafqazda uzun illər davam edən gərginliklər yeni bir mərhələyə qədəm qoydu. Ermənistan və Azərbaycan arasında 2020-ci il müharibəsindən sonra davam edən postkonflikt prosesləri müxtəlif vasitəçilik təşəbbüslərinə baxmayaraq, uzun müddət nəticəsiz qalmışdı. Rusiya bu müddətdə özünü əsas vasitəçi kimi təqdim etsə də, həm Ukrayna müharibəsindəki resurs itkisi, həm də beynəlxalq təcrid şəraiti onun vasitəçilik rolunu zəiflətdi. Nəticədə Moskvanın "sülhməramlı" missiyası real təsir gücünü itirdi və regionda etimad itkilərinə səbəb oldu. Məhz bu zəiflik fonunda ABŞ diplomatiyası Cənubi Qafqazda fəallaşdı. 2025-ci ilin avqustunda Donald Trampın vasitəçiliyi və şahidliyi ilə Ermənistan və Azərbaycan arasında sülh müqaviləsinin paraflanması bu tarixi prosesin dönüş nöqtəsi oldu. Bu hadisə illərdir təxirə salınan sülhün reallığa çevrilməsi baxımından, regionun siyasi arxitekturasını əsaslı şəkildə dəyişdirdi. Müqavilənin paraflanması yalnız iki dövlət arasında müharibənin bitməsi deyil, həm də regional münasibətlərin yeni fazaya keçidi anlamına gəlirdi. ABŞ-ın vasitəçiliyi Moskvanın uğursuzluğunu qabarıq şəkildə nümayiş etdirdi və Cənubi Qafqazda təsir balansının dəyişməsinə səbəb oldu. Tramp administrasiyası üçün bu diplomatik qələbə həm geosiyasi, həm də simvolik əhəmiyyət daşıyırdı: ABŞ özünü yenidən "qlobal sülhün memarı" kimi təqdim etdi [1; 3]. Vaşinqtonun bu prosesdə əsas məqsədi regionda Rusiya və İran təsirini məhdudlaşdırmaq, enerji və nəqliyyat dəhlizlərini Qərb bazarları ilə əlaqələndirmək idi. Ermənistan isə uzun illər Rusiya orbitində qaldıqdan sonra ilk dəfə Qərblə balanslı siyasətə yönəldi. Azərbaycan üçün isə sülh müqaviləsi müharibədən sonra əldə edilən strateji üstünlüyün siyasi baxımdan möhkəmləndirilməsi, legitimləşdirilməsi və regionda öz suverenliyinin tam təmin edilməsi demək idi.

Sülh prosesi ilə paralel olaraq ABŞ tərəfindən təşviq olunan "Trans-Regional Infrastructure and Prosperity Partnership" (TRIPP) layihəsi regionun iqtisadi gələcəyi üçün yeni perspektivlər açdı. Bu layihə Zəngəzur dəhlizini və Orta Dəhlizi birləşdirərək, Cənubi Qafqazı Qara dəniz və Aralıq dənizi

vasitəsilə Avropa bazarlarına bağlamağı hədəfləyir. TRIPP çərçivəsində Türkiyə, Azərbaycan, Ermənistan və Gürcüstanın iştirakı ilə nəqliyyat-logistika infrastrukturu modernləşdiriləcək, ABŞ və Avropa maliyyə institutlarının sərmayələri cəlb ediləcək. Bu, regionun təkcə iqtisadi deyil, həm də siyasi müstəqilliyini gücləndirəcək. Rusiyanın təsir dairəsinin daraldığı, İranın isə regional nəqliyyat zəncirindən kənarda qaldığı bu yeni geoiqtisadi düzən, Cənubi Qafqaz dövlətləri üçün real suverenlik imkanlarını genişləndirir. Bununla belə, sülh və inkişaf perspektivləri ilə yanaşı, Cənubi Qafqaz üçün yeni çağırışlar da meydana çıxır. ABŞ-ın fəallaşması və Qərb kapitalının artan təsiri regionda geosiyasi rəqabətin yeni formasını yaradır. Moskva və Tehran bu prosesi öz milli maraqlarına təhdid kimi qiymətləndirir və TRIPP layihəsinə qarşı dezinformasiya kampaniyaları aparır. Eyni zamanda, Ermənistan daxilində ruspərəst və revanşist siyasi elitalar arasında Qərbə yönəlmiş yeni kursa qarşı müqavimət var. Azərbaycanda isə sülhdən sonra regionda liderlik mövqeyinin saxlanması, iqtisadi üstünlüyün davamlı inkişafla möhkəmləndirilməsi və təhlükəsizlik balansının qorunması dövlət siyasətinin prioritetlərinə çevrilib.

Bu baxımdan, suverenlik məsələsi hələ də Cənubi Qafqaz üçün həm ən böyük imkan, həm də ən ciddi sınaq olaraq qalır. Ermənistan üçün bu, Moskvanın siyasi himayəsindən çıxmaq və Qərblə real tərəfdaşlıq qurmaq anlamına gəlir. Azərbaycan üçün isə regional layihələrdə əsas tranzit və enerji mərkəzi statusunun qorunması ilə bərabər, müstəqil qərarvermə imkanlarını gücləndirmək deməkdir. Cənubi Qafqaz dövlətləri ilk dəfədir ki, böyük güclərin təsiri altında deyil, qarşılıqlı maraqlara əsaslanan yeni regional əməkdaşlıq sisteminin formalaşmasına real töhfə verir. Əgər bu sistem sabitləşərsə, 2025-ci ilin avqustunda atılan addım yalnız bir sülh sənədinin deyil, bütöv bir regionun siyasi və iqtisadi azadlığının başlanğıcı kimi tarixə düşəcək.

Nəticə

Ukrayna münaqişəsi beynəlxalq münasibətlər sistemində güc siyasətinin hələ də dominant prinsip olaraq qalmasını bir daha sübut etdi. ABŞ və Rusiya arasında gedən rəqabət yalnız hərbi və iqtisadi sahələrdə deyil, həm də ideoloji və normativ səviyyədə qlobal sistemin gələcəyini müəyyənləşdirən əsas faktora çevrildi. Münaqişə göstərdi ki, beynəlxalq hüququn prinsipləri, xüsusilə də suverenlik və ərazi bütövlüyü məsələləri, böyük güclərin maraqları toqquşduqda selektiv şəkildə tətbiq olunur. ABŞ liberal-demokratik dəyərləri müdafiə adı altında öz təsir dairəsini genişləndirməyə, Rusiya isə bu prosesi Qərbin hegemonluğuna qarşı müqavimət kimi təqdim etməyə başladı. Bu, beynəlxalq münasibətlərdə sabitlikdən çox qeyri-müəyyənliyi artırdı və qlobal təhlükəsizlik sisteminin çoxqütblü, lakin qeyri-sabit xarakter aldığını göstərdi. Ukrayna böhranı həm də beynəlxalq təşkilatların effektivliyinin azaldığını, diplomatik mexanizmlərin hərbi güc qarşısında zəif qaldığını nümayiş etdirdi.

Cənubi Qafqaz kontekstində isə davam etməkdə olan Ukrayna münaqişəsi yeni reallıqlar doğurdu. Region ölkələri, xüsusilə Azərbaycan və Ermənistan artıq suverenlik və təhlükəsizlik məsələlərinə yalnız geosiyasi deyil, həm də strateji iqtisadi baxımdan yanaşmağa başladılar. ABŞ-ın vasitəçiliyi ilə əldə edilən Ermənistan-Azərbaycan sülh razılaşmasının paraflanması mərasimi regionda uzunmüddətli sabitlik üçün imkanlar açsa da, bu, eyni zamanda Rusiya və İran kimi güclərin təsir dairəsinin daralması ilə yeni balans mübarizəsinə səbəb oldu. TRIPP layihəsi və Qərb kapitalının regiona daxil olması Cənubi Qafqazı daha inteqrativ və müstəqil inkişaf yoluna yönəldə bilər, lakin bu prosesin uğuru dövlətlərin öz suveren qərarvermə qabiliyyətini qorumaq və daxili siyasi sabitliyi təmin etmək bacarığından asılı olacaq. Nəticə etibarilə, Ukrayna münaqişəsi yalnız Avroatlantik məkanın deyil, həm də Cənubi Qafqazın geosiyasi gələcəyini müəyyən edən əsas qlobal sınaqlardan birinə çevrilmişdir. TRIPP layihəsi Azərbaycanın suverenliyini iqtisadi və siyasi baxımdan daha da möhkəmləndirərək onu regionun əsas tranzit və enerji mərkəzinə çevirir. Bu layihə vasitəsilə Azərbaycan həm regional nəqliyyat şəbəkələrində qərarverici mövqeyini gücləndirir, həm də xarici təsirlərdən asılılığı minimuma endirərək strateji müstəqilliyini qoruyur.

Резюме

ПРОБЛЕМА СУВЕРЕНИТЕТА УКРАИНЫ В ОТНОШЕНИЯХ США И РОССИИ

Украинский конфликт вновь вывел на первый план значение политики силы, суверенитета и принципов международного права в системе международных отношений XXI века. Противостояние между США и Россией на фоне этой войны подорвало основы глобальной архитектуры безопасности и значительно ослабило эффективность международных организаций. Поддержка США Украины в военной, экономической и политической сферах, а также стремление России отстаивать собственные геополитические интересы привели к формированию новой многополярной реальности. В результате конфликт показал, что понятие суверенитета теперь определяется не только юридическими, но и экономическими и стратегическими факторами. Эти процессы оказали прямое влияние на регион Южного Кавказа. В частности, парафирование мирного договора между Арменией и Азербайджаном в августе 2025 года при посредничестве США и запуск проекта TRIPP открыли новую страницу экономической и политической стабильности региона. В рамках TRIPP Азербайджан укрепил свой статус основного транзитного и энергетического центра, тем самым усилив свою суверенность на основе устойчивых экономических механизмов. Таким образом, украинский кризис стал фактором трансформации глобального баланса сил и пересмотра региональных моделей суверенитета.

Ключевые слова: украинский конфликт, отношения США и России, суверенитет, Южный Кавказ, проект TRIPP.

Summary

The Problem of Ukraine's Soverentity U.S.-Russia relations

The Ukraine conflict has once again highlighted the relevance of power politics, sovereignty, and the principles of international law in the 21st-century international relations system. The confrontation between the United States and Russia amid this war has undermined the foundations of global security architecture and significantly weakened the effectiveness of international organizations. The U.S. support for Ukraine in military, economic, and political spheres, combined with Russia's efforts to

defend its own geopolitical interests, has led to the emergence of a new multipolar reality. As a result, the concept of sovereignty has evolved beyond its purely legal meaning to encompass economic and strategic dimensions. These developments have had a direct impact on the South Caucasus region. Notably, the peace agreement between Armenia and Azerbaijan, paraphed in August 2025 under U.S. mediation, along with the launch of the TRIPP project, opened a new stage of regional economic and political stability. Through TRIPP, Azerbaijan has strengthened its position as a key transit and energy hub, thereby consolidating its sovereignty on a more sustainable economic basis. Thus, the Ukraine crisis has become a catalyst for reshaping the global balance of power and redefining regional models of sovereignty.

Abstract

This article explores the role and functions of civil society institutions in achieving the Sustainable Development Goals (SDGs) within the framework of the 2030 Agenda for Sustainable Development. Drawing on United Nations reports, international policy documents, and national experiences, the study examines how civil society contributes to promoting social, economic, and environmental sustainability. The paper highlights civil society's participation as a key partner in policy implementation, advocacy, monitoring, and awareness-raising efforts. It also emphasizes the significance of cross-sectoral partnerships between the state, private sector, and non-governmental organizations in fostering inclusive and sustainable development. Particular attention is given to Azerbaijan's experience, where the cooperation between government institutions and civil society organizations demonstrates a successful model of shared responsibility and collective progress toward national priorities aligned with the SDGs. The findings suggest that strengthening civic participation and institutional collaboration is essential for achieving long-term sustainability and social cohesion.

Keywords: Sustainable Development Goals, civil society, Azerbaijan, United Nations, social development, public policy.

INTRODUCTION

The Sustainable Development Goals cover key areas of public and social activity – social, economic, and environmental. The seventeen Sustainable Development Goals adopted by the United Nations for 2030 reflect the main global challenges of our time and propose comprehensive solutions.

The purpose of this article is to analyse the role and functions of civil society institutions in achieving the Sustainable Development Goals, as well as to identify areas for their further participation in the implementation of the 2030 Agenda for Sustainable Development. The study is based on an analysis of international documents of the United Nations, reports on the implementation of the Sustainable Development Goals, and reviews of the practical activities of civil society at both the global and national levels.

Issues related to achieving the Sustainable Development Goals, as well as the search for effective tools and mechanisms for their implementation, are becoming the subject of active discussions among politicians, experts, scientists, and representatives of civil society at both the national and international levels.

Implementing the Sustainable Development Goals requires concerted efforts and investments from the state, the private sector, and civil society institutions, as their interaction ensures sustainable and balanced social development.

Civil society has played a significant role in the development of the Sustainable Development Goals from the very beginning. The formulation and subsequent adoption of the Sustainable Development

Goals were the result of a long and comprehensive consultative dialogue between the United Nations, states, and representatives of global civil society. Today, civil society is considered one of the state's key partners in achieving the Sustainable Development Goals.

It is recognized, both theoretically and practically, that the state and civil society represent interconnected elements of a single system. Social stability, progressive transformation, and sustainable development depend on the nature of their interactions, the degree of cooperation, and the ability to exercise mutual control.

Civil society is particularly important in the implementation of the social Sustainable Development Goals, as the so-called "third sector" is based primarily on civic initiatives from local communities aimed at developing education, science, healthcare, the environment, and social protection—areas directly linked to ensuring the social sustainability of society.

THE IDEA OF SUSTAINABLE DEVELOPMENT

Sustainable development of a country, region, or the entire world is development that meets the needs of the present generation without posing a threat to future generations. The idea of sustainable development seeks to find a balance between economic growth that can guarantee a high standard of living for both current and future generations and the need to protect and improve the environment. Sustainable development is a process of change in which the use of natural resources, investment, the advancement of science and technology, and the development of individuals occur in harmony and interconnectedness.

Sustainable development issues have become some of the most discussed globally in recent decades. This problem encompasses such important areas as ensuring gender equality and equity, eradicating poverty and hunger, ensuring sustainable economic growth, preserving the environment, developing quality education, and improving living standards. All of these aspects are universal in nature and affect all countries, and their successful resolution is possible only through global partnership and the joint development of strategies to achieve the Sustainable Development Goals. (Popolzina, P) (Popolzina, 2019).

The concept of "sustainable development" has been around for some time, but it was at the United Nations Conference on the Human Environment, held in Stockholm in 1972, that the global community first came together to discuss global challenges in environmental protection and development. As a result, fundamental principles for preserving and improving the natural environment were formulated, and the need to support people as the central participant in this process was emphasized (United Nations, 2021).

In 1992, at the United Nations Conference on Environment and Development, 178 heads of state adopted three key documents: the comprehensive action plan "Agenda 21," the Rio Declaration on Environment and Development, and the Statement of Principles for Sustainable Forest Management. These documents and principles were reaffirmed in 2002 at the World Summit on Sustainable Development in Johannesburg, which brought together tens of thousands of participants to attract the attention of the international community and take practical measures to improve the quality of life and conserve natural resources. The media were also recognized as important partners in education for sustainable development.

Participating states were encouraged to reconsider existing production and consumption patterns, commit to ensuring environmentally sound economic growth, and intensify joint efforts to develop transboundary cooperation and exchange expertise, technologies, and resources.

Three years later, the United Nations declared the Decade of Education for Sustainable Development (2005–2014). Its goal was to integrate the principles, values, and practical experience of sustainable

development into all levels of education and learning, so that everyone understands the essence of sustainable development and participates in its implementation at all levels of society (Institut du développement durable et des relations internationales [IDDRI], 2016).

The core idea of the concept of sustainable development is the need for harmonious interaction between nature, society, and the economy. The key strategic areas of sustainable development include:

For Society

- Human rights;
- Peace and security;
- Gender equality;
- Cultural diversity and intercultural understanding;
- Health;
- The fight against HIV and AIDS;
- Effective governance.

For the Environment:

- The rational use of natural resources (water, energy, agriculture, biodiversity);
- The fight against climate change;
- Rural development;
- Sustainable urban development;
- The prevention and mitigation of natural disasters;

For the Economy

- Poverty reduction;
- Strengthening responsibility and accountability;
- The development of a market economy.

The concept of sustainable development is based on five key principles:

- Humanity is capable of making development sustainable and long-term;
- Limits in the use of natural resources are relative;
- The basic needs of all people must be met and they must be able to strive for a more prosperous life;
- The lifestyle of people with greater material resources must be consistent with the planet's ecological capabilities, particularly in terms of energy consumption;
- The size and rate of population growth must be consistent with the productive potential of the Earth's global ecosystem.

Thus, sustainable development aims to meet the needs and aspirations of humanity. A sustainable development model based on the rational use of resources and environmental protection should serve not only today's society but also future generations.

THE NEED TO ENGAGE CIVIL SOCIETY IN ACHIEVING THE SUSTAINABLE DEVELOPMENT GOALS

The importance of civil society in addressing global challenges is demonstrated by the extensive work being carried out at the United Nations level. The UN's work in supporting civic space is based on three key principles: (United Nations Human Rights Council, 2016).

Participation: ensuring inclusive, diverse, safe, independent, and meaningful participation of civil society in decision-making processes in line with the 2030 Agenda for Sustainable Development, as well as facilitating inclusive, safe, and meaningful civil society participation in United Nations intergovernmental processes.

Protection: promoting the protection of civil society representatives at risk, including in cases of intimidation or harassment for collaborating with the United Nations.

Promotion: actively developing and strengthening open civic space, including creating legal and policy conditions that facilitate free public debate online and offline, and that provide civil society with the opportunity to freely associate and express their views.

The need for active civil society participation in achieving the Sustainable Development Goals is driven by the fact that "effective civic engagement fosters social cohesion and empowers people, including minorities and vulnerable groups, to be heard and participate in public processes."

It should be emphasized that the non-profit sector ranks seventh among the world's largest economies, just behind the United Kingdom and France, and ahead of countries such as Italy, Brazil, Russia, Spain, and Canada. It is a major employer and an effective mechanism for mobilizing public resources. Thus, the non-profit sector contributes not only to meeting the needs of the population but also to the creation of a favourable business climate, strengthening the stability of economic development, and fostering a political system based on the principles of democracy, transparency, and accountability, which, in turn, is essential for achieving the Sustainable Development Goals. embodies the ideals of responsibility, unity, and creativity, and its contribution to achieving the Sustainable Development Goals serves as proof that Azerbaijan is confidently moving forward, combining national interests with global challenges, while remaining true to its spiritual roots, values, and independent path of development (Lee & Moon, 2018).

THE ROLE AND FUNCTIONS OF CIVIL SOCIETY IN THE IMPLEMENTATION OF THE SUSTAINABLE DEVELOPMENT GOALS

Civil society plays a vital role in the implementation of the Sustainable Development Goals. As is well known, the most effective partnerships are those focused on specific objectives, in which each participant performs clearly defined functions. Therefore, defining the functions of civil society in achieving the Sustainable Development Goals is of particular importance.

First and foremost, civil society should support government agencies in implementing the Sustainable Development Goals at the national level by proposing and promoting initiatives. Civil society institutions are capable and called upon to initiate significant social change.

Civil society institutions can act as a bridge between the government and the public, communicating information about society's needs and demands to government agencies and transforming public feedback into socially significant initiatives. Thus, civil society can act as an advisor to government in achieving the Sustainable Development Goals. In countries with transition economies, it is often necessary to rely on the expertise and services of civil society institutions. Conducting both formal and informal consultations between government agencies and civil society representatives fosters mutual understanding, increases trust, and enhances the potential for further cooperation.

Civil society institutions also contribute to the achievement of the Sustainable Development Goals through the implementation of various socially oriented projects (Global Public Policy Institute [GPPi] & Konrad Adenauer Stiftung [KAS], 2016).

Civil society institutions help raise public awareness of the Sustainable Development Goals. However, some studies show that public awareness of these goals remains low. Today, not only the general public but also many government officials have a rather unclear understanding of the essence of sustainable development and the reasons why its achievement is a global priority. According to surveys, only 54% of respondents in Europe are aware of the Sustainable Development Goals and national plans for achieving them, while in African countries this figure is only 29%. Therefore, it is important for civil

society to take on the task of educating local authorities, donors, businesses, and colleagues about the 2030 Agenda and the Sustainable Development Goals.

Civil society plays a key role in monitoring and ensuring accountability for both government and the private sector. States are currently introducing voluntary national reports on the implementation of the Sustainable Development Goals. Civil society, in turn, prepares alternative reports that provide a more comprehensive understanding of existing challenges and achievements in SDG implementation.

One of the goals, SDG 17, calls for the development of global partnerships. Civil society institutions are an important tool for strengthening this cooperation. Currently, civil society coalitions exist that make a significant contribution to the promotion and implementation of the principles of the Sustainable Development Goals.

Thus, civil society institutions can act as initiators of social change, advisors, communicators, monitors, and instruments for strengthening partnerships at the national and global levels in achieving the Sustainable Development Goals.

In today's world, civil society institutions play a key role in achieving the Sustainable Development Goals, ensuring a balance between the interests of the state, the private sector, and the population. Their participation contributes to the effective implementation of the 2030 Agenda, strengthening social cohesion, transparency, and accountability of public institutions.

Civil society not only acts as an intermediary between the state and society but also serves as a source of initiatives, knowledge, and innovative approaches to addressing social and environmental challenges. Expanding the participation of civil society institutions in the implementation of the Sustainable Development Goals is a prerequisite for sustainable and inclusive development based on the principles of partnership, democracy, and justice (European Environmental Bureau [EEB], 2022).

THE ROLE OF CIVIL SOCIETY IN ACHIEVING THE SUSTAINABLE DEVELOPMENT GOALS IN AZERBAIJAN

In Azerbaijan, civil society is considered a critical factor in sustainable development, reflecting the people's active position and their desire for creativity, social justice, and progress. In the context of implementing the Sustainable Development Goals, the participation of civil society institutions has become an integral part of the national strategy aimed at strengthening social well-being, protecting the environment, and building a modern, inclusive, and prosperous state.

Over the years of independence, Azerbaijan has developed a unique model of interaction between the state and civil society, based on the principles of partnership, mutual trust, and shared responsibility for the country's future. The state places particular importance on the active involvement of non-governmental organizations, public associations, and initiative groups in processes aimed at implementing the 2030 Agenda for Sustainable Development. The establishment and development of the Agency for State Support to Non-Governmental Organizations is clear evidence of the state's systematic and consistent approach to cooperation with the civil society sector. Thanks to the activities of this agency, hundreds of projects aimed at addressing social, environmental, and educational issues have received support and been successfully implemented. Azerbaijan's civil society is actively involved in achieving national priorities that are fully aligned with the Sustainable Development Goals. Non-governmental organizations implement numerous initiatives in areas such as poverty eradication, gender equality, human rights protection, education, healthcare, and environmental protection. Particular attention is paid to the social integration of vulnerable groups and support for families and individuals with special needs. All of this demonstrates the civil society sector's high social responsibility and its commitment to the ideals of justice, humanism, and social progress (Trend News Agency, 2024) (Azerbaijan State Statistical Committee, n.d.).

Azerbaijani civil society also plays a key role in raising public awareness of the Sustainable Development Goals and their practical implementation. Thanks to the efforts of public organizations, the media, and volunteer movements, sustainable development ideas have become part of public discourse. Improving environmental awareness, promoting a healthy lifestyle, fostering a responsible attitude toward natural resources, and promoting social justice are all the result of the consistent work of civil society institutions inspired by the spirit of patriotism and national unity (United Nations in Azerbaijan, n.d.).

Civil society's participation in the restoration and development of Azerbaijan's liberated territories is particularly important. Following the Great Victory in the Patriotic War of 2020, NGOs, volunteers, youth, and environmental organizations actively engaged in Karabakh revival projects. Their activities are aimed at restoring social infrastructure and environmental rehabilitation.

Abstract

This article addresses the issue of inclusive tourism, focusing on the availability of tourism infrastructure and services for people with disabilities. The relevance of this topic is driven by the need for sustainable development in the tourism industry, which advocates for creating and providing equal opportunities for all categories of tourists and the principles of social equality. The aim of the study is to identify barriers and opportunities for improving accessibility in the tourism sector and to determine the role of digital technologies and public policy in promoting the principles of 'Tourism for All'. The research employs an analysis of scientific publications from 2010 to 2025, statistical data from the World Tourism Organisation (UNWTO), and a comparative review of the best international practices.

Keywords: Inclusive tourism, accessibility, people with disabilities, digital technologies, sustainable development, tourism for all.

INTRODUCTION

A rising area of study and application, inclusive tourism reflects the global push for sustainability, equality, and universal accessibility. The World Health Organisation estimates that 16% of the world's population, which is around 1.3 billion people, lives with a handicap. However, there are very few accessible tourist destinations for individuals with disabilities. For instance, according to the VisitBritain report on 'Accessible and Inclusive Tourism', roughly 30% of rooms (hotels, etc.) in the UK have some form of accessibility (e.g., step-less entry, and at least one room for the disabled). This difference demonstrates the pressing need for a structural development in the way the travel and tourism sector plans and provides its services.

The concept of '*Tourism for All*', promoted by the World Tourism Organisation (UNWTO), emphasises that travel is a human right and that accessible tourism benefits not only people with disabilities but also elderly travellers, families with young children, and individuals with temporary mobility restrictions. Accessibility is also a key element of *Sustainable Development Goals of the UN 2030 Agenda* – Goal 10 (Reduced Inequalities) and Goal 11 (Sustainable Cities and Communities). Here, inclusive tourism can be considered as a crucial component of sustainable development, boosting destination competitiveness, social equity, and economic diversification, not only a social concern. Also, it should be mentioned that a few destinations and facilities are equipped to serve tourists with disabilities, notwithstanding global attempts to create standards and guidelines aimed at enhancing accessibility in the tourism industry.

The primary barriers are insufficient social and policy support, a lack of specialised services, low awareness among tourism staff, and a lack of physical and informational accessibility. These elements severely limit this group's travel options and prevent them from being socially included.

It is well known that in recent decades tourism has emerged as one of the most profitable economic sectors. In 2024, 10.9 trillion US dollars, or 10% of the world economy, was generated by travel tourism, according to the World Organisation's EIR's most current data (ODO, 2024). The value to the local

economy could be added by travellers with disabilities, who frequently travel with family members or friends, in addition to the fact that they used to spend more money and stay longer than other tourists. However, permanent obstacles, which include a lack of infrastructure, inadequate staff training, poor, trustworthy information on accessible destinations, and restricted digital inclusion, prevent this potential from being fully realised.

The main goal of this study is to identify the major barriers and possibilities for the growth of inclusive tourism and the function of institutional mechanisms and digital technologies in enhancing accessibility within the tourism industry.

The following research goals are established in order to accomplish this goal:

i. To examine regional and worldwide patterns in the growth of inclusive travel.

ii. To determine the informational, attitudinal, and infrastructure obstacles to accessibility.

iii. To analyse how digital change may support inclusive travel.

iv. To create proposals for incorporating accessibility concepts into sustainable travel plans.

The study keeps its main focus on the elaboration of inclusive tourism in the context of sustainable development and global digitisation. It also examines how social, economic, and technological factors impact the accessibility of tourism services for people with disabilities.

MATERIALS AND METHODS

This study explores the main challenges, opportunities, and drivers of inclusive tourism elaboration within the context of sustainable development and digital transformation. The research employs a qualitative and analytical approach, comparing government practices and analysing secondary data from reports and statistics provided by leading international organisations.

The report, which spans the years 2010 to 2025, examines the impact that accessibility guidelines, legislative frameworks, and technological advancements have on the tourism industry. The exploratory research aims to provide a comprehension of inclusive tourism by integrating information from academic and institutional sources.

When discussing the information sources used for the article's statistics, both domestic and foreign sources were consulted:

i. World Tourism Organisation (UNWTO, 2023, 2025);

ii. World Health Organisation (WHO, 2023);

iii. World Travel and Tourism Council (WTTC, 2024).

Academic literature was collected from various databases, such as Cyberleninka, Google Scholar, and Scopus, using search terms like ‘*inclusive tourism*’, ‘*sustainable tourism*’, and ‘*Tourism for All*’.

Each document and dataset was evaluated based on its credibility, publication date, and relevance. The primary focus was on official papers and well-known global organisations’ research. Because of the fact that this study is more conceptual and exploratory, quantitative data were compiled descriptively and highlighted key trends instead of running statistical tests. Hence, all materials used in the study were freely available. There was no private or confidential information used or examined. The study complies with academic integrity standards, guaranteeing openness, accurate citation, and intellectual property recognition. Thus, the analytical approach used provides evidence-based understanding of the term *'inclusive tourism*' and its significance for both sustainable and digital transformation in the tourism industry.

FINDINGS

In today's travel, making trips comfortable and accessible for all is a tremendous economic opportunity and a social requirement. The study mentioned several times that about 1.3 billion individuals worldwide who live with disabilities (WHO, 2023) constitute a sizable yet underdeveloped portion of the travel industry. Although accessibility still varies significantly from region to region, there have been clear improvements, especially in developed countries.

In the study of one of the factors of sustainable development, it is impossible not to mention the UN Agenda for Sustainable Development 2030, where Goals 10 (Reduced Inequalities) and 11 (Sustainable Cities and Communities) most accurately convey the significance of inclusive tourism. Achieving these goals is facilitated by involving more people in both cultural and economic life, bringing people together, and promoting equal development around the world. Frequently, improvements in one aspect of life contribute to the development of others. For example, inclusive tourism initiatives will support large-scale changes and infrastructure improvements that will be used not only to attract more visitors, but also by local families and seniors. Therefore, a concept which is becoming increasingly popular in modern tourism management research is created by such kind of investments in availability across the world.

As stated by HTF Market Intelligence, the accessible tourism industry is expected to double its value by 2032 (HTF, 2025). However, it is not possible to realise the economic potential of inclusive tourism if there is no government policy support. For example, countries like Japan, Australia, and Spain used to have more competitive destinations and higher satisfaction rates because of their comprehensive legal frameworks. Based on the examples above, it is proposed that a policy be agreed upon and implemented, which is a vital element of market growth.

There are three different approaches worldwide for the development of inclusive tourism:

i. ***Regulatory Model:*** This approach uses laws and enforcement, seen in the EU and Japan;

ii. ***Market-Driven Model:*** Here, innovations will be given priority if there is a demand and a benefit - North America;

iii. ***Emerging Hybrid Model:*** This approach is a mix of the previous two, meaning that when laws do not exist, innovations take over, and vice versa.

Best success requires a combination where we can observe both technology, social awareness, and policy; however, these three methods taught a couple of valuable lessons.

In general, we should observe inclusive tourism as a pivotal part of sustainable economic growth rather than just a charitable effort. Creativity, uniqueness, and adaptability are opened up by the weave of accessibility, technology, and policy in the global tourism industry.

DISCUSSION AND CONCLUSION

At present, when the whole world is focused on sustainable development, the prospect of equalising the rights of each individual in all areas of life, including tourism, seems the most important. Accessibility is a fundamental human right, not simply one of the elements of economic competitiveness, highlighted in the report. About 1.3 billion people with disabilities worldwide struggle with travel opportunities, which are complicated by issues related to infrastructure, awareness, and attitudes, according to findings. From an economic perspective, inclusive tourism is a fast-growing sector. Frequently, customers with special needs are ready to pay for their comfort and quality of service due to their disposable income. Thus, this sector, which aims to make travel cosy, should be considered the most beneficial investment in the future.

Currently, a vital factor in every field of life, including the tourism industry, is digital transformation. Independent travel and expanded participation options for tourists are promoted by innovative tools: artificial intelligence, AR, smartphone applications, and accessible booking platforms. Nevertheless, one of the challenges in developing countries is digital inequality, which remains even nowadays. If we want to liquidate this gap and maintain sustainable development in the foreseeable future, governments, independent businesses, and international organisations must work together. Innovative tools (artificial intelligence, AR, smartphone applications, and accessible booking platforms) encourage independent travel as well as increase the options for participation of tourists. These technologies not only contribute to the increased convenience but also lead to the sustainability and responsible tourism practices by enhancing visitor experiences and making them more accessible (Nawaz & Iqbal, 2025).

In summary, the transition to inclusive tourism should be viewed not only as a moral obligation but also as a strategic necessity for sustainable development worldwide. Also, destinations that focus on accessibility will be in a favourable position from a socio-economic perspective, offering a comfortable visit both for local residents and visitors, and boost their global reputation.

Recommendations

i. Monitoring systems need to be established by governments, so that they would be able to follow the UN Tourism's recommendations for inclusive tourism and make accessibility a key part of their national tourism goals.

ii. To make their services more convenient and accessible, tourism businesses ought to invest in employee training and digital tools.

iii. Educational institutions should include inclusive tourism management in their programs to build professional skills.

iv. The main focus of technology developers should be on creating open and compatible accessibility standards.

ACKNOWLEDGMENT

The authors acknowledge that this work was made possible thanks to the data on the Fragile States Index provided by the Fund for Peace. This study did not receive financial support from any sources. The authors are grateful for the helpful comments from their colleagues at Baku State University and the University of Public Policy.

CYCLICAL NATURE OF ECONOMIC DEVELOPMENT: FROM CLASSICAL CONCEPTS TO MODERN MODELS

Abstract

The cyclical nature of economic development remains one of the most fundamental subjects in macroeconomics, reflecting the periodic fluctuations of economic activity around a long-term growth trend. This paper aims to trace the evolution of theories of business cycles — from classical and Keynesian interpretations to modern real business cycle (RBC) and dynamic stochastic general equilibrium (DSGE) models — and to assess their analytical and practical relevance. The study relies on a comprehensive literature review, theoretical synthesis, and comparative analysis of endogenous and exogenous approaches to economic fluctuations. The findings highlight how modern macroeconomic modeling integrates microfoundations, expectations, and financial frictions while retaining the cyclical essence first observed in early classical thought. The paper concludes by emphasizing the importance of integrating financial, institutional, and behavioral aspects into future macroeconomic modeling frameworks.

Key words: economic cycles, business cycle theory, RBC, DSGE, Kondratiev waves, macroeconomic fluctuations, endogenous growth.

Introduction

Economic cycles — systematic expansions and contractions in aggregate economic activity — are a defining feature of capitalist economies. Since the late eighteenth century, economists have debated whether such cycles arise from intrinsic structural mechanisms or external shocks. Classical economists such as Adam Smith and David Ricardo viewed economic growth as a predominantly linear process driven by capital accumulation, productivity, and specialization, where deviations were largely accidental. It was only in the nineteenth and early twentieth centuries that cyclical dynamics began to receive formal theoretical treatment, notably in the works of Marx, Juglar, and Kondratiev. The evolution of business cycle theory mirrors the development of macroeconomics itself. From the descriptive “long waves” of Kondratiev (1925) and the investment–employment dynamics of Keynes (1936), the field has progressed toward microfounded equilibrium frameworks such as RBC and DSGE models. This transition reflects the growing sophistication of macroeconomic thought and the increasing reliance on quantitative modeling for policy design. Yet, despite theoretical advances, the essence of cyclical behavior — recurrent, nonlinear, and often unpredictable — remains a core empirical challenge.

The purpose of this paper is threefold: (1) to review key theoretical approaches to business cycles; (2) to systematize models according to historical and methodological principles; and (3) to assess their relevance in explaining contemporary macroeconomic fluctuations.

Materials and Methods

The study is based on a qualitative and conceptual methodology. A comprehensive literature review was conducted across historical, neoclassical, and modern schools of economic thought. The analytical framework classifies models by:

(1) their historical phase — from classical to Keynesian to modern RBC/DSGE;

(2) their methodological orientation — exogenous versus endogenous sources of cycles; and

(3) their explanatory mechanisms — technological shocks, demand variations, and financial dynamics.

Comparative analysis was used to synthesize key characteristics: cycle phases, causes, and modeling techniques. The paper deliberately focuses on theoretical integration rather than econometric estimation, as the goal is to trace intellectual evolution rather than to test a specific model empirically. Data sources include peer-reviewed journal articles, institutional working papers (NBER, IMF, World Bank), and canonical economic literature. The limitations of this method include the absence of direct statistical validation and potential generalization across heterogeneous macroeconomic systems.

Findings

Classical foundations and long-wave theories

Classical economists such as Smith, Ricardo, and Mill described economic growth as a function of capital accumulation, labor division, and technological progress. Cyclicality, when recognized, was viewed as exogenous — the result of wars, harvest failures, or financial crises. The systematic study of long-term cyclical movements was introduced by Nikolai Kondratiev (1925), who proposed the existence of 40–60-year "long waves" driven by technological revolutions and major structural shifts. Later theorists, including Joseph Schumpeter, emphasized the role of innovation clusters in generating these waves. Richard Goodwin (1967) extended this approach with a nonlinear macro-dynamic model linking income distribution and employment, capable of producing endogenous oscillations without exogenous shocks — an early precursor of modern cyclical endogeneity.

Transition to Keynesian and neoclassical schools

The Keynesian revolution (Keynes, 1936) reframed economic cycles as outcomes of aggregate demand fluctuations and investment expectations. Keynesian models inspired the development of multiplier–accelerator frameworks (Samuelson, 1939) and emphasized fiscal and monetary stabilization policies. By contrast, the "new classical" school, led by Lucas (1977) and Sargent (1978), argued that cycles result from rational responses to information and policy shocks. The emergence of the **Real Business Cycle (RBC)** paradigm (Kydland & Prescott, 1982) marked a turning point: it explained fluctuations as optimal intertemporal responses to real (mainly technological) shocks, assuming fully rational agents and frictionless markets.

Modern DSGE and hybrid approaches

In the late 1990s and 2000s, the **Dynamic Stochastic General Equilibrium (DSGE)** framework emerged as the synthesis of microfoundations, rational expectations, and stochastic disturbances. DSGE models incorporate multiple types of shocks — technology, preferences, fiscal, financial — and allow for nominal rigidities and frictions. These models replicate "stylized facts" of cycles, such as comovements of output, consumption, and investment, and have become standard in central banks (Smets & Wouters, 2007; Christiano et al., 2005).

Recent developments extend the paradigm to include financial cycles (Gertler & Kiyotaki, 2010), behavioral expectations (De Grauwe, 2012), and bounded rationality. The global financial crisis of 2008 revealed the limitations of purely equilibrium-based models, leading to hybrid frameworks integrating macro-financial linkages, debt accumulation, and expectations dynamics (Minsky, 1986; Borio, 2012).

A summarized typology of business cycle models:

Approach	Core Idea	Typical Causes	Representative Models
Classical / Long Waves	Technological or industrial shifts	Technological revolutions, sectoral change	Kondratiev, Schumpeter
Keynesian / Neoclassical	Demand fluctuations, expectations	Investment, consumption, fiscal shocks	Keynes, Samuelson
New Classical / RBC	Rational reactions to real shocks	Technology, labor productivity	Kydland & Prescott
Modern DSGE	Stochastic shocks, microfoundations	Supply, demand, financial, expectations	Smets & Wouters, Christiano et al.
Post-Keynesian / Financial	Endogenous credit and leverage cycles	Debt, expectations, financial markets	Minsky, Borio

Discussion and Conclusion

The evolution of business cycle theory reflects the broader trajectory of macroeconomic thought — from descriptive empiricism to mathematical formalism and, more recently, to structural realism. Classical insights into long waves emphasized the technological and institutional nature of cyclical processes. Neoclassical and Keynesian theories formalized the short- and medium-term dynamics, leading to policy-relevant macro-models. Modern RBC and DSGE frameworks integrate stochastic shocks and microfoundations, allowing quantitative policy simulation but often criticized for excessive abstraction.

Contemporary macroeconomics increasingly recognizes the need to reintroduce financial, institutional, and behavioral components into cycle theory. The integration of financial accelerator mechanisms (Bernanke, Gertler & Gilchrist, 1999), credit constraints, and heterogeneous agents provides a richer understanding of real-world dynamics. Furthermore, the incorporation of bounded rationality and adaptive expectations may bridge the gap between theoretical precision and empirical realism. From a policy perspective, understanding cyclical phases is vital for designing countercyclical fiscal and monetary instruments. Technological shocks call for innovation policy; financial shocks — for prudent regulation; and demand shocks — for timely stabilization. The cyclical perspective remains essential for anticipating turning points and mitigating macroeconomic volatility.

In conclusion, the cyclical nature of economic development represents both a theoretical and practical challenge. Its explanation evolved from exogenous waves to endogenous dynamics embedded in complex macroeconomic systems. Future research should focus on integrated models combining real, financial, and behavioral dimensions, thereby enhancing the explanatory and predictive power of modern macroeconomics.

Abstract

The paper examines international models of legal regulation of the digital economy. It provides a comparative analysis of institutional and legal mechanisms, regulatory frameworks, and public policies adopted by various countries during the transition to a digital economy. Particular attention is paid to the experiences of the European Union, the United States, and Asian countries, where issues of market transparency, e-commerce, data protection, taxation, and digital entrepreneurship are explored. The results show that for Azerbaijan, an adaptive mixed model is the most promising, combining the EU's legal transparency, the US's innovation-oriented flexibility, and the strategic management practices of East Asia.

Keywords: digital economy, legal regulation, international experience, e-commerce, data protection.

INTRODUCTION

The digital economy has formed a new global model of economic relations. The spread of information technologies, e-commerce, cryptocurrencies, digital financial services, and artificial intelligence has profoundly changed how economies are governed. These processes demand renewed legal frameworks and the creation of specific mechanisms for regulating digital economic relations. International practice shows that legal approaches to the digital economy vary across countries depending on their economic and political systems. The digital economy is now a key driver of global transformation, encompassing not only the use of digital technologies in production and services but also a new logic of interaction among markets, governments, and citizens (Schwab, 2022).

The rise of digital platforms, artificial intelligence, blockchain, and fintech services has created an urgent need to modernize legal regulation. Governments face challenges ranging from personal data protection and cybersecurity to the taxation of cross-border digital transactions. As noted by the OECD (2020), the regulation of the digital economy is not merely a legal category but a strategic tool of economic policy. The relevance of this study lies in the fact that, amid digital transformation, the regulatory framework defines the boundaries of innovation, competitiveness, and user trust.

MATERIALS AND METHODS

The empirical basis includes:

- EU legal acts (GDPR, DMA, DSA);
- U.S. legislation and Federal Trade Commission (FTC) reports;
- Chinese regulations on digital economy promotion;
- Singapore's Personal Data Protection Act (PDPA);
- Analytical reports from OECD, UNCTAD, and the World Bank.

Methodologically, the study employs interdisciplinary, comparative, and adaptive approaches:

- Interdisciplinarity combines economic, legal, and institutional dimensions.
- Comparability involves analyzing common criteria such as state intervention, data protection, market freedom, and innovation support.
- Adaptivity focuses on identifying models applicable to transition economies like Azerbaijan.

The comparison was carried out across four key dimensions:

- Regulatory philosophy (the role of the state and degree of self-regulation);
- Institutional structure (regulatory bodies and mechanisms),
- Regulatory framework (laws and acts), and
- Economic outcomes (impact of regulation on digital growth).

FINDINGS

European Union: Centralized Regulatory Model

The EU model is based on the rule of law and the protection of citizens' rights. The General Data Protection Regulation (GDPR, 2018) has become the global benchmark for data protection. The Digital Markets Act (DMA) and Digital Services Act (DSA), both effective since 2022, restrict the market power of digital giants and promote transparency in online services. The EU model features a clear institutional structure (European Commission, European Data Protection Board), strict sanctions, and a strong focus on user rights. This has increased consumer trust and limited corporate abuse, though excessive regulation may slow innovation.

United States: Liberal Regulatory Model

The American model emphasizes minimal government intervention and relies heavily on market mechanisms. Regulation is mainly implemented through antitrust and consumer protection laws. The Federal Trade Commission (FTC) monitors competition and addresses abuses but does not interfere in digital entrepreneurship itself. This system fosters innovation and startup growth, making the U.S. a global digital leader (Google, Amazon, Meta, Tesla). However, it also generates issues of monopolization and unequal access to digital services.

China and East Asia: Mixed Model

In China, the state acts both as regulator and strategic investor. The 2021 "Regulations on the Promotion of the Digital Economy" govern e-commerce, fintech, and data processing. Authorities such as the MIIT and the Cyberspace Administration oversee platforms and prevent abuse. China's model is characterized by state support for major tech firms (Alibaba, Huawei, Tencent), strong cybersecurity strategies, and data sovereignty principles. Singapore demonstrates a more balanced approach, creating a transparent and innovation-friendly legal environment through the PDPA, which protects personal data while enabling business flexibility.

DISCUSSION AND CONCLUSION

Comparative analysis reveals several patterns.

First, the level of state intervention correlates with policy priorities: the EU focuses on fairness and security, the U.S. on innovation and market freedom, and China on strategic governance. Second, regulatory efficiency depends not only on laws but also on public trust. The EU model fosters trust via transparency, while the U.S. relies on entrepreneurial initiative. Third, the digital economy requires hybrid regulation that guides rather than restricts innovation. Hence, many countries, including South Korea, the UAE, and Singapore, implement mixed frameworks.

For Azerbaijan, adopting an adaptive hybrid model would be optimal. This should ensure:

- data protection and digital sovereignty;

- support for private investment and startups;
- legal recognition of digital contracts, e-documents, and fintech tools;
- harmonization with EU and OECD standards.

Such adaptation would integrate Azerbaijan's digital economy into global ecosystems while maintaining domestic legal stability. Ultimately, the synthesis of international practices—EU transparency, U.S. innovation, and Asian strategic coordination—can provide Azerbaijan with a sustainable, competitive, and secure digital future.

ACKNOWLEDGMENT

The preferred spelling of the word "acknowledgment" in America is without an "e" after the "g". Avoid the stilted expression "one of us (R. B. G.) thanks ...". Instead, try "R. B. G. thanks...". Put sponsor acknowledgments in the unnumbered footnote on the first page.

Abstract

Recent changes in society have made the urban-rural divide more obvious and important to study. This significant social call is marked by deep polarization in values and unequal opportunities. While cities usually lean more liberal, promoting diversity and progressive attitudes, rural areas tend to be conservative, upholding traditional values. This paper explores this divide through a sociological lens, focusing on how polarization affects social cohesion and access to resources. In addition, the paper also examines the role of inequality in education, economy, and politics, showing that this division is evident not just in social values, but in economic growth, educational access, and stability. This paper investigates how the separation has grown and why it persists and suggests a need for policy attention to promote equality and integration.

Keywords: Urban-rural divide, social polarization, political polarization, liberalism, conservatism, inequality, opportunity gap, social cohesion.

INTRODUCTION

The growing divide between urban and rural areas is a major challenge globally. It's not just about geography, but also about culture and social identity. Urban areas, often multicultural and progressive, contrast with rural regions, which are more traditional and conservative (Johnston, 2021). Cities attract migrants seeking jobs and education, which means a higher concentration of youth and innovation, while rural regions often experience aging populations and loss of skilled, physically strong labor. This split leads to different values, lifestyles, and unequal opportunities in education, employment, and public services (Zahl-Thanem, 2024). Such differences create social and political tension that impacts national cohesion. Understanding these divides sociologically helps explain the effects on democracy and social stability. This paper explores the causes and consequences of urban-rural polarization and opportunity inequality.

SOCIAL POLARIZATION AND VALUES

Urban populations tend to hold liberal values such as support for gender equality, immigration, and minority rights (Kaufman, 2021). Moreover, multiculturalism and diversity are celebrated, which encourages openness to new ideas and lifestyles. For instance, Social movements often begin in cities, spreading liberal opinions on social justice, LGBTQ+ rights, and environmental protection. They also generally have higher education levels and diverse cultural experiences (Pew Research Center, 2018). In contrast, rural communities often emphasize traditional family roles, national identity, and conservative politics (Wilkinson, 2018). This polarization influences voting behaviors and contributes to political fragmentation which is visible in many democracies, reflecting deeper social cleavages (Agnew & Shin, 2020).

INEQUALITY OF OPPORTUNITIES

Economic and educational inequalities widen the divide. Urban areas typically provide better access to higher education and job markets dominated by knowledge and technology sectors (NOU, 2020). Rural regions face limited educational facilities, fewer high-skilled jobs, and lower incomes, reinforcing social stratification (Newbold & Brown, 2015). This limits career choices and contributes to migration toward cities as youth students from rural areas move to cities for education but do not return, weakening rural communities over time (McCan, 2019). Such disparities make equal opportunity across regions difficult to achieve.

Economic inequality is also shaped by industry and job availability. Cities usually have more dynamic economies, allowing for startups, tech companies, and service industries to grow. The concentration of jobs and resources attracts further talent and investment, creating a cycle that rural areas struggle to compete with. In addition, healthcare access in rural areas often lags behind, resulting in differences in life expectancy and overall well-being (NOU, 2020).

The divide influences social mobility, meaning the chance to change one's economic situation is not equal for all (Newbold & Brown, 2015). Youth who leave rural areas rarely return, leaving behind aging populations and shrinking community resources (McCan, 2019). Women in rural areas may face extra barriers to education and employment, deepening the gap with urban counterparts. This loss causes social fragmentation and undermines rural resilience (Newbold & Brown, 2015).

POLITICAL AND SOCIAL IMPLICATIONS

This polarization also affects trust in political institutions. Rural residents may feel neglected by policymakers focusing on urban priorities, leading to political disenchantment and populist movements (Jennings & Stoker, 2016). Urban residents, in contrast, may support policies on social justice and climate change that rural communities view as threats to their way of life (Guilluy, 2016). The differing economic interests and social values create persistent tensions challenging social integration.

Urban-rural divisions also affect international relations, as migration and development patterns set standards for other nations (Pew Research Center, 2018). Rural regions may resist globalization, protecting traditional identities and local markets (Wilkinson, 2018). Cultural organizations, schools, and civil groups can help bridge gaps, but success requires coordinated effort from national and local leadership (McCan, 2019).

CONCLUSION

The urban-rural divide is a multifaceted problem driven by polarization in values and unequal access to opportunities. It has significant political and social consequences, threatening democratic cohesion. Policies addressing disparities in education, infrastructure, and economic development are essential to bridge the gap. Policymakers must consider the unique needs of rural regions, learning from local voices and adapting development plans. Encouraging dialogue between urban and rural populations can reduce misunderstandings and promote national unity. Future research should continue exploring solutions for sustainable social integration. These research highlights not only the problems but also the potential for solutions through trust, empathy, and effective public policy.

Abstract

At the end of the 20th and the beginning of the 21st century, Azerbaijan faced intense migration flows at a time when its economic base was in a state of crisis. This situation required new approaches to migration policy.

The article analyzes the characteristics of migration processes in Azerbaijan, the most important directions of migration management, the main tools of its legal regulation, as well as the statuses of refugees, internally displaced persons, and labor migrants.

The main directions of the state migration policy of the Republic of Azerbaijan are examined. This was a result of the adoption of the State Migration Policy Concept, the State Migration Program, and the establishment of the State Migration Service.

Keywords: migration processes, migration policy, migration management, legal regulation, law, categories of migration.

INTRODUCTION

Migration processes have accompanied the entire history of humanity, evolving over time. Today, migration is a phenomenon influenced by various factors and has a significant impact on individual countries and regions. In the modern world, migration plays an important role in the socio-economic development of states, labor market organization, and international cooperation. The acceleration of globalization, the growing demand for labor, and expanding educational opportunities make migration processes increasingly complex and multifaceted. Azerbaijan is also part of these global trends, and migration regulation in the country is carried out both through national legislation and international legal instruments.

The legal and regulatory framework for migration in the country is aimed at protecting the rights of migrants, ensuring lawful and orderly management of migration processes, and implementing them in accordance with international standards. Migration includes both the internal movement of citizens and the entry and stay of foreigners in the country. In this context, the legal framework defines the rights and responsibilities of migrants and creates the conditions for the effective implementation of the state's socio-economic and administrative policies.

The regulatory framework is shaped by the interaction between national legislation and international legal instruments. As a result, migration regulation in Azerbaijan contributes to the protection of migrants' rights, the lawful and effective management of migration processes, and the maintenance of the country’s socio-economic stability.

MATERIALS AND METHODS

This article uses official government documents, relevant legal and regulatory acts, and migration statistics. Scientific articles, analytical materials, and online resources were also utilized.

Data collection was carried out through document analysis, and the methodological basis of the study was grounded in institutional and policy analysis approaches. The focus was on examining the structure of regulatory institutions, their powers, and the effectiveness of the implemented migration policy.

LEGAL REGULATION OF MIGRATION

The modern era, beginning from the last quarter of the 20th century, is often referred to as the "age of migration," emphasizing the particularly important role that migration processes play in regional and global development. Azerbaijan is also experiencing migration-related challenges.

The issues caused by internal migration in our republic are mainly linked to the outflow of the population from rural areas to cities. The primary reason for this was the relatively weak development of the regions in the country prior to 2008. Because of the adoption and implementation of three state programs related to the socio-economic development of the regions, significant progress has been achieved: regional socio-economic infrastructure has improved considerably, many new jobs have been created, and the level of employment has increased.

In Azerbaijan, the legal regulation of migration is carried out not only on the basis of national legislation but also in accordance with international legal instruments. The legal foundations of migration regulation are reflected in the Constitution and the following laws of the Republic of Azerbaijan:

- "On Arrival, Departure and Passports," dated 14.06.1994;
- "On the Legal Status of Foreign Citizens and Stateless Persons," dated 13.03.1996;
- "On Registration at the Place of Residence and Stay," dated 04.04.1996;
- "On the Approval of the Regulation on Identity Documents of Stateless Persons Permanently Residing in the Republic of Azerbaijan and Foreign Citizens Residing in the Territory of the Republic of Azerbaijan for More Than 30 Days," dated 30.12.1997;
- "On Citizenship of the Republic of Azerbaijan," dated 30.09.1998;
- "On Immigration," dated 22.12.1998;
- "On the Status of Refugees and Internally Displaced Persons," dated 21.05.1999;
- "On Labor Migration," dated 28.10.1999;
- "On the Approval of the Migration Code," dated 02.07.2013, and others.

Within the framework of national legislation, the main documents regulating migration define the rights and obligations of migrants, their legal status, as well as the rules governing both internal and international migration. The legal regulation of migration in the country is aimed at protecting the rights of migrants, ensuring lawful and orderly management of migration processes, and implementing them in accordance with international standards. Migration encompasses both the internal movement of citizens and the entry and stay of foreign nationals in the country. In this context, the legal framework establishes the rights and responsibilities of migrants and creates the necessary conditions for the effective implementation of the state's socio-economic and administrative policies.

The main legal framework is the Constitution of the Republic of Azerbaijan (1995), which recognizes the right of every person to freedom of movement and guarantees the right to enter and leave the country. For example, citizens may leave the country at any time; however, certain restrictions may be applied within the law, such as travel bans imposed by a court decision. The Constitution also outlines principles for the protection of the rights of foreigners [3].

The Law "On the Legal Status of Foreign Citizens and Stateless Persons" (1998) regulates in detail the rights of foreigners to stay, work, and reside in the country. According to this law, a foreign citizen must obtain the appropriate work permit and register in the country before beginning any employment.

According to the Law "On Labor Migration," any legal or natural person in the country has the right to employ a foreign national based on a special permit issued by the Ministry of Labor and Social Protection of the Population of the Republic.

Azerbaijan has acceded to the UN International Convention on the Protection of the Rights of All Migrant Workers and Members of Their Families, the European Social Charter, and has ratified a few International Labour Organization (ILO) instruments. All new developments related to labor migrants

are implemented in accordance with Azerbaijan's international obligations under the conventions and agreements it has signed.

The Law "On Migration," adopted in 2013, provides a systematic framework for the regulation of migration processes. This law defines the duration of legal stay for migrants in the country, procedures for registration, work permits, and social rights.

CATEGORIES OF MIGRATION

In Azerbaijan, migration is mainly divided into four primary categories:

Internal migration involves the permanent or temporary movement of citizens within the country, from one region to another. This process is primarily driven by socio-economic factors such as job opportunities, regional development, and access to education and healthcare services. From a legal standpoint, internal migration does not require special permission. However, when relocating to a new place of residence, citizens must register in the relevant system, which allows government agencies to track population movements and plan regional social services accordingly.

International migration refers to the arrival of foreign nationals in Azerbaijan, their residence, employment, and study in the country. This type of migration can be either permanent or temporary and is regulated through various types of visas and permits. Foreigners enter the country for tourism, education, or employment purposes and are issued appropriate visas. From January to June 2025, the Ministry of Internal Affairs and the State Migration Service registered 1,709 individuals who arrived in Azerbaijan for permanent residence and 1,092 individuals who left the country [5].

Internally Displaced Persons and Refugees have rights defined by law, including access to asylum, social assistance, education, and healthcare services. The state provides them with temporary or permanent housing. Between 1988 and 1994, Armenia carried out ethnic cleansing of Azerbaijanis from Armenia and occupied Azerbaijani territories. As a result, Azerbaijan became home to over one million refugees and internally displaced persons [6].

Labor migration is particularly associated with attracting a foreign workforce from neighboring countries to Azerbaijan and makes a significant contribution to the country's economic development, meeting labor market demands, and ensuring the effective operation of the labor market. From a legal standpoint, labor migration is regulated by law, and a foreign national can only work after obtaining the appropriate work permit. The employer is required to sign an employment contract and fulfill obligations related to wages, taxes, and social insurance.

Labor migration, migration management, and the legal framework are closely interconnected and play a key role in protecting migrants' rights, maintaining the socio-economic stability of the state, and ensuring effective implementation of legislation.

MAIN DIRECTIONS OF MIGRATION POLICY

The most important directions in managing migration processes are as follows:

1. Development of migration management. This helps to effectively utilize the potential of migration development in the interests of the state, society, and individual citizens.

2. Support for migration. This ensures minimal time loss during the free movement of people across territories and safe and convenient travel in accordance with the relevant permits.

3. Migration regulation. It enables the state and society to monitor who enters and leaves the country and helps prevent unlawful activities.

4. Management of forced migration. It assists people in escaping life-threatening and emergency situations and subsequently returning to their places of residence [2, p.109].

The main directions of the state migration policy of Azerbaijan are: ensuring control over migration processes within Azerbaijan and preventing illegal migration; encouraging Azerbaijani compatriots living abroad to resettle in Azerbaijan and assisting the return of emigrants; promoting the immigration of qualified specialists and other foreign workers needed in the Azerbaijani labor market; and simplifying entry and residence procedures for foreign citizens conducting business in Azerbaijan [5].

CONCLUSION

The main cause of migration in Azerbaijan is related to political reasons: the deportation of Azerbaijanis from Armenia in 1918-1920, 1947–1953, and 1987-1991; the occupation of 20% of Azerbaijan's territory by Armenians, which resulted in about 1 million people becoming refugees; and the collapse of the USSR, all of which led to large migration flows from Azerbaijan and significant demographic changes in the country. Overall, during these years, about 850,000 people left Azerbaijan, while up to 500,000 immigrated [2, p.89]. This, in turn, created an unstable economic situation in the country characterized by inflation, economic crisis, declining living standards, and mass unemployment, which became the cause of labor and international migration.

In 2006, by order of the President of the country, the State Migration Program was approved, and in 2007, the State Migration Service of the Republic of Azerbaijan was established. One of the key tasks of the Migration Service became the creation of a unified database and a modern automated control system in the field of migration. The Unified Migration Information System (UMIS) contains data on categories of migrants and migration-related events. These include the registration of procedures for granting permanent or temporary residence status, citizenship issues, preventive work to combat illegal migration, and more.

At the current stage, the legal regulation of migration in Azerbaijan is carried out based on national legislation and international legal norms. Migration management, the rights and obligations of migrants, and the protection of refugees and internally displaced persons are systematically regulated. Nevertheless, further work is needed to simplify legislation, digitize procedures, and strengthen social integration. This is important both for ensuring national security and for protecting the rights of migrants.

Abstract

Institutional quality remains a cornerstone of economic progress, shaping the business climate, governance efficiency, and long-term fiscal stability of nations. In the digital era, strong institutions are more crucial than ever for achieving sustainable development, a fact underscored by recent global recognition, including the 2024 Nobel Prize in Economics. Effective institutions play a vital role in addressing fiscal imbalances and promoting steady economic growth, especially in developing countries grappling with high debt burdens. This study empirically examines the influence of institutional quality on public debt dynamics using panel data from 116 countries over the period 2000–2022. An Institutional Quality Index is constructed through Principal Component Analysis (PCA) to capture the multidimensional nature of governance. After conducting necessary pre-estimation diagnostics to ensure data validity, the analysis applies the two-step System GMM estimation technique to manage endogeneity and dynamic persistence. The findings reveal that stronger institutional quality significantly contributes to lower public debt levels. Moreover, debt persistence indicates that current debt levels are strongly shaped by past fiscal conditions. The results also show that higher tax revenues are associated with reduced debt, while rising unemployment, inflation, and government expenditure tend to aggravate debt pressures. These insights underscore the importance of institutional reforms and prudent fiscal management in achieving long-term debt sustainability worldwide.

Keywords: Public debt, Institutional quality, System GMM

JEL Codes: H63, O43, C33

1. Introduction

According to the International Monetary Fund (IMF) 2024 report, global public debt is expected to exceed $100 trillion in 2024 and continue to increase, nearing 100 percent of GDP by 2030. Several countries, including Sri Lanka, Zambia, and Ghana, have defaulted on sovereign debt and are undergoing restructuring efforts (Jones, 2022). While nations like Kenya, Pakistan, the Maldives, and Argentina remain at risk due to high borrowing costs (Jones, 2022). Emerging market defaults are

expected to rise over the next decade, driven by heavy debt burdens and high borrowing costs. Innovative governance-linked bonds are emerging as tools to manage defaults sustainably. Both developing and developed economies face significant debt challenges. Elevated debt levels can expose an economy to macroeconomic shocks and volatility and raise the likelihood of default. It also constrains private sector growth, discourages capital investment, weakens economic performance, diminishes tax revenues, and contributes to inflation. (Burriel et al., 2020; Dimakou, 2015; Woo & Kumar, 2015; Sargent & Wallace, 1981). Addressing debt sustainability is vital, particularly for developing nations facing severe debt burdens, as it is crucial to restoring fiscal stability and ensuring long-term economic growth. These developments raise a key question: *what drives public debt ratios?* While various factors contribute to a nation's debt burden, achieving fiscal discipline is impossible without robust institutions to support it.

Research indicates that robust institutions, including government effectiveness, regulatory quality, the rule of law, and control of corruption, play a vital role in managing public debt effectively and addressing financial crises. Countries with inclusive institutions are more prone to increased risk of debt accumulation (Cerra et al., 2008). In Sweden, good governance and political system effectively overcame the 1991-1993 financial crisis (Jonung, 2009). Political institutions are critical in understanding the likelihood of defaults on external and domestic debt obligations, as they shape governance, policy consistency, and fiscal accountability (Van Rijckeghem & Weder, 2008). In a similar vein, Acemoglu et al. (2001) and Acemoglu (2004) stress the critical significance of institutions in promoting economic growth, whereas Alesina and Tabellini (1990) explore how political conflict shapes fiscal deficits. Heimberger (2023) highlights the importance of institutions in explaining disparities between bond returns and economic growth, while Woo (2003) examines the interplay between economic, political, and institutional factors and their influence on budget deficits. Extensive research suggests that the effect of corruption on economic performance is shaped by the institutional context in which it occurs (Shleifer & Vishny, 1993; La Porta et al., 1999; Méon & Sekkat, 2005; Aidt, 2009; Méon & Weill, 2010; De Rosa et al., 2010). Consequently, the quality of a nation's institutions significantly impacts its fiscal and debt management as well as its overall governance.

This leads to the second question: *How do institutions affect government debt?* Institutions significantly influence government debt by shaping fiscal rules, economic systems, and policies, with classical and Keynesian perspectives offering distinct insights. Classical economists, such as David Ricardo, viewed public debt as a burden, arguing it crowds out private investment, reduces savings, and poses long-term risks to national wealth. The Ricardian equivalence hypothesis argues that individuals anticipate future taxation to repay debt, ignoring any net wealth effect from government borrowing (Barro, 1979; Tsoulfidis, 2007). In contrast, Keynesians highlight the potential of government debt to stimulate aggregate demand and reduce unemployment during downturns, particularly when it is directed toward public spending and targeted programs, which can also mitigate income inequality (Fengze, 2023; Jong-Il & Dutt, 1996). Institutions like central banks play a pivotal role in managing debt sustainability, determining interest rates, and influencing the cost of debt servicing, as seen in Canada, where monetary policy significantly impacts long-term government bond yields (Das & Akram, 2020). Fiscal rules influence how economies respond to high debt, necessitating careful management to avoid inflation and stagnation (Balassone et al., 2004). Overall, classical views emphasize the risks of debt, while Keynesian approaches focus on its economic benefits, with institutions playing a critical role in balancing these outcomes.

Strong institutions are crucial in managing government debt effectively and ensuring fiscal sustainability. Studies demonstrate that institutional quality, particularly governance indicators like political stability, regulatory quality, and the rule of law, significantly curtail excessive debt accumulation. Conversely, poor governance often correlates with higher debt levels due to inefficiencies and reduced GDP growth (Tarek & Ahmed, 2017). Debt offices in New Zealand and Ireland have minimized the long-term costs of debt service by aligning borrowing needs with fiscal stability. For

emerging economies, strong debt management frameworks can reduce macroeconomic risks, including vulnerability to inflation and external shocks (Wheeler, 2004). Additionally, institutional mechanisms like debt laws and fiscal rules improve state-level debt performance by limiting over-borrowing and enhancing financial stability (Velazquez, 2006). Strong institutions provide a framework for better coordination between monetary and fiscal policies, ensuring efficient debt issuance, cost control, and market confidence, which are essential for sustainable economic development and crisis resilience (Montiel, 2012).

Weak institutions exacerbate the challenges of debt management, rising inefficiencies, fiscal instability, and costs. Poor governance, characterized by corruption, lack of transparency, and inadequate regulatory frameworks, directly correlates with higher levels of debt accumulation. In regions like the MENA countries, weak institutional indicators, such as low regulatory quality and absence of the rule of law, significantly increase debt burdens, often through decreased GDP growth and inefficient resource allocation (Tarek & Ahmed, 2017). In transition economies, weak institutions fail to effectively manage public debt, as governance issues like poor control of corruption lead to unsustainable debt trajectories. Efforts to finance institutional improvements often result in increased debt without immediate economic benefits (Nguyen & Luong, 2021). Furthermore, low fiscal credibility and transparency increase borrowing costs, as investors demand higher interest rates due to perceived risks (Johnson & Kriz, 2005). Weak institutional frameworks also make governments more vulnerable to fiscal dominance, where monetary policy becomes constrained by unsustainable debt levels, leading to inflationary pressures and exchange rate instability (Ize, 1987). Ultimately, these factors underscore the critical need for institutional reforms to ensure effective debt management and fiscal sustainability.

The third and final question asks: *How do institutions shape public debt under fiscal rules? Are such rules effective only in countries with strong institutions?* Institutions shape public debt dynamics, and fiscal rules serve more effectively in countries with strong institutional frameworks. Fiscal rules, when effectively enforced, help restrain public debt by imposing clear expenditure and borrowing limits. For example, studies in the European Union have shown that numerical fiscal rules reduce the cost of debt servicing and enhance fiscal discipline, particularly when paired with strong institutional oversight (Stawiarska, 2023; Park & Kim, 2024). EU nations differ from non-EU nations because, besides adhering to their national fiscal rules, they are also subject to supranational fiscal regulations (Davoodi et al., 2022). Classic theoretical work, like “Public Principles of Public Debt” by Prest and Buchanan (1959), highlights that fiscal constraints support accountability and help prevent overreliance on debt financing, particularly in democracies where short-term political incentives can drive excessive borrowing. In contrast, countries lacking fiscal rules often experience adverse debt dynamics, exacerbated by weak institutions. Poor governance, low regulatory quality, and corruption undermine fiscal discipline, leading to higher borrowing costs and unsustainable debt accumulation. The work of North (1990) in "Institutions, Institutional Change, and Economic Performance" provides a theoretical basis for this phenomenon, arguing that institutions shape economic behavior by reducing uncertainties and transaction costs, which, when absent, leave fiscal policy vulnerable to short-term pressures. Empirical evidence from transition economies demonstrates that institutional weaknesses directly correlate with increased debt burdens, especially in contexts with high corruption and low transparency (Nguyen & Luong, 2021). Further, in countries without fiscal rules, the absence of institutional constraints allows for pro-cyclical fiscal policies, which amplify economic instability. The findings of Kudrin et al. (2023) suggest that such countries often fail to stabilize debt during periods of growth, leading to greater vulnerabilities in recessions (Kudrin et al., 2023). Additionally, Velazquez (2006) highlights how weak subnational fiscal institutions in Mexico resulted in over-borrowing and macroeconomic risks, reinforcing the critical role of institutional quality in debt management (Velazquez, 2006). Overall, robust institutions enable the effective implementation of fiscal rules, providing a foundation for sustainable debt management. In their absence, weak governance, short-term political incentives, and fiscal indiscipline lead to higher debt levels and greater macroeconomic

instability. The theoretical contributions of Buchanan and North, combined with modern empirical findings, underscore the importance of institutional reforms to manage public debt effectively.

This research is significant because it provides fresh empirical evidence regarding the impact of institutional quality on public debt. The study's novelty lies in its use of the institutional index incorporating all six governance indicators: control of corruption, government effectiveness, regulatory quality, rule of law, political stability, absence of violence/terrorism, and voice and accountability, constructed using Principal Component Analysis (PCA). The results indicate that institutional quality significantly impacts the debt level. Inclusive institutions have a high risk of debt accumulation.

The study aims to investigate the impact of institutional quality on public debt accumulation on global datasets of 116 countries for 2000-2022. Using the Generalized Method of Moments, the analysis accounts for dynamic dependencies in public debt, isolates the causal impact of institutions, and highlights the differing roles of fiscal rules in various governance settings. This approach not only strengthens the empirical rigor of the study but also provides a nuanced understanding of how institutional frameworks interact with fiscal policies to influence public debt outcomes.

The structure of the study is as follows: Section 2 reviews the comprehensive literature on the subject matter, Section 3 details the data, model, and methodology, Section 4 presents the empirical findings, and the final section provides the conclusion and policy implications.

2. Literature Review

Institutional quality significantly impacts public debt by influencing its sustainability, management, and broader economic implications. High-quality institutions can mitigate the adverse effects of public debt, while poor institutional frameworks may exacerbate debt issues. The relationship between institutional quality and public debt is multifaceted, involving governance, regulatory frameworks, and economic policies. Despite the importance of the critical role played by institutional quality in driving economic stability by addressing the public debt, only limited empirical studies have been conducted to examine the direct association between public debt and institutional quality at the global level.

Earlier studies regarding the subject matter emphasized the institutional foundations of fiscal transparency and debt control. For instance, Alesina and Tabellini (1990) argued that improved performance of country-level institutional quality can enhance financial market transparency, thereby reducing public debt. More recent studies, such as Woo and Kumar (2010), found that a 10% increase in the debt-to-GDP ratio, on average, slows down the economy's annual real GDP per capita growth by 0.2%. Panizza and Presbitero (2014) studied OECD countries and found an inverse relationship between public debt and economic growth. Tarek and Ahmed (2017) analyzed data from MENA countries over the period 1996–2015 using the GLS random effects method. Their findings revealed that most governance indicators exhibit a negative relationship with public debt. Additionally, they observed that inflation contributes to higher levels of debt accumulation, while public debt demonstrated persistence over time. Sani et al. (2019) investigated 46 Sub-Saharan African countries from 2000 to 2014 using a GMM estimation approach. The study highlighted that institutional quality significantly influences economic growth both directly and indirectly. Moreover, public debt was found to have a substantial impact on economic growth, with governance indicators playing a crucial role in mitigating the adverse effects of public debt on economic performance. Blanchard (2019) emphasized the importance of institutional reforms in ensuring debt sustainability and fostering economic growth.

Mehmood et al. (2021), examining Pakistan's data from 1996 to 2018 using OLS estimation and quantile regression approaches, concluded that political stability, government effectiveness, and the rule of law negatively and significantly affect public debt. On the other hand, factors such as voice and accountability, regulatory quality, and control of corruption show a positive and significant relationship with public debt. Nguyen and Luong (2021) examined panel data from 27 transition countries from 2000

to 2018 using OLS, random effects, and two-step GMM methods. The results showed that extractive institutions lead to higher debt accumulation in these countries, while improvements in tax revenue mitigate the debt burden. Kemoe and Lartey (2021) examined panel data from 44 Sub-Saharan African countries. They concluded that the adverse impact of public debt on economic growth diminishes with improved institutional quality. Mehmood et al. (2022) examined the South Asian region from 2002 to 2018 using the panel ARDL approach. They concluded that governance indicators like control of corruption and political stability have a significant inverse relationship with public debt. Conversely, government effectiveness and the rule of law have a significant direct relationship with public debt. Nutassey et al. (2023) examined 40 Sub-Saharan African countries from 2010 to 2019, employing GMM concluded that a significant negative relationship exists between public debt and political institutions. Kongo (2023) examined that in Kenya, better institutional quality enhances public debt sustainability by promoting transparency and accountability, which are crucial for effective fiscal management. Ramzan et al. (2023) analyzed data from Pakistan spanning 1996 to 2020. Their study revealed that public debt positively correlates with economic growth in the short term. However, in the long run, high-quality institutions are crucial in mitigating the adverse effects of public debt on growth, underscoring the importance of governance in fostering sustainable economic development.

Ojeka et al. (2024) examined 47 Sub-Saharan countries from 1996 to 2021 using a two-step system GMM and Driscoll-Kraay regression. They concluded that strong institutions enable countries to utilize debt more effectively by promoting efficient resource allocation and encouraging additional investment. Ullah et al. (2024) employed Japan's time-series data from 1996 to 2017. The study found a significant correlation between the quality of institutions at the country level and public debt in Japan, indicating that better governance can lead to lower public debt levels. This relationship holds in both the long term and the short term. Cooray and Özmen (2024) analyzed the impact of institutional quality on public debt in EU and non-EU countries, which varies across different countries and debt levels. Examine the data span from 2010 to 2022, employing the Logistic Quantile Regression (LQR) and Recentered Influence Function (RIF) method. In the EU, political stability and control of corruption significantly reduce debt, whereas these factors are less impactful in non-EU countries. In developing economies, the interaction between institutional quality and public debt can narrow income inequality, suggesting that institutions play a role in ensuring that debt-financed spending benefits lower-income groups (V. B. Nguyen, 2024). While institutional quality generally supports better debt management and economic outcomes, the specific effects can vary based on the country's context and the particular institutional factors at play. In some cases, certain institutional aspects like the Rule of Law and Control of Corruption may have complex or even counterintuitive effects on public debt, as seen in Japan (Ullah et al., 2024).

This body of literature underscores the intricate relationship between institutional quality and public debt, emphasizing how effective governance and robust institutional frameworks can mitigate the adverse effects of public debt and foster economic stability. Notably, a significant portion of existing studies focuses on the interplay between debt and institutions concerning economic growth, often using governance indicators from the Worldwide Governance Indicators (WGI) dataset individually at the country level. While these studies provide valuable insights, they fall short of capturing the broader and more cohesive impact of institutional quality on public debt dynamics. This study addresses this gap by employing a composite institutional quality index, offering a more comprehensive and multidimensional approach to institutional measurement. Furthermore, rather than examining the indirect pathways through which institutions affect debt via economic growth, this research directly investigates the causal relationship between institutional quality and public debt. By doing so, it provides a more nuanced understanding of how institutional strength shapes fiscal outcomes and public debt sustainability, bridging an important gap in the existing literature.

3. Data, Model, and Methodology

3.1 Data

This study empirically examines the direct relationship between public debt and institutional quality using the global dataset comprising 116 countries over the period 2000–2022 (annual). Countries were selected based on data availability to construct a balanced panel dataset. The full list of countries is provided in the appendix. Table 1 provides a detailed description of all the variables included in the model.

Table 1: Variables Description

Variables	Description	Symbol	Source
Debt	General Government Gross Debt, % of GDP	DBT_{it}	IMF
Government spending	Government expenditure, % of GDP	$GEXP_{it}$	IMF
Revenue	Tax Revenue, % of GDP	TAX_{it}	IMF
Economic Growth	GDP per capita, constant 2015 US$	$lnGDP_{it}$	WDI
Inflation	Inflation, GDP deflator (% annual)	INF_{it}	WDI
Unemployment	Unemployment rate, % of the total labor force (modeled ILO)	UEM_{it}	WDI
Trade	Trade, Sum of exports and imports (% of GDP)	TRD_{it}	WDI
Savings	Gross savings, Gross national income less total consumption, plus net transfers (% of GDP)	SAV_{it}	WDI
Institutional Quality	Index constructed using PCA based on six governance indicators	IQ_{it}	WGI

The institutional quality index is constructed using the WGI's six governance indicators, i.e., Control of Corruption, Government Effectiveness, Political Stability and Absence of Violence/Terrorism, Regulatory Quality, Rule of Law, Voice and Accountability. All the dimensions for governance indicators are in percentile rank. The index is constructed using the PCA technique. The first principal component was retained based on an eigenvalue of 5.25, which explains approximately 87.56% of the total variance in the dataset. As shown in Table 2, all six governance indicators load positively and relatively uniformly on the first component, confirming the presence of a strong common latent factor. This supports the index's validity as a comprehensive proxy for institutional quality, aligning with best practices for dimensionality reduction and empirical analysis.

Table 2. PCA Loading for Institutional Index (Component 1)

Governance Indicator	**First Principal Component Loading**
Government Effectiveness (GE)	0.4183
Rule of Law (RL)	0.4257
Regulatory Quality (RQ)	0.4124
Voice and Accountability (VA)	0.3940

Political Stability (PS)	0.3764
Control of Corruption (CC)	0.4205

3.2 Estimation model

To empirically examine the determinants of public debt across 116 countries from 2000 to 2022, the following baseline estimation model is specified:

$$DBT_{it} = \alpha + \beta_1 LDBT_{it-1} + \beta_2 IQ_{it} + \beta_3 lnGDP_{it} + \beta_4 TAX_{it} + \beta_5 GEX_{it} + \beta_6 INF_{it} + \beta_7 UEM_{it} + \beta_8 TRD_{it} + \beta_9 SAV_{it} + \varepsilon_{it}$$

In the above equation, α is the intercept of the equation, ε_{1it} shows the error term, $\beta's$ are the coefficients of the independent variables. ln shows the natural log. The subscript it indicates that the variable varies across cross-sectional units i and periods t. This study includes 116 cross-sectional units over 23 years.

The hypotheses for this study are grounded in theoretical and empirical literature, outlining the expected relationships between public debt and key explanatory variables. Government expenditure (GEX) is anticipated to have a positive impact on public debt, as higher spending increases borrowing needs (Woo, 2003). Conversely, tax revenue (TAX) is expected to reduce debt levels by boosting fiscal capacity (Checherita-Westphal & Rother, 2012). Inflation (INF) may have mixed effects, with moderate inflation reducing real debt while high inflation increases borrowing costs (Sargent & Wallace, 1981). Higher unemployment (UEM) is linked to increased debt through higher welfare spending and reduced tax revenue (Afonso & Jalles, 2013), while trade openness (TRD) is hypothesized to reduce debt by enhancing economic growth (Rodrik, 1998). Similarly, higher GDP per capita (lnGDP) is expected to lower debt due to stronger fiscal capacity (Barro, 1990), and improved institutional quality (IQ) is hypothesized to reduce debt by fostering fiscal discipline (Acemoglu & Robinson, 2012). Finally, higher savings rates (SAV) are anticipated to negatively affect public debt by reducing the need for external borrowing (Loayza et al., 2000).

The model is estimated using the Two-Step System Generalized Method of Moments (System GMM). System GMM has been widely used in public debt studies to address endogeneity concerns and dynamic relationships (Arellano & Bond, 1991; Blundell & Bond, 1998). Public debt is inherently persistent, and the inclusion of its lagged levels introduces endogeneity, making ordinary least squares (OLS) and fixed-effects estimations biased and inconsistent. System GMM resolves this issue by utilizing internal instruments (lagged levels and first differences of the explanatory variables), ensuring unbiased and consistent parameter estimates. The technique effectively addresses potential endogeneity between public debt and its explanatory variables, particularly institutional quality and fiscal variables (e.g., government expenditure and tax revenue). By incorporating lagged values, it captures the dynamic nature of public debt, allowing the analysis to account for path dependency.

The estimation employs the Arellano-Bover/Blundell-Bond framework, which combines moment conditions for the first differences and level equations. The validity of the instruments is assessed using the Hansen test of overidentifying restrictions.

4. Empirical Results and Discussion

This section delves into the empirical findings of the study, examining the relationship between institutional quality and public debt sustainability across a global dataset of 116 countries spanning 2000 to 2022. By employing the Generalized Method of Moments (GMM) two-step system estimation technique, the analysis aims to address endogeneity concerns and provide robust insights. The results not only highlight the significant role of institutional quality in shaping debt dynamics but also shed

light on how variations in governance, transparency, and policy frameworks influence a country's ability to manage and sustain public debt levels effectively.

Table 3: Descriptive Statistics

Variable	Obs	Mean	Std. dev.	Min	Max
DBT_{it}	2,668	55.00	37.22	0.1	349.9
GDP_{it}	2,668	14778.64	19467.92	262.1848	112417.9
TAX_{it}	2,668	28.55	12.10	0.6368772	63.86255
GEX_{it}	2,668	30.87	11.89	2.489422	66.8228
INF_{it}	2,668	7.60	52.73	-25.12814	2630.123
UEM_{it}	2,668	7.77	5.90	0.12	37.852
TRD_{it}	2,668	83.97	50.18	2.698834	442.62
SAV_{it}	2,668	22.01	10.30	-36.41072	60.23566
IQ_{it}	2,668	-5.06E-10	1.00	-2.003897	1.651028

Descriptive statistics provide a concise summary of key economic variables, offering insights into the underlying patterns within the data. Table 3 highlights critical indicators such as debt-to-income ratios, GDP, taxation, and inflation across 2,668 observations. The debt-to-income ratio (DBT_{it}) shows an average of 55.0, with significant variation, ranging from 0.1 to 349.9, indicating stark financial disparities. GDP averages $14,778.64, yet its wide range—from $262.18 to $1,12,417.9 reflects large-scale differences in economic size. Tax revenue (TAX_{it}) and government expenditure (GEX_{it}) average 28.5% and 30.8%, respectively, with noticeable variation, demonstrating diverse fiscal policies. Inflation (INF_{it}) reveals an average of 7.6%, but extreme values—ranging from -25.1% to 2,630.1%—signal deflationary and hyperinflationary pressures. Similarly, unemployment rates (UEM_{it}) fluctuate widely, from near-zero levels (0.12%) to severe levels (37.8%). Trade as a percentage of GDP (TRD_{it}) shows significant openness, with an average of 83.9%, while savings (SAVit) present an average of 22%, albeit with cases of dissaving as low as -36.4%. The Index of Quality (IQ_{it}) standardizes regional performance with values around 0. These descriptive statistics reveal vast economic disparities and highlight potential areas requiring targeted policy intervention to promote stability and growth.

4.1 Graphical Analysis

Figure 1. Mean Institutional Quality vs. Mean Debt

This scatterplot depicts the relationship between the mean institutional quality index (x-axis) and the mean public debt-to-GDP ratio (y-axis). The fitted line's negative slope indicates a significant negative association, suggesting that countries with stronger institutions experience lower levels of public debt. This result underscores the critical role of institutional quality in enhancing fiscal discipline and debt management.

Figure 2. Mean Tax vs. Mean Debt

This scatterplot illustrates the relationship between the mean tax-to-GDP ratio (x-axis) and the mean public debt-to-GDP ratio (y-axis) for 116 countries from 2000 to 2022. The negative slope of the fitted line indicates an inverse relationship, suggesting that countries with higher average tax revenues tend to have lower levels of public debt. This finding aligns with the theory that stronger fiscal capacity, reflected in higher tax collection, can reduce reliance on debt financing.

Table 4. Multicollinearity Test Results

Variables	VIF
TAX_{it}	8.92
GEX_{it}	8.41
GDP_{it}	2.70
IQ_{it}	2.59
TRD_{it}	1.19
SAV_{it}	1.15
UEM_{it}	1.11
INF_{it}	1.02
Mean VIF	3.39

Source: Author's construction using STATA 17.0

Before delving into regression analysis, it is crucial to ensure that multicollinearity does not distort the estimates. Table 4 summarizes the Variance Inflation Factor (VIF) values for the explanatory variables in the model. Among the variables, TAX_{it} and GEX_{it} exhibit relatively higher VIF values of 8.92 and 8.41, respectively, suggesting a potential overlap in their explanatory power. However, these values remain below the commonly accepted threshold of 10, indicating that multicollinearity is not severe enough to warrant immediate concern. Other variables, such as GDP_{it} (2.70) and IQ_{it} (2.59), show moderate collinearity, while variables like TRD_{it}, SAV_{it}, UEM_{it}, and INF_{it} have VIF values close to 1, reflecting minimal multicollinearity. The mean VIF for the model stands at 3.39, further reinforcing the acceptability of the variables for inclusion in the analysis. In summary, while some degree of multicollinearity is present, it does not pose a significant issue, ensuring that the regression estimates remain reliable and interpretable.

Table 5: Breusch-Pagan Test Result

	chi2(1)	Prob > chi2
H_0 = No Heteroskedasticity H_1 = Heteroskedasticity exists	2944.49	0.0000

Source: Author's construction using STATA 17.0

The Breusch-Pagan test is used to check for heteroskedasticity, which occurs when the variability of errors in a regression model is not constant. In this case, the test results show $chi^2 = 2944.49$ and a p-value = 0.0000. Since the p-value is less than 0.05, we reject the null hypothesis (H_0) that assumes homoskedasticity. This confirms that heteroskedasticity exists in the model. Heteroskedasticity can lead to unreliable conclusions, so adjustments are necessary for accurate analysis. This ensures the suitability of using the GMM estimation method to address the heteroskedasticity issue.

4.2 Two-Step System GMM Estimation Results

Table 6 below summarizes the results of the two-step system GMM estimation, assessing the impact of institutional quality and other variables on public debt sustainability. Key diagnostic tests for model validity and instrument strength are also presented to ensure robustness.

Table 6: Dynamic Panel-Data Estimation Results

Variable	Coefficient	Std. Error	p-value
$DBT_{(-1)}$	0.1939	0.0573	0.001
GDP_{it}	0.0059	0.0014	0.000
Tax_{it}	-2.6218	0.8803	0.003
GEX_{it}	1.4274	0.5605	0.011
INF_{it}	0.6160	0.1965	0.002
UEM_{it}	8.7591	2.1465	0.000
TRD_{it}	-0.3121	0.2044	0.127
SAV_{it}	0.9790	0.6265	0.118
IQ_{it}	-53.6656	20.7251	0.010
Constant	452.3877	189.2399	0.017

	Statistic	p-value
AR (1)	-2.30	0.021
AR (2)	0.77	0.439

Sargan Test	103.65	0.000
Hansen Test	19.76	0.138

Source: Author's estimation using STATA 17.0

Out of the nine variables included in the model, seven variables show a significant impact on the level of debt accumulation. Trade and Savings show no significant impact on the level of debt.

The positive and significant coefficient (0.1939, p = 0.001) lag of debt indicates that past debt levels have a persistent impact on current debt accumulation. This suggests that countries with higher debt levels in the past are more likely to experience sustained debt accumulation in the future. Nguyen and Luong (2021) observed similar persistence in debt levels among transition economies, attributing it to structural inefficiencies and weak fiscal adjustments. On the other hand, Reinhart and Rogoff (2010) argued that debt persistence is less pronounced in high-income countries, where stronger fiscal policies counteract debt accumulation.

The positive and highly significant (0.0059, p = 0.000) relationship between debt and GDP indicates that economic growth contributes marginally to reducing public debt. A growing GDP provides a broader fiscal base, improving a country's ability to manage its debt sustainably. Checherita-Westphal and Rother (2010) demonstrated that GDP growth supports debt sustainability, particularly in European economies. The results are consistent with Lee et al. (2017), Baum et al. (2012), and Bökemeier and Greiner (2014).

The negative and significant (-2.6218, p = 0.003) effect of tax on public debt implies that higher tax revenues help reduce public debt levels by enabling governments to fund expenditures without borrowing excessively. This aligns with Gnangnon (2022), who found that tax reforms in emerging markets significantly reduced debt burdens. In contrast, Oppong et al. (2023) noted that in some sub-Saharan African economies, increased taxation led to lower economic activity, undermining fiscal stability.

Government Expenditure has a positive and significant coefficient (1.4274, p = 0.011), which highlights that higher government spending exacerbates public debt levels, especially when expenditure is not matched by proportional revenue generation. Afonso and Jalles (2012) observed similar trends, arguing that poorly targeted government spending fuels unsustainable debt growth. Alternatively, some scholars, like Blanchard and Perotti (2002), suggested that well-targeted expenditures, such as on infrastructure, can enhance economic growth and offset debt.

Inflation has a statistically significant positive effect (0.6160, p = 0.002) on debt levels. Higher inflation may erode fiscal discipline by increasing interest rates and debt servicing costs. This finding resonates with Nguyen et al. (2022), who linked inflationary pressures to rising debt in developing economies. Conversely, Sargent and Wallace (1984) argued that moderate inflation could help reduce real debt burdens by eroding nominal liabilities.

A positive and significant coefficient (8.7591, p = 0.000) of unemployment implies that higher unemployment rates contribute substantially to debt accumulation, likely due to increased welfare spending and reduced tax revenues. Similar trends were noted by Checherita-Westphal et al. (2010), who emphasized that labor market inefficiencies strain fiscal resources.

Trade has a negative but statistically insignificant coefficient (-0.3121, p = 0.127), indicating a weak direct impact of trade openness on debt sustainability in the sample. Oppong et al. (2023) similarly found limited effects of trade openness on debt in sub-Saharan Africa. In contrast, Sachs and Warner (1995) argued that greater trade openness reduces debt burdens by fostering export-led growth.

Savings has a positive coefficient (0.9790, p = 0.118), but it is not statistically significant, suggesting that savings rates do not directly influence debt levels in this dataset. This is consistent with findings from Loayza et al. (2000), who noted that savings impact debt only indirectly through investment channels. However, Modigliani (1986) found a strong link between national savings and reduced debt levels in high-income countries.

Institutional quality has a significant negative impact (-53.6656, p = 0.010) on public debt, emphasizing that strong governance frameworks play a critical role in debt sustainability. This finding aligns with Kongo (2023), who demonstrated the debt-mitigating effects of transparency, the rule of law, and corruption control. In contrast, Acemoglu and Robinson (2001) highlighted that institutional reforms take significant time to yield fiscal benefits, which may not be immediately reflected in debt metrics.

From a diagnostic perspective, the Arellano-Bond AR (1) test confirms the absence of first-order autocorrelation (p = 0.021), while the AR (2) test (p = 0.439) suggests no evidence of second-order autocorrelation, ensuring model consistency. The Hansen test (p = 0.138) supports the validity of the chosen instruments, a critical aspect for robustness in GMM estimation techniques.

5. Conclusion

In conclusion, the study provides valuable insights into the intricate relationship between public debt and institutional quality, considering a comprehensive global dataset spanning from 2000 to 2022. The Institutional Quality Index has been constructed using Principal Component Analysis, comprising six governance indicators sourced from World Governance Indicators. It comprises Control of Corruption, Government Effectiveness, Political Stability and Absence of Violence/Terrorism, Regulatory Quality, Rule of Law, Voice and Accountability. The results reveal a significant negative relationship between institutional quality and public debt, indicating that stronger institutions are associated with lower levels of public debt. This underscores the crucial role of robust governance structures in managing national finances efficiently. Additionally, the application of GMM estimation, along with AR (1), AR (2) corrections, and Hansen-Sargan tests, strengthens the reliability of these findings, addressing potential endogeneity concerns.

The pre-estimation tests, such as the Breusch-Pagan test for heteroskedasticity and the Variance Inflation Factor (VIF) analysis, further support the robustness of the model, ensuring that multicollinearity and other issues are appropriately accounted for. Moreover, the significance of institutional quality in shaping public debt dynamics is a noteworthy policy implication. Governments with weaker institutions may find it more challenging to control debt levels, and this could amplify economic vulnerabilities over time. In conclusion, the findings of this study strongly emphasize that improving institutional quality plays a crucial role in ensuring the sustainability of public debt. The results point to the significant link between strong institutions and better fiscal management, suggesting that nations with robust governance structures tend to experience lower levels of public debt. This highlights the urgent need for focused reforms in governance, especially in areas such as transparency, accountability, and the reduction of corruption, to reduce the risks associated with excessive debt. Strengthening these institutional frameworks can not only improve financial discipline but also enhance the overall economic resilience of countries, especially in times of financial stress.

In terms of policy recommendations, the study highlights the importance of strengthening institutional frameworks in developing and emerging economies. Governments should prioritize improving the transparency, efficiency, and accountability of public financial management systems, as these are closely linked to better debt management outcomes. Additionally, fostering a culture of good governance and enforcing strong legal frameworks can help limit the misuse of public resources, further reducing the burden of public debt. Lastly, policymakers should focus on enhancing the capacity of financial institutions to manage and monitor debt, ensuring that borrowing remains sustainable in the long run.

Transxəzər Beynəlxalq Nəqliyyat Marşrutu (TXBNM) Orta Ticarət Dəhlizinin inkişafı kontekstində

afa.sfrva.19@gmail.com

Orcid: 0000-0001-5422-5748

X Ü L A S Ə

Ölkələrin, xalqların və xüsusən də iqtisadiyyatların tam qarşılıqlı asılılığı dövründə geosiyasət yeni ittifaqlar qurmaq və təsir dairələrini müəyyən etmək deyil, bu ölkələri, xalqları və iqtisadiyyatları birləşdirən marşrutlara nəzarət etməkdən ibarətdir. Bu gün ixrac və idxal üçün alternativ marşrutlar mövzusu o qədər populyardır ki, bunun niyə yarandığını və bu marşrutların nə olduğunu izah etməyin mənası yoxdur. Orta dəhliz Mərkəzi Asiyadan Xəzər dənizi vasitəsilə Azərbaycana uzanır və Rusiya ərazisindən yan keçməklə ya Gürcüstan limanlarına, ya da Bakı-Tbilisi-Qars xətti ilə Türkiyəyə qədər davam edir. Bu gün Orta Dəhlizə yüksək marağın səbəbi Ukraynadakı müharibə və Avropa Birliyinin anti-Rusiya sanksiyalarının Rusiya ərazisindən keçən Aİ-yə gedən marşrutu praktiki olaraq bağlamasıdır. Layihənin bütün iştirakçılarının onu həyata keçirmək üçün siyasi iradəsi var. Onların hamısı ikitərəfli və çoxtərəfli görüşlər zamanı Transxəzər Beynəlxalq Nəqliyyat Marşrutunu (TİTR) və Orta Dəhlizi inkişaf etdirmək əzmində olduqlarını təsdiqləyirlər.

Açar sözlər: Transxəzər Beynəlxalq Nəqliyyat Marşrutu, Orta Dəhliz, "Bir kəmər, bir yol", Azərbaycan, Çin, Qazaxıstan, Türkiyə, Gürcüstan

THE TRANS-CASPIAN INTERNATIONAL TRANSPORT ROUTE (TCITR) IN THE CONTEXT OF THE DEVELOPMENT OF THE MIDDLE TRADE CORRIDOR

S U M M A R Y

Geopolitics in the era of total interdependence of countries, peoples and especially economies is not so much about building new alliances and defining spheres of influence as it is about controlling the routes connecting these countries, peoples and economies. Today the topic of alternative routes for export and import is so popular that there is no point in explaining why it arose and what these routes are. The middle corridor runs from Central Asia through the Caspian Sea to Azerbaijan and continues either to Georgian ports or to Turkey along the Baku-Tbilisi-Kars line, bypassing Russian territory. Today, the high interest in the Middle Corridor is due to the fact that the war in Ukraine and the anti-Russian sanctions of the European Union have practically blocked the route to the EU passing through Russia. All project participants have the political will to implement it. All of them, during bilateral and multilateral meetings, confirm their determination to develop the Trans-Caspian International Transport Route (TITR) and the Middle Corridor.

Keywords: Trans-Caspian International Transport Route, Middle Corridor, "One Belt, One Road", Azerbaijan, China, Kazakhstan, Turkey, Georgia

Giriş

Son illərdə dünya arenasında baş verən qlobal dəyişikliklər və Avrasiya qitəsində ticarət-iqtisadi əlaqələrinin transformasiyası bir sıra layihələrə marağı artırıb. Bu gün bir sıra səbəblərdən həyata keçirilməsi mümkün olmayan hesab edilən bu layihələri reallaşdırmaq istəyi, Rusiya-Ukrayna müharibəsinin başlamasından sonra baş verən hadisələr tərəfindən dəstəklənir.

Antirusiya sanksiyaları, əvvəlki iqtisadi zəncirlərin qırılması, siyasi mərkəzlərin yeni bölgələrə köçməsi və bir çox digər amillər Mərkəzi Asiya regionundakı ölkələrin fəaliyyətinin aktivləşməsinə birbaşa təsir göstərdi. Bu vəziyyətdə, yaranmış şəraitdə sərfəli alternativ nəqliyyat marşrutları üçün imkan pəncərəsi görən ölkələrin diqqətini çəkməsi təəccüblü deyil. Bu baxımdan, son bir ildə Transxəzər qaz kəmərinə (TXQK) olan marağın kəskin artması da təbii haldır; bu kəmər, bütün Avrasiya məkanında strateji əhəmiyyətə malik enerji layihələrindən biri halına gəlib.

Rusiyanın bu gün sanksiyalar altında olması və bir sıra ölkələrin onunla ticarət-iqtisadi əməkdaşlığını məhdudlaşdırması səbəbindən, Mərkəzi Asiya dövlətləri və Çin Rusiyadan yan keçərək Avropaya mallarının ixracını artırmaq üçün yeni imkanlar axtarırlar. Rusiyanın dominant mövqedə olduğu və nəqliyyat yolunun böyük hissəsinə nəzarət etdiyi Şimal Nəqliyyat Dəhlizinə və Hind okeanı vasitəsilə keçən ənənəvi dəniz yoluna ən perspektivli alternativ Mərkəzi Asiyadan Avropaya malların tədarükü üçün yaradılmış Orta Dəhlizdir. Bu dəhliz həmçinin Transxəzər Beynəlxalq Nəqliyyat Marşrutu adı ilə də tanınır. Orta Dəhlizin keçdiyi əsas ölkələr, xüsusilə Azərbaycan, Çin, Gürcüstan, Qazaxıstan və Türkiyə üçün bu marşrut Rusiyadan yan keçən alternativ Avrasiya ticarət marşrutuna olan beynəlxalq maraqdan faydalanmaq imkanı verəcək.

Orta Dəhliz təxminən qədim İpək Yolunun marşrutunu izləyir. Tarixi ticarət yolu Xəzər dənizinin cənubundan və Fars (müasir İran) ərazisindən keçsə də, Orta Dəhliz İrandan yan keçərək Qazaxıstan və Türkmənistan limanlarından istifadə edərək yükləri Xəzər dənizi vasitəsilə Azərbaycana daşıyır. Oradan yüklər Gürcüstanın yük limanları və ya Türkiyə ərazisi vasitəsilə Avropaya göndərilir.

Orta Ticarət Dəhlizinin İnkişafının Aktuallığı

7 oktyabr 2023-cü il tarixində baş verən faciəli hadisələr Yaxın Şərqdə gərginliyin artmasına səbəb oldu və bunun nəticəsində Qırmızı dənizdə husi hücumlarının sayı artdı. Bundan əlavə, Rusiyaya qarşı tətbiq olunan çoxsaylı beynəlxalq sanksiyalar, ən populyar qlobal gəmiçilik marşrutlarının getdikcə daha etibarsız hala gəldiyini ortaya qoydu. Rusiyada qərb istiqamətində yük daşımalarının dəmir yolu tranziti, Ukraynaya tammiqyaslı müdaxilənin başlanması ilə kəskin şəkildə azaldı. Nəticədə, daha az tanınan marşrut olan Orta Dəhliz, beynəlxalq bazarlar üçün yaşamağa qadir alternativ ola bilər.

Qırmızı dəniz və Süveyş kanalı beynəlxalq gəmiçilik və ticarət üçün mühüm qovşaq nöqtələridir. Təxminlərə görə, dünya ticarətinin 15 faizə qədər hissəsi Süveyş kanalından keçir, həmçinin dünya konteyner daşımalarının 30 faizə qədər hissəsi [4]. Noyabr ayından etibarən husilər Qırmızı dəniz və Aden körfəzində ticarət və hərbi gəmilərə qarşı təxminən 60 hücum həyata keçiriblər. Davam edən hücumlara baxmayaraq, gəmiçilik şirkətləri hələ də bu marşrut üzrə fəaliyyət göstərirlər. Lakin bu şirkətlərin bir çoxu gəmilərə və heyətə olan təhlükələri kompensasiya etmək üçün minlərlə dolları aşan fövqəladə əlavələr də daxil olmaqla, əlavə ödənişlər tətbiq edirlər.

Digər şirkətlər Süveyş kanalı vasitəsilə marşrutdan tamamilə qaçmaq üçün addımlar atırlar, hətta bu, tranzit müddətinin uzanmasına və daha yüksək xərclərə səbəb olsa da. Analitiklər qiymətləndirir ki, Qırmızı dəniz və Süveyş kanalı vasitəsilə keçən adi konteyner yükdaşımalarının

təxminən 90 faizi Cənubi Afrikadakı Düzgün Ümid burnunu əhatə etmək üçün yönləndirilib. Şərqi Asiyadan Avropaya göndərişlər indi əlavə 10 gün tranzit müddəti ala bilər. Bəzi şirkətlər hətta yükünü çatdırmaq üçün hava daşımalarına müraciət edirlər. Bu metod tranzit müddətini əhəmiyyətli dərəcədə azaldır və daha təhlükəsizdir, lakin hava daşımalarının xərci ənənəvi Süveyş marşrutundan 15 dəfə baha ola bilər.

Rusiya əleyhinə sanksiyalar və Şimal Dəhlizindən istifadə etməyə artan istehsaçlıq bu marşrut üzrə daşımaların həcminin əhəmiyyətli dərəcədə azalmasına səbəb olub. 2023-cü il ərzində Qərb daşımalarının həcmi Şimal Dəhlizi marşrutu üzrə əvvəlki illə müqayisədə 51 faiz azalıb. Orta Dəhliz hər iki marşruta daha təhlükəsiz, qısa və əlverişli alternativ təklif edə bilər.

Orta Dəhliz vahid nəqliyyat marşrutu deyil, daha çox qarşılıqlı əlaqəli yol, dəmir yolu və dəniz marşrutları şəbəkəsidir. Son üç onillikdə bir sıra infrastruktur layihələri Orta Dəhlizin modernləşdirilməsinə və naviqasiya üçün tranzit vaxtının azaldılmasına kömək etdi. Çinin Bir Kəmər-Bir Yol Təşəbbüsü çərçivəsində kütləvi investisiyalarla yanaşı, Avropa Birliyi də Orta Dəhlizə əhəmiyyətli miqdarda sərmayə qoyub [7].

Orta Dəhlizi təşkil edən Avrasiya ölkələri mövcud infrastrukturun yaxşılaşdırılmasına xeyli vaxt və resurslar sərmayə qoyublar. 2022-ci ilin sonunda Qazaxıstan, Gürcüstan, Azərbaycan və Türkiyənin xarici işlər və nəqliyyat nazirləri marşrut üzrə inkişafın sürətləndirilməsi və yük axınının genişləndirilməsi yollarının işlənib hazırlanması üçün toplaşıblar. Nazirlər dəmir yollarının modernləşdirilməsinə yönəlmiş beşillik plan elan etdilər və dəmir yolunun gücü başa çatdıqdan sonra iki dəfə artdı. 2027-ci ilə qədər ölkələr ildə 10 milyon ton daşıma qabiliyyətinə və 14-18 gün tranzit vaxtına sahib olmağı planlaşdırırlar [9].

Orta dəhlizin Avropa ucunda dəhlizə marağı Çinin marağına uyğun olan ölkə Türkiyə yerləşir. Ankara dəhlizə təkcə Mərkəzi Asiya ilə iqtisadi əlaqələri gücləndirmək deyil, həm də strateji mövqeyini yaxşılaşdırmaq üçün bir yol kimi baxır. Türkiyə bölgənin türkdilli ölkələri ilə ortaq dil köklərindən istifadə edərək və onlara İranla və ya Rusiya ilə ticarətə cəlbedici alternativ olan ticarət imkanlarını təklif etməklə buna nail olmağa ümid edirdi. Əslində Türkiyə Orta dəhlizi Mərkəzi Asiyadakı xarici siyasətinin mərkəzi elementi edib. 2013-2015-ci illər arasında Azərbaycan, Çin, Gürcüstan və Qazaxıstan ilə dəhlizin Avropa ilə əlaqəsinin yaxşılaşdırılmasına dair sazişlər imzalanmışdır. Türkiyə 2016-cı ildə İstanbulda Avrasiya tuneli və Yavuz Sultan Səlim körpüsünü tikib və artıq Ədirnə-Qars yüksək sürətli dəmir yolunun və Şimal Mərmərə dənizi avtomobil yolunun tikintisini başa çatdırır. Diplomatik cəhətdən Ankara Ermənistanın Zəngəzur regionu vasitəsilə yeni Orta dəhliz dəmir yolunun tikintisinə kömək etməyə çalışır [3].

Mərkəzi Asiya və Çin ölkələrinin Transxəzər Beynəlxalq Nəqliyyat Marşrutu layihəsinə marağı

Daha əvvəl qeyd edildiyi kimi, məhz Ukraynada vəziyyətin gərginləşməsi Mərkəzi Asiya ölkələrinin Rusiyadan yan keçərək Asiyadan Avropaya malların tədarükünü həyata keçirmək mümkün olan alternativ ticarət dəhlizini fəal şəkildə təbliğ etməyə başlamasına səbəb olub. Mərkəzi Asiya ölkələri münaqişədə bitərəf qalsalar da, Rusiyanın üstünlük təşkil etdiyi Şimal dəhlizinə alternativin mövcudluğunda üstünlük gördülər. Orta dəhliz regiondaxili ticarətin artmasına kömək edir, belə ki, 2022-ci ildə Orta dəhliz üzrə yük daşımaları 3,2 milyon tona qədər artıb, ticarət yolunun tutumunun 10 milyon tona çatacağı gözlənilir [2].

Orta dəhliz layihəsinin inkişafında beş ölkə, o cümlədən Azərbaycan, Gürcüstan, Qazaxıstan, Türkiyə və Çin ən böyük maraq göstərir. Transsərhəd dəmir yolu əlaqələrinin yaxşılaşdırılması və ticarətdəki ziddiyyətlərin azaldılması məqsədilə nazirlər səviyyəsində silsilə konfranslar və görüşlər keçiriblər və bu sahələrdə bir sıra məsələləri müzakirə ediblər. Orta dəhliz regional güc mərkəzi statusunu artıracağını vəd edir, buna görə də onun keçdiyi Mərkəzi Asiya ölkələri, məsələn, Qazaxıstan, Özbəkistan, Türkmənistan, Qırğızıstan, dəhlizlə birləşəcək öz dəmir yollarını qurmağa çalışırlar.

Çin üçün Orta dəhlizə maraq beynəlxalq bazarlara çıxış əldə etmək və Moskva ilə Pekin arasında uzun müddətdir rəqabətin müşahidə olunduğu Mərkəzi Asiya regionunda nüfuzunu artırmaq imkanlarına əsaslanır.

Çinin «Bir kəmər - bir yol» təşəbbüsü ölkənin xarici siyasətində prioritetdir. Bu təşəbbüs çərçivəsində Çin Orta Yol layihəsinin infrastrukturunun inkişafına sərmayə qoyur. Çin üçün dəmir yolu transkontinental dəhliz geostrateji əhəmiyyət daşıyır. Bu, dar Malakka boğazından asılılığı azaldır, bu da ABŞ və onun peykləri ilə bağlana bilər, Çini Hind okeanı və Avropadan kəsir. Buna görə də Çin Avropa ilə dəmir yolu əlaqəsinin yaradılmasına və inkişafına böyük töhfə verib. Pekin əvvəlcə zərərli olan dəmir yolu ilə yüklərin göndərilməsini subsidiyalaşdırdı. Əgər 2011-ci ildə cəmi 11 qatar işə salınıbsa, ötən il Çin və Avropa arasında hər iki istiqamətdə 16 min qatar keçib. Pekin Avropa biznesini dəmir yolu marşrutunun nəinki daha sürətli, etibarlı, sabit və təhlükəsiz olduğuna öyrətdi. Pandemiya və karantin tədbirləri zamanı dəniz marşrutu daha etibarlı və demək olar ki, ucuzlaşıb. Ən təsirli dəhliz şimal dəhlizi oldu. Lakin eyni zamanda Çin cənub marşrutunu da sınaqdan keçirdi və müharibənin başlamasından xeyli əvvəl. Buna görə də, Orta Dəhlizi Şimal kimi etibarlı və sürətli etməyin ən yaxşı (və bəlkə də yeganə) yolu Çin təchizatçıları tərəfindən marşruta tələbatı artırmaqdır [1].

Çin və Qazaxıstan sərhədində yerləşən geniş dəmir yolu keçid mərkəzi olan Horgos Qapısının tikintisi və Horgos - Şərqi Qapı xüsusi iqtisadi zonasının maliyyələşdirilməsi infrastrukturun inkişafına misal ola bilər. Aydındır ki, Pekinin nöqteyi-nəzərindən Rusiyanın üstünlük təşkil etmədiyi (Şimal dəhlizində olduğu kimi) və ABŞ-ın birbaşa müdaxilə edə bilmədiyi (ənənəvi dəniz yolunda olduğu kimi) ticarət marşrutunun mövcudluğu Çin üçün strateji əhəmiyyət kəsb edir [1].

Təhlükəsizliyin artırılması və tranzit vaxtının azaldılması ilə yanaşı, Orta Dəhlizdən istifadə əmək miqrasiyasının ümumi mövzu olduğu bütün Mərkəzi Asiyada iqtisadi imkanları yaxşılaşdırmağa kömək edə bilər. Rusiyanın Ukraynaya genişmiqyaslı işğalından sonra da Orta Asiyadan bir milyondan çox əmək miqrantı Rusiyaya köçdü. Özbəkistan kimi Mərkəzi Asiya dövlətləri əmək miqrasiyasının istiqamətlərini şaxələndirmək üçün yollar axtarır. Avropa İttifaqının və müxtəlif beynəlxalq qurumların yeni investisiyaları bütün Mərkəzi Asiya və Qafqaz üzrə əmək miqrasiyasının dövriyyəsi üçün bir yol təklif edə bilər, bütün marşrut üzrə daha böyük ölkələrarası əməkdaşlığı təşviq edir.

Azərbaycan Orta dəhliz layihəsinin mühüm aktoru kimi

Azərbaycan coğrafi cəhətdən «Şimal-Cənub» və «Şərq-Qərb» ən böyük beynəlxalq nəqliyyat dəhlizlərinin kəsişməsində yerləşir. Ölkə ərazisindən digər MTK-lar da keçir: «Cənub-Qərb» (Aİ - Hindistan), «Şimal-Qərb» (RF - Aralıq dənizi ölkələri), həmçinin gələcəkdə «Şimal-Cənub» və «Şərq-Qərb» dəhlizlərinin inkişafına təkan verən Zəngəzur dəhlizi.

Azərbaycanın öz ərazisindən keçən dəhlizlərin bərabər inkişafı şərti ilə beynəlxalq nəqliyyat mərkəzinə tam miqyaslı çevrilməsi potensialı var. Lakin bunun üçün infrastrukturun modernləşdirilməsi və inkişafı, normativ-hüquqi bazanın təkmilləşdirilməsi və uyğunlaşdırılması, logistika sahəsinin inkişafı, o cümlədən logistika mərkəzlərinin yaradılması zəruridir. 2020-ci il 44 günlük müharibəsinin və 2023-cü il yerli antiterror tədbirlərinin nəticələrinə əsasən ərazi bütövlüyünün bərpasından sonra Azərbaycanın böyük regional və beynəlxalq layihələrin həyata keçirilməsi üçün yeni imkanlar yaranıb. Belə ki, artıq azad edilmiş ərazilərdə dəmir yolu və avtomobil nəqliyyatının bərpası istiqamətində işlər aparılır. Zəngəzur dəhlizinə gəlincə, onun istifadəyə verilməsi Azərbaycanla Türkiyə arasında birbaşa yerüstü əlaqə yaradacaq, bu isə Aİ və Mərkəzi Asiya ölkələri arasında ticarət dövriyyəsini artıracaq. «Azərbaycan Respublikası ərazisindən keçən beynəlxalq nəqliyyat dəhlizlərinin tranzit potensialının artırılması və tranzit yükdaşımaların inkişafı üzrə 2024-2026-cı illər üçün Fəaliyyət Planına» əsasən ölkə ərazisindən yük axını 2022-ci ilin göstəriciləri ilə müqayisədə 27% artmalıdır. Hazırda azad edilmiş ərazilərdə yol infrastrukturunun tikintisinə xüsusi diqqət yetirilir [8].

Hacıqabul-Mincivan-Zəngəzur dəhliz avtomobil yolundan başlayaraq Şuşa şəhərinə qədər davam edən «Qələbə yolu», uzunluğu 123,6 km olan Horadiz-Cəbrayıl-Zəngilan-Ağbənd (Zəngəzur dəhlizi) avtomobil yolunun tikintisi də demək olar ki, istismara verilib Azərbaycan və Naxçıvan Muxtar Respublikasını Zəngəzur dəhlizi ilə birləşdirəcək Horadiz-Ağbənd dəmir yolunun tikintisi başa çatıb, davam etdirilir.

Dəniz nəqliyyatı da inkişaf edir. Bakı Beynəlxalq Dəniz Ticarət Limanı 2018-ci ildən istifadəyə verilmişdir. Hazırda limanın ikinci mərhələsinin açılması planlaşdırılır.

Dünya Bankının Orta dəhlizin fəaliyyəti haqqında hesabatında qeyd olunub ki, 2022-ci ildə Azərbaycan tərəfinin ixracı 72% artıb ki, bu da əsasən faydalı qazıntıların ixracına səbəb olub. Eyni dövrdə qeyri-mineral malların ixracı 50% artdı [8].

Rəqəmsallaşma prosesi nəqliyyat-logistika sahəsinin inkişafında xüsusi yer tutur. Belə ki, 2021-ci ildə Azərbaycanın Rəqəmsal İnkişaf və Nəqliyyat Nazirliyi və Asiyada Əməkdaşlıq və Etimad Tədbirləri üzrə Müşavirə «Nəqliyyat-logistika əməliyyatlarının rəqəmsallaşdırılmasının gücləndirilməsi istiqamətində əməkdaşlığın təşviqi» mövzusunda xüsusi tədbir keçirib və burada nəqliyyat və logistikanın rəqəmsallaşdırılması sahəsində əməkdaşlıq imkanlarını müzakirə ediblər.

2022-ci ildə Azərbaycan İnnovasiya və Elm Nazirliyinin İdarəetmə Sistemləri İnstitutunun və Özbəkistan Daşkənd Dövlət Nəqliyyat Universitetinin ekspert qrupları arasında Orta Dəhliz çərçivəsində rəqəmsallaşdırma layihəsi hazırlanmağa başlayıb.

2023-cü ildə Azərbaycanın Rəqəmsal İnkişaf və Nəqliyyat Nazirliyi müqavilələrin imzalanması prosesindən tutmuş nəqliyyat növünün seçilməsinə qədər nəqliyyat-logistika sahəsində bütün proseslərin rəqəmsallaşdırılması layihəsini təqdim edib. Layihə 2024-cü ildə həyata keçirilməlidir.

Azərbaycan tərəfindən dəhlizin inkişafı çərçivəsində ölkənin öz vəsaiti hesabına böyük işlər görülüb, o cümlədən infrastrukturun inkişafı və modernləşdirilməsi, dəmir yollarının və avtomobil yollarının tikintisi və təmiri. Kifayət qədər böyük həcmdə yük qəbul edə və malların sürətli hərəkətini təmin edə bilən Bakı limanı tikilib. Xəzər dənizində Azərbaycan tərəfdən iri logistika donanması yaradılıb.

Azərbaycan üçün tam hüquqlu nəqliyyat mərkəzinə çevrilmək təkcə iqtisadi cəhətdən sərfəli addım deyil, strateji hədəfə çevrilib. Söhbət gəlirlərin neft sektorundan asılılığının azaldılmasından, həmçinin milli təhlükəsizliyin təmin edilməsindən gedir.

Azərbaycan və Mərkəzi Asiya ölkələri arasında əməkdaşlıq kontekstində Orta dəhliz də əhəmiyyətli rol oynayır. Türk dünyası ölkələri arasında həm TDT çərçivəsində, həm də ikitərəfli formatda əməkdaşlıq inkişaf edir. Bu kontekstdə Azərbaycan Qərb və Mərkəzi Asiya ölkələri arasında birləşdirici həlqəyə çevrilib. Özbəkistan (avqust 2023) və Qazaxıstan (mart 2024) dövlət başçılarının Azərbaycana rəsmi səfərləri təsdiqidir. Bu səfərlərin əhəmiyyəti onunla müəyyən edilir ki, onlar ölkələrin infrastruktur və ticarət əməkdaşlığı məsələlərində ilkin inkişaf mərhələsinə müəyyən xətt çəkirlər. Məlum səbəblərə görə «Orta dəhliz» - Bakıdan Gürcüstana və Türkiyəyə gedən transxəzər ticarət marşrutu ideyası onun əsasını təşkil edir. "Resurslarla yanaşı, hazırda bütün dünyada məhz nəqliyyat-logistika imkanlarına çıxış uğrunda mübarizə kəskinləşir. Bu strateji sahədir. Sevindirici haldır ki, həm Qazaxıstan, həm də Azərbaycan burada təbii tərəfdaş kimi sıx əməkdaşlıq edir. Və bu gün Sian limanından Qazaxıstan ərazisi ilə Azərbaycana dəmir yolu marşrutunun açılış mərasimi çox şeydən danışır", - deyə Azərbaycan Prezidenti İlham Əliyev Qazaxıstan Prezidenti Kasım-Jomart Tokayevin Bakıya səfəri zamanı keçirdiyi mətbuat konfransında bildirib. [11] 2022-ci il aprelin 13-də Çinin Sian şəhərindən idman qatarı ilə yola düşüb mal. Beləliklə, Siyandan Almaniyanın Mannheim şəhərinə Qazaxıstan, Azərbaycan, Gürcüstan və Qara dəniz boyunca Rusiya ətrafında dəmir yolu qatarlarının hərəkəti başladı [12].

Orta dəhliz kifayət qədər çox sayda ölkəni əhatə edir və infrastrukturun inkişaf səviyyəsi, rəqəmsallaşma səviyyələri, dəmir yollarının ötürmə qabiliyyəti arasındakı fərqlərə görə ticarət dövriyyəsi səmərəli və sürətlə baş verə bilər.

Azərbaycan ölkə ərazilərinin çoxillik işğalına və kifayət qədər uzun və nəticəsiz danışıqlar prosesinə baxmayaraq, nəqliyyat-logistika sahəsinin inkişafına xeyli səy göstərib. Ərazi bütövlüyü bərpa edildikdən sonra ölkə hakimiyyəti azad edilmiş ərazilərdə tikinti işlərinin başlanmasına birdən-birə müdaxilə edib.

Zəngəzur dəhlizinin açılması Azərbaycan üçün mühüm vəzifəyə çevrilib, çünki onun istifadəyə verilməsi Azərbaycanla Türkiyə arasında birbaşa quru əlaqəsi yaradacaq, həm regional inkişaf kontekstində, həm də Orta dəhlizin inkişafı kontekstində mühüm rol oynayacaq.

Orta dəhliz layihəsinin həyata keçirilməsi yolunda Azərbaycan əsasən öz vəsaiti hesabına böyük işlər görmüşdür. Lakin dəhlizin inkişafı yolunda həllini tələb edən bir çox vəzifələr var:

- yükdaşımaların dəyərinin aydınlığının və proqnozlaşdırılmasının təmin edilməsi

- malların yerini yoxlamaq imkanı

- sənədləşmə də daxil olmaqla bütün proseslərin rəqəmsallaşdırılması, vahid logistika mərkəzlərinin yaradılması

- layihənin inkişafı üçün özəl sektorun, eləcə də investisiyaların işə cəlb edilməsi.

Avropa İttifaqının Transxəzər Beynəlxalq Nəqliyyat Marşrutu mövqeyi

Orta dəhliz mövzusu Transxəzər beynəlxalq nəqliyyat marşrutunu geosiyasi layihə hesab edən Avropa İttifaqının diqqət mərkəzində qalır.

2023-cü ildə «Orta dəhliz» mövzusu bir çox yüksək səviyyəli platformalarda geniş müzakirə edilmişdir. O cümlədən G7 sammitində və Ümumdünya İqtisadi Forumunda. Orada Böyük Britaniya və ABŞ da daxil olmaqla Qərb ölkələrinin nümayəndələri layihəyə investisiyalarla dəstək verməyə hazır olduqlarını bildiriblər. G7 sammitində 2027-ci ilə qədər "Orta dəhliz 'in inkişafına 600 milyard dollar ayırmaq barədə razılığa gəldilər [2].

Brüsseldə Avropa İttifaqı, Mərkəzi Asiya, Qafqaz və Türkiyədən hökumət, maliyyə qurumları, biznes və vətəndaş cəmiyyəti nümayəndələrinin iştirakı ilə Global Gateway investisiya forumu keçirilmişdir. Avropa Komissiyası və Avropa İnvestisiya Bankı strateji nəqliyyat infrastrukturu obyektlərinə investisiya qoymağa hazırdır. "Uzunluğu 11 min km olan nəqliyyat dəhlizi regionlarımızı 15 gün və ya daha az müddətə birləşdirməlidir. Biz bu dəhlizi rəqabətə davamlı etməliyik. Biz konkret nəticələr əldə etmək niyyətindəyik. Buna görə də Avropa Komissiyası və Avropa İnvestisiya Bankı Mərkəzi Asiyanın nəqliyyat imkanlarına 1,5 milyard avro sərmayə qoymaq niyyətindədir. Daha sonra qarşılıqlı anlaşma haqqında müvafiq memorandumlar imzalanacaq", - deyə Avropa Komissiyası sədrinin müavini, ticarət məsələləri üzrə komissar Valdis Dombrovskis bildirib. Bundan əlavə, AİB Qazaxıstanla artıq həyata keçirilən nəqliyyat layihələrinə 1,5 milyard avro ayrılması barədə saziş imzalayıb [2].

Dombrovskisin qeyd etdiyi kimi, Avropa İttifaqı "Transxəzər Beynəlxalq Nəqliyyat Marşrutu 'na 20 milyard avro sərmayə qoyur, uzunmüddətli perspektivdə isə söhbət ictimai və özəl investisiyalardan 2027-ci ilə qədər yığılması planlaşdırılan 300 milyard avro həcmində təsirli məbləğdən gedir.

Siyasi baxımdan aydındır ki, Avropa İttifaqı öz layihəsi ilə Mərkəzi Asiyaya Rusiyadan yan keçmək üçün yeni yollar axtarır. Digər tərəfdən, Azərbaycan, Gürcüstan və Türkiyə öz coğrafi mövqelərindən Mərkəzi Asiya ərazisindən yüklərin tranzitçisi kimi istifadə edə biləcəklər. Bu gün ölkələr arasında «Bakı - Tbilisi - Qars» dəmir yolu layihəsi fəaliyyət göstərir və artıq Qazaxıstan vasitəsilə daşınan Çin yükləri onunla hərəkət edir. Avropa layihəsində iştirak yalnız bu dövlətlərin Aİ üçün əhəmiyyətini

artıracaq. Gürcüstan - bu, onun avrointeqrasiyaya olan ümidlərinə, Türkiyə - investorların etimadını bərpa etmək və lirə böhranını söndürmək üçün, Azərbaycana isə avroquruculuqların anti-Azərbaycan hücumlarını dayandırmaq üçün lazımdır.

Nəticə

Beləliklə, beynəlxalq münasibətlərin qeyri-sabitliyi şəraitində Orta dəhliz hazırda Avropa İttifaqının Rusiyaya tətbiq etdiyi sanksiyalarla əlaqədar fəaliyyət göstərən Şimal Ticarət Yolunun yeganə alternatividir. Bu layihənin bir sıra üstünlükləri var, məsələn, Orta Asiya ölkələrindən və Çindən Avropaya malların daha sürətli daşınması təmin edilir ki, bu da cəmi 12 gündür, Şimal dəhlizi ilə ən azı 19 gün çəkir.

Lakin malların Orta dəhliz boyunca daşınması prosesində bir sıra çətinliklər var. Bu çətinliklər ilk növbədə nəqliyyat yolunun çoxlu sayda ölkələrin ərazisindən keçməsi ilə bağlıdır ki, bu da daşınma prosesini maliyyə baxımından kifayət qədər bahalı edir, çünki gömrük rüsumlarını ödəmək lazımdır. Bundan əlavə, marşrutun bir hissəsi Xəzər dənizindən keçir və burada tankerlər vasitəsilə daşımaq lazımdır.

Bu nəqliyyat marşrutunun gələcək inkişaf perspektivlərinə nəzər salsaq, demək olar ki, geosiyasi liderlər dəyişə bilər. Mərkəzi Asiya regionunda nüfuz uğrunda mübarizədə Çin bu marşrutun yaradılmasının təşəbbüskarlarından biri kimi qalib gələcək. Eyni zamanda, bu marşrut Rusiyaya Avropa İttifaqının sanksiya siyasətindən yan keçməyə və ticarətin bərpası və yeni bazarların axtarışı üçün Orta Marşrutdan istifadə etməyə kömək edə bilər.

Təhlükəsizliyin artırılması və tranzit vaxtının azaldılması ilə yanaşı, Orta Dəhlizdən istifadə əmək miqrasiyasının ümumi mövzu olduğu bütün Mərkəzi Asiyada iqtisadi imkanları yaxşılaşdırmağa kömək edə bilər. Rusiyanın Ukraynaya genişmiqyaslı işğalından sonra da Orta Asiyadan bir milyondan çox əmək miqrantı Rusiyaya köçdü. Özbəkistan kimi Mərkəzi Asiya dövlətləri əmək miqrasiyasının istiqamətlərini şaxələndirmək üçün yollar axtarır. Avropa İttifaqının və müxtəlif beynəlxalq qurumların yeni investisiyaları bütün Mərkəzi Asiya və Qafqaz üzrə əmək miqrasiyasının dövriyyəsi üçün bir yol təklif edə bilər, bütün marşrut üzrə daha böyük ölkələrarası əməkdaşlığı təşviq edir.

İqtisadi imkanları artırmaqla yanaşı, Orta Dəhliz üzrə daşımaların həcminin artırılması daşımalarla bağlı tranzit rüsumlarından əldə edilən gəlirləri artıracaq. 2021-ci ildə Misir Süveyşdən keçən yük gəmilərindən tranzit ödənişlərindən 6,3 milyard dollar qazanıb. Bu rekord rəqəmlər koronavirus pandemiyası və Ever Given yük gəmisi tərəfindən altı günlük kanal blokadasına baxmayaraq əldə edilmişdir. Süveyşdən keçən həcm Orta Dəhlizin gözlənilən tutumundan dəfələrlə çox olsa da, Orta Dəhliz üzrə həcmin artması layihədə iştirak edən bütün ölkələr üçün sabit gəlir axını təmin edərdi.

Abstract

In recent years, sustainability-oriented consumption has become a major driver of change in both marketing strategies and financial models across global markets. This paper explores the marketing and financial determinants influencing consumer behavior in purchasing organic products in the Republic of North Macedonia. The research aims to identify key behavioral, socio-demographic, and economic factors that shape consumers' willingness to pay for organic goods, integrating sustainability perspectives into marketing and financial decision-making frameworks. Using quantitative research design and statistical analysis conducted through SPSS, the study finds that perceived nutritional value, education level, income, and trust in certification systems significantly affect consumers' readiness to pay premium prices for organic products. The findings suggest that transparent marketing communication, consumer education, and strong brand positioning can enhance market loyalty and stimulate sustainable demand. From a financial perspective, increased consumer awareness and government incentives for organic production can contribute to market growth, producer profitability, and long-term economic stability. The study underscores the importance of aligning marketing innovation and financial policy instruments to promote sustainable consumption behavior in emerging markets.

Keywords: Sustainability, marketing strategy, financial dynamics, consumer behavior, organic products.

INTRODUCTION

Food safety is widely recognized as one of the most critical issues in the production and processing of agricultural and food products. In this context, organic food has gained considerable attention, as its production is grounded in the balanced use of renewable resources, preservation of soil and water quality, and mitigation of environmental degradation. The growing interest in organic agriculture has encouraged an expanding body of research comparing the nutritional, environmental, and economic characteristics of organic and conventionally produced food.

Although the market for organic products in the Republic of North Macedonia is still emerging, consumer interest has increased steadily in recent years. Many consumers are willing to pay a price premium for organic goods, perceiving them as more nutritious and safer relative to conventional alternatives. This positive shift in consumer attitudes is accompanied, however, by several structural constraints, including limited purchasing power, high retail prices, and persistent albeit decreasing concerns about the reliability of certification and control mechanisms.

According to consumer behavior theory, individual choices are shaped by the maximization of utility based on personal preferences, income constraints, product prices, and broader socio-economic factors (Thompson, Consumer Demand for Organic Foods: What We Know and What We Need to Know, 1998). Building upon this theoretical premise, the present research aims to identify the profile of organic food consumers in North Macedonia by examining their socio-demographic characteristics and the economic and psychological determinants that influence their purchasing decisions. In line with the methodological framework outlined by Hanić (2005a), the research questions are translated into clearly formulated objectives and testable hypotheses.

Global trends further underscore the relevance of this study. The market for organic food and beverages has expanded significantly over the past two decades, with demand in many regions outpacing supply. Notably, the consumption of organic products continued to rise even during periods of global economic instability, indicating resilient and deeply rooted changes in consumer preferences. As highlighted by Vapa Tankosić & Lekić (2018), the alignment of national agricultural policies with European standards supported by adequate financial incentives can foster long-term income stability for producers, higher productivity, and improved market positioning for organic agricultural products.

Given these developments, a systematic investigation of the determinants shaping the behavior of domestic consumers is essential. Understanding the interplay between consumer awareness, trust in certification systems, psychological attitudes, income levels, and price sensitivity can provide meaningful insights for policymakers, producers, and retailers seeking to advance the development of the organic food market in North Macedonia. Such knowledge is crucial for strengthening the connection between organic production and consumer demand, thereby supporting the sustainable growth of this sector.

LITERATURE REVIEW

Organic food consumption has been widely examined across diverse markets, with research emphasizing determinants such as health consciousness, environmental concern, and trust in certification systems. Aertsens et al. (2009) highlight that personal and socio-psychological factors shape consumers' organic choices, while Magnusson et al. (2001) demonstrate that positive attitudes toward organic foods do not always convert into actual purchasing behavior. Padel & Foster (2005) address the persistent attitude-behavior gap, noting that price sensitivity, limited availability, and perceived product credibility affect final purchasing decisions. Yiridoe et al. (2005) further compare

consumer perceptions of organic versus conventional foods, underscoring the premium pricing challenge and the importance of clear labeling. Complementing these findings, Zanoli & Naspetti (2002) reveal that motivations for organic consumption are value-driven and culturally contingent, suggesting that marketing strategies must tailor messaging to specific consumer belief structures.

Overall, the literature demonstrates a complex interplay between motivations, perceived benefits, and market constraints. Understanding these dynamics is essential for improving demand forecasting, designing effective promotional strategies, and refining policy measures that support the organic sector's growth.

METHODOLOGY

Data Collection

Primary data were collected through an online structured questionnaire distributed to approximately 500 consumers across the Republic of North Macedonia. The survey instrument, adapted from internationally validated tools used in studies on organic food consumption, consisted of 17 mandatory questions, ensuring a complete dataset without missing responses. The questionnaire captured sociodemographic characteristics, general purchasing behavior related to organic products, willingness to pay a price premium, and respondents' evaluation of the nutritional attributes of organic products. Items included categorical variables, ordinal scales, and five-point Likert-type measures, allowing for precise operationalization of the key constructs. Secondary data from relevant academic literature, institutional reports, and prior empirical studies were used to contextualize the primary findings and to support the theoretical orientation of the research.

Analytical Framework

The empirical analysis centers on two dependent variables willingness to pay a higher price for organic products and perceived nutritional value while sociodemographic characteristics and consumer attitudes serve as explanatory variables. Data processing was performed using SPSS, employing a set of statistical techniques suitable for examining both associative and predictive relationships. Descriptive statistics were used to summarize consumer profiles and purchasing patterns. The binomial test and Chi-square test of independence assessed proportional differences and associations between categorical variables. Correlation analysis examined the strength and direction of relationships among key constructs, and multiple regression models were applied to evaluate the predictive power of sociodemographic and attitudinal factors on the dependent variables. This integrated analytical design ensures methodological robustness, supports rigorous hypothesis testing, and provides a comprehensive understanding of the determinants shaping consumer behavior in the organic products market.

RESEARCH AND DISCUSSION

To examine the relationship between socio-demographic characteristics and the regularity of organic food consumption, a new variable, "Regularity of Organic Consumption," was introduced.

Table 1: Distribution of respondents by regularity of organic consumption

Distribution of responses to the question: 'How often do you purchase organic products?'	Frequency	%	Variable: "Consumption Regularity"	Frequency	%
Daily	0	2,86	Regular consumers	165	3,05

Weekly	25	0,19	(1)		
Monthly	22	9,22			
Quarterly	21	,76	Casual consumers (2)	146	6,95
Semiannually	2	,64			
Annually	1	,32			
Total:	11	00,0	Total:	311	00,0

Source: Authors' calculations

Survey responses classified 53.05% of participants as regular consumers and 46.95% as occasional consumers, indicating a fairly balanced distribution. A binomial test confirmed that the proportion of regular consumers did not significantly differ from the expected 50% (p = 0.281).

Table 2: Binomial test for proportion of regular vs. occasional consumers

		Category	N	Observed Prop.	Test Prop.	Exact Sig. (2-tailed)
Regularity	Group 1	Irregular	146	,47	,50	,281
	Group 2	Regular	165	,53		
	Total		311	1,00		

Source: Authors' calculations

Descriptive analysis revealed that regular consumers were slightly more often women, predominantly aged 31–40 years, with higher education levels, living in households of up to four members, with monthly incomes between €500 and €1,000, and mainly residing in urban areas. These patterns are consistent with previous studies across Europe and the USA, where women, middle-aged adults, and urban residents are more likely to be regular purchasers of organic products.

The results indicate that socio-demographic factors—gender, age, education, household size, income, and urban residence—significantly influence the regularity of organic food consumption in North Macedonia.

Analysis of the Regularity of Organic Food Consumption and Consumers' Socio-Demographic Characteristics

To investigate the first hypothesis, which posits that socio-demographic characteristics do not significantly influence whether an individual is a regular or irregular consumer of organic products, a Chi-square test of independence was employed. One of the key assumptions for the validity of the Chi-square test is that the sample size must be sufficiently large so that the expected frequency in each cell is at least five. The present study, with a sample of 311 respondents, met this requirement, ensuring the robustness of the statistical analysis.

Table 3: Significance levels of socio-demographic characteristics and consumption regularity

Socio-Demographic Characteristics of Organic Food Consumers	Regularity in Purchasing Organic Products
Gender	,617
Age	,572
Education	,763
Household size	,096
Monthly income	,096
Place of residence	,897

Source: Authors' calculations

The analysis revealed that gender does not have a statistically significant effect on the regularity of organic food consumption ($\chi^2(1, n=311)=0.251$, $p=0.617$). This finding aligns with previous research conducted in multiple countries, including the United States, Greece, Italy, Croatia, and Serbia, where gender was similarly found not to significantly determine organic food consumption patterns ((Thompson & Kidwell, 1998); (Wandel & Bugge, 1997); (Tsakiridou et al., 2008); (Gracia & De Magistris, 2008); (Anic et al., 2014); (Vehapi & Dolićanin, 2016)).

Further, age was not significantly associated with consumption regularity ($\chi^2(5, n=311)=3.845$, $p=0.572$), suggesting that regularity in purchasing organic products is relatively consistent across different age groups in the study sample. Education level also showed no significant relationship with consumption regularity ($\chi^2(2, n=311)=0.541$, $p=0.763$), indicating that higher educational attainment does not necessarily predict more frequent consumption of organic products.

Household size was categorized into two groups (1–4 members vs. 5 or more members) to satisfy the Chi-square assumptions, and no significant association with consumption regularity was found ($\chi^2(1, n=311)=2.766$, $p=0.096$). Similarly, monthly household income did not show a statistically significant effect ($\chi^2(4, n=311)=7.884$, $p=0.096$), indicating that variations in income within this sample do not substantially influence whether consumers are regular or irregular buyers. Finally, the place of residence, whether urban or rural, also exhibited no significant impact on consumption patterns ($p=0.897$).

Overall, these results suggest that socio-demographic characteristics including gender, age, education, household size, income, and place of residence do not play a decisive role in determining the regularity of organic food consumption within the population studied. This insight is consistent with evidence from other international studies, which also reported the limited explanatory power of socio-demographic variables on consumer behavior regarding organic products. These findings imply that other factors, such as psychological attitudes, perceived health benefits, environmental concerns, and trust in certification mechanisms, may be more critical in shaping regular purchasing behavior.

Analysis of Socio-Demographic Characteristics of Loyal Consumers and Willingness to Pay a Premium for Organic Products

To examine the second hypothesis "Socio-demographic characteristics can serve as predictors of regular consumers' willingness to pay a higher price for organic products compared to conventional products"

descriptive statistics were first analyzed to identify the socio-demographic profile of regular consumers and their readiness to pay a premium for organic products. The analysis provided insights into the characteristics of consumers who are most willing to allocate additional resources for the purchase of organic products.

Regarding gender, the findings indicate that a higher proportion of male respondents were not willing to pay more than the conventional price for organic products. Overall, both male and female regular consumers were generally willing to pay a premium of 10–20%. However, female respondents were more willing than males to pay an additional 10–20% and 20–30% for organic products. Interestingly, in the category exceeding a 30% premium, male consumers demonstrated a slightly higher willingness to pay.

Age significantly influenced willingness to pay. Among all age groups, consumers aged 21–30 years were least willing to pay any additional amount for organic products (38.5%). The highest willingness to pay a 10–20% premium was observed among consumers aged 31–40 years (35.8%), followed by those aged 41–50 years (28.4%). Consumers over 50 years demonstrated greater readiness to pay a 20–30% premium. These results suggest that willingness to pay increases with age, likely reflecting higher income levels and educational attainment among older consumers, both of which positively influence the decision to pay a premium for organic products.

Education also played a notable role. Consumers with higher educational attainment were more willing to pay additional amounts, with 32.1% prepared to pay 10–20% more and 27.3% willing to pay 20–30% more. This supports existing evidence that higher education correlates with greater organic food consumption. Similarly, higher income was associated with a greater willingness to pay, as better-educated consumers typically have higher disposable incomes and can allocate more resources to organic products. Previous research in North Macedonia and Serbia corroborates these findings, identifying the typical organic consumer as an individual aged 18–50 years with higher education, generally unwilling to pay a premium exceeding 30% ((Sekovska et al., 2013); (Vehapi & Dolićanin, 2016)).

Household size also influenced willingness to pay. Smaller households, typically up to four members, were more willing to pay a 10–20% premium (37.6%), while a 20–30% premium was also notable (29.1%). The presence of children increased the likelihood of purchasing organic products, whereas larger households faced higher food expenditure burdens and were less willing to allocate additional funds to organic products. Similarly, monthly household income affected willingness to pay: households earning under €500 were generally unwilling to pay more than 10% extra, whereas households with incomes between €500–2,000 were willing to pay up to a 30% premium, and households earning over €2,000 were prepared to pay more than 30% extra. Place of residence also demonstrated an effect, with the majority of urban respondents willing to pay higher prices, reflecting urban predominance among regular consumers.

To formally test the predictive power of socio-demographic variables on willingness to pay, an ordinal logistic regression was conducted. The dependent variable was willingness to pay a premium for organic products, while independent variables included gender, age, education, household size, monthly household income, and place of residence. Multicollinearity was assessed using Spearman correlations and Variance Inflation Factor (VIF) analysis, revealing no violation of assumptions (all VIFs < 1.2).

Model fitting statistics indicated a significant improvement over the null model ($\chi^2(13)=34.188$, $p=0.001$), suggesting that the predictors meaningfully contributed to predicting willingness to pay. Goodness-of-fit tests showed acceptable model fit, with Pearson $\chi^2(335)=379.128$, $p=0.048$ and Deviance $\chi^2(335)=254.157$, $p=1.000$. Pseudo R^2 values were 0.074 (McFadden), 0.187 (Cox & Snell), and 0.199 (Nagelkerke), indicating that the model explained a meaningful portion of variance in the

dependent variable. Parallel lines assumption was satisfied (χ^2=52.839, df=39, p=0.069), confirming proportional odds across response categories.

Analysis of the final model revealed that only age and monthly household income were statistically significant predictors of willingness to pay. Specifically, respondents aged 20–30, 31–40, and 41–50 showed a reduced likelihood of paying a higher price compared to those over 60 (Exp(B) ranging from 0.23–0.24). Conversely, higher household income significantly increased the probability of willingness to pay: those earning €1,000–2,000 were 4.04 times more likely, and those earning over €2,000 were 13.67 times more likely, to pay a premium compared to households earning less than €200. Other socio-demographic factors, including gender, education, household size, and place of residence, did not reach statistical significance.

In conclusion, the empirical evidence supports the second hypothesis, confirming that certain socio-demographic factors namely age and monthly household income significantly determine regular consumers' decisions to pay a higher price for organic products. These findings have important implications for marketers and policymakers seeking to design targeted strategies to promote organic food consumption.

Analysis of the Nutritional Properties and Consumers' Willingness to Pay a Premium for Organic Products

The third working hypothesis assumed that consumers' willingness to pay a higher price for organic products significantly depends on their evaluation of the nutritional properties of these products. The majority of respondents (89.4%) who assessed organic products as having higher nutritional properties were willing to allocate additional funds for their purchase. Most respondents perceived organic products as having moderate nutritional properties (39.5%) compared to conventional products. The largest share of respondents who evaluated organic products as moderately nutritious were willing to pay 10–20% more for these products (36.6%). Among respondents who considered organic products to have higher (44.9%) or very high nutritional properties (33.3%), the willingness to pay 10–20% more was also prevalent, indicating that respondents recognize the superior quality and greater nutritional value of organic products relative to conventional alternatives. These products are perceived as tastier, more visually appealing, richer in nutrients, containing fewer chemicals, and offering more health benefits, which encourages consumers to pay a premium. To test the statistical independence between the categories of willingness to pay more and the evaluation of the nutritional properties of organic products, a Chi-square test was applied. The SPSS output showed a Pearson Chi-square value of 44.500 with 16 degrees of freedom (p = 0.000), indicating sufficient evidence to conclude that willingness to pay more and the evaluation of nutritional properties are dependent variables; in other words, willingness to pay more depends on the perception of nutritional properties. While Radović-Marković and Hanić (2018) note that Chi-square values and associated measures of association do not necessarily indicate a direct relationship between two variables, a correlation analysis was further applied to examine the strength and direction of the association. Spearman's rank correlation coefficient between the willingness to pay more for organic products and the evaluation of nutritional properties was 0.115, statistically significant at the 0.05 level (p = 0.042). Although the correlation is weak, it is positive, suggesting that higher perceived nutritional properties are associated with greater consumer willingness to pay a premium. This result confirms the initial hypothesis, as empirical evidence demonstrates a significant, positive linear relationship. Supporting these findings, prior research on consumers in North Macedonia and Serbia ((Sekovska и др., 2013)) showed that the majority of respondents (72% of Macedonian and 58% of Serbian consumers) believe that organic products are healthier and more natural than conventionally produced foods. Our study corroborates these observations, indicating that North Macedonian consumers who perceive organic products as nutritionally superior are more willing to spend additional resources to purchase them. This highlights that consumers in North Macedonia who

prioritize nutrition, food safety, and product quality are indeed more prepared to pay higher prices for organic products, thereby contributing to the confirmation of the third hypothesis.

Analysis of Consumers' Socio-Demographic Characteristics and the Assessment of the Nutritional Properties of Organic Products

The fourth working hypothesis was based on the assumption that consumers' socio-demographic characteristics (gender, age, education, household size, place of residence, and monthly income) can be used to predict their assessment of the nutritional properties of organic products. Based on descriptive indicators, conclusions were drawn regarding the characteristics of consumers who evaluate organic products as having higher nutritional properties compared to conventional products. The descriptive analysis shows that a high percentage of both men and women (92.6%) hold positive attitudes toward the superior nutritional value of organic products compared to conventional ones. The largest proportion of male (48.4%) and female (51.6%) respondents assessed organic products as having moderate nutritional properties (rating 3). A higher percentage of female respondents (62.2%) rated the nutritional qualities of organic products with a score of 4 compared to male respondents (37.8%), as well as with a score of 5 (53.0% and 47.0%, respectively). A small proportion of respondents (7.4%) rated the nutritional qualities of organic products as 1 or 2. It can therefore be concluded that female respondents are more likely to assign the highest ratings to the nutritional properties of organic products. The largest percentage of respondents in the 31–40 age group rated the nutritional properties of organic products with a score of 3 (36.3%). Among age groups over 40, no respondents assigned a rating of 1. Respondents who gave the highest rating of 5 mostly belong to the over-50 age category, indicating that older consumers have the most positive attitudes toward the higher nutritional value of organic products. Consumers with secondary education (36.7%), higher education (39.0%), and those with master's or doctoral degrees (44.6%) rated organic products as having moderate nutritional properties (score 3). A larger proportion of small households (up to 4 members) rated the nutritional properties of organic products with a score of 3. Within the moderate nutritional property category (score 3), households with monthly incomes of €500–1,000 were predominant (44.4%), while households with monthly incomes of €200–500 and €500–1,000 were most represented in the highest rating category (score 5). This suggests that households that value nutritional properties the most generally have monthly incomes between €200 and €1,000. Among respondents assigning a score of 5, the majority were urban residents (78.8%), suggesting that consumers from urban areas rated the nutritional value of organic products higher, likely because they are farther removed from nature and perceive these products as healthier than conventionally produced ones.

To further test Hypothesis 4, which states that "Based on consumers' socio-demographic characteristics (gender, age, education, household size, place of residence, monthly income), it is possible to predict their assessment of the nutritional properties of organic products," a statistical analysis was conducted using ordinal regression. All independent predictors were included in the model: gender, age, education, household size, monthly household income, and place of residence, while the assessment of the nutritional value of organic products was used as the dependent variable. First, the assumptions regarding model adequacy were tested. To examine potential multicollinearity, the correlations among predictor variables were inspected, and all coefficients were below the threshold of 0.6, indicating no multicollinearity. This was further confirmed using the Variance Inflation Factor (VIF), which showed no multicollinearity in the model, allowing all predictor variables to be retained for regression analysis.

Initial testing of the model across the total sample of organic consumers showed that the ordinal regression parameters were not statistically significant. Regularity of consumption was then included as a control variable, and further testing was conducted. The final model, including predictors such as gender, age, education, household size, monthly income, and place of residence, was evaluated to determine whether it improved prediction of the dependent variable (assessment of nutritional value) compared to the baseline model. The model fitting results ($\chi^2(14)=15.992$; $p=0.314$) indicated no

statistical significance. However, the Goodness-of-Fit test for irregular consumers showed significance, suggesting that the observed data are consistent with the tested model, justifying further analysis exclusively for the irregular consumer sample. Pseudo R^2 values indicated that the model explained approximately 11% of the variance in the dependent variable (Nagelkerke R^2=0.114). The parallel lines test confirmed the proportional odds assumption (χ^2=41.743, df=42, p=0.482), validating the adequacy of the final model.

Analysis of the final ordinal regression model revealed that only one variable—Education in the category of higher vocational education—was a significant predictor of the assessment of the nutritional value of organic products (Sig.=0.03) among irregular consumers. Based on the Exp(B) (odds ratio), irregular consumers with university-level education were 2.59 times more likely to rate the nutritional value of organic products higher compared to those with master's or doctoral degrees, assuming all other predictors are held constant.

CONCLUSION

This study provides empirical evidence on the determinants shaping consumer behavior toward organic products in the Republic of North Macedonia, offering insights relevant to sustainability-driven markets in emerging economies. The findings reveal that while socio-demographic characteristics do not systematically predict the regularity of organic food consumption, age and household income significantly influence consumers' willingness to pay a price premium. These results underscore the economic nature of sustainable purchasing decisions, where financial capacity and life-cycle stages condition the adoption of higher-priced organic alternatives. The analysis further confirms that perceptions of superior nutritional value strongly reinforce willingness to pay more, indicating that cognitive evaluations and product-related beliefs remain central drivers of sustainable consumption. Although this relationship is modest in magnitude, its statistical significance highlights the need for credible, evidence-based marketing communication and transparent certification systems capable of reducing consumer uncertainty and strengthening trust. Importantly, the study demonstrates that structural constraints price sensitivity, limited purchasing power, and perceived reliability of certification continue to moderate the translation of positive attitudes into actual purchasing behavior. These findings align with international literature and emphasize that behavioral, informational, and institutional barriers persist even in markets with increasing interest in organic products. Overall, the research contributes to the literature by integrating socio-demographic, economic, and perceptual determinants into a unified analytical framework. Policy measures that enhance consumer education, improve labeling credibility, and support affordability combined with marketing strategies emphasizing verified nutritional superiority have the potential to expand organic demand and foster a more resilient and sustainable food system.

EVALUATION OF RECREATIONAL HOT WATER USE IN THERMAL HOTELS IN KÜTAHYA IN TERMS OF SUSTAINABILITY AND ECONOMY

Mert TESTERE

Yüksek Lisans Öğrencisi, Rekreasyon Yönetimi Bölümü, Dumlupınar Üniversitesi, Kütahya, Türkiye

mert.testere@ogr.dpu.edu.tr

ORCID: 0000-0002-0293-0063

Abstract

Kütahya is one of Turkey's leading centers for health and tourism, renowned for its rich thermal resources. The recreational use of thermal waters (such as in spas, pools, and wellness facilities) constitutes a significant source of income for hotel enterprises; however, the intensity of this use raises important questions regarding environmental sustainability. This study aims to evaluate the recreational use of thermal water in Kütahya's thermal hotels from a sustainability perspective. Based on a review of the literature, the research emphasizes the necessity of utilizing thermal resources in tourism enterprises in an environmentally responsible, energy-efficient, and economically sustainable manner. The findings indicate that modern thermal hotels should adopt practices aligned with environmental sustainability principles, including energy efficiency, wastewater recovery, and natural resource management.

KÜTAHYA'DAKİ TERMAL OTELLERDE REKREASYONEL SICAK SU KULLANIMININ SÜRDÜRÜLEBİLİRLİK VE EKONOMİ AÇISINDAN DEĞERLENDİRİLMESİ

Öz

Termal otellerde kullanılan sıcak su, hem rekreasyonel hizmetlerin temel unsurlarından biri hem de işletmenin çevresel ve ekonomik sürdürülebilirliğini doğrudan etkileyen stratejik bir kaynaktır. Jeotermal kaynakların yenilenme hızları ile otellerin kullanım yoğunluğu arasındaki dengenin bozulması, mevsimsel değişimler sebebi ile yağmurun az yağması ve nerdeyse hiç kış yaşanmaması ayrıca kaçak kuyuların kullanılması kaynakların giderek azalmasına ve yenilenme hızının düşmesine sebep olduğu gözlemlenmiştir. Bu çalışma, termal otellerde sıcak su kullanımının yenilenebilirlik ilkeleri çerçevesinde değerlendirilmesini ve sürdürülebilir yönetim modellerinin ortaya konulmasını amaçlamaktadır. Literatür bulguları; kapalı devre sistemler, ısı geri kazanım teknolojileri, su yönetimi otomasyonları ve kuyuların izleme mekanizmalarının sürdürülebilir termal su kullanımında kritik rol oynadığını göstermektedir. Elde edilen sonuçlar, termal suyun yalnızca bir hizmet girdisi değil, aynı zamanda korunması ve etkin yönetilmesi gereken stratejik bir doğal sermaye olduğunu vurgulamaktadır.

Anahtar Kelimeler: Termal İşletmeler,Sürdürülebilirlik,Ekonomi

GİRİŞ

Kütahya, zengin termal kaynaklarıyla Türkiye'nin önemli sağlık ve turizm merkezlerinden biridir. Termal suların rekreasyon (dinlenme ve eğlence) amaçlı kullanımı, otel işletmeleri için önemli bir gelir kaynağı oluşturmaktadır. Ancak, bu kaynakların sürdürülebilirliği, aşırı kullanım, çevresel etkiler ve enerji verimliliği gibi konularla yakından ilişkilidir. Bu çalışma, Kütahya'daki termal otellerde rekreasyonel sıcak su kullanımının sürdürülebilirlik açısından değerlendirilmesini amaçlamaktadır.

Termal sular, kaplıca turizminin yanı sıra spa, havuz ve wellness hizmetleri gibi rekreasyonel faaliyetlerde yaygın olarak kullanılmaktadır. Kütahya'daki oteller, misafirlerine termal suyun rahatlatıcı ve şifa verici özelliklerini sunarken, aynı zamanda lüks bir konaklama deneyimi sağlamaktadır. Ancak, bu kullanımın yoğunluğu, su kaynaklarının geleceği açısından önemli soruları beraberinde getirmektedir.

Termal Turizm

Turizm sektörünün son yıllarda hızla gelişip büyümesi, sağlık turizmine olan ilgiyi de hızlı bir şekilde arttırmıştır (Kuşat & Esen, 2022; Sarkım, 2007; Garda&Temizel, 2017). İnsanların yoğun ilgi göstermesi ile birlikte artan ticaret hacmi farklı kollarda çeşitlilik sunmuştur. Sağlık turizmi yelpazesi içinde en büyük payı "termal turizm" işletmeleri oluşturmaktadır. Günümüzde insanlarının değişen yaşam tarzları ve sağlıksal ihtiyaçlarının daha iyi karşılanacağı düşüncesi ile sağlık turizminin bir kolu olan termal turizme yönelme ihtiyacı hissedilmiştir (Tengilimoğlu & Işık 2010). Sağlık turizmi içerisinde yer alan termal turizm, yeraltından çıkan 18 –20 derece üzerinde sıcaklığı olan ve içeriğinde litresinde en az 1 gram mineral bulunan maden sularına denilmektedir. Dinlenme, zindeleşme, tedavi ve bunun gibi amaçlarla başvurulan mekanlar "termal otel" olarak adlandırılmaktadır (Çontu, 2006; Keskin, 2008). Başka bir deyişle termal otellerin genel tanımlarda, kısaca şifa dağıtan tesisler olup, insanların bedensel, zihinsel ve ruhsal olarak rahatlamak istediği için tercih ettiği merkezler denilmektedir (Akyürek, 2016).

Kültür ve Turizm Bakanlığı'na göre termal turizm; mineral ve çamur banyosu gibi çeşitli türler ile birlikte fizik tedavi, egzersiz, diyet gibi yardımcı tedavilerin birleştirilmesi ile termal kaynakları eğlence ve rekreasyon amaçlı kullanılan turizm çeşididir (Öztürk & Bayat, 2011).

Türkiye, sahip olduğu yenilenebilir jeotermal kaynakları daha etkin ve verimli bir şekilde kullanabilmek amacıyla, geleneksel kaplıca anlayışının ötesine geçen yeni bir model benimsemektedir. Bu kapsamda, kür parkı, kür merkezi ve konaklama olanaklarını bir araya getiren ve uluslararası standartlara uygun nitelikli tesislerin sayısının artırılması hedeflenmektedir. Söz konusu yatırımlarla birlikte, termal turizmden elde edilen gelirin ve bu alanı ziyaret eden turist sayısının yükseltilmesi öngörülmektedir (Aklanoğlu, 2008).

Günümüzde turizm sektörünün çevresel etkilerinin artmasıyla birlikte, termal turizmin sürdürülebilirlik boyutu da ön plana çıkmıştır. Termal kaynakların bilinçsiz kullanımı, su ve enerji israfı ile doğal çevrenin tahribatı, uzun vadede bu işletmelerin faaliyetlerini riske atabilmektedir (Şen & Uz, 2023). Bu nedenle modern termal otel işletmeleri, çevresel sürdürülebilirlik ilkelerini benimseyerek enerji verimliliği, atık suyun geri kazanımı, karbon ayak izinin azaltılması ve doğal kaynakların dengeli kullanımı gibi uygulamalara yönelmektedir. Sürdürülebilir termal turizm anlayışı, yalnızca ekonomik kazanç sağlamayı değil; aynı zamanda yerel toplulukların refahını artırmayı, çevresel değerleri korumayı ve gelecek nesillere yaşanabilir bir çevre bırakmayı hedeflemektedir (Battaglia, 2017).

Sürdürülebilir Turizm

Sürdürülebilirlik kavramı; ekolojik, toplumsal, politik ve ekonomik pek çok alanda genişleyen bir etki alanına sahiptir. Kitlesel turizm faaliyetlerinin günlük yaşamın bir parçası haline gelmesi ve sanayi devrimi sonrasında gelişen ağır endüstriler, sağladıkları faydanın yanı sıra, çevre üzerinde yok edici bir tahribata neden olmuşlardır. Buna ilave olarak, hızlı nüfus artışı ve aşırı doğal kaynak tüketimi sonucu ortaya çıkan bozulma; çevrenin korunmasını zorunlu hale getirmiştir (Oflaz, 2023).

Dolayısıyla toplumlarda aşırı ve bilinçsiz doğal kaynak tüketimine karşı bir tepki oluşturmuştur. Bu çerçevede sürdürülebilirlik: "günümüzün ihtiyaçlarının gelecek nesillerin yaşam standartlarını zedelemeden karşılanması" olarak kabul edilebilir. Diğer bir tanıma göre ise; sürdürülebilirlik "toplum veya ekosistem gibi devam eden bir sistemin işlerini kesintisiz, bozulmadan veya aşırı kullanımla ana kaynaklara aşırı yüklenilip tüketilmeden sürdürebilmesi yeteneğidir" (Köroğlu & Karaman ,2014). Bu

bağlamda turizm özelinde, sürdürülebilirlik "turistik merkezin ayırt edici çekiciliklerinin korunarak geleceğe aktarılması" olarak da ifade edilebilir.

Sürdürülebilirlik, ekonomik büyüme, çevresel koruma ve toplumsal refah arasında denge kurmayı amaçlayan bütüncül bir kalkınma anlayışıdır. Günümüz küresel ekonomisinde artan çevresel sorunlar, doğal kaynakların tükenmesi ve toplumsal eşitsizlikler, sürdürülebilirlik kavramını hem bireyler hem de kurumlar açısından stratejik bir zorunluluk hâline getirmiştir (Kaypak, 2011).

İşletmeler açısından sürdürülebilirliğin benimsenmesi, uzun vadeli rekabet avantajı elde etmenin, kurumsal itibarın güçlendirilmesinin ve paydaş güveninin tesis edilmesinin temel koşullarından biridir. Sürdürülebilirlik ilkelerinin işletme stratejilerine entegre edilmesi, kaynak kullanımında etkinliği artırırken çevresel etkileri azaltmakta; aynı zamanda sosyal sorumluluk bilincini kurumsal kültürün bir parçası hâline getirmektedir (Yalçın, 2024). Bu durum, işletmelerin yalnızca ekonomik performanslarını değil, topluma ve çevreye olan katkılarını da ölçülebilir hâle getirerek kurumsal değer üretimini sürdürülebilir kılmaktadır (Düzer, 2018).

Dolayısıyla sürdürülebilirlik, çağdaş işletmecilik anlayışında etik, ekonomik ve ekolojik boyutlarıyla bir zorunluluk olarak ele alınmakta; işletmelerin uzun vadeli başarısının, çevreyle uyumlu ve toplumsal faydayı gözeten politikalar geliştirmelerine bağlı olduğu kabul edilmektedir. Sürdürülebilir turizmde aşırı kullanımdan kaynaklanan yıpranmayı önlemek için tercih edilebilecek bir pazarlama türüdür (Sezgin, Bilgiç & Akgül, 2024). Bu çerçevede, sürdürülebilir turizme uygun turizm nişleri; etkinlik turizmi, ekoturizm, doğa turizmi, kültür turizmi, keşif turizmi ve macera turizmi olarak belirlenebilir (Karpuz, 2017).

Sürdürülebilir Turizm Çeşitleri

Dünya Turizm Örgütü, sürdürülebilir turizm için üç temel ilke öngörmüştür. Bunlar; ekolojik ve biyolojik çeşitliliğin korunması, ev sahibi toplumların özgün sosyokültürel değerlerinin bozulmaması ve yerel halkın turizm sektöründe istihdamı sağlanarak, toplumsal yaşam standartlarının yükseltilmesidir (Goodwin 2007). Modern turizm pazarlamasındaki “niş pazarlama” teriminin kullanımı özel bir kitle için gerçekleştirilen odaklanmış pazarlama olarak ifade edilebilir. Diğer bir tanıma göre ise niş pazarlama; göreceli olarak benzer niteliklerde mal/hizmetlere gereksinim duyan, bir ya da daha çok benzer özelliği paylaşan, küçük bir tüketici kitlesinin istemlerini daha iyi karşılamak amacıyla geliştirilen pazarlama faaliyetleridir. Bu durumda niş pazar; gereksinimleri tam olarak karşılanamayan küçük bir müşteri grubunun istemlerini daha iyi karşılayabilmek için belirlenen çok dar kapsamlı, küçük bir pazar bölümüdür. Genellikle her endüstri kolunda, kendi alanında uzmanlaşmış, pazar nişlerinde hizmet veren firmalar vardır. Bu firmalar, bütün pazarda geniş bir alanda faaliyet göstermek yerine, pazar bölümlerini daha da bölümlendirerek pazar içinde pazar olarak bilinen çok küçük pazar bölümlerini kendilerine hedef pazar seçerler. Niş pazarlama, herkesin tercih ettiği mallar/hizmetler üretmek yerine, az kişinin çok fazla sevdiği malların/hizmetlerin üretimini gerçekleştirme temeline dayanır. Kitlesel pazarlarda bütün pazar için tek bir ürün modeli yapılırsa, tüketiciler ortalama düzeyde memnuniyet duyarlar. Bu bağlamda niş pazarlamada az sayıda tüketici için yüksek düzeyde tatmin sağlayacak ürünler kullanıma sunulur. Niş pazarlamanın önemi, boşlukları doldurmaktan kaynaklanmaktadır. Yani piyasada rakiplerin fark edemediği bir boşluk tespit edilir ve doldurulur (Uçkun & Çeltek, 2004). Sürdürülebilir turizmde aşırı kullanımdan kaynaklanan yıpranmayı önlemek için tercih edilebilecek bir pazarlama türüdür. Bu çerçevede, sürdürülebilir turizme uygun turizm nişleri; etkinlik turizmi, ekoturizm, doğa turizmi, kültür turizmi, keşif turizmi ve macera turizmi olarak belirlenebilir.

Örnek Sürdürülebilir Turizm Çeşitleri;

- Etkinlik Turizmi: Doğal çevre; kasırgalar, kutup buzulları, dağlar, okyanuslar gibi tekrar gidildiğinde sonsuz yenilik ve çeşitli hazır mücadeleleri sunan çok çeşitli olay ve ortamları birleştirmektedir.
- Ekoturizm: Ekoturizm, doğayı gözlemlemek ve deneyimle öğrenmek için boş zaman seyahatleri üzerine kurulmuştur.
- Doğa Turizmi: Doğa turizmi bazı kaynaklarda ekoturizmle eş anlamlı olarak kullanılırken bazılarında tamamen ayırt edici özellikleri olan bir turizm dalı olarak görülmektedir. Örneğin; Whelan'ın doğa turizminin ayırt edici özelliklerini vurgulayan ilk çalışmasında, ekoturizmin önemi de vurgulanmasına rağmen, turizmin sürdürülebilmesi için; doğal kaynakların acilen yönetilmesi ve korunması gerektiği savunulmuştur.
- Macera turizmi: Macera seyahati, geleneksel açık hava rekreasyonlarının gelişmiş şeklidir. Ewert (1994) göre, macera seyahatini diğer rekreaktif faaliyetlerden ayıran en önemli özellik, katılımcısına daha riskli bir deneyim yaşatmasıdır. Macera seyahati, doğal bir çevredeki veya egzotik bir açık hava ortamındaki kişisel mücadele ile ilgili algılanmış risk veya kontrollü tehlike içeren, katılım amacı yeni bir deneyimi keşfetmek olan, özel hedefli bir seyahattir
- Kültür Turizmi: Kültür turizmi, değişik kültürler ile yabancı, olağandışı ve alışılmamış ortamlara yoğunlaşan bir turizm türüdür. Kültür turizmi, etkinlik turizmi gibi oldukça geniş bir kavramdır.
- Keşif Turizmi : Keşfe yönelik kültür turizmi, zihinsel uyarım ve fikir geliştirme deneyimleri üzerine kurulmuştur. Kültürel turizmin en belirgin özelliği kişisel gelişim sağlanabilecek öğrenme ve keşif fırsatı için seyahat etmektir. Kültür turizminin tercih edilme nedeni; yeni yer, kültür, etkinlikleri keşfetme çevreyi öğrenme ihtiyacıdır.

Termal Turizm ve Sürdürülebilirlik İlişkisi

Termal turizm, doğal kaynakların kullanımına dayalı bir turizm türü olduğundan, sürdürülebilirlik kavramıyla doğrudan ilişkilidir. Yer altından çıkan sıcak su kaynakları, mineraller ve çamur gibi doğal unsurlar, doğru yönetilmediğinde tükenebilir veya ekosistemde kalıcı hasarlara yol açabilir. Bu nedenle termal turizmin geleceği, kaynakların çevreye duyarlı ve uzun vadeli bir planlama çerçevesinde kullanılmasına bağlıdır (Kaman & Bozkurt, 2025).

Termal tesislerin faaliyetleri sırasında ortaya çıkan en önemli çevresel sorunlardan biri, jeotermal suların aşırı ve kontrolsüz kullanımıdır. Kullanım sonrası arıtılmadan doğaya bırakılan termal sular hem yüzey hem de yeraltı sularının sıcaklığını ve kimyasal dengesini bozabilmektedir. Ayrıca enerji tüketimi, atık yönetimi ve karbon salınımı gibi unsurlar da termal işletmelerin sürdürülebilirlik performansını doğrudan etkilemektedir. Bu bağlamda, modern termal tesislerde atık suyun geri kazanımı, ısı enerjisinin yeniden kullanımı, yenilenebilir enerji sistemlerinin entegrasyonu ve doğal kaynak kullanımının izlenmesi gibi çevresel uygulamaların önemi giderek artmaktadır (Kaypak, 2011).

Ekonomik sürdürülebilirlik açısından bakıldığında, termal turizm yalnızca sağlık arayışı içindeki bireylere değil, aynı zamanda bölge halkına da gelir kaynağı oluşturmaktadır. Termal otellerin bulunduğu bölgelerde konaklama, ulaşım, gastronomi ve el sanatları gibi sektörlerin canlanması, yerel ekonominin güçlenmesine katkı sağlar (Cihangir, 2016). Ancak bu ekonomik büyümenin çevresel dengeyi tehdit etmemesi için kaynakların bilinçli yönetimi ve yerel toplulukların sürece aktif katılımı büyük önem taşır.

Sosyal sürdürülebilirlik boyutunda ise termal turizm, yerel halkın yaşam kalitesini artırma potansiyeline sahiptir. Termal tesislerin sağladığı istihdam olanakları, bölge gençlerinin göç etmesini önleyebilir; aynı zamanda halkın kültürel kimliğini ve bölgesel değerlerini koruma bilincini güçlendirebilir. Bu nedenle sürdürülebilir termal turizm, yalnızca çevre korumasına değil, aynı zamanda toplumsal refahın güçlendirilmesine de hizmet eden çok boyutlu bir kalkınma yaklaşımıdır (Bilgili, 2017).

Türkiye'de özellikle Afyonkarahisar, Kütahya-Yoncalı, Balıkesir-Gönen, Denizli-Karahayıt ve Nevşehir-Kozaklı gibi bölgelerde son yıllarda "yeşil otel", "eko-termal tesis" gibi kavramların yaygınlaşması, termal turizmin sürdürülebilirlik perspektifine yöneldiğini göstermektedir. Bu tesislerde enerji verimliliği sağlayan teknolojilerin kullanılması, atık yönetimi planlarının hazırlanması ve çevreye duyarlı mimari tasarımların benimsenmesi sürdürülebilir termal turizmin somut örnekleri olarak değerlendirilebilir (Kozak ,1992).

Sonuç olarak, termal turizm ile sürdürülebilirlik arasındaki ilişki, yalnızca doğal kaynakların korunmasına yönelik değil; aynı zamanda ekonomik sürekliliğin sağlanması, toplumsal faydanın artırılması ve çevresel bilincin yaygınlaştırılması açısından da stratejik bir öneme sahiptir. Bu ilişki, turizmin doğa ve insan arasında kurduğu dengenin geleceğe taşınabilmesi için bir zorunluluk hâline gelmiştir.

Termal Turizmin Sürdürülebilir Kalkınmaya Katkısı

Termal turizm, sürdürülebilir kalkınma hedefleri açısından çevresel, ekonomik ve sosyal boyutlarıyla önemli katkılar sunmaktadır. Öncelikle çevresel açıdan, termal turizmin gelişimi doğal kaynakların daha bilinçli ve kontrollü kullanılmasını gerektirdiğinden, suyun ve enerjinin verimli yönetimi konusunda farkındalık yaratmaktadır. Bu kapsamda birçok termal tesis, yenilenebilir enerji kullanımı, gri su geri dönüşüm sistemleri, ısı yalıtımı ve atık ayrıştırma uygulamaları ile çevreye duyarlı üretim modelleri benimsemektedir. Bu uygulamalar hem çevresel tahribatın önüne geçilmesini hem de işletme maliyetlerinin azaltılmasını sağlamaktadır (Cesur, 2023).

Ekonomik boyutta, termal turizm bölgesel kalkınmanın itici gücü konumundadır. Türkiye'nin termal bölgelerinde (örneğin Afyonkarahisar, Kütahya, Balıkesir, Nevşehir) oluşturulan turizm altyapısı, sadece turistik gelirleri değil; aynı zamanda yerel istihdamı, küçük ölçekli işletmelerin gelişimini ve bölgesel girişimciliği de desteklemektedir. Termal turizm, yılın dört mevsiminde talep görebilmesi sayesinde turizmde mevsimsellik sorununu azaltmakta ve sürdürülebilir gelir akışı sağlamaktadır (Erdoğan & Aklanoğlu, 2008).

Sosyal sürdürülebilirlik açısından termal turizm, yerel halkın yaşam kalitesini yükselten ve toplumsal refahı destekleyen bir rol üstlenmektedir. Termal tesislerin açılmasıyla birlikte bölge halkı için yeni istihdam alanları doğmakta; aynı zamanda halkın sağlık bilinci, çevre duyarlılığı ve sosyal etkileşim fırsatları da artmaktadır. Bununla birlikte, yerel kültürün korunması, geleneksel şifa uygulamalarının tanıtılması ve gastronomi turizmiyle birleşen yöresel mutfak kültürünün yaşatılması da kültürel sürdürülebilirliğe katkı sağlamaktadır (Çağlı, 2012).

SONUÇ VE ÖNERİLER

Termal turizm, sağlık ve rekreasyonun birleştiği bir turizm türü olarak Türkiye'nin turizm çeşitliliğine önemli katkılar sunmaktadır (Göçmen, 2008). Ancak bu katkının sürdürülebilir olabilmesi, doğal kaynakların doğru ve yenilenebilir biçimde kullanılması, sürece yerel toplulukların da dahil edilmesi ve çevre bilincinin artırılması ile mümkündür. Sürdürülebilir termal turizm anlayışı, yalnızca ekonomik kazanç elde etmeyi değil; aynı zamanda doğanın korunmasını, gelecek nesillere aktarılabilirliğinin sağlanmasını ve toplumun refah düzeyinin yükseltilmesini hedeflemektedir.

- Kaynak Yönetimi: Termal suyun kullanım sonrası arıtılarak yeniden kazanımı zorunlu hâle getirilmeli; suyun debi, sıcaklık ve kimyasal bileşimi düzenli olarak izlenmelidir.
- Enerji Verimliliği: Termal tesislerde güneş, jeotermal ve biyokütle gibi yenilenebilir enerji kaynaklarının kullanım oranı artırılmalıdır.
- Çevre Sertifikasyonları: Termal otellere çevreye duyarlı işletme belgeleri (Green Key, Eco Label, ISO 14001 vb.) almaları için teşvik sağlanmalıdır.
- Yerel Katılım: Yerel halkın karar alma süreçlerine dahil edilmesi, bölgesel kalkınmanın sosyal boyutunu güçlendirecektir.

- Eğitim ve Farkındalık: Turizm fakülteleri, belediyeler ve kamu kurumları iş birliğiyle "Sürdürülebilir Termal Turizm Yönetimi" konulu eğitim programları düzenlenmelidir.
- Ar-Ge ve İzleme: Termal kaynakların uzun vadeli korunması için araştırma merkezleri kurulmalı ve bu kaynakların kullanım verileri kamuya açık hâle getirilmelidir.

Sonuç olarak, sürdürülebilir termal turizm anlayışı; yalnızca ekonomik kazanç sağlamayı değil, aynı zamanda çevresel dengenin korunmasını, yerel halkın yaşam kalitesinin yükseltilmesini ve kültürel sürekliliğin sağlanmasını da hedeflemektedir. Doğaya zarar vermeden gerçekleştirilen planlı yatırımlar, kaynak yönetimi ve çevre bilinciyle desteklendiğinde, Türkiye'nin sahip olduğu zengin jeotermal potansiyel ülkeyi sağlık ve sürdürülebilirlik temelli turizmde küresel ölçekte güçlü bir aktör hâline getirecektir.

TEŞEKKÜR

Bu çalışmada sundukları kritik yönlendirmeler ve değerli katkılar için Sayın Prof. Dr. Emin Kuru, Prof. Dr. Niyazi Kurnaz ve Dr. Öğr. Üyesi Burcu Akdeniz'e teşekkür ederim.

Özet

Bu çalışma, finansal kapsayıcılığın (FK) gelir dağılımı eşitsizliği üzerindeki etkilerine ilişkin ampirik bulguları, 2010 sonrası dönemi kapsayan bir taramayla ve çeşili FK göstergeleri temelinde sistematik biçimde özetlemeyi amaçlamaktadır. Finans–büyüme ilişkisine dair literatür geniş olsa da, finansal sektörün gelir eşitsizliği üzerindeki etkilerinin görece daha sınırlı şekilde incelendiği görülmektedir. İncelenen çalışmaların genel eğilimi, FK'nın özellikle düşük ve orta gelirli ülkelerde eşitsizliği hafifletme potansiyeline sahip olduğunu, ancak finansal derinliğin yüksek olduğu ülkelerde etkinin zayıflayabileceğini ve belirli koşullar altında tersine dönebileceğini göstermektedir. Etkilerin büyüklüğü ve yönü; erişim–kullanım–kalite, kurumsal kalite ve düzenleyici/denetleyici kapasite ile sosyal grupların erişim kalıplarına bağlı olarak geniş ölçüde değişiklik göstermektedir. Çalışma, literatürden elde edilen bulguları kamu politikalarıyla ilişkilendirmektedir. Bu bağlamda; temel hesaplara erişimin kolaylaştırılması, maliyetlerin düşürülmesi, tüketicilerin koruması, finans piyasalarında rekabetin tesis edilmesi ve dezavantajlı grupları hedefleyen tasarımların geliştirilmesi gibi gelir eşitsizliğiyle mücadelede uygulanabilir bir politika çerçevesi önerilmektedir.

Keywords: Finansal kapsayıcılık, finansal erişim, gelir dağılımı, gelir eşitsizliği

Abstract

This study aims to systematically summarize empirical findings on the impact of financial inclusion (FI) on income inequality, covering the post-2010 period and based on various FI indicators. While the literature on the finance-growth relationship is extensive, the impact of the financial sector on income inequality appears to have been relatively limited. The general trend of the reviewed studies suggests that FI has the potential to alleviate inequality, particularly in low- and middle-income countries, but that the impact may be weakened and, under certain circumstances, reversed in countries with high financial depth. The magnitude and direction of the effects vary widely depending on access, usage, and quality, institutional quality, regulatory/supervisory capacity, and access patterns of social groups. The study relates the findings from the literature to public policies. In this context, a viable policy framework is proposed to combat income inequality, including facilitating access to basic accounts, reducing costs, protecting consumers, establishing competition in financial markets, and developing designs targeting disadvantaged groups.

Keywords: Financial inclusion, financial access, income distribution, income inequality

GİRİŞ

Son yirmi yılda artma eğilimi gösteren gelir ve servet eşitsizlikleri, toplumsal refahı ve sürdürülebilir kalkınmayı doğrudan etkileyen bir sorun olarak yeniden öne çıkmıştır. Söz konusu eşitsizliklerin derinleşmesi, fırsat eşitliğini de olumsuz yönde etkileyerek sosyal mobilite önünde önemli bir engel haline gelmektedir (Cihak ve Sahay, 2020). Bu bağlamda, maliye politikalarının vergi–transfer sistemi ve kamusal hizmetler vasıtasıyla eşitsizlikle mücadelede bakımından merkezi rolü tartışmasızdır.

Bununla birlikte, hanehalklarının ve küçük işletmelerin formel finansal hizmetlere erişimi ve bu hizmetleri fiilen kullanabilmesi, fırsat eşitliğini ve ekonomik dayanıklılığı artırabilecek tamamlayıcı bir mekanizma olarak öne çıkmaktadır.

Finansal kapsayıcılık, yalnızca krediye erişim değil; ücret ve işlem maliyetlerinin düşüklüğü, ürünlerin uygunluğu, güvenli ödeme kanalları ve sigorta benzeri koruma araçları gibi birden çok boyutu birlikte içerir (Dünya Bankası, 2014). FK'nın artması, düşük gelirli hanehalklarının beşerî sermaye yatırımları yapabilmesini, üretken yatırımlara yönelmesini ve şoklara karşı dayanıklılığını güçlendirebilir. Bu nedenle literatürde FK, eşitsizliği azaltıcı bir kaldıraç olarak ele alınmaktadır. Öte yandan, heterodoks yaklaşımlar FK genişlemesinin borçluluk ve finansallaşma kanalıyla dezavantajlı grupların kırılganlığını artırabileceğini ve uzun dönemde servet eşitsizliğini derinleştirebileceğini vurgulamaktadır. Bu ikili tartışma, FK–eşitsizlik ilişkisinin ülke grupları, kurumsal yapı, inceleme dönemi ve düzenleme çerçevesi gibi koşullara duyarlı olduğunu göstermektedir.

Bu çalışma, 2010 sonrası dönemde FK ile gelir eşitsizliği arasındaki ilişkiyi inceleyen ampirik literatürü tematik biçimde derleyerek bulguların genel yönünü, etkilerin hangi kanallar üzerinden işlediğini ve sonuçları farklılaştıran kurumsal ve yapısal koşulları ortaya koymayı hedeflemektedir. Bu sayede maliye politikalarının yanında finansal sektöre ilişkin düzenleyici politikaların, eşitsizliğin azaltılmasında nasıl tamamlayıcı bir rol üstlenebileceği ve finansal kapsayıcılığı artırıcı etkin kamu politikası seçeneklerinin neler olabileceği tartışılmaktadır.

TEORİK ARKA PLAN

FK–eşitsizlik ilişkisini açıklamak için literatürde iki ana yönelim öne çıkmaktadır. Ortodoks yaklaşımlar, finansal dışlanma ve özellikle krediye erişim eksikliğinin yoksulluk tuzaklarını derinleştirdiğini, sosyal hareketliliği sınırladığını ve uzun dönemde büyüme ve gelir dağılımını olumsuz etkileyebileceğini ileri sürer. Bu çerçevede teminat ve başlangıç serveti kısıtlarının eğitim ve girişimcilik gibi yatırım kararlarını belirlediği modeller kapsamlı biçimde tartışılmıştır (Banerjee ve Newman, 1993; Galor ve Zeira, 1993; Aghion ve Bolton, 1997). Örneğin Galor ve Zeira'nın (1993) yaklaşımında, başlangıç serveti düşük olan bireyler beklenen getirisi yüksek olsa dahi eğitime yatırım yapamaz; sonuçta kuşaklar arası eşitsizlik kalıcılaşır. Banerjee ve Newman'ın (1993) modelinde ise bireylerin meslek seçimi (girişimci olmak ile ücretli kalmak arasında) başlangıçtaki gelir ve servet düzeyleri tarafından kısıtlanır. Bu modeller, finansmana erişim eksikliğinin kalıcı gelir eşitsizliği veya yoksulluk tuzakları üretmesinde ve aynı zamanda daha düşük büyüme ile sonuçlanmasında kritik bir rol oynayabildiğini göstermektedir.

Heteredoks yaklaşımlar ise finansal hizmetlerin düşük ve orta gelirli hanehalklarına ulaştırılması ile ortaya çıkan refah etkisinin geçici olduğunu, gerçekte gelecekteki tüketimlerin bugüne çekilmesiyle borçluluk seviyelerinin arttığını, finansallaşmanın uzun vadede gelir ve servet eşitsizliklerini artırmaya devam edeceğini vurgulamaktadır (Lapavistas, 2009; Saad-Filho, 2011). Bu görüşe paralel bir şekilde, düşük ve orta gelirli ülkelerde, finansal kapsayıcılık belli bir seviyeyi aştıktan sonra, hanehalklarının borçluluk düzeylerinin önemli ölçüde yükseldiğini raporlayan bulgular da mevcuttur (Sezer vd., 2025). Ayrıca FK kavramının, neoliberal dönüşüm sürecinde tartışılan eşitsizlik, yoksulluk ve borçluluk sorunlarının hem nedeni hem sonucu olarak gündeme geldiği yönünde eleştiriler bulunmaktadır. Abuk Duygulu ve Özyiğit (2022) finansal kapsayıcılığı, kapitalizmin finansal mekanizmalar aracılığıyla dönüşümünü ifade eden bir finansallaşma biçimi olarak ele almaktadır. Bu sebeple, eşitsizliği ve yoksulluğu finansal mekanizmalar aracılığıyla yönetmeyi amaçlayan politikaların yerine, ücret, istihdam ve maliye politikalarıyla doğrudan düşük gelirlilerin gelirini artırmayı hedefleyen, vatandaşlık geliri vb. uygulamaların somutlaştırılacağı politikaların tartışılmasını ve geliştirilmesini önermektedir.

KAVRAMSAL ÇERÇEVE VE ÖLÇÜM YAKLAŞIMLARI

Finansal gelişme kavramı geleneksel olarak finansal derinleşme anlamında yorumlanmıştır ve bu da finansal sistemin büyüklüğüyle temsil edilmiştir. Ancak finansal sistemin büyüklüğü her zaman düşük gelirlilerin finansal hizmetlere erişimini ve kullanımını garanti etmez. Yakın dönemde ortaya çıkan finansal kapsayıcılık kavramı ise, gelir eşitsizliğini azaltmada finansal derinleşmeden çok daha etkili bir araç olarak görülmektedir (García-Herrero & Turégano, 2015).

Finansal kapsayıcılık, resmî (formel) finansal hizmetlere *erişim* ve bu hizmetlerin *kullanımı* olarak tanımlanır. Temel fikir, finansman araçlarının mümkün olduğunca çok kişi için ve çeşitli amaçlarla erişilebilir olmasıdır. Çalışma çağındaki tüm yetişkinlerin gelir ya da transferleri alabilecek hesaplara, paralarını güvenli ve ihtiyatlı biçimde tutmaya yarayan tasarruf hesaplarına, bireysel ya da ticari amaçlı kredi kaynaklarına ve olumsuz dönemlere karşı dayanıklılık sağlayan sigorta ürünlerine resmi hizmet sağlayıcılar yoluyla erişimi finansal kapsayıcılığın yüksek olduğu durumu işaret etmektedir (Kim, 2016). Dünya Bankası (World Bank) (2014)'na göre, finansal kapsayıcılık kavramı "sorumlu ve sürdürülebilir biçimde sunulan finansal hizmetlere erişim ve kullanım"dan, "dezavantajlı ve düşük gelirli kesimlere karşılanabilir maliyetlerle finansal hizmetlerin ulaştırılması"na kadar uzanan bir yelpazeyi kapsamaktadır.

Erken dönem çalışmalar, finansal gelişmeyi çoğunlukla özel sektöre verilen kredi/GSYH gibi tekil göstergeler üzerinden izlemiştir (Beck vd., 2007; Fowowe ve Abidoye, 2013). Bu durumun başlıca sebebi finansal kapsayıcılığın ölçülmesinde kullanılan çok boyutlu göstergelere ilişkin veri tabanlarının 2000'li yılların sonlarına doğru oluşturulmaya başlamasıdır. Yakın dönem yazında ise finansal hizmetlere ilişkin:

-Erişim (demografi ya da coğrafyaya göre Şube sayısı, ATM sayısı, kişi başına düşen mevduat hesabı sayısı vb.),

-Kullanım (kredi hacmi/GSYH, mevduat hacmi/GSYH, sigorta prim hacmi/GSYH, vb.),

-Kolaylık (teminat tutarları, işlemlerin aldığı süre, dökümantasyon gereklilikleri, dijitalleşme, vb.),

-Maliyet (yıllık hesap ücretleri, aracılık işlem ücretleri, kredi maliyetleri, transfer ücretleri, vb.),

gibi çeşitli boyutları bir araya getiren kompozit endekslerin, finansal kapsayıcılığın ölçülmesinde yaygın biçimde kullanıldığı görülmektedir (Sarma, 2012, 2015; Omar ve Inaba, 2020). Boyutların endekste temsil edeceği ağırlıkların belirlenmesinde ise eşit ağırlık gibi sübjektif yaklaşımlar ile PCA (Temel Bileşenler Analizi) benzeri istatistiki yöntemler kullanılabilmektedir (Camara ve Tuesta, 2014; Yorulmaz, 2018).

Bu göstergeler arz yanlı bilgilerin toplandığı veri tabanları (IMF-Financial Access Survey (2004-), Financial Development Database (1960-), Financial Development index (1980-), Bank Regulation and Supervision Survey, 2011-2016) ya da talep yanlı bilgilerin toplandığı veri tabanlarından (World Bank, Global Findex Database (2011-), Enterprise Survey (2002-)) faydalanılarak toplulaştırılmakta ve endeks haline getirilmektedir. Çalışmalar arasında kullanılan veri seti ve göstergeler farklılaştıkça, bulguların karşılaştırılabilirliği de sınırlanabilmektedir.

FİNANSAL KAPSAYICILIĞIN EŞİTSİZLİĞİ ETKİLEDİĞİ KANALLAR

Finans kuramına göre finansal kurumlar ve piyasalar, sermayenin etkin tahsisinde kritik bir rol oynar. Bu çerçevede, sermayenin hanehalkları ile firmalar arasında dağılımı finansal hizmetler aracılığıyla gerçekleşir ve nihayetinde ekonomik büyümeyi destekler. Finans–büyüme ilişkisi literatürde kapsamlı

biçimde incelenmiş olsa da, finansal hizmetlerin yoksulluk ve gelir eşitsizliğiyle bağlantısı görece daha az ele alınmıştır. Öyle ki eşitsizlik üzerine gerçekleştirilen ampirik çalışmaların sadece 10'da 1'inde finansal sektörün etkileri tartışılmaktadır (Cihak ve Sahay, 2020). Oysa finansal hizmetlere erişimin artması, özellikle düşük gelirli kesimlerin eğitim-istihdam-yatırım fırsatlarına ulaşımını kolaylaştırarak gelirlerini yükseltebilir; dolayısıyla gelir dağılımının daha adil hâle gelmesine katkı sağlayabilir.

İncelenen literatürde FK'nın gelir eşitsizliği üzerinde olumlu yönde etkili olabileceği başlıca kanallar şu şekilde sınıflandırılabilir:

(i) Krediye erişim: Uygun maliyetli kredi, düşük gelirli bireylerin tüketim seviyesini destekleyerek refahını artırabilir, eğitime yahut üretken faaliyetlere yatırım yapmasını kolaylaştırarak gelir yaratma kapasitesini ve sosyal hareketliliği destekleyebilir (Fowowe & Abidoye, 2013; Banerjee ve Duflo, 2014).

(ii) Tasarruf ve varlık birikimi: Resmî tasarruf araçlarıyla hesap sahipliğinin artması, gelir dalgalanmalarına karşı dayanıklılığı ve varlık birikimini güçlendirebilir (Burgess ve Pande, 2005).

(iii) Sigorta ve risk azaltma: Mikro sigorta ve benzeri koruma araçları, düşük gelirlilerin olumsuz şoklar karşısında tüketim ve yatırım kararlarını daha istikrarlı biçimde sürdürmesine katkı sağlayabilir (Cull vd., 2014).

(iv) İstihdam ve girişimcilik: Resmî finansmana erişim, özellikle küçük işletmelerin sermaye kısıtlarını hafifleterek girişimcilik faaliyetlerini teşvik edebilir ve istihdam yaratma kapasitelerini artırabilir (Beck ve Demirgüç-Kunt, 2008; Li vd., 2025).

(v) Makroekonomik istikrar: Finansal aracılık hizmetlerinin artışı, risklerin havuzlanmasını sağlar ve bu sayede azaltılmasına yardımcı olur, finansal piyasalara özgü asimetrik bilgi sorununu azaltıcı fonksiyon gösterir, böylece düşük gelirliler için daha faydalı olan istikrarlı bir makroekonomik çevrenin inşasını destekler (Fowowe & Abidoye, 2013).

(vi) Kurumsal tamamlayıcılar: FK'nın olumlu etkilerinin ortaya çıkabilmesi; finansal okuryazarlık, tüketici koruması ve düzenleme/denetleme kapasitesi gibi tamamlayıcı kurumlarla güçlenebilir (Čihák ve Sahay, 2020).

Bununla birlikte, finansal kapsayıcılığın eşitsizlikle ilişkisi ülkeler arasında yön ve büyüklük bakımından farklılaşabilmektedir. Bu ilişki ekonomik gelişmişlik, sosyo-kültürel yapı, kurumsal kalite ve düzenleyici çerçeve ile finansal kurumların, piyasaların ve araçların niteliği ve izlenen kapsayıcılık politikalarının tasarımına bağlıdır.

YÖNTEM

Bu çalışma, 2010 sonrası dönemde yayımlanan ampirik araştırmaları sistematik bir derleme mantığıyla sentezleyerek finansal kapsayıcılık (FK) ile gelir dağılımı eşitsizliği arasındaki ilişkinin yönünü, gücünü ve koşullara bağlılığını değerlendirmeyi amaçlamaktadır. Bu çerçevede dört temel araştırma sorusu belirlenmiştir: (S1) Finansal kapsayıcılık gelir eşitsizliğini azaltmakta mıdır? (S2) Bu etki hangi kanallar üzerinden işlemektedir (erişim/kullanım/kalite)? (S3) Ülkelerin gelir düzeyine göre bulgular nasıl farklılaştırmaktadır? (S4) FK'nın etkisini güçlendiren/zayıflatan etkileşim faktörleri (cinsiyet, kültürel normlar, kurumsal kalite vb.) nelerdir?

Bu sorulara yanıt üretmek amacıyla literatür taraması, "financial inclusion" ve "income inequality" anahtar kavramları etrafında kurgulanmış; tarama dizgileri gerekli durumlarda "inequality", "Gini", "financial access", "account ownership", "ATM/branch density" gibi terimlerle genişletilmiştir. İncelemenin kapsamı, finansal kapsayıcılığı tekil göstergelerle değil çok boyutlu biçimde (erişim–

kullanım–kalite/uygunluk) ölçen ve gelir eşitsizliğini Gini katsayısı üzerinden ele alan ampirik çalışmalar ile sınırlandırılmıştır. Böylece FK'nın "finansal derinlik" göstergeleriyle (ör. kredi/GSYH) karıştırılmasının doğurabileceği kavramsal belirsizlik azaltılmaya çalışılmıştır. Dahil etme sürecinde FK ile eşitsizlik arasında açık bir ampirik ilişki test eden, değişken tanımı ve yöntem bilgisini şeffaf biçimde raporlayan çalışmalar esas alınmıştır.

LİTERATÜR TARAMASI

2000'li yıllarda IMF ve Dünya Bankası'nın finansal kapsayıcılığa ilişkin veri tabanlarının gelişmesiyle birlikte, özellikle 2010 yılı ve sonrasında FK'nın gelir eşitsizliği üzerindeki etkilerinin ampirik olarak analiz edildiği çalışmaların sayısı da hızla artış göstermiştir. Aşağıda yer alan tabloda, söz konusu çalışmalar inceleme dönemi ve ülke örneklemi, FK ve eşitsizlik ölçütü, incelemede kullanılan yöntem ve elde edilen bulgulara göre kronolojik olarak gösterilmektedir.

Tablo 1: Finansal Kapsayıcılık ve Gelir Eşitsizliği Üzerine Ampirik Literatür

Çalışma	Örnek/ Periyot	FK Ölçütü	Eşitsizlik Ölçütü	Yöntem	Bulgular (özet)
Mookerjee ve Kalipioni (2010)	99 ülke, 2000-2005	100.000 kişiye düşen banka şubesi, banka hesabı için gereken min. tutar, kredi başvurusu için uzaklık	Gini katsayısı	OLS/IV	Banka şube yaygınlığı arttıkça Gini katsayısı düşmekte, hesap açmanın maliyeti ve uzaklık arttıkça Gini katsayısı artmaktadır.
Dabla Norris vd. (2015)	Uganda, Kenya, Mozambik, Malezya, Filipinler ve Mısır 2005/2007	Erişim boyutu: Kredi kullanma maliyeti, Derinlik boyutu: borçlanma kısıtı (teminatlar) ve Aracılık maliyetlerinin bileşkesi olan bir endeks	Gini katsayısı	Genel Denge Analizi	Finansal kapsayıcılığın etkisi, ülkeye özgü özelliklere bağlı olarak değişkenlik gösterir. Örneğin Uganda'da teminatlar çok yüksek belirlenmiştir, kredi hacminin artışı varlıklı firmalara yarar. Finansmana erişim maliyetlerinin düşmesi ise eşitsizliği azaltmaktadır.
García-Herrero ve Turégano (2015)	Geniş örneklem, 2000-2011	Finansal kapsayıcılık, Finansal derinlik	Gini katsayısı	Panel OLS	FK eşitsizliği azaltır. Finansal derinliğin ise anlamlı bir etkisi yoktur.

Park & Mercado (2015)	37 GOÜ Asya ülkesi, 2004–2011	Bileşik FK endeksi	Gini, yoksulluk	FE/RE, 2SLS	Finansal kapsayıcılık yoksulluğu önemli ölçüde azaltır; gelir eşitsizliğini düşürdüğüne dair kanıtlar daha zayıftır.
Kim (2016)	40 OECD ve EU ülkesi	Bileşik endeks: Yaygınlık (1000 kişiye düşen banka hesabı), erişebilirlik (şube sayısı), kullanım (kredi/GSYH)	Gini katsayısı	OLS/GMM	Tüm örneklemde FK arttıkça Gini düşmektedir. Ülkeler gruplandırıldığında, düşük gelirli ülkelerde etki daha güçlüdür. Finansal sistemin görece daha zayıf olduğu ülkelerde, kapsayıcılık gelir eşitsizliğini daha fazla azaltmaktadır.
Aslan vd. (2017)	140 ülkeden 146000 bireyin anket verisi, 2011/2014	Bileşik FK endeksi, finansal erişimde cinsiyet eşitsizliği	Gini katsayısı	Çoklu Uyum Analizi	Finansal hizmetlere erişimdeki cinsiyet eşitsizliği, daha yüksek gelir eşitsizliği ile ilişkilidir. Kadın-erkek finansal erişim farkının azaltılması, gelir eşitsizliğini önemli ölçüde azaltmaktadır.
Park & Mercado (2018)	176 ülke ve Asya	Bileşik FK endeksi (PCA analizi)	Gini, yoksulluk	Panel OLS	FK arttıkça orta ve yüksek gelirli ülkelerde yoksulluk azalmaktadır. Gelir eşitsizliği için anlamlı ilişki tespit edilememiştir.
Neaime & Gaysset (2018)	8 MENA ülkesi, 2002–2015	FK göstergesi olarak erişim: 100 bin kişiye düşen banka şube sayısı ve ATM sayısı	Gini, yoksulluk	GLS/GMM	FK gelir eşitsizliğini azaltmaktadır ancak yoksulluk üzerinde anlamlı bir etkisi yoktur.
Chu Khanh & Chu (2018)	69 ülke, 2015-2017	FK indeksi (hesap-kart sahipliği ve kullanım sıklığı, tasarruf ve	Gini katsayısı	OLS	Finansal kapsayıcılık arttıkça gelir eşitsizliği azalmaktadır. Bu etki GOÜ'lerde daha yüksektir. Finansal

		borçlanma oranı/ PCA analizi), finansal derinlik (kredi hacmi)			derinlik bir noktaya kadar gelir eşitsizliğini azaltıcı etki gösterirken, belli bir eşik seviyesini aştığında gelir dağılımını bozucu etkisi ortaya çıkar.
Fouejieu vd. (2019)	Geniş örnek; 2004-2015	Finansal kapsayıcılık (ATM ve banka şubesine erişim)	Servet eşitsizliği endeksi (en varlıklının serveti/ortalama servet)	OLS/ GLS/ GMM	Hem Gelişmiş, hem de gelişmekte olan ülkelerde, finansal kapsayıcılık servet eşitsizliğini azaltmaktadır.
Le vd. (2019)	Geçiş ülkeleri (2005-2015)	FK endeksi (ATM, şube sayısı, mevduat ve kredi hesabı sayısı)	Gini katsayısı	2SLS	FK endeksi ile gini arasında negatif yönde ilişki vardır.
Čihák & Sahay (2020)	Geniş örnek; 2004–2015	Finansal derinlik–finansal kapsayıcılık (ATM ve banka şubesine erişim)–kullanım (1000 kişi başına düşen kredi kullanımı) finansal istikrar	Gini katsayısı	OLS/ GLS/ GMM	Finansal kapsayıcılık artışı, (finansal derinlik daha düşükken) eşitsizliği daha fazla azaltmaktadır (Gini'de %9 azalma). Finansal derinlik yüksekse %7 azalma) Kadınların finansal erişimi, eşitsizliği daha hızlı düşürür. Kredi kullanımı bakımından, finansal derinlik düşükse eşitsizlik azalır, çok yüksekse eşitsizlik artar. Gelişmekte olan ülkelerde finansal derinlik artarken, eşitsizlik azalmakta, gelişmiş ülkelerde ise artmaktadır.

Omar & Inaba (2020)	118 GOÜ ülke, 2004–2016	Çok boyutlu FK endeksi. Yaygınlık (mevduat hesabı), Erişebilirlik (ATM, şube) Kullanım (kredi sayısı)	Gini katsayısı	Panel Sabit etkiler	FK anlamlı biçimde gelir eşitsizliğini azaltır. Hukukun üstünlüğü bu etkiyi güçlendirir.
Ouechtati (2020)	53 GOÜ, 2007-2017	Erişim (ATM, şube), kullanım (mevduat hesabı, kredi hesabı sayısı)	Gini katsayısı	Fark GMM, system GMM	Banka şubesi yaygınlığı ve krediye erişim arttıkça, gelir eşitsizliği düşmektedir.
Sari ve Falianty (2021)	Hindistan'ın bölgeleri, 2010-2020	Bileşik FK indeksi (PCA yötemi)	Gini katsayısı	Panel sabit etkiler	FK'nın gelir eşitsizliği üzerinde anlamlı bir etkisi yoktur.
Tsouli (2022)	30 Avrupa ülkesi, 2004-2019	Bileşik FK indeksi (PCA yötemi)	Gini katsayısı	Panel sabit etkiler, GMM	FK endeksi ile Gini arasında negatif yönlü ilişki vardır.
Verma ve Giri (2024)	Asya ülkeleri, 2005-2019	Şube sayısı, mevduat hesabı sayısı, kredi hacmi	Gini katsayısı	Pedroni koentegrasyon, FMOLS, ARDL, Granger	Kısa dönemde gelir eşitsizliği finansal kapsayıcılık göstergelerinden etkilenmezken, uzun dönemde azaltıcı etki görülmektedir.
Atadouanla Segning vd. (2024)	Sahraaltı Afrika ülkeleri, 2002-2015	FK indeksi, (banka hesabı sayısı, şube sayısı, mevduat hacmi, kredi hacmi)	Gini katsayısı	Sistem GMM	Sosyokültürel farklılıklara göre sonuçlar değişmektedir. İslam'ın yaygın olduğu ülkelerde FK ile eşitsizlik arasındaki ilişki anlamsızken, Hristiyanlığın yaygın olduğu ülkelerde anlamlı ve negatif ilişki vardır.
Eriqat vd. (2025)	70 GOÜ, 2014/17/21	Erişim (şube ve ATM yaygınlığı), kullanım	Gini katsayısı	PLS-SEM	Finansal kapsayıcılık göstergeleri, gelir eşitsizliğini azaltır. Özellikle düşük gelirli

		(mevduat hesabı, tasarruf hesabı ve kredi hesabı)			ülkelerde kullanımın artması, daha etkili sonuçlar doğurur.
Rubio ve Leon (2025)	Latin Amerika ülkeleri, 2004-2021	Erişim (ATM, şube), kullanım (özel sektör kredileri, emeklilik fonları, sigorta primleri), etkinlik (düşük maliyet)	Gini katsayısı	Sistem GMM	FK gelir eşitsizliğini azaltır. Kullanımın artması, erişimin artmasından çok daha yüksek etki sağlar.

BULGULARIN DEĞERLENDİRİLMESİ

Derlenen literatürün genel eğilimi, FK'nın kısa dönemde Gini katsayısı üzerinde azaltıcı etkide bulunarak gelir eşitsizliğini azaltabildiğini göstermektedir. Bu etkinin, özellikle düşük ve orta gelirli ülkelerde daha güçlü ve belirgin olduğu görülmektedir. Ampirik literatürden elde edilen analiz sonuçları tematik bir şekilde sentezlendiğinde ortaya çıkan temel bulgular ise şu şekilde sıralanabilmektedir:

FK > finansal derinlik: Gelir eşitsizliğini azaltmada finansal kapsayıcılık, finansal derinlikten daha etkilidir.

Tersine dönen etkiler: Finansal derinlik çok arttıkça (üst gelir gruplarının ürün çeşitliliğini daha fazla kullanması, olası finansal krizlerin gelir eşitsizliğini artırması gibi kanallarla) etki zayıflar veya tersine dönebilir.

Genel eğilim: Literatürün büyük bölümü, FK'nın gelir eşitsizliğini azalttığını gösterir. Ancak çalışmaların çoğu -veri kısıtı altında- kısa dönemi incelemektedir.

Düşük–orta gelirli ülkelerde güçlü etki: Erişim ve kullanım artışı eşitsizliği belirgin biçimde azaltır.

Yüksek gelirli ülkelerde sınırlı etki: Derinlik seviyesi yükseldikçe eşitsizlik üzerindeki olumlu etki küçülür.

Dezavantajlı gruplar: Kadınların finansmana erişimini artırmak eşitsizliği daha hızlı düşürür.

Erişim ≠ kullanım: Sadece ATM/şube ağını genişletmek yetmez; fiilî kullanımın kolaylaşması ve maliyetlerin düşmesi (düşük ücret/masraf, sade ürünler, dijital erişim) etkileri güçlendirir.

Servet boyutu: FK, yalnızca gelir eşitsizliği değil servet eşitsizliği üzerinde de azaltıcı yönde etkide bulunabilir.

Maliyet/mesafe engelleri: Hesap ve kredi maliyetlerinin düşmesi, mesafe ve belge yükünün azalması finansal kapsayıcılığın etkisini artırmaktadır.

Kurumsal kalite ve regülasyon: Güçlü düzenlemeler ve hukuki altyapı, tüketici koruması ve şeffaflık olumlu etkileri artırır; zayıf kurumsal düzenlemeler ise aksi yönde etki gösterir.

Kültürel bağlam: Toplumsal/kültürel farklılıklar (normlar, dinî yapı, vb.) FK ile eşitsizlik ilişkisinin gücünü ve yönünü etkileyebilir.

Politika önceliği: Kullanımı artıran düzenlemeler (düşük masraf, şeffaf sözleşmeler, basit ürünler, tüketici koruması, finansal eğitim) erişimi artırmaktan daha etkili sonuçlar sağlar.

KAMUSAL POLİTİKA ÖNERİLERİ

Finansal piyasaların etkin çalışmamasına yol açan asimetrik bilgi sorunları, kamu otoritesinin düzenleme ve denetleme faaliyetlerinin temel gerekçesini oluşturur. Bu nedenle FK'nın gelir eşitsizliği üzerinde yaratabileceği olumlu etkilerin gerçekleşmesi, kamu kesiminin kurumsal altyapıyı güçlendirme ve piyasa işleyişini gözetme kapasitesiyle yakından ilişkilidir (Čihák & Sahay, 2020).

Literatürden elde edilen bulgular, gelir eşitsizliği ile mücadelede maliye politikalarını tamamlayıcı bir önlem olarak finansal kapsayıcılığın artırılması gerektiğini göstermektedir. Ancak özellikle finansal derinliği değil de finansal kapsayıcılığı hedefleyen kamu politikalarının uygulamaya koyulması gerekmektedir. Finansal hizmetlere erişimin/kullanımın düşük olduğu bölgelerde erişimi güçlendirecek, toplumda kadınların finansal erişimini artıracak önlemlerin hayata geçirilmesi, gelir eşitsizliğiyle mücadelede önemli bir kaldıraç niteliği taşımaktadır. Bu bağlamda hükümetler, merkez bankaları, finansal kurumlar ve kalkınma ortakları, finansal hizmet altyapısını geliştirmek ve kırsal ile kentsel alanlarda hizmet ağını güçlendirmek için etkin bir işbirliği yürütmelidir (Omar ve Inaba, 2020).

Kamu kesiminin finansal kapsayıcılığı artırmak suretiyle gelir eşitsizliğinin azaltılması ve toplumsal refaha katkı sunulması noktasında gerçekleştirebileceği bazı politika önlemleri de öne çıkmaktadır. Öncelikle kamusal düzenlemelerle, özellikle dezavantajlı bireylerin temel hesaplara erişimini kolaylaştırmak adına düşük maliyetli ürün standartları geliştirilebilir. Örneğin temel finansal hizmetlerde belli bir ücret tavanı uygulanması sağlanarak erişim hızlandırılabilir. Erişimin yanında kullanımın artması ile finansal kapsayıcılığın gelir eşitsizliği üzerindeki etkisinin daha güçlü olarak ortaya çıktığı düşünüldüğünde, finansal hizmetlerin kullanımı teşvik edici yönde politikalar geliştirilebilir. Örneğin kamu sosyal yardımları dijital finansal hizmetler yoluyla bireylere ulaştırılabilir. Kamu kesimi finansal kesimde rekabeti etkin şekilde tahsis edebilecek düzenlemeleri uygulamaya koyduğu ölçüde, tüketicilerin hizmetlere ulaşım maliyetinin de düşürülmesi yönünde etki sağlayacaktır (Dabla Norris vd., 2015).

Kamu kesiminin düzenleyici ve denetleyici rolü, özellikle tüketici haklarının korunması, finansal hizmetlere erişimi kısıtlayan teminat gösterme, belge yükümlülükleri vb. konularda düzenlemelerin kolaylaştırılması-etkinleştirilmesi, kredi bilgi altyapı sisteminin güçlendirilmesi hususlarında önem kazanmaktadır. Bunların yanında toplumda finansal okuryazarlığın geliştirilmesi, yeni dijital teknolojilerin takibi ve regülasyonu da kamusal politikaların kapsamına girmekte ve politika yapıcılara çeşitli görevler yüklemektedir (Omar ve Inaba, 2020; Čihák & Sahay, 2020).

Kamu kesimi düzenleyici ve denetleyici rolünün yanında, kamu bankaları aracılığıyla da finansal kapsayıcılıkla ortaya çıkacak faydaların gerçekleşmesinde öncü rolü üstlenebilir. Kredi piyasasına dönük doğrudan müdahale araçlarıyla, faiz-destekli, teminat kolaylıkları sunan kredi programlarıyla küçük ve orta ölçekli işletmelerin yahut toplumdaki dezavantajlı grupların finansmana erişimini kolaylaştırabilir.

Son olarak kamu kesimi tarafından üstlenilen düzenleme ve denetleme fonksiyonunun daha etkin hale getirilmesi ve finansal kapsayıcılığın gelir eşitsizliğini azaltıcı yönde fonksiyon ifa edebilmesi için, FK'ya yönelik göstergelerin izlenmesi-raporlanması ve değerlendirilmesi, gelir ve servet eşitsizliği

göstergeleri ile ilişkisinin kurulması ve bu hususta ulusal stratejilerin geliştirilmesi, finansal dışlamanın önüne geçebilmek için olası sorunların tespiti ve güncel gelişmeler karşısında aksiyon alınması da önemli görünmektedir.

SINIRLILIKLAR VE ARAŞTIRMA BOŞLUKLARI

Literatür incelemesi sonucunda ortaya çıkan sınırlılıklar ve araştırma boşlukları ise aşağıda maddeler halinde özetlenmiştir:

Ölçüm Tutarsızlığı: Çalışmalar finansal kapsayıcılığı farklı göstergelerle ölçmektedir, bu da farklı çalışmaların bulgularını karşılaştırmayı zorlaştırmaktadır. Yaygın olarak kullanılabilecek ortak bir finansal kapsayıcılık göstergesinin geliştirilmesine ihtiyaç vardır.

Nedensellik Sorunları: Az sayıda çalışma içsellik sorununu titizlikle ele almaktadır; finansal kapsayıcılığın mı eşitsizliği azalttığı, yoksa daha düşük eşitsizliğin mi kapsayıcılığı artırdığı hâlâ tartışmalıdır. Karşılıklı nedensellikler, dinamik modellerle elimine edilmeye çalışılmışsa da nedensellik ilişkisini tahmin etmek için veriler hala kısıtlıdır.

Zamansal ve Bölgesel Sınırlılıklar: Mevcut araştırmalar çoğunlukla belirli bölgeler veya kısa dönemler üzerinde yoğunlaşmaktadır. Bu durum finansal kapsayıcılığın uzun vadeli etkilerinin yeterince anlaşılmasını engellemekte ve heterodoks yaklaşımların öngörülerinin test edilebilirliğini önemli ölçüde sınırlandırmaktadır.

Dijital Finansmanın Etkileri: Dijital finansmana hızlı geçiş, dijital okuryazarlığı veya teknolojiye erişimi olmayan bireyler için yeni bir finansal dışlanma biçimi yaratmıştır. Dijital finansman araçlarının eşitsizlik üzerindeki etkileri literatürde yeni dikkat çeken bir konudur. Bunların uzun dönem etkileri ve tüketicilerin korunmasına yönelik alınacak önlemler gelecek çalışma konularıdır.

Toplumsal Cinsiyet ve Sosyal Boyutlar: Pek çok analiz, finansal sistemlerin kapsayıcılığını etkileyen toplumsal cinsiyet, eğitim düzeyi veya kırsal-kentsel farklar gibi faktörleri göz ardı etmektedir.

Mikro Analizlerin Eksikliği: Makro verilerle elde edilen bulgular politika önlemleri için yeterli olmayıp, sadece birer gösterge niteliğindedir. Mikro analizlerle ülkelere özgü politika çıkarımlarına ihtiyaç vardır.

Kamu Maliye politikalarının etkileri: Finansal kapsayıcılığın gelir eşitsizliği üzerindeki etkilerini incelerken, gelir dağılımını doğrudan değiştiren maliye politikalarının etkisini dikkate almayan çalışmalar mevcuttur. Olası spesifikasyon hatalarını en aza indirmek ve elde edilen bulguların sağlamlığını kontrol etmek için, tahminler yapılırken mali göstergelerin gelir eşitsizliği üzerindeki etkisi mutlaka dikkate alınmalıdır.

SONUÇ

Bu çalışma, 2010 sonrası ampirik literatürü sistematik bir çerçevede derleyerek finansal kapsayıcılık (FK) ile gelir eşitsizliği arasındaki ilişkinin yönünü ve koşullara bağlılığını tartışmaktadır. Literatürde gözlenen genel eğilim, FK'nin özellikle düşük ve orta gelirli ülkelerde eşitsizliği azaltıcı bir potansiyel taşıdığına işaret etmektedir. Bununla birlikte bulgular, etkinin büyüklüğünün ve hatta yönünün; FK'nin hangi boyutla ölçüldüğüne (erişim–kullanım–kalite), finansal derinliğin seviyesine, kurumsal kaliteye ve düzenleme-denetleme kapasitesine göre anlamlı biçimde farklılaştığını göstermektedir. Başka bir ifadeyle, finansal sektörün büyüklüğü ya da kredi hacmindeki artış tek başına "kapsayıcılık" anlamına gelmemekte; kapsayıcılığın eşitsizlik üzerinde olumlu sonuçlar üretebilmesi, ürünlerin erişilebilirliği kadar fiilî kullanımına ve tüketicilerin korunma mekanizmalarının niteliğine bağlı bulunmaktadır.

Bu noktada maliye politikası perspektifinden temel çıkarım şudur: Finansal kapsayıcılık, eşitsizlikle mücadelede vergi-transfer sistemi ve kamusal hizmetlere erişim gibi klasik yeniden dağıtım araçlarının alternatifi değil, doğru tasarlandığında onları tamamlayan bir politika aracıdır. Kamunun temel rolü, piyasadaki asimetrik bilgi sorunları ve dışlanma mekanizmaları karşısında kapsayıcılığı artıracak kurumsal zemini oluşturmaktır. Bu çerçevede (i) temel finansal hizmetlere düşük maliyetli erişimi genişleten düzenlemeler, (ii) tüketici korumasını ve şeffaf ücretlendirmeyi güçlendiren denetim kapasitesi, (iii) aşırı borçlanmayı ve dezavantajlı grupların borç döngülerine sıkışmasını önleyici makro-ihtiyati araçlar, (iv) rekabeti artırarak hizmet maliyetlerini düşüren piyasa tasarımları ve (v) toplumsal cinsiyet ve bölgesel eşitsizlikleri hedefleyen programlar, FK'nin dağılımsal etkilerini belirleyen kritik politika kaldıraçlarıdır. Ayrıca sosyal yardım ve transferlerin dijital kanallar üzerinden ödenmesi gibi uygulamalar, kapsayıcılığın kullanım boyutunu güçlendirebilse de, dijital uçurum riskini azaltmak için eş zamanlı olarak finansal okuryazarlık ve dijital erişim yatırımlarıyla desteklenmelidir.

Sonuç olarak, finansal kapsayıcılığın eşitsizlik üzerindeki etkisi otomatik ve tek yönlü değildir; kamusal düzenleme, denetim ve sosyal politika bileşimi tarafından şekillendirilebilen bir yapıya sahiptir. Bu nedenle gelir dağılımı eşitsizliğini azaltma hedefi açısından, FK politikalarının maliye politikası gündemiyle bütünleşik biçimde ele alınması; hem gelir dağılımı hem de fırsat eşitliği kanallarından toplumsal refahın güçlendirilmesine yönelik daha tutarlı ve uygulanabilir bir politika çerçevesi sunmaktadır. Gelecek araştırmaların, nedensellik sorununu daha güçlü biçimde ele alan mikro veri temelli stratejilerle ve FK'nin borçluluk/finansal kırılganlık kanalları üzerinden yaratabileceği ters etkileri ayrıştıran analizlerle literatürdeki belirsizlikleri azaltması beklenmektedir.

Abstract

The reform of the Common Agricultural Policy (CAP) 2023–2027 introduced a new governance model and a strengthened Performance Monitoring and Evaluation Framework (PME), placing national administrations at the forefront of strategic design and implementation. This article examines the new Performance Framework focusing on the Control Strategy of the National Strategic Plan of Greece, comparing it with the practices of other Member States, such as Austria, Italy and Germany. Through a bibliographic analysis and comparison of national approaches, the main problems, challenges and prospects for a more effective policy evaluation are highlighted. The study concludes with proposals for improving the efficiency of the evaluation system in Greece and new research directions.

Keywords: Common Agricultural Policy (CAP), National Strategic Plan, Performance Framework, Governance, Subsidy Evaluation, Monitoring, Greece, European Union

INTRODUCTION

The goal of the new CAP is to guide the European agriculture sector's transition to a resilient, sustainable, and contemporary one. Funding will be allocated more equitably to young farmers and small and medium-sized family farms under the revised program. Additionally, farmers will get assistance in adopting new technologies, such as agro-ecological production techniques and precision farming. The new CAP may serve as the cornerstone for agricultural communities and food security in the European Union by promoting tangible initiatives in these and other sectors.

A more effective and efficient method of operation is included into the redesigned CAP. EU nations will combine funds for market measures, rural development, and income assistance to achieve their national CAP Strategic Plans. Each Member State choose from a variety of EU-level interventions when creating their CAP Strategic Plan, modifying and focusing on them to meet their unique requirements and regional circumstances. The Commission has been evaluating how well each Plan advances the 10 main CAP goals, which address common social, economic, and environmental issues. Therefore, as outlined in the Commission's Farm to Fork and Biodiversity policies, the Plans will comply with EU law and should support the EU's environmental and climatic objectives, especially those pertaining to animal welfare.

For the years 2023–2027, the CAP will receive €270 billion in financing. Over €34 billion of the €120 billion budgeted for the seven Plans agreed today is solely allocated to environmental and climatic goals and eco-schemes. For instance, this quantity may be used to enhance grassland quality, water management, and soil-beneficial activities. Additionally, the CAP may support forest restoration, adaptation, fire avoidance, and afforestation. Among other things, farmers taking part in eco-schemes may get rewards for restricting or outlawing the use of pesticides and preventing soil erosion. Approximately 86% to 97% of the country's cultivated land will be farmed under favorable environmental and agricultural circumstances. The growth of organic agriculture will also get significant investment, with the majority of nations hoping to increase or even quadruple their agricultural area. Naturally restricted areas, including coastal or mountainous regions, will continue to receive special financing to support agricultural operations.

The Commission urged Member States to take use of every chance in their CAP strategic plans to increase the resilience of their agricultural sector in order to advance food security, given the Russian aggression against Ukraine and the current commodities boom. This entails encouraging sustainable agriculture practices, decreasing reliance on artificial fertilizers, and increasing the production of renewable energy without compromising the production of food.

One of the biggest issues confronting European agriculture in the next years is generational renewal. Maintaining the agriculture sector's competitiveness and making rural communities more appealing are crucial. With more than €3 billion going directly to young farmers throughout the seven nations, specific assistance for young farmers is a major component of every approved plan. In addition to enhancing access to services and infrastructure, such as internet, rural development funding will help local companies create thousands of employment in rural regions. Other EU tools, like the Recovery and Resilience Facility (RRF) or the European Structural and Investment Funds (ESIF), will also address the needs of rural residents in accordance with the long-term vision for the EU's rural regions.

After approving the first seven CAP Strategic Plans, the European Commission is still fully committed to approving the other 21 Plans as soon as possible, taking into consideration the promptness and caliber of responses to the Commission's concerns.

Having taken the aforementioned into consideration, this article aims at evaluating the new governance model of the CAP 2023-2027, concentrating on the Control Strategy of the National Strategic Plan and the Monitoring and Evaluation Framework for performance at both national and EU levels. Through the article it is sought to delineate the principal challenges and optimal practices, with the insights gained for enhanced policy implementation within the Greek context, via a comparative analysis with other European countries (Italy, Austria, Germany) (Pierangeli et al., 2025; Tyrovoli, 2024).

In this regard, the research questions that would be attempted to be answered are the following:

•What are the main characteristics of the CAP 2023–2027 new governance and assessment model?

•What are the primary barriers and difficulties Greece is facing while putting the Monitoring and Evaluation Framework into practice?

•In terms of performance and preparedness for adopting the new CAP, how does Greece stack up against other European nations?

•What lessons and best practices may be modified to improve the policy's efficacy in Greece?

The importance of the present article relies on the scarcity of targeted and comparative documentation about the implementation of the new governance framework in Greece, despite the multiple evaluations previously undertaken (Cagliero et al., 2025; Pufahl & Sinabell, 2023). In addition, achieving the objectives of the European Green Deal and ensuring the long-term resilience of the agricultural sector need the integration of innovative and sustainable Common Agricultural Policy (CAP) methods (Peeters et al., 2020; García Azcárate & Folkeson, 2020). With this in mind, the article aims to contribute to the global body of knowledge and provide science-based suggestions for policymakers, researchers, and agricultural specialists.

Finally, the article is structured as follows: Aside the present introductory chapter, section Comparative Literature Review provides an overview of the literature on the CAP reform and the new governance model.

Section Methodology presents the policies and ways of implementing them into action in some EU countries, such as Greece, Italy, Austria, and Germany.

Section Comparison of Greece to other European Countries refers to the knowledge acquired from the comparisons, the problems that arose, and the barriers that were faced.

Section Challenges on the implementation of CAP 2023–2027goes into more detail about what Greece learned and what it means for policy; and finally, section 6 presents the conclusions and suggestions.

Comparative Literature Review

As being aforementioned, within a unified European framework, the "New Delivery Model" (NDM), which is introduced in the new CAP 2023–2027, renders planning, implementation, and assessment responsibilities from the European Commission to the Member States (Cagliero, Licciardo, & Legnini, 2023). Critical success factors and shortcomings at the national level are revealed by comparing scientific research, particularly with regard to governance, assessment capabilities, and the relationship between goals and performance (Pufahl & Sinabell, 2023; Pierangeli et al., 2025).

The New CAP assessment framework

The late 1980s European structural policy reform brought in European Rural Development (RD) initiatives to make farms more competitive and encourage long-term growth in rural regions (Esposti & Sotte, 1999; van der Ploeg et al., 2002; Sotte, 2006; Mantino, 2008). These policies use the LEADER (Liaison entre actions de développement de l'économie rurale) strategy, which is now part of rural development intervention, to bring together a big-picture view of the land with local involvement. RD is beginning a new era of programming more than 30 years after it was founded. In June 2018, the European Commission suggested new CAP laws to deal with problems that could come up in the future (European Commission, 2007). The goal was to help European farmers remain competitive and keep farming going. The Council and European Parliament started the trilogue process in October 2020. This was the final stage in passing the CAP. This legislation brings together the first and second pillars. The NDM is a big step forward since it is a new way of doing things. The Commission says that we should move from compliance to performance. They think that the National Strategic Plan (NSP) will make the CAP easier to understand. Member States (MS), on the other hand, need to do a better job of organizing this, especially by area.

Over time, rural development initiatives have changed the ways and needs for assessments. It's clear that the way we make policies and the way we judge them are connected. This assertion is substantiated by the efficacy of rural development initiatives; nevertheless, it is inapplicable in other contexts. During the Structural Funds (SF) reform, evaluation became an important part of programming operations. The rules made it obvious what each person's job was, how things should be done, and what the main ways to evaluate were, including who was in charge (Cagliero & Cristiano, 2013; Mantino et al., 2000).

The Directorate-General for Budget set out standards for other Directorate-Generals to use when judging. Regulation (EEC) No. 2052/88 acknowledges evaluation as an essential tool for the design and execution of interventions. This law, together with other working papers and recommendations, has started to put together questions, indicators, and standards (Mantino et al., 2000; Commission of the European Communities, 1999, 2001).

This was the first time that evaluations before and after the fact were utilized to make assessments and program cycle match better. During the trial phase, there has been immature assessment, a range of opinions, and an unequal grasp of what evaluation can do and how it may be used. Vision coordination at the Member State (MS) and community (EC and MS) levels may have required to be better. The European Commission created MEANS, STAR VI/7676/98 to make sure that all techniques and processes are the same. The Commission said that the intervention logic, or logical framework (Mantino,

Monteleone & Pesce, 2000; Dax, Oedl-Wieser & Strahl-Naderer, 2014), was the most important part of this standardization process.

None of these approaches enhanced evaluation methods or guaranteed compliance with the framework. It is evident that evaluation reports from that era were often inadequate and seldom used (Monteleone, 2006; Mantino, 2010). There is little understanding about the enhancement of program development via assessment (Mantino, Monteleone & Pesce, 2000). The assessment criteria from other Directorate-Generals were utilized instead of those from the Directorate-General for Agriculture and Rural Development. These criteria were not necessarily suitable for rural development. Rural development policies were established during a transitional period between the CAP reform and the cohesion policy, coinciding with the conclusion of structural policies and the commencement of the new rural policy (Mantino, 2008).

The Commission changed the SF (Reg. (EC) No. 1260/99) and RD (Reg. (EC) No. 1257/99) evaluations such that they showed outcomes. The regulations for the 2000–2006 cycle made the monitoring and evaluation system stronger by using a single reason for control and reporting. The Commission's evaluation process became better thanks to two publications: STAR VI/8865/99 and STAR VI/12004/00. This strategy was based on questions, criteria, and indications. The second part of the EC's Common Evaluation Questionnaire question is important. The Commission does, however, have certain unique ways of managing assessments. For MSs, the evaluation cycle involves evaluations before, during, and after the event. This will make it faster to deploy and reprogram RDP. The evaluation looked at how RDP and Agenda 2000 were used from 2000 to 2006. This programming made it possible to use both new territorial tools, such those suggested and established by Article 33 of Regulation 1257/99, and old tools, like those from Regulations (EC) 950/96 and 951/96. The RDPs were complicated and looked like mosaics. Evaluation standards such as STAR document 12204/00 provide criteria and indicators, and they also reexamine the reasoning behind each intervention to make these treatments more systematic. The Commission advised that local government, industry groupings, and the scientific community become more involved and set up steering committees. The National Evaluation System of Italy (Sistema Nazionale di Valutazione) urged evaluators and public organizations to share their evaluation methods. The legislation from 2007 to 2013 made rural development easier by focusing on the "strategic approach," which included needs assessment, goal setting, and measure selection. Evaluation turned become a strategic tool for gathering information that aided with planning and carrying out projects, making it simpler to reach rural development goals (Mantino, 2008; Monteleone, 2005).

The Common Monitoring and Evaluation Framework (CMEF) was very important since it included all of the commitments and methodological standards. Regulation (EC) No. 1698/2005 makes it easier for Member States to keep an eye on and evaluate their work (Bergschmidt, 2009). According to Smismans (2015), the European Commission's "Reinforcing Evaluation" (2007), "Smart Regulation" (2010), and "Improving Evaluation" (2013) pronouncements helped the EU become a place where policies are founded on facts.

The CMEF employed standardized questions and indicators for baseline, output, result, and effect to make evaluation more consistent. This methodological approach guarantees superior evaluations across all Member States and facilitates European comparison and enhancement (Dax, Oedl-Wieser & Strahl-Naderer, 2014; Maye, Enticott & Naylor, 2020).

The Common Monitoring and Evaluation Framework (CMEF) set up standardized standards for methods and procedures to make sure that evaluation methods are the same across Member States and at the EU level. But assessors had a lot of freedom since there were no clear rules or ways to make decisions and assessments (Directorate-General for Agriculture and Rural Development, 2014;

Michalek, 2012). This openness brought forth new ideas, but it also made it harder for countries to agree on how to evaluate and report on things.

From 2007 to 2013, the "ongoing method" was the second big change in programming. Its goal was to make testing better all the way through the development cycle. Evaluation used to be thought of as post-hoc. It is currently seen as a process that goes on all the time, from design to implementation. This technique gave Managing Authorities timely information and feedback that helped them improve the implementation of the Rural Development Programme (RDP) and adapt to changing needs. The continuous technique changed evaluation from a duty to report to a way to learn.

Third, there were more national and European assessment networks. The European Evaluation Network for Rural Development, the Evaluation Helpdesk, and national rural networks were all set up. The goal of these initiatives was to make reviews easier, promote learning, and get Member States and others to share information. These collaborative frameworks enhance evaluation by making it more evidence-based and participatory, therefore legitimizing and holding the Common Agricultural Policy framework responsible (Cristiano & Licciardo, 2017; Smismans, 2015).

The EU put a new version of the Common Agricultural Policy (CAP) into effect in 2023. Since then, Member States (MS) have been adding the CAP to their national policies via the CAP Strategic Plans (CSP) 2023–2027. The CSPs list the CAP objectives that should be pushed at the national level, as well as the money and activities that will be utilized to reach those goals.

A MS has a great deal of flexibility to modify the CAP to suit its own requirements and tastes thanks to the new distribution model. The integrated program management and execution of rural development (RD) policies (Pillar 2) and market-related measures and direct payments (Pillar 1) under a single national CSP is a distinctive aspect of the current programming era. Regionalized RD MSs, like Germany, were compelled to incorporate their regional RD initiatives into a national CSP. Unified requirements for programming, monitoring, and evaluation resulted from the combination of both pillars into a single planning document. The Better Regulation Strategy, which aims to simplify and enhance rules via evidence-based policymaking, is a commitment made by the European Commission (EC) (EC, 2021). This is especially true for the CAP and the Cohesion Policy. In the current multiannual financial framework 2021-27, these two programs make up 62% of total EU spending (not including NextGenerationEU) (BACHTRÖGLER, et al., 2021). The most contentious topic in society is the CAP, but programs funded by structural funds are seldom contested in public. The European Court of Auditors often complains that assessments do not support the CAP's efficacy (ECA, 2021, 2017, 2016). The EC is thus eager to demonstrate that the CAP is accomplishing its goals. The law governing the CSP 2023-2027, which established the new delivery model, reflects this concern. The performance-based implementation of CAP is strengthened, and there is further flexibility to customize the CAP to the demands of MSs. Annual monitoring of the attainment of established policy goals is required. When deviations occur, MSs are required to provide an explanation and modify their CSP accordingly. Effectiveness, efficiency, relevance, coherence, Union added value, and effects in connection to the established CAP general and particular objectives (SOs) are all factors that MSs must consider when assessing their CSPs. A performance review and assessment at the EU level is also carried out by the EC (see Art. 140, 141 of CSP regulation (EU) 2021/2115). The assessment will be significantly impacted by the new deployment method using CSP: Pillar 1 and Pillar 2 interventions are being assessed together for the first time. This makes it possible to examine how they together affect goals like revenue, competitiveness, and environmental and climatic concerns. Prior to 2022, only Pillar 2 actions were subject to the CAP review criteria for MSs; the EC was in charge of evaluating Pillar 1. MSs have to provide a strategy for assessment. All assessment activities, their schedule, data needs, and other administrative and communication elements up to the ex-post evaluation in 2031 must be included in the evaluation plan. The implementing regulation (EU) 2022/1475 lays forth minimum standards for the frequency, duration, and subject matter of CSP evaluations. Certain clauses, such as the use of impact

indicators specified in the performance monitoring and evaluation framework (PMEF; EC, 2023b), are legally enforceable in and of themselves. MS's interests and requirements must be taken into consideration while making decisions about the evaluation's scheduling, format, and content. Making ensuring there are enough activities for data collection and administration is a key responsibility of the evaluation plan. A significant amount of data is already being gathered since the assessment of the CAP using MSs has been a continuous endeavor since 2000. When the intermediate review of the CSP begins, the ex-post evaluation of the 2014–22 period will be conducted. Even if there are still certain data gaps that need to be filled, better data management and enrichment are receiving more attention. The latter entails gathering and combining information from many sources (EEH and EC, 2020). Given that farm businesses get over 93% of CAP funding in the EU, this is particularly true for farm-level data (BECKER et al., 2022: 36).

Structural Weaknesses and challenges in Greece

For more than four decades, Greek agriculture has been fully integrated into the European Union's Common Agricultural Policy (CAP) mechanisms, remaining one of the largest recipients of CAP funds among Member States (European Commission, 2024). In GDP terms, EU support to Greek agriculture consistently ranks among the highest in the Union, with Greece receiving 1.4% of its GDP in agricultural support in 2021—second only to Bulgaria's 1.7%—while countries like Spain recorded considerably lower shares (Karantininis, 2017; Dianeosis, 2024). Historically, CAP resources constituted about fifty percent of total EU aid to Greece; however, this has changed considerably with the establishment of the Recovery and Resilience Facility, which expanded the EU's financial support framework (European Commission, 2023b).

Even though money has been coming in steadily, Greek agriculture has had a hard time using CAP financing to modernize its structures and make them as competitive as those in other Member States with similar agro-environmental circumstances (Haniotis, 2023a).

Nowadays, exports and value-added output pertaining agri-food have risen, something which means that economy can sustain and adapt periods of crises. This does not mean that there is connection to the adoption of the CAP (Sorrentino, Henke & Severini, 2011; Swinnen, 2015).

Green Deal and CAP

The Commission's main political goals for the next five years are outlined in the Communication on the "European Green Deal," which was released on December 11, 2019 (EC, 2019). With a focus on sustainability and the goal of making Europe "the world's first climate-neutral continent by 2050," it establishes a new growth strategy for the EU. The European Parliament welcomed the idea in a Resolution3 voted on January 15, 2020.

The Green Deal addresses the mounting issues and worries of Europeans over the state of the environment, the climate, and other aspects that affect the food and agricultural industries. "Europe's environment is at a tipping point," says Hans Bruyninckx, Executive Director of the European Environment Agency (EEA). In the next ten years, we have a limited window of time to drastically cut down on our use of natural resources, mitigate the effects of climate change, and increase environmental protection efforts. In order to address "urgent sustainability challenges," the EEA (2020) calls for structural adjustments.

In addition to the EU's primary goal of climate neutrality, the European Green Deal lays out a plan of action to reduce pollution, restore biodiversity, and increase resource efficiency by transitioning to a clean, circular economy whose development will be independent of resource usage. By offering a Just shift Mechanism that offers both financial and technical help throughout this shift, it also seeks to guarantee that no one or no area is left behind (Maréchal et al., 2020).

These strategic advancements have coincided with the world's and the EU's unparalleled COVID-19 sanitary catastrophe. By focusing on vulnerability and the importance of resilience in adapting to shocks, this expands the topic and offers new insights into the sustainability of current supply chain models, including agri-food systems. Because they are linked all over the globe, they are more vulnerable to a number of threats, and this makes it harder for them to fix any problems that come up.

So, it will probably be more important to plan for even greater resilience in our future health, social, and economic systems. To make food supply chains more shock-resistant, to reduce the impact of food production and consumption on the environment and climate, and to move to healthier and more sustainable diets will be important parts of this.

The June 2018 publication of the legislative recommendations for the CAP after 2020, which the Commission has not since changed, aims to raise the policy's degree of environmental and climatic ambition. They are offered as a tool to aid in the shift to an entirely sustainable agriculture industry using a new, results-driven delivery paradigm. The Commission's proposals update the overarching legal framework and goals while streamlining EU law. Member states are expected to create national CAP Strategic Plans (CSPs) outlining their planned interventions for both Pillar 1 and Pillar 2 in order to accomplish the nine CAP goals. These CSPs must be justified based on their assessment of needs and priorities, but they also have more flexibility and subsidiarity (Maréchal et al., 2020).

Four broad and one overarching goals for the new CAP are outlined in the legislative proposals:

1.To modernize the sector by fostering and sharing knowledge, innovation, and digitalization in agriculture and rural areas and encouraging uptake (cross-cutting); 2

2.To strengthen the socioeconomic fabric of rural areas;

3.To support environmental care and climate action and to contribute to the Union's environmental and climate-related objectives; and

4.To cultivate a smart, resilient, and diversified agricultural sector that ensures food security.

There are nine distinct goals depicted on the figure that follows, some of which are pertinent to enhancing the sustainability of agri-food systems and are shown in the diagram on the page that follows.

According to Bas-Defossez et al. (2018), the suggested new delivery model may, in theory, provide more creative, inventive, targeted, and cohesive methods to improve the sustainability of agri-food systems.

However, given the continued dominance of direct payments in the policy menu offered to Member States, as well as concerns about Member States' ability to create more ambitious CSPs and the European Commission's ability to evaluate and approve them, particularly under pressure, there are still concerns about how much of this will actually be implemented in practice (Erjavec et al., 2018; Hart and Bas-Defossez, 2018; Pe'er et al., 2019). The suggestions, according to Pe'er et al. (2019), provide "an inadequate response to environmental and sustainability challenges, and makes a business-as-usual scenario very likely." They also highlight "a gap between the green aspirations of [CAP] payments and reality of the CAP." According to the European Court of Auditors' 2018 critical analysis, the proposed CAP Regulations lacked the components of an effective performance-based system since its nine goals were "not clearly defined, neither specific nor translated into quantified targets" (ECA, 2018). However, several Member States are still reluctant to adopt a performance-based strategy.

The European Green Deal, the umbrella for a number of new policies, including the Farm to Fork Strategy, which aims to mainstream the relevant Green Deal targets within the CAP and requires Member States to set explicit values for these targets and identify appropriate interventions within their CSPs, is at the center of the new five-year vision adopted by the newly appointed Commission following the publication of the 2018 proposals (EC, 2020a).

As a crucial policy tool and financial source, the CAP might contribute significantly to achieving the goals of the Green Deal if it is planned and executed in a manner that takes into account the new European agenda. In the next era, agriculture and rural development will receive €343.9 billion6 in support from the CAP between 2021 and 2027. A small amount of the CAP budget is also available to fund activities and projects with actors along the agri-food supply chain, in the forest sector, and in rural areas more generally. The majority of the CAP budget is allocated to the agricultural sector, with €258.6 billion going to Pillar 1 and €85.3 billion going to Pillar 2 over the period. Therefore, if properly designed and executed, the CAP may serve as a key policy instrument to accomplish the goals of the Green Deal. A Staff Working Paper on the connections between CAP reform and the Green Deal (EC, 2020c) was released with the Farm to Fork Strategy. It demonstrated how the CAP proposals met the Green Deal's aims, highlighting areas that may be reinforced.

Member states will have much more freedom to use the entire range of CAP interventions (both in Pillar 1 and Pillar 2) to fulfill their priorities in accordance with EU goals, which should also include the goals outlined in the Green Deal, thanks to the new flexibility proposed for the next CAP. Additionally, they will need to show in their CAP Strategic Plans (CSPs) how they prevent unsustainable behaviors (e.g., by using linked income support).

MATERIALS AND METHODS

This research employs qualitative comparative policy analysis to examine the functionality and efficacy of the Performance Monitoring and Evaluation Framework within the forthcoming Common Agricultural Policy (CAP) 2023–2027 (Cagliero, Licciardo & Legnini, 2023; Pufahl & Sinabell, 2023). The methodological approach follows different steps, which include the systematic literature review, the selection of comparative case studies, the assessment of control techniques and the awareness of study limits.

Data collection

The study was based on seven key scientific sources, which encompass theoretical, methodological and empirical components of the implementation of the CAP. Specifically, the following were examined:

•the institutional framework and governance philosophy (García Azcárate & Folkeson, 2020),

•the performance assessment system and lessons learned from the previous Rural Development Programme (Cagliero et al., 2023),

•the environmental and agroecological methodologies (Peeters et al., 2020),

The case studies that are going to be presented are from Italy, Austria, and Germany (Pierangeli et al., 2025; Pufahl & Sinabell, 2023), together with the specifics of the Greek institutional framework (Tyrovoli, 2022).

The comparative literature assessment included content analysis to identify recurring thematic patterns, prevalent indicators, and conceptual deficiencies in the available studies (Krippendorff, 2018). This method was chosen because it offers an interpretative framework that accurately reflects the political differences and governance patterns across the Member States.

Selection of Countries for Comparison

Four countries were selected for the comparative research, representing different levels of development and institutional frameworks of the CAP evaluation system.

Greece is the main case study since it has to deal with problems that are different from those in other countries when it comes to carrying out the program. Italy was selected due to its similar rural character and decentralized administrative framework, although Austria and Germany were referenced as examples of countries with advanced and effective monitoring and evaluation systems (Pufahl & Sinabell, 2023; Pierangeli et al., 2025).

The selection of the aforementioned countries was based on the criteria of data accessibility, institutional variety of governance structures, and sufficient bibliographic material to ensure the validity and comparability of the results.

Examination of Control Strategies

The examination of the control strategies concentrated on evaluating the systematic oversight of indicators, the incorporation of evaluation outcomes into the decision-making process, the transparency and public accessibility of reports, and the involvement of stakeholders in the formulation and assessment of policies (Cagliero et al., 2023; García Azcárate & Folkeson, 2020). The comparison method was undertaken via the research of official documents of the European Commission, technical reports of the Member States and descriptions of the CAP Strategic Plans 2023–2027 (European Commission, 2022). The data were organized by theme, which made it possible to compare national plans based on how mature they were, how open they were to the public, and how well they fit into the common European assessment framework.

Study Limitations

The study relies only on secondary data, foregoing primary empirical research methods like as interviews or surveys, so limiting the potential for a comprehensive examination of the administrative experiences of the Member States (Bowen, 2009).

Additionally, the comparison study is informative rather than comprehensive, due to the heterogeneity and variability in data availability and structure among countries.

Lastly, it is important to note that there is a temporal asymmetry in the available sources. This is because some studies were published before the Strategic Plans were fully put into action, which means that the results should be seen as preliminary assessments rather than final conclusions (Cagliero et al., 2023; Pierangeli et al., 2025).

FINDINGS

Comparison of Greece to other European Countries

The comparison of Greece with other European countries in the field of implementation and evaluation of the CAP 2023–2027 reveals significant differences that mainly concern the institutional framework, governance, availability and quality of data, as well as the participation of stakeholders.

Greece

Greece is anticipated to receive around €19.4 billion from CAP funds from 2021 to 2027. This is a little less than the amount for the previous period, 2014–2020 (−0.5%). The small drop is because the Recovery Fund's "extraordinary" resources provided a lot of extra help during the two-year "transitional CAP" period from 2020 to 2022.

The European Commission approved Greece's final plan for the years 2023 to 2027. It says that 73% of the support (about €10 billion) will go to the first Pillar (aid and market measures), and the second Pillar

(investments) will get the other 27% (about €4 billion). Greece's strategy also includes assistance for the market in some areas of production, such as fruits and vegetables, olive oil and table olives, wine, and beekeeping products.

The diaNEOsis report makes it very clear that "it is very early to make any kind of assessment" about the strategic part, which is the national strategic plan for the CAP. This is because "we are only at the beginning of the implementation of the new CAP," and many parts of the policy's implementation in the country are still "general and descriptive." (Nikolaidis, 2023)

The process for creating and getting the Greek strategic plan for the CAP approved was also not straightforward and had a lot of problems both within and outside of Greece. For instance, the implementation of the country's strategic decision to equalize the unit value of all payment entitlements in each agronomic region (arable crops, tree crops, and pastures) will not be painless, as it is anticipated to significantly affect the income support of small and medium-sized farms that historically established high unit value entitlements from crops such as raisins, tobacco, etc. This is despite the fact that the SWOT analysis of Greece's strengths and weaknesses, which was done to help make its strategic plan, showed that "10% of farms get 48% of direct payments, while 45% of farms that can be considered small farmers get 10% of direct payments." (Nikolaidis, 2023).

Italy

BPS, which made up over 55% of the direct payment budget in 2020, dominated direct payments in Italy prior to the 2023–2027 reform. The change reflects a move towards redistributive goals, with BISS now making up 48% of the budget and CRISS contributing 10%. Coupled payments, which support important industries like rice, buffalo milk, and durum wheat, still account about 13% of the envelope. In Italian agriculture, direct payments make up a considerable portion of FNVA. Decoupled payments made up, on average, 18 percent of FNVA in 2020, albeit this varied by farm type and geographic location. After reform, this percentage is anticipated to modestly decrease as a result of budget reallocations that favor eco-schemes and redistributive payments. Along with direct payments, Italian farmers also receive risk management instruments including subsidized insurance (€3 billion), rural development initiatives (€3 billion), eco-schemes encouraging sustainable practices (€4.4 billion), and coupled assistance (13% of the direct payment budget).

In Italy, the post-reform scenario (2026) and the status quo (2020) are applied differently. Italy continues to use payment entitlements (PEs) as a means of allocating basic income assistance for both BPS (2020) and BISS (2026). As a consequence, farmers get unit quantities that fluctuate, sometimes by a large amount. Under the BPS from 2015, a process of partial internal convergence was started to progressively lessen these disparities. This approach entails the progressive equalization of the value of payment entitlements (Pierangeli et al. 2023).5. By 2020, the first stage of convergence was complete, guaranteeing that all PEs attained at least 60% of the national average. Italy has to stick with the partial internal convergence process under BISS in order to continue with PEs in 2023–2027. By 2026, all PEs must achieve at least 85% of the national average value, which is equivalent to 139,50€/ha and 164,12€/ha 6 respectively. The funding for this procedure came from lowering the PEs' value above the national average according to their distance; in other words, the higher the value, the larger the decrease. This decrease may reach a maximum of -30% (halt loss). Starting in 2023, all payment entitlements above €2000 are subject to a maximum ceiling in order to decrease extreme values and speed the transition towards the national average. This limit makes sure that entitlement values that are higher than this cutoff are appropriately decreased. During the convergence phase, a stop loss mechanism is implemented separately, restricting decreases to no more than 30% of each entitlement's starting value in 2020. Notably, the computation of this stop loss limit does not account for decreases brought on by the limitation.

In 2023, Italy will finally implement the redistributive payments (CRISS) for the first time, supporting small and medium-sized farms by offering unitary income assistance for the first 14 hectares of all farms with sizes between 0.5 and 50 hectares.

In order to account for the (differing) EU constraints associated with the requirement to allocate fixed quotas of the budget to specific payments, as well as the fact that different decisions were made in the two programming periods, the direct payment ceilings into the two periods were split between a number of components at the national level. As a result, BPS received almost 55% of the direct payment funding in 2020, or 2,074,792,970 euros. BISS and CRISS will get 48% (1,678,197,054 euros) and 10% (349,624,386 euros) of the total share in 2026. When comparing the national budget for agricultural income assistance in 2020 and 2026, the disparity in resource distribution shown above results in a decrease of −2.3 percent.

Austria and Germany

Article 140 of the CSP regulation sets out the broad rules for when and how evaluations should be done. The implementing rule, on the other hand, sets out more specific minimum criteria for how they should be made up and what they should include. The European Evaluation Helpdesk for the CAP (EC, 2023a; 2023b) makes it further clearer what parts of the evaluation plan are required and which are suggested. The CSP 2023–2027 evaluation framework seems much more demanding than the one from 2014 to 2022. This is because the European Commission wants to make sure that Member States take the evaluation process more seriously and use consistent methods.

In Austria, the assessment framework is based on the primary parts of the evaluation, and twenty-five of the thirty-six planned studies are directly related to particular goals as well as secondary ones that include natural resources broken down into more specific research on issues like air quality, soil erosion, and water quality. Four further synthesis studies are planned to bring together the results of the CAP Strategic Plan (CSP) and its main aims. Austria's plan also includes particular research of national relevance, such looking at how the CAP affects organic farming, figuring out what would happen if there were no CAP funding, and making it easier to carry out the plan. One of the best things about the Austrian system is its excellent way of handling data. The Federal Institute of Agricultural Economics, Rural and Mountain Research (BAB) manages the central data pool, which brings together georeferenced IACS data, rural development data since 2000, sectoral and non-IACS interventions, beneficiary-level information, and outcome indicators. Austria improves both transparency and the ability to analyze data by encouraging organized, standardized, and easy-to-find datasets. The nation is better able to do evidence-based evaluations because it keeps adding to its metadata, adds new econometric datasets, and uses machine-learning methods to find old data.

Germany has a different approach that is less centralized. The federal government orders one or more assessments for each specified objective (SO) in the CSP review. The federal government and the Länder share several responsibilities. The federal government is the only one who can measure farm income (SO a), however both levels of government are responsible for goals connected to generational renewal and the environment and climate (SOs g, d, e, and f). The Länder are the only ones who look at a number of additional goals, such as competitiveness and rural vitality. But Germany's review procedure is made more difficult by the fact that its data management system is broken up into several parts. There are thirteen separate systems at the state level that gather monitoring and IACS data. Each system has its own indications and formats, which makes it hard to make them all work together. There have been some attempts to combine monitoring data and change IACS data into a single format for use in larger policy evaluations, but there are still problems in combining and reusing data for CAP evaluations.

Austria conducts evaluations in a more centralized and tech-savvy way, focusing on efficiency, digital coordination, and well-organized data management. Germany, on the other hand, lets regions choose

their own rules, which is more decentralized. But it has trouble getting to and standardizing data. Both nations have set up interim reviews for 2025 and 2026 and a final assessment for 2031. Austria, on the other hand, is better ready for swift, data-driven inspections since it has a solid database infrastructure and an integrated governance framework.

Analysis and Discussion

The comparative analysis of European experiences in the implementation of the new Common Agricultural Policy (CAP) framework for 2023–2027 indicates that Greece lacks both institutional organization and technical infrastructure, essential for the effective execution of the Performance Monitoring and Evaluation Framework (PME). Cagliero, Licciardo, and Legnini (2023) assert that the efficacy of the new governance model hinges on the member states' capacity to continuously incorporate performance indicators, gather dependable data, and synchronize activities with quantifiable outcomes. In Greece, the fragmentation of data and the absence of compatible information technology hinder a unified assessment of performance. In contrast, Austria and Germany use centralized databases and well established methodological standards for evaluation (Pufahl & Sinabell, 2023).

Italy's experience teaches us more about how to help people in a fair manner. The BISS and CRISS systems were set up between 2023 and 2027. This gradually brought the values of payment entitlements together, which helped small and medium-sized farmers and made things more equitable (Pierangeli et al., 2025). The previous subsidy scheme is still producing problems in Greece, where 10% of farmers get around half of the direct payments (Tyrovoli, 2022). The program isn't performing as effectively as it should since resources are not being used fairly and the Farm Advisory System is not working adequately. This makes things much worse for regions that are already doing poorly.

Also, the difficulties that Member States have in aligning their environmental goals with those of the European Green Deal and the Farm to Fork strategy show how important it is for these two sets of goals to be quite similar. Peeters et al. (2020) and García Azcárate & Folkeson (2020) assert that the new model will only be effective if Member States implement agro-ecological practices and transform environmental indicators into significant evaluative tools. Greece is lagging in both using accurate environmental performance data and setting up regular systems to keep a check on problems.

The comparative study indicates that Greece could derive substantial advantages by implementing strategies utilized in Central European nations, including the formal incorporation of local entities in oversight mechanisms, the application of geospatial monitoring technologies, and the standardization of data management practices. Cagliero et al. (2023) underscore that the institutional and technological maturity of the system is a critical determinant of the New Delivery Model's (NDM) efficacy.

Challenges on the implementation of CAP 2023–2027

The change to the new governance structure introduces a lot of problems, and each Member State has its own set of them. In Greece, there is no method to coordinate things, and responsibilities are divided, which makes it hard to make quick choices and keep an eye on things. Tyrovoli (2022) says that the National Strategic Plan is taking longer to put into action since there isn't a clear institutional structure for collaboration between ministries and regions. On the other hand, managing things in Austria and Germany is harder.

However, the existence of institutionally reinforced structures and established procedures makes things more obvious and responsible (Pufahl & Sinabell, 2023).

Greece also faces challenges with the technologies it uses to gather and analyze data. People can't access real-time data without a fully operating information system, which makes it impossible to assess and make adjustments. Austria, on the other hand, has made it simpler to keep track of and evaluate by

creating an integrated digital platform via the Federal Institute BAB that combines geographical data, subsidy data, and result indicators (Pufahl & Sinabell, 2023).

Greece has very few local groups and rural organizations that are active in organizing and evaluating social participation. This makes the rules less obvious and less popular with the people (Tyrovoli, 2022). Italy and the Central European countries, on the other hand, have chosen more participatory forms of government. This has made it simpler for people to relate to each other and share the burden of carrying out the CAP (Pierangeli et al., 2025).

Combining environmental indicators with agroecological techniques is a difficulty that all countries face. Greece is especially behind when it comes to figuring out how things affect each other and utilizing indications to determine how long something will last (Peeters et al., 2020).

Lessons learned for Greece

The comparison of Member States shows that the CAP 2023–2027 requires strong institutions, qualified workers, and people who are involved in their communities to function. Greece can make its own system better by seeing what works well in other nations. To improve institutions, there has to be one system for coordinating and keeping an eye on things, with defined responsibilities and the same standards for judging (Cagliero et al., 2023). To improve technology, we need to build digital geographic monitoring tools, utilize AI to look at data, and link information bases as they do in Austria.

There has to be more social aspects to the plan, such as means for farmers, local governments, and scientific groups to help make decisions. The Italian experience shows that being open and letting people be a part of changes makes them more likely to be accepted and helps treatments work better (Pierangeli et al., 2025). Using accurate environmental indicators together with agro-ecological technology would help people accomplish the goals of the Green Deal at the same time (Peeters et al., 2020).

Greece has an advantage over other nations because of its biodiversity and agro-ecological features. You may exploit this benefit by partnering with universities and tech institutes on research initiatives, or by employing remote sensing technologies and big data analytics to monitor how well the environment is doing (García Azcárate & Folkeson, 2020).

DISCUSSION AND CONCLUSION

The review of the new CAP model for 2023–2027 shows that Greece has a number of structural issues, including a lack of administrative coherence, poor technological infrastructure, and low levels of public participation. Here are some suggestions about how to make the policy work better:

• Making the institutional structure and coordination stronger by setting up a single information system and making sure that ministries, regions, and supervisory bodies know what their roles are.

• Upgrading technology with digital geographic monitoring tools, collecting data in real time, and combining analytical platforms.

• Increasing social engagement by making it a rule for local and professional groups to talk and work together when making and judging policies.

• Combining scientifically proven measuring techniques with environmental indicators, working together with research institutes and technology networks.

• Invest in the education and training of executives to enhance their adaptability to the new governance model and to improve data management and assessments.

Finally, it is recommended that more empirical study be conducted to assess administrative experiences and investigate the environmental and social impacts of the new CAP at the local level. Such studies might greatly improve the creation of more fair, open, and long-lasting policies for Greek agriculture that are in line with the goals of sustainable development in Europe.

Orcid id: 0000-0001-7342-0477

ABSTRACT

Although the influence of monetary relations on world politics has recently become the subject of analysis in various branches of social science, no comprehensive research has been conducted in this area. It is this circumstance that makes this topic particularly relevant. Events related to the growth in the number of conflicts with monetary aspects, the conscious internationalization of currencies, and the emergence of new monetary institutions give reason to assert that monetary relations have become one of the most important factors in the formation of a new world order, on which the degree of influence of each actor in international politics will depend. Having proven the connection between these facts, we can state that monetary relations have become politicized, creating a new sphere of international confrontation and a new power hierarchy. Undoubtedly, monetary relations are influenced by technological progress, forcing the introduction of electronic and digital currencies into the analysis matrix.

Key words: monetization, global politics, tariffs, trade war, reserve currency, dollar, the USA, China, imports, exports

INTRODUCTION

All the recent changes that have already taken place and are taking place on the international stage lead us to believe that the old conceptual models of world order are outdated and need to be revised. These traditional models cannot provide an adequate response to all the events we are witnessing in world politics today. One of the main trends, in our opinion, is the further monetization of international politics. Issues of monetary influence and monetary sovereignty reinforce the factor of full financial sovereignty. In this regard, the main trigger in the world is the struggle against US monetary dominance. The United States began a trade war during Donald Trump's first term as president, primarily against China. Trump's trade war takes us back to the era of tariff wars and devaluations of the 1930s. Ultimately, this all ended in the Great Depression and World War II. The president's main argument in

favor of increasing tariffs is to reduce the tax budget deficit. The change in the basic settings of liberal trade policy has resulted in turbulence throughout the global economic system [1].

Monetary tools of US influence

During his first presidential term in 2018-2019, Donald Trump imposed tariffs on imports from China worth $380 billion and from Europe worth $8 billion. However, he introduced them gradually. Nevertheless, the confrontation with China caused significant damage to the US economy. Now, the US president has also struck a blow to his main allies on the American continent – Canada and Mexico. The total amount of taxes on imports from the above-mentioned countries turned out to be much higher – $1 trillion. All this was accompanied by attacks on major trading partners. Trump was not deterred by the stock market crash, the threat of rising inflation, or the possibility of a recession in the US economy. As a result, while the UK, Australia, and Mexico tried to negotiate with the eccentric Trump, China, Canada, and the EU responded with a decisive rebuff. Their retaliatory restrictions on US imports amounted to $190 billion.

The dollar is the world's reserve currency, and the United States, as the issuer of this currency, experiences both positive and negative effects. The main negative effect is the trade deficit. An increase in demand for the global reserve currency during times of crisis has a negative impact on the issuer of this currency. Issuance causes inflation, the price of the dollar rises, and it strengthens, which has a negative impact on exporters and reduces their competitiveness in the global market. This is what happened to the US economy during the global economic crisis of 2008-2009 [2; 6, pp. 72-73]. The Trump administration considers the situation critical, stating the need to eliminate the budget deficit.

This situation occurred in the 1970s, when demand for the US currency rose sharply. Later, in the fall of 1985, a solution to this problem was found at the Plaza Hotel in New York. The agreement, signed by the finance ministers of the world's five leading economies - the US, the UK, Germany, France, and Japan—was called the Plaza Accord. The G5 agreed to coordinate their actions to weaken the dollar, which the US itself needed. The countries decided to correct the trade imbalance with the United States. The main levers for this were currency interventions and stimulation of domestic demand. The main result of the agreement after a year and a half was a 35% devaluation of the dollar. Not wanting the dollar to weaken further, Washington, together with its G5 partners and Canada, initiated a new conference, this time in Paris. The meeting at the Louvre Palace in February 1987 led to the signing of a new document called the “Louvre Agreement”. The signatories pledged to coordinate their monetary and fiscal policies to stabilize currency imbalances and increase economic growth. The main emphasis was on reducing the budget deficit and lowering inflation.

Summarizing the results of the agreements for the US, it is worth noting that Washington implemented its policy in the medium term: the dollar fell in value and the trade deficit was significantly reduced. While in 1984 it amounted to $112 billion, by 1991 it had fallen to $30 billion. However, in the long term, this strategy did not work. Since the mid-1990s, global demand for the dollar as a safe haven for investors has grown again. Developing countries such as China and Mexico replaced cheap competitors. Nevertheless, the dollar weathered this crisis and remained the world's reserve currency. It is quite possible that exports will increase and the value of the dollar will decline, while the US currency will maintain its leading position in the world [5, pp. 24-25].

The US trade deficit reached $1 trillion in 2022, which the new administration considers critical. Donald Trump's tariff policy led to a 9% weakening of the dollar by the fall of 2025, which is beneficial to American manufacturers, as it increases the competitiveness of their goods. However, unlike the Plaza Accord and the Louvre Agreement, the United States began to act aggressively, disregarding its partners and offering them nothing in return. One example is the US-EU trade agreement of July 2025, under

which imports of European goods will be subject to 15% tariffs, while imports of American goods into Europe will be subject to a 1% tariff.

Policy on de-dollarization

It is clear that the role of the US currency will not be undermined in the near future. Nevertheless, a number of countries are pursuing an active policy of de-dollarization. It is worth noting here that when it comes to de-dollarization, it is important to distinguish between the dollar as a reserve currency and the dollar as an invoice currency. There are more opportunities to avoid using the dollar as a means of payment than in the reserve currency sphere, where the only alternative at present is gold, which is hitting historic lows. There are more options in the area of settlements. There are a number of initiatives that bypass the dollar and the banking system. One of the most advanced initiatives is the mBridge project, which allows central banks to conduct currency settlements and transactions between different national digital currencies on a multilateral platform, speeding up and reducing the cost of cross-border payments. The People's Bank of China, the central banks of Hong Kong and Thailand are participating in this pilot project. The Mariana project with European participating countries also allows settlements in national currencies that are included in the multilateral settlement pool, which automatically forms a bilateral price between each currency.

China has set itself the clear goal of reducing the international influence of the United States, which is based on the dominance of the dollar. In this regard, the inclusion of the yuan in the IMF's currency basket in 2016, alongside the dollar, euro, pound sterling, and yen, was a significant achievement for China. At the same time, China began trading gold in yuan on its exchanges, and later, in 2018, oil as well. All of this is part of China's “One Belt, One Road” strategy, which aims to squeeze out its American competitor in the Eurasian and Middle East regions [4, p. 229].

In 2018, Germany announced that it would include the Chinese yuan in its foreign exchange reserves, while simultaneously reducing the share of the US dollar in those reserves. A year earlier, in 2017, Germany completed its program to repatriate part of its gold reserves stored at the Federal Reserve Bank in New York ahead of schedule. Three hundred tons of gold were transported to the German Federal Bank in Frankfurt am Main. There is no doubt that Germany's actions are mainly motivated by political considerations and a desire to gradually withdraw from US tutelage.

A number of countries have begun developing their own national cryptocurrencies, all with the same goal of undermining the dominance of the United States. For example, in 2017, Venezuelan President Nicolas Maduro announced the creation of a Venezuelan cryptocurrency, El Petro, backed by the country's oil reserves. The Venezuelan president believes that this will strengthen the country's monetary sovereignty and get rid of the American financial blockade. Maduro's actions have caused concern in Washington, which fears that other countries will follow suit [3].

In Venezuela, as well as in Iran and Russia, the abandonment of the dollar is primarily motivated by the sanctions imposed on these countries. All of them are forced to seek an alternative to the dollar. The decline in demand for the U.S. currency is a consequence of the absence or low volume of financial transactions in the commodity market, for which payments need to be made in dollars. Sanctions that restrict the freedom of international trade operations also apply to Iran, Russia, and Venezuela. To some extent, Russia's actions regarding the shift of international trade to settlements in other convertible currencies can be seen as a preventive measure. In this light, further rapprochement between Russia and China and the gradual replacement of the dollar by the yuan appear logical, which strengthens the Chinese currency and further increases Russia's dependence on Beijing [8, pp.99-100].

The meeting between U.S. President D. Trump and Chinese President Xi Jinping on October 30, 2025, in Busan (South Korea) at the APEC summit was the first in six years. Moreover, as mentioned

above, this meeting was preceded by a tough tariff policy implemented by the U.S. against China. In response, Beijing tightened control over the export of strategically important rare earth metals to the U.S. In April 2025, the United States and China mutually increased tariffs to 145% and 125%, respectively, and then in June of the same year, the parties agreed to reduce these figures to 10% and 30%. According to a decree by D. Trump, the reduced tariffs are to remain in effect until November 10 of this year. Following the bilateral meeting, the American president decided against imposing new tariffs and also announced a reduction of the tariff rate on Chinese goods from 57% to 47%. In addition, the so-called fentanyl tariff was reduced from 20% to 10% (fentanyl overdose annually causes the deaths of a large number of young Americans). China, in turn, agreed to suspend the introduction of new restrictions on the export of rare earth metals for one year. However, this easing does not apply to seven rare earth metals (samarium, gadolinium, terbium, dysprosium, lutetium, scandium, and yttrium) and their alloys, which are essential for the American automotive industry. Nevertheless, as Trump stated following the meeting, he managed to 'resolve a crisis affecting not only the US but the entire world'.

Undoubtedly, the Chinese export restrictions imposed before the summit allowed the parties to reach a compromise. According to experts, Trump's trade war did not bring the desired results for the American administration, as the Chinese economy was prepared for a new round of tariff confrontations. During talks with Comrade Xi, the American president also tried to raise the issue of China's purchases of Russian energy resources. Washington has repeatedly expressed its dissatisfaction with this fact, lamenting that it contributes to prolonging the conflict in Ukraine. In particular, for the same reason, in August 2025, the U.S. imposed 25% 'penalty' tariffs on Indian goods (New Delhi is actively buying Russian oil). However, similar "penalty" tariffs against China were not imposed. Most likely, this was due to Beijing agreeing to purchase American energy resources (oil and gas) from Alaska. As for changes in Chinese trade policy towards Russia under American pressure, that would mean a demonstrative loss of "sovereignty" for Beijing, so one should not expect it. Thus, this meeting should be seen as something of a diplomatic pause in the trade wars. The parties are seeking compromises, but they are not abandoning global competition. There is a possibility that by the end of the year, Washington will tighten its tariff policy toward China again.

CONCLUSION

The use of monetary instruments by states to achieve their foreign policy goals is becoming one of the triggers of the emerging new world order. Finance expands the toolkit of traditional means of influence. Just like financial relations in general, monetary relations play a dual role, bringing not only economic but also political benefits to those actors in world politics who have established effective control over them, linked to influencing the behavior of other actors. Due to the fact that not all actors are able to establish control over global monetary relations, a new power hierarchy has formed in the world, consisting of beneficiaries and benefactors, with semi-beneficiaries occupying an intermediate position. This gradually led to the emergence of two opposing trends in the development of the international system of monetary unification and monetary diversification. An actor that imposes its own model of monetary relations on the world strengthens its power position relative to others. In this case, all other actors must implement a monetary policy favorable to it, recognizing its currency, issued without any restrictions, as a sort of collateral basis for their national currencies, a role previously fulfilled by gold [7, p.153]. Thus, for the actor to gain maximum political benefits, it is necessary to achieve monetary unification of the international system, i.e., a monetary policy advantageous to itself.

Abstract

In this article, the authors discuss how the external trade in Kazakhstan developed between 2004 and 2024 based on the increase in trade volumes, export and import structure, geographic concentration, and structural imbalances underlying it. The total turnover in the trade grew about four times, exports rose to US$81.6 billion and US$59.7 billion as a result of the 20 years. This quantitative growth notwithstanding, export structure remained starkly contingent on raw materials (approximately 77-88 percent of exports), and imports were still characterised by machinery, equipment, and consumer goods, which is still symptomatic of technological asymmetry. The importance of geographic concentration and susceptibility to external shocks in response to changes in world energy and commodity prices is highlighted by leading trade partners (Russia, China, Italy). Even though recent years reflect a slight diversification of services (IT, finance, culture) and re-export activity, little structural transformation has occurred. The article talks about the trade policy implications, diversification strategy implications, and structural resilience implications.

Keywords: Kazakhstan; foreign trade; export structure; import composition; trade balance; diversification; raw materials; services export; re-export; trade concentration; Herfindahl–Hirschman Index; economic development; external shocks; trade policy; Central Asia.

INTRODUCTION

External trade is one of the central aspects of economic change in countries with rich resources and middle-income. In the case of Kazakhstan, blessed with much endowment of hydrocarbons and minerals, the ensuing years between 2004 and 2024 have been marked by significant growth in external trade. The numbers on the quantitative growth are astounding: trade turnover (imports + exports) increased not only in 2004 (around US$32.9 billion) but also in 2024 (around US$141.3 billion). During the same time, exports increased by about US$20.1 billion to US$81.6 billion, and imports increased by about US$12.7 billion to US$59.7 billion.

Growth is, however, not an assurance of structural sustainability. In the economies that depend on the export of commodities and are highly dependent on the select few, the growth might conceal the underlying weaknesses. The primary aim of the article is to examine the external trade of Kazakhstan in relation to: (a) growth patterns; (b) form of export-import structure; (c) concentration of export and import partners; (d) phenomenon of services trade and re-export; and (e) policy suggestions towards diversification and resiliency.

Research Context and Literature Review

External trade is also generally accepted as one of the key factors in economic growth, the spread of technology, and structural change in international economics (Krugman et al., 2022). Export diversification, the level of technological sophistication of the goods to be exported, and the involvement of a nation in world value chains are some of the factors that tend to mediate the relationship between

trade and growth. Based on the comparative advantage theory and its dynamic comparative advantage theory developed by Balassa (1985), countries with a natural resource endowment are prone to specialisation in commodities in the initial processes of development, but have to progressively shift to the processing of goods and services in order to achieve sustainable development.

As a post-Soviet transition economy, Kazakhstan had an intensive export structure based on resources as it entered the 2000s. The country's dependence on hydrocarbons (mainly crude oil and gas), ferrous and non-ferrous metals, and mineral resources determined its course of trade. The literature on the resource dependence problem has been presented in the form of the resource curse (Auty, 2001) and the Dutch disease (Corden & Neary, 1982) focusing on the negative structural and institutional implications of commodity booms. These models give an analytical perspective on evaluating Kazakhstan's external trade trends from 2004 to 2024.

A number of empirical studies have examined the performance of Kazakh external trade, but they have used shorter periods or limited fields. As an example, Pomfret (2019) noted that the structure of the exports in Kazakhstan continues to be predominantly mineral, with over 80 per cent of the total exports comprising mineral commodities and less than 10 per cent of manufacturing exports. He claimed that even though there has been a tremendous increase in exports made since 2000, the lack of deep industrialization prevents the integration of Kazakhstan into global value chains.

In the same way, according to the World Bank's report (2021) on the Kazakhstan Country Economic Memorandum, the country's export base is limited to crude oil, copper, uranium, and grain with minimal technological content. The report determined that Kazakhstan's trade performance has been volume and not value performance, and the growth in productivity outside the resource sector is still low (Lall et al., 2022).

Kalyuzhnova (2016) also investigated the impacts of external shocks, especially the fluctuation in oil prices, on Kazakhstan's export revenues and fiscal balance. As shown by her study, in oil boom periods, trade surpluses significantly grow and contract considerably in periods of crisis, indicating pro-cyclical fiscal and external policies. This leads to cyclical dependence that causes instability in the macroeconomy and makes planning difficult.

The trade of Kazakhstan is also to be examined in the context of the Central Asian and the Eurasian economic space in general. Being an original member of the Eurasian Economic Union (EAEU), the Kazakh trade relations with Russia, Belarus, Armenia, and the Kyrgyz state adhere to a customs union government. Research by Vinokurov (2018) and Libman and Shagina (2020) shows that the EAEU has not only led to the liberalisation of trade between the states but also increased Kazakhstan's exposure to Russia's external sanctions and supply-chain risks.

The general trade environment of Central Asia is typified by a two-fold reliance of the region on the export of resources to the international markets, as well as the importation of capital goods and technology from Russia, China, and the European Union. In this respect, Kazakhstan has a strategic transit and logistic location- the geography of this country places it both as a landlocked and transit-locked economy (Alam et al., 2019). The creation of the trans-Eurasian routes (the Trans-Caspian International Transport Route, the China-Europe rail corridor, and the North-South Corridor) has been mentioned, again and again, as a tool for diversifying trade flows and increasing connectivity (ADB, 2020).

It is estimated that Kazakhstan's engagement in such initiatives has increased the export of transport services, but it has yet to be reflected in significant industrial diversification and value addition (solid empirical studies indicate this) (Vinokurov et al., 2023).

The need to have an export diversification has not been a new concept in the policy discourse of Kazakhstan. Both the "Kazakhstan 2050 Strategy" (Nazarbayev, 2012) and the National Development

Plan 2025 focus on the growth of processed and high-value exports, as well as on facilitating the involvement of SMEs in trade. The focus of the programme in terms of diversification is on clusters in metallurgy, petrochemistry, agriculture, and machine-building, which are focused on in the Industrial-Innovative Development Programme 2020-2025.

However, the Anderson et al. (2018) and WorldBank (2017) evaluations indicate that the pace of progress has been slow and disproportionate. Export to non-oils has increased at a modest growth but the total composition of the export is biassed towards commodity. In addition, the coordination of policies in the trade, industrial and innovation sectors is still poor.

At the regional level, Kazakhstan seeks to leverage the Trans-Caspian International Transport Route (Middle Corridor) within China's Belt and Road Initiative (BRI) to enhance connectivity and logistics competitiveness. Empirical assessments (ADB, 2023) indicate that the corridor's efficiency has improved, but logistical costs and border-crossing times remain constraints.

Although various institutional and academic studies exist, few cover the full twenty-year period 2004–2024 with integrated quantitative and qualitative analysis. Earlier works tend to stop around 2016 or 2020 and seldom include the pandemic and post-sanction periods. Moreover, the re-export phenomenon and service-sector expansion have emerged only recently and remain understudied in peer-reviewed literature.

This article, therefore, contributes to the existing body of knowledge by:

i. Providing a comprehensive two-decade analysis (2004–2024) of Kazakhstan's external trade dynamics;
ii. Integrating merchandise and service trade statistics into a unified structural framework;
iii. Applying the Herfindahl–Hirschman Index to evaluate product and partner concentration;
iv. Linking macroeconomic shocks (oil-price fluctuations, COVID-19 pandemic, sanctions) with trade structure evolution; and
v. Discussing the policy implications of re-export growth and the transition toward service-based exports.

In doing so, the study aims to fill an empirical and analytical gap in Central Asian trade research by offering a longitudinal, data-driven overview of Kazakhstan's trade structure, its vulnerabilities, and its evolving integration into regional and global trade systems.

MATERIALS AND METHODS

The data sources are not only official national statistics (e.g., Kazakhstan Statistics Agency), but also international databases (UN COMTRADE, Wits), as well as the series given in the introduction (2004-2024). The most important variables: total trade (turnover), exports, imports, export share, export composition (raw materials; semi-processing goods; finished goods), import composition (consumer goods; intermediate/investment goods), partner country share, and concentration measures (e.g., HHI). Structural shares and growth rates are calculated. It provides descriptive time-series analysis of the growth and structure, identifies key years of inflexion (2008-2009, 2014-2016, 2020), and deciphers imbalances in the structure. The qualitative discussion is another extension of the quantitative results, relying on the commodity price shocks and the geopolitical events.

FINDINGS

The overall external trade of Kazakhstan grew between 2004 and 2024 by approximately US$32.9 billion to approximately US$141.3 billion, approximately four times. Exports stood at US 20.1 billion (61.1 percent export share) and imports at 12.7 billion in the year 2004. The export was US$81.6 billion, imports were US$59.7 billion, and the export share was approximately 57.7 percent by 2024. This

expansion, however, did not follow a straight line: the boom years culminated in 2008 with trade paying US$109 billion (exports). Before the 2009 global financial crisis, it grew to US$71.2 billion but was severely contracted (e.g., exports declined by approximately 39 per cent in 2009). The fall following the 2014 oil-price plummet and once more in the 2020 COVID-19 pandemic show that external commodity price shocks and externalities are a considerable burden. Trade balance was positive during numerous years; trade surplus was the highest in the period of 2011 (US$47.4 billion) and the lowest in 2016 (US$11.4 billion) when the conditions were not the most favourable.

Table 1: Dynamics of Kazakhstan's External Trade, 2004–2024

Year	Total Trade (US$ billion)	Export (US$ billion)	Import (US$ billion)	Export Share (%)	Trade Balance (US$ billion)
2004	**32.9**	**20.1**	**12.7**	**61.1**	**+7.4**
2008	**109.0**	**71.2**	**37.8**	**65.3**	**+33.4**
2011	**125.3**	**86.4**	**38.9**	**68.9**	**+47.5**
2014	**119.8**	**84.0**	**35.8**	**70.1**	**+48.2**
2016	**60.0**	**46.0**	**25.0**	**59.2**	**+21.0**
2020	**82.0**	**47.5**	**34.5**	**57.9**	**+13.0**
2022	**132.7**	**84.6**	**48.1**	**63.8**	**+36.5**
2024	**141.3**	**81.6**	**59.7**	**57.7**	**+21.9**

Source: Based on data from the State Revenue Committee under the Ministry of Finance of the Republic of Kazakhstan.

The composition is still skewed, notwithstanding the dramatic export growth. In 2004, raw materials and primary processing contributed about 84 per cent, increased to 89.4 per cent in 2012, and dropped to approximately 77.5 per cent in 2024. In 2004, semi-finished (intermediate) and finished consumer goods were 10-12 percent and 5 percent, respectively, and in 2024, it is projected at about 9.8 percent. These data indicate that, though an upgrade toward finished goods has been done to some degree, it is at a slow rate, and reliance on raw materials is still high.

Table 2: Composition of Exports by Product Category (%)

Category	2004	2012	2021	2024	Change 2004–2024
Raw and primary commodities	**84.0**	**89.4**	**81.0**	**77.5**	**−6.5**
Intermediate/semi-processed	**11.0**	**10.0**	**10.0**	**12.7**	**+1.7**
Finished/consumer goods	**5.0**	**4.0**	**9.0**	**9.8**	**+4.8**

Source: Based on data from the KDG MF RK

Structural change can also be seen in import composition: In 2004, imports of investment goods (capital and intermediate goods) predominated (81 %), and only a little more than 19 percent of imports were of consumer goods. The share of investment goods decreased to approximately 64% by 2024, with consumer goods increasing to approximately 36%. This reflects a shift in Kazakhstan's import orientation from heavy infrastructure investment-led imports to consumption-driven import growth,

which may signal the maturation of some investment projects but could also reveal rising dependency on consumer imports.

Table 3: Export Concentration and Partner Diversification

Indicator	2004	2012	2018	2024	Benchmark
Herfindahl–Hirschman Index (HHI) for product concentration	**0.36**	**0.40**	**0.35**	**0.34**	**EU-27 = 0.07**
HHI for partner concentration	**0.33**	**0.38**	**0.36**	**0.31**	**Uzbekistan = 0.20**
Top-3 partners' share (Russia + China + Italy) % of exports	**63**	**68**	**61**	**59**	**—**

Source: Based on data from the KDG MF RK

Kazakhstan's major trade partners remain concentrated. The main export partners include Russia, China, and Italy. For example, according to Trading Economics, in 2024, exports were significantly shaped by these three partners. High concentration is confirmed by HHI values of about 0.34–0.40 for export distribution, which are notably higher than, e.g., EU-27 (≈0.07) or Uzbekistan (≈0.17–0.22). This concentration implies vulnerability to partner-specific shocks (e.g., sanctions, demand slowdown).

Kazakhstan has shown some positive trends in services exports: transport services (especially international transit) grew from about US$841 million in 2004 to over US$4 billion in 2024; IT and telecom exports rose from US$61 million in 2004 to US$623 million in 2024; financial services exports increased from US$19 million to US$615 million over the same period. Nonetheless, these figures remain minor relative to total merchandise exports, and the significant growth in some high-tech goods (e.g., electronic components, communications equipment) appears driven largely by re-exports (especially to Russia/Belarus) rather than domestic value-added expansion. For instance, the export of smartphones rose by +8 076 % from 2021 to 2022, and computer hardware rose by +24 200 %. These are extraordinary rates but point to re-export rather than indigenous production scale-up.

Although the growth is quantitative, a number of structural challenges remain: (i) raw-materials export share is too high; (ii) import structure is based on machinery, electronics, consumer goods, which means that the country remains technologically asymmetrical; (iii) the trade partners are highly geographically concentrated; (iv) the country is too sensitive to external commodity price and geopolitical shocks (examples of these phenomena are the oil-price collapse in 2014 and the COVID-19 pandemic in 2020). The implication of these facets is that the trade development in Kazakhstan is still weak and is not diversified.

DISCUSSION AND CONCLUSION

The figures show that the external trade of Kazakhstan was impressive in terms of volumetric growth between 2004 and 2024, with the best years being boom years. However, the structural characteristics demonstrate the perpetuation of dependence on the extraction of raw materials and energy exports, as well as reliance on the imports of technology and consumer goods. The large concentration of partners is one more risk factor: the country is still vulnerable to changes in world trade of commodities and to geopolitical interruptions.

The fact that the import composition is changing, with more weight being placed on investment goods than consumer goods, indicates that domestic demand is gaining momentum. However, that can also be a result of earlier maturing infrastructure investment cycles. The increase in services exports and

IT/finance points to promising diversification; however, absolute volumes are small, and the situation with re-exports makes one question domestic value-added.

To policymakers, the dilemma is to create real structural change: more processing of raw materials at home, more into higher-value-added exports, more partner and product diversifications, more industrialisation down the value chain, and more integration of domestic companies into world value chains. The objective of increasing the export of processed goods by 2030 is, therefore, quite topical.

Besides, one needs to focus on the risk of re-exports: on the one hand, re-exports increase the volumes; however, on the other hand, they do not lead to sustainable industrial growth, and on the third hand, they leave the country vulnerable to sanctions or transport issues. Developing transparency, improving the customs/statistics systems, tracking the value-added content, and diversifying the logistic corridors are necessary.

Also, the larger landscape of transport corridors (e.g., the Middle Corridor between China and Europe) provides Kazakhstan with the potential to capitalise on its geographical position as a transit point. However, transit services must be complemented with industrial upgrading to prevent the lockage of transit services in low-value services.

Structurally, Kazakhstan needs to reduce its export concentration (product and partner) to lower vulnerability. Measures might include promoting non-hydrocarbon exports, bilateral/multilateral trade agreements beyond traditional markets, investment in human capital and manufacturing, and enhancing institutional capacity to support export diversification.

Conclusion

Kazakhstan's external trade expanded substantially over the two decades from 2004 to 2024, but structural transformation has been partial. The dominance of raw-material exports, the reliance on imported technology and consumer goods, and the geographic concentration of trade partners continue to pose risks. While services exports and re-exports have grown rapidly, the new growth is still small in absolute terms and often lacks deep domestic value-added. Moving forward, the country’s strategic aim to expand processed goods exports and diversify its trade must be operationalised with robust industrial, institutional, and trade-policy support. Without that, Kazakhstan’s trade growth may remain vulnerable to external shocks and not translate into broad-based structural resilience.

ACKNOWLEDGMENT

The authors acknowledge that this work was made possible thanks to the data on the Fragile States Index provided by the Fund for Peace. This study did not receive financial support from any sources. The authors are grateful for the helpful comments from their colleagues at Baku State University and the University of Public Policy.

Аңдатпа:
Бұл зерттеу Қазақстандағы атом электр станциясы (АЭС) жобасының қаржылық, экономикалық және экологиялық аспектілерін шетелдік тәжірибе мен халық пікірін ескере отырып талдайды. Елдегі энергия тұтынуының артуы және энергия тапшылығы АЭС құрылысының қажеттілігін айқындайды. 2030 жылға қарай электр энергиясына сұраныс 2,7 есе өсуі мүмкін, бұл жобаның маңыздылығын арттырады. Қазақстанның мол уран қоры мен атом энергетикасындағы әлеуеті жобаны қаржылық және экологиялық тұрғыдан тиімді етеді. Алайда бастапқы жоғары шығындар, құрылыс мерзімі, қауіпсіздік мәселелері және халықтың қарсылығы сияқты қиындықтар бар.
Зерттеудің мақсаты – АЭС құрылысының қаржылық және экономикалық мүмкіндіктерін, энергетикалық инфрақұрылымға әсерін және экологиялық тиімділігін бағалау, сондай-ақ аналитикалық сараптама негізінде ұсыныстар жасау.
Кілт сөздер: Атом электр станциясы (АЭС), инвестиция, қаржылық тәуекелдер, уран қоры, энергия тапшылығы, энергетикалық инфрақұрылым, экологиялық тиімділік, мемлекетаралық ынтымақтастық, экспорттық әлеует.

Abstract:

This study examines the financial, economic, and environmental aspects of the nuclear power plant (NPP) project in Kazakhstan, considering international experiences and public opinion. Rising energy demand and shortages in Kazakhstan highlight the necessity of constructing an NPP. By 2030, electricity demand may increase 2.7 times, emphasizing the project's importance. Kazakhstan's abundant uranium reserves and nuclear energy potential make the project financially and environmentally feasible. However, high initial costs, construction timelines, safety issues, and public concerns remain challenges.

The study aims to evaluate the financial and economic feasibility of the NPP, its impact on energy infrastructure, and environmental efficiency, while providing recommendations based on critical analysis.

Keywords: Nuclear Power Plant (NPP), investment, financial risks, uranium reserves, energy shortage, energy infrastructure, environmental efficiency, international cooperation, export potential.

Özet:

Bu çalışma, Kazakistan'daki nükleer enerji santrali (NES) projesinin finansal, ekonomik ve çevresel yönlerini, uluslararası deneyimler ve kamu görüşleri ışığında incelemektedir. Kazakistan'daki artan enerji talebi ve enerji sıkıntısı, NES inşasının gerekliliğini ortaya koymaktadır. 2030 yılına kadar elektrik talebinin 2,7 kat artması, projenin önemini artırmaktadır. Kazakistan'ın zengin uranyum rezervleri ve nükleer enerji potansiyeli, projeyi finansal ve çevresel açıdan uygulanabilir kılmaktadır. Ancak, yüksek başlangıç maliyetleri, inşaat süresi, güvenlik sorunları ve halkın tepkisi gibi zorluklar bulunmaktadır.

Çalışma, NES'in finansal ve ekonomik uygulanabilirliğini, enerji altyapısına etkilerini ve çevresel verimliliğini değerlendirmeyi, ayrıca eleştirel analizler doğrultusunda öneriler sunmayı amaçlamaktadır.

Anahtar Kelimeler: Nükleer Enerji Santrali (NES), yatırım, finansal riskler, uranyum rezervleri, enerji sıkıntısı, enerji altyapısı, çevresel verimlilik, uluslararası iş birliği, ihracat potansiyeli.

Кіріспе

Қазіргі таңда атом электр станцияларын (АЭС) салу мәселесі әлемде және Қазақстанда маңызды әрі өзекті тақырыптардың бірі болып отыр. Атом энергетикасы тарихы күрделі эволюциядан өтіп, индустрияландыру және Екінші дүниежүзілік соғыстың әсерімен дамыған. Дегенмен, халық арасында атом энергетикасына қатысты пікір көбіне теріс болып қалыптасқан.

Әлемдік тәжірибеде АЭС салу 1950–1960 жылдары талқылана бастады. Алайда ядролық қалдықтар мен қауіпсіздікке қатысты күмәндер 1970 жылдары жобаларды тоқтатуға себеп болды. Три-Миль аралы мен Чернобыльдегі апаттар атом энергетикасына деген сенімділікті төмендетті. Дегенмен, энергетикаға сұраныстың артуы атом энергетикасына біртіндеп қайта оралуға алып келді. Қазіргі таңда әлемде 439 атомдық қуат блогы жұмыс істеп тұр, ал 52 жаңа энергоблоктың құрылысы басталу үстінде.

Қазақстан үшін бұл тенденциялар маңызды болып табылады. Елдегі теріс пікірлерге қарамастан, атом энергетикасының экономикалық, экологиялық және энергетикалық әлеуетін елемеу мүмкін емес. Соңғы 50 жылдағы әлем елдерінің энергия тұтынуы адамзат тарихындағы барлық кезеңдерді асып кеткені АЭС салудың тиімділігін көрсететін статистикалық деректердің бірі болып табылады.

Қазақстандағы АЭС жобалары халықаралық деңгейде қарастырылуда. MAGATE халықаралық ұйымы, Ресейдің «Росатом» компаниясы (Түркиядағы АЭС жобаларына да қатысады), сондай-ақ Қытай компаниялары құрылыстың қауіпсіздігі мен қаржылық мәселелерін шешуде маңызды серіктестер болып отыр. АЭС құрылысы үшін сейсмикалық, геологиялық және табиғи-климаттық факторларды ескеру қажет.

Аталған факторларды бағалау негізінде келесі аймақтар АЭС салу үшін ықтимал деп танылуда:

1. Үлкен кенті (Балқаш көлі маңы, Алматы облысы) – Балқаш көліне жақындығы сумен қамтамасыз етуді шешеді, электр энергиясын оңтүстік және орталық аймақтарға таратуға тиімді. Сейсмикалық тұрғыдан тұрақты аймақ ретінде қауіпсіз саналады.

2. Курчатов қаласы (Шығыс Қазақстан облысы) – бұрынғы Семей ядролық полигонына жақын, ядролық зерттеулер инфрақұрылымы мен тәжірибелі мамандар бар. Дегенмен радиоактивті ластану мәселесін ескеріп, қосымша экологиялық зерттеулер қажет.

3. Ақтау қаласы (Маңғыстау облысы) – Кеңес дәуірінде БН-350 реакторы негізінде алғашқы коммерциялық АЭС жұмыс істеген. Каспий теңізіне жақындығы сумен қамтамасыз етуді жеңілдетеді. 2017 жылғы сауалнамаға сәйкес, тұрғындардың 58%-ы АЭС құрылысына қарсы.

4. Шымкент немесе Түркістан аймағы – халық тығыз орналасқан оңтүстік өңірді энергиямен қамтамасыз ету үшін әлеуетті. Инфрақұрылымды дамыту мүмкіндігі бар, алайда сейсмикалық белсенділікті ескере отырып қосымша геологиялық зерттеулер қажет.

Материалдар мен әдістер

1 АЭС құрылысының маңызын саралау үшін әдебиеттерге шолу жасау

Мақалада Қазақстан мен Қытай арасындағы энергетикалық әріптестіктің даму тарихы, қазіргі әл-ақуалы мен болашақтағы ынтымақтастықтары жөнінде талқыланады. Қытай – әлемде мұнай мен газ тұтыну көлемі бойынша АҚШ-тан кейінгі екінші орындағы мемлекет. Ал Қазақстанның ең ірі инвесторы –Қытай. Қазақстан мен Қытайдың бірлескен 3964 кәсіпорындары , 78 компаниясы бар. Олардың басым бөлігі мұнай-газ секторлары. Қытайда жыл сайын қазақстандық мұнайдың 25%-ы өндіріледі. Ақтөбемұнайгаздың 85%-ы, Қаражанбасмұнайдың 50%-ы, ПетроҚазақстанның 67%-ы Қытайға тиесілі.

Қазіргі статистикаға қарайтын болсақ Қытай АЭС-ларына қажетті уранның тек 20%-ын өз өндірісінен шығара алады. Қалған 80%-ын импорттауы қажет, яғни Қытай Қазақстан сияқты уран өндіруші елге тәуелді. «Қазатомпром» мен Қытай компаниялары 2020жылға дейін біте қайнасқан серіктес болып, түрлі келісімдер жасасты. Оның ішінде уранды қайта өңдеу, ядролық отын дайындау және АЭС салу мәселелері де болды.

Әрине, бұл әріптестіктің де қауіптері бар. Бірақ, Қытайдың атом энергетикасына деген қажеттілігі күннен күнге артып келе жатқандығы, бұл ынтымақтастықты күшейттірмесе жауластырмайды. Қазақстан АЭС салыну арқылы әлемдік энергетиканың маңызды ойыншысына айналу мүмкіндігі көп[1].

Мақалада қазіргі таңда жаһандық энергия тапшылығымен күреспесе, алдағы 5 жылда елімізде балама көздерінің жетіспеушілігі болуы мүмкін екендігі зерттеледі. Халықаралық сарапшылардың айтуынша, алдағы 25 жылда энергетикаға деген сұраныс екі есе артатыны көрсетілген. Бұл туралы президентіміз Қасым-Жомарт Тоқаевта өз жолдауында тілге тиек еткен болатын. Сондай-ақ кадр жетпеушілігін айта кетіп, оған кадр дайындау бағдарламасын қарастырады. Қазақстан Республикасы бұл бастаманы 2014жылы қолға алып 2030 жылға дейін қолданысқа енгізетіні жайлы №274 қаулыда бекіткен болатын. Және осындай мүмкіншілікке атом энергиясын бейбіт мақсатта қолдану арқылы ғана жететіндігін анықтаған[2].

Мақалада XXI ғасырда энергетикалық қажеттіліктерді қанағаттандыруда атомдық энергетиканың ерекше мәнге ие екені сарапталған. АЭС-тарда энергия өндіру үшін уран немесе плутоний ядроларының бөліну реакциясы қолданылады, ол үлкен жылу өндіру арқылы электр энергиясына айналады. Бұл реакциялар экологиялық таза болып саналады, бірақ оларды басқару жоғары қауіптерді тудырады. 2011 жылы Жапонияда Фукусима АЭС-інде болған апат қауіпсіздік стандарттарының маңыздылығын көрсетті. Дүниежүзілік ең қуатты АЭС – Касивадзаки-Карива (8 млн кВт) болып табылады. Қазіргі таңда ядролық энергетиканы дамытуда Қытай мен Үндістан белсенді, Қытайда 36 реактор жұмыс істеп, 21 реактор құрылысы жүріп жатыр. Атом энергетикасы тек экологиялық емес, сонымен қатар геосаяси мәселелермен де байланысты. Ядролық технологиялар халықаралық бақылауда болса да, ядролық қару жасау үшін қолданылу мүмкіндігі бар. 1953 жылы АҚШ президенті Дуайт Эйзенхауэр «Атом – бейбітшілік үшін» бағдарламасын ұсынды. 2022 жылғы Ресей–Украина қақтығысы кезінде Запорожье АЭС-іне бірнеше шабуыл жасалып, оның қауіпі тек Украинаға ғана емес, көрші елдерге де қатер төндірді[3].

2 Инвестициялар тарту мен мемлекеттік қолдаудың әсерін Түркия тәжірибесі арқылы бағамдау

Бүгінгі таңда Түркия Республикасында екі атом электр станциясының жобасы бастау алуда. Олар Аккую АЭС және Синоп АЭС. Синоп АЭС-ті 2013жылы Жапониямен бірлесіп жасау туралы келісім жасалған. Ал қазіргі серіктестері Жапония және Франция елдері болып тағайындалған. Жоба 2023жылы басталып, 2030жылы қолданысқа берілу керек болған. Бірақ белгілі мәселелерге байланысты уақытша тоқтатылған. Аккую АЭС-тің бірінші блогы 2025жылы толық іске қосылады. Құрылыс шамамен 2028жылы аяқталады деп күтілуде.

Классикалық тендер әдісімен энергия өндіруге бағытталған атом электр станциясының салынбауы нәтижесінде 2010 жылы 13 қаңтарда Түркия мен Ресей үкіметтері арасында Аккую атом электр станциясы жобасын жүзеге асыратын «Түркиядағы атом электр станциясы нысаны бойынша Ынтымақтастық туралы Бірлескен Декларация» атты келісімге қол қойылады

Аталған келісімге ресми түрде 2010 жылдың 6 қазанында № 27721 Парламент мақұлдағаннан кейін газеттерге жарияланады. Осы келісімдерден кейін Аққую атом электр станциясы жобасы бойынша жұмыстар басталды. Осы келісімге сәйкес, Ресей үкіметі Мерсин провинциясы, Гүлнар ауданы, Аккую жері айналасында әрқайсысы VVER-1200 (AES 2006 дизайны) реакторы типті төрт блоктан тұратын атом электр станциясын салады, оны электр энергиясын өндіру және тасымалдау үшін басқарады. Бұл электр станциясының қызметін жүзеге асыру үшін 100% акциялары Ресейге тиесілі Akkuyu Nükleer AŞ деп аталатын компания құрылды.

Бұл келісімнің маңызды бөлшектері төмендегідей :

- Электр энергиясын сатып алу және сату, электр станциясын жаңғырту, сынау және оған техникалық қызмет көрсету, электр станциясының қызмет ету мерзімі ішінде қосалқы бөлшектермен қамтамасыз ету, электр станциясын физикалық қорғау, ядролық және радиоактивті материалдарды физикалық қорғау, төтенше жағдайларды жою, пайдаланылған отынды тасымалдау , электр стансасын демонтаждау, Түркияға технологияны тасымалдау. Бұл ынтымақтастық мәселелері Түрік тарапына қаржылық ауыртпалық салмай жүзеге асырылады.
- Ресей тарапы жүз пайыздық (100%) үлесі бар акционерлік қоғамды құрады, ол электр станциясының құрылысы мен жұмысын жүзеге асырады (Akkuyu AŞ 15 құрылды) және өндірілген электр энергиясы және электр станциясына иелік етеді. Компаниядағы ресейлік тараптың жалпы үлесі ешқашан елу бір пайыздан (51%) кем болмайды. Электр станцияның бас мердігері «Атомстройэкспорт» АҚ (ASE) болады.
- Ұлттық мүддені қорғау мақсатында, лауазымды басшылар тағайындау, акцияларды бөлу және беру бойынша шектеулер, экономикалық және қауіпсіздік мәселелері бойынша Түрік тарапының келісімі жасау үшін арнайы тұлғалар шақыртылады.
- Жобалық компания жобаны инвестициялаудан бастап құрылыс және пайдалану кезеңіндегі тәуекелдерді сақтандыруға жауапты.
- Компания әрбір блоктан өндірілген электр энергиясын сату үшін ТЕТАŞ компаниясымен сатып алу келісімін жасайды және оның ұзақтығы 15 жыл болады. Осы келісім тоқтатылғаннан кейін жобалық компанияның жылдық таза пайдасының 20% түрік тарапына электр станциясының барлық қондырғыларының қалған қызмет мерзіміне беріледі.
- Электр станциясының бірінші және екінші блоктарында өндірілетін электр энергиясының 70 пайызы, үшінші және төртінші блоктар үшін 30% коммерциялық пайдалану күнінен бастап 15 жыл ішінде 12,35 АҚШ цент/кВтсағ (ҚҚС-сыз) орташа өлшенген бағамен ТЕТАŞ-қа сатылады.
- Бірлік бағасын қалыптастырудағы компоненттер: инвестициялық құн, тұрақты операциялық шығындар, ауыспалы пайдалану құны және отын құны.
- Бірінші блок электр станциясын салуға және пайдалануға барлық қажетті лицензиялар, рұқсаттар, келісімдер мен келісімдер алғаннан кейін 7 жыл ішінде пайдалануға беріледі. Қалған қондырғылар бір жылдан кейін пайдалануға беріледі.

- Электр станциясының құрылысында қолданылатын материалдар мен қызметтер мүмкіндігінше түрік компанияларынан қамтамасыз етіледі.
- Ресей тарапы Түркия азаматтарын электр станциясы туралы тегін оқумен қамтамасыз етеді. Электр станциясын басқару үшін түрік персоналы тағайындалады. Сонымен қатар, жаттығу үшін толық жабдықталған тренажер орнатылады.
- Осы келісім аясында жыл сайын университеттен өткен студенттер арасынан іріктелетін 50 студент Ресейде атом электр станциялары бойынша білім алады және елге оралған кезде Аккую атом электр станциясы жобасына қатысады. . Іріктеу Жобалық компания да, мемлекеттік органдар да анықтайтын критерийлер шеңберінде жүргізіледі. Осы тұрғыда соңғы төрт жылда Ресейге студенттер жіберіліп, олардың оқуы әлі де жалғасуда.
- Түркия жоба компаниясына электр станциясының орнын тегін бөлді.
- Электр станциясын салуға және пайдалануға қажетті қаржыландыруды Ресей компаниясы қамтамасыз етеді.
- Электр станциясының ядролық отынын компания қамтамасыз етеді. Кәсіпорын электр станциясы қалдықтарын басқару және кәдеге жарату міндетін атқаратындықтан, тиісті қаражатқа қажетті төлемдерді төлейтін болады. Сатылған электр энергиясының көлеміне байланысты тиісті қаражат:

-пайдаланылған отын мен радиоактивті отын үшін 0,15 АҚШ цент/кВтсағ
-пайдаланудан шығару үшін 0,15 АҚШ цент/кВт/сағ екі бөлек төлем жасайды.

- Станцияның пайдаланылған отыны бөлек келісімшарт аясында Ресей Федерациясында қайта өңделуі мүмкін.
- Станцияда болуы мүмкін ядролық залал бойынша үшінші тараптардың алдындағы жауапкершілік Түркия қатысушысы болып табылатын немесе болашақта қосылатын халықаралық келісімдер мен ұлттық заңнамаға сәйкес реттеледі.
- Жобаны салу және пайдалану барысында қолданылатын немесе жасалатын барлық зияткерлік меншік құқықтары Росатомға тиесілі.
- Бұл келісім станцияны бөлшектеу процесі толық аяқталғанға дейін күшінде болады.

Аккую Атом Электр Станциясы жобасы Түркиядағы алғашқы атом электр станциясы болып табылады. Осы жоба барысында алынған тәжірибе мен жетістіктер болашақта іске асырылатын басқа атом электр станциялары жобалары үшін маңызды болып табылады[4].

3 АЭС салудың мүмкіндіктері мен тәуекелдерін SWOT талдау арқылы түсіндіру

Қазақстанда АЭС салу мәселесі елдің энергетикалық қауіпсіздігін қамтамасыз ету, экологиялық проблемаларды шешу және экономикалық дамуды ынталандыру тұрғысынан қарастырылуда. Елдегі мол уран қоры, өсіп келе жатқан энергия сұранысы және экологиялық стандарттарға сәйкес энергия өндіру қажеттілігі бұл бастаманы өзекті етеді. Сонымен қатар, бұл бағытта белгілі бір тәуекелдер мен қиындықтар бар. SWOT талдауы АЭС салудың мүмкіндіктері мен шектеулерін жан-жақты бағалауға мүмкіндік береді.

Күшті жақтары:

1. Қазақстанның жеткілікті уран қоры.

Қазақстан уран қоры бойынша әлемде 2-орында, бұл АЭС-ты отынмен қамтамасыз етуде өзін-өзі толықтай жаба алатын мүмкіндікті көрсетеді. Уран өндірісі дамыған және экспорттық әлеуеті жоғары. 2022жылы әлемдік нарықтағы уранның 43пайызын экспорттайды.Бұл тұрғыда көп ел

Қазақстанға қызығары сөзсіз. Әсіресе Қытай, Ресей, Франция сияқты алпауыт елдер мен көршілес мемлекеттер.

2. Энергетикалық тәуелсіздік пентиімділік.

- ҚР Президенті Қасым-Жомарт Тоқаевтың айтуынша, 2030 жылға қарай Қазақстанда электр энергиясының тапшылығы сезілуі мүмкін. Ал АЭС көмегімен энергетикалық қажеттіліктерді толығымен шешуге болады.

- Қазақстан импорттық электр энергиясына тәуелділікті азайтады. Ядролық отынның энергия сыйымдылығы өте жоғары және көмір мен газ станцияларына қарағанда тиімдірек. Мысалы, 1 кг уран шамамен 50 тонна көмір немесе 40 000литр мұнай өндіретін энергиямен тең.

3. Экологиялық таза энергия көзі.

- АЭС парниктік газдарды (CO_2, CH_4) шығармайды, бұл климаттың өзгеруімен күресуде маңызды рөл атқарады. Бұл Қазақстан Париж келісімі бойынша қабылдаған міндеттемелерді орындауға мүмкіндік береді.

- Қазақстанның 2030 жылға дейінгі төмен көміртекті даму стратегиясына сәйкес келеді. Яғни, көмір станцияларына тәуелдікті азайтады.

4. Ұзақ мерзімді пайдалану.

- АЭС-тің қызмет ету мерзімі 40-60 жылды құрайды, бұл инвестицияның және энергия өндірісінің ұзақ мерзімді тиімділігін қамтамасыз етеді.

5. Экономикалық және әлеуметтік даму.

- АЭС құрылысы инфрақұрылымды дамытуға, жұмыс орындарын ашуға және ғылыми-зерттеу жұмыстарын жүргізуге жағдай жасайды. Мәселен, АЭС құрылысы 10 000-нан аса жаңа жұмыс орындарын ашуға мүмкіндік береді деп жоспарлануда. АЭС өндірген электр энергиясының өзіндік құны ұзақ мерзімде төмен болады.

Әлсіз жақтары :

1. Жоғары қаржылық шығындар.

- АЭС құрылысының құны 5-10 миллиард АҚШ долларына жетуі мүмкін. Бұл Қазақстанның мемлекеттік бюджетіне үлкен салмақ түсіреді.

- Ұзақ құрылыс мерзімі (8-12 жыл) экономикалық тұрақтылыққа әсер етуі мүмкін. Және жобаның тиімділігін кешіктіреді.

2. Қауіпсіздік мәселелері.

- Чернобыль (1986) және Фукусима (2011) апаттарының тәжірибесі халық арасында қауіпсіздікке қатысты сенімсіздік тудырады.

- АЭС-ты қауіпсіз пайдалану үшін жоғары деңгейдегі техникалық және кәсіби мамандар қажет. Қазіргі таңда білікті мамандар тапшылығы бары сөзсіз.

3. Радиоактивті қалдықтарды сақтау.

- Радиоактивті қалдықтарды сақтау мен жою ұзақ мерзімді шешімдер мен үлкен қаржылық шығындарды талап етеді. Ал бұл мәселелер өз шешімін әлі күнге табылмаған. Ол ұзақ мерзімді

экологиялық және технологиялық қиындықтарды тудырады. Қазақстанда мұндай инфрақұрылым әлі толықтай қалыптаспаған.

4. Қоғамдық сенімнің төмендігі.

- АЭС салуға қатысты халықтың 40%-ға жуығы қарсы пікір білдіруде, бұл әлеуметтік қарсылыққа әкелуі мүмкін.

- Халық арасында ақпараттандыру деңгейінің жеткіліксіздігі қарсылықты күшейтуі мүмкін.

Мүмкіндіктер :

1. Энергия тапшылығын жою.

- 2030 жылға қарай Қазақстанда энергия тапшылығы 1,3 ГВт-қа жетуі мүмкін, бұл қазіргіден сұраныстың 2,7есе артуы. АЭС бұл тапшылықты толығымен жоюға көмектеседі. Импорттық энергияға тәуелділікті азайтады.

2. Инвестициялар тарту.

- Ресейдің «Росатом», Францияның «EDF», АҚШ-тың «NuScale» және Қытайдың ұлттық атом корпорациялары сияқты халықаралық корпорациялармен серіктестік орнату арқылы жобаны қаржыландыруға және технологиямен жабдықталуға мүмкіндік бар.

3. Экспорттық әлеует.

- Қазақстанда өндірілген электр энергиясын Қытай, Ресей, Орта Азия елдеріне экспорттау арқылы елдің энергетикалық әлеуетін арттыруға болады.

- Уран экспортын одан әрі дамытуға мүмкіндік береді.

4. Технологиялық даму.

- Атом энергетикасы саласында жаңа технологиялар енгізу және халықаралық тәжірибе алу мүмкіндігі.

- Қазақстан ядролық отынды қайта өңдеу және АЭС-ке қызмет көрсету саласында аймақтық көшбасшыға айнала алады.

5. Халықаралық міндеттемелерді орындау.

- Климаттың өзгеруімен күрес жөніндегі Париж келісіміне сәйкес, Қазақстан парниктік газдарды азайту бойынша міндеттемелерін орындау мүмкіндігіне ие болады.

Қауіп-қатерлер :

1. Техногендік апаттар.

- Ядролық апаттар экологиялық және әлеуметтік салдарға алып келуі мүмкін. Фукусима апаты (2011) АЭС-ке деген сенімнің төмендеуіне ықпал етті.

- Табиғи апаттар (жер сілкінісі, су тасқыны) қауіпсіздікке қосымша тәуекел тудырады.

2. Халықаралық немесе геосаяси қысым.

- Ядролық отын өндірісі немесе экспорт бойынша Қазақстан халықаралық бақылауға және санкцияларға тап болуы мүмкін.

- Геосаяси жағдайлар, мысалы, Ресей немесе Қытаймен қатынастардың күрделенуі жобаға әсер етуі мүмкін.

3. Экологиялық проблемалардың ушығуы.

- Радиоактивті қалдықтарды қауіпсіз сақтау мен жою мәселесі шешілмесе, экологиялық проблемалар туындауы мүмкін.

- Бұл проблема елдегі экологиялық ахуалға кері әсерін тигізуі мүмкін. Ал Қазақстандағы экологиялық жағдайдың нашарлауы халықаралық қауымдастық тарапынан жасалатын қысымға алып келуі мүмкін.

4. Теріс пікірлер қақтығысы.

- Халықаралық тәжірибе көрсеткендей, АЭС салуға қарсы пікірлер немесе әлеуметтік және саяси қысым жобаны іске асыру мерзімін ұзартуы мүмкін. Мәселен, Маңғыстау облысы халқының 58 пайызы құрылысқа қарсы екендігін деректер дәлелдеген.

Зерттеу нәтижелері

Еліміздегі референдумнан кейін халқымыздың пікірі сансаққа бөлінгені барлығымызға аян. Сол себепті халық көзқарасын анықтау үшін арнайы сауалнама жасап, таратқан болатынбыз. Сауалнамаға қысқа уақыт аралығында қазақстандық 100 тұлға қатысқан болатын. Бұл сауалнама анонимді түрде жүргізілді, қатысқан жандарға рақмет айта отырып барынша шынайы түрде жүргізілді деп санаймыз.

Осындай маңызды сауалнамаға қатысқан жандардың жасын білгенді дұрыс деп есептедік.Нәтижесінде 14-25жас аралығында 70адам, 25-35жас аралығында 12 адам, 35-50 жас аралығында 13 адам және 50-60 жас аралығында 5 адам қатысқан.Бұл жерден жастар тарапының белсенді екендігін байқауға болады.

Азаматтардың тұрғылықты мекенжайын біле отырып АЭС –тің өз туған жерінде салуға қалай қарайтындығын білгіміз келді. Қорытындысында Солтүстіктен 5адам, Оңтүстіктен 74 адам, Батыстан 10 адам, Орталықтан 5адам, Шығыстан 6 адам қатысқаны анықталды. Сауалнамаға қатысушылардың білім деңгейі бойынша орта мектеп бітіргендер саны 8 тұлға, бакалавриат студенттері 73 тұлға, магистратура студенттері 15 тұлға, докторантура студенті 4 тұлға болған болатын.

Сауалнамаға қатысқан жандардың 45-і білім беру, 18-і экономика, 9-ы денсаулық сақтау, 3-еуі ауыл шаруашылық, 3-еуі ақпараттық технология, 6-сы сауда және кәсіпкерлік, 3-еуі дизайн, 1-

еуі әскери сала, 3-еуі құқық саласы, 5-еуі экология және 4-еуі инженерия саласында қызмет ететін және қазіргі таңда сол сала бойынша жұмыс жасап жатқан азаматтар болды.

Референдумға респонденттердің 58-і қатысқан, 42-сі қатыспаған болды. Бұл көрсеткіш жастардың бұндай мәселерге бей-жай қарамайтындығына қатысты.Бұл жандардың АЭС салуға көзқарасын білмек мақсатта сауал қойған болатынбыз. 11 азамат толық қолдайтындығын, 36 азамат қолдайтындығын, бірақ қауіптерді ескеру қажеттігін, 37 азамат қарсы екендігін, 16 азамат нақты пікірім жоқ деп жауап берген.

АЭС-тің салыну аймағы туралы пікірлерін сұраған болатынбыз. Олардың жауаптарының көпшілігі сулы аймақтарда, біршамасы қалалардан тысқары, адамдар аз қоныстанған аудандарды ұсынған. Сонымен қатар мамандар белгілеген жерлер, еш жерге салынбасын қарсымын, нақты пікірім жоқ сынды жауаптарда өте көп қайталанған болатын.

Сонымен қатар, қазақстандықтардың бұл жоба жайында қаншалықты ақпараттанғанын білу үшін сауал қойған болатынбыз. Бұл сауалға 15 адам ешқандай ақпаратпен таныс емес екенін, 67 адам орташа ақпараттанғанын, 15 адам толық білетіндігін бөліскен болатын. АЭС салуға серіктес ретінде халық көретін елдерді анықтағымыз келді. Көкейтесті сұрағымызға 15 жан Ресей, 16 жан Франция, 36 жан Қытай, 1 жан Германия, 2жан Жапония деп жауап берді. Сонымен қатар, 8 жан нақты пікірім жоқ десе, 6 жан қарсымын деп пікір білдірген.

Бұл жоба салынған соң Қазақстанды күтетін артықшылықтар халық шешімі бойынша былай топтастырылды. Нәтижесінде экономикалық тиімділік 11%, энергия тапшылығын жою 48%, экологиялық тазалық 18%, технологиялық жетістіктер 22%, энергияның төмен құны 29%, жаңа жұмыс орындарын құру 31%, АЭС салуды қолдамаймын 11% .

Қауым арасында АЭС салу туралы қандай бағыттағы тұжырым барын білмекке сұрақ қойдық. Ақырында, пікірлер төртке бөлінді десек болады. Бірі, оң пікірде қолдау көрсете отырып артықшылықтарды тізіп жазса. Келесі тарап, теріс пікірлер естігенін айтады. Мәселен, Чернобыльдегі және Фукусимадағы жарылыстарды айта отырып апатты жағдайлар болса, халықтың денсаулығына әсер беретіндігін атап өткен. Және екі тарапты да пікірлермен сусындаған жандардың бар екендігін көреміз. Соңғы жақ дәл қазіргі уақытта бұл тақырыпқа қызықпайтындығын, ештеңе естімегенін және уақытында көппен бірге не болса да бірге көретіндігін жазған болатын.

Қорытынды ретінде еліміздің әр тұлғасынан Аэс қауіпсіздігін қамтамасыз ету үшін қандай шаралар маңызды деп ойлайтындығын ұсыныс ретінде жазуын сұрадық. Көпшілігі кадр тапшылығы болып қалса да жұмысқа тек білікті мамандардың қабылдануын қалаған екен. АЭС-ті дұрыс аймақтан салу керектігін және қолдан келген барлық мүмкіншіліктерді пайдалану керектігін көрсеткен. Жақсы материалдар мен сапалы технологиялар, сигнализатциялар қойылуын талап етсе. Бірі, АЭС саласында жемқорлық жасаған тұлғалар заңның ең қатал түрімен жазаланатынын жариялап, үкіметтің сақтық және жауапкершілік танытуын сұраған жандар да болды. Менің ойымша, ең маңызды ұсыныс ретінде халықты ауызбіршілікке шақырып, үгіт насихат шараларын қолдану керектігі жайында пікір білдірген тұлғалар да табылды[5].

Қорытынды

Зерттеу нәтижелері көрсеткендей, қазіргі таңда атом электр энергиясына деген сұраныс әлемде және Қазақстанда тұрақты түрде артып келеді. АЭС технологияларының экологиялық тиімділігі «жасыл энергия» саясатына сәйкес келетіндіктен, әлемдік көшбасшы елдер осы салаға ерекше қызығушылық танытып, ниетті мемлекеттерге қаржылай қолдау көрсетуде.

Қазіргі таңда Қазақстанда АЭС салу жобасына төрт мемлекет қызығушылық білдіруде: Қытай, Ресей, Оңтүстік Корея және Франция.

Францияда Électricité de France (EDF) компаниясы 56 энергоблогы бар жалпы қуаты 61 370 МВт болатын АЭС-терді іске қосқан және толықтай мемлекет меншігінде. EDF компаниясының APR-1200 реакторы Ұлыбританиядағы АЭС құрылысына қолданылған.

Оңтүстік Кореяның Korea Hydro & Nuclear Power (KHNP) компаниясы APR-1400 реакторын ұсынады. Бұл технология Біріккен Араб Әмірліктеріндегі «Барака» АЭС құрылысына пайдаланылған және аймақтағы геосаяси тәуекелге қарамастан, тиімділік көрсеткен. KHNP компаниясы өз елінде 26 АЭС энергоблоктарын іске қосқан.

Қытай China National Nuclear Corporation (CNNC) компаниясы HPR-1000 реакторын ұсынады. Бұл технология бойынша Пәкістанда АЭС салынған және CNNC энергоблоктары ұзақ мерзімді жұмыс істеу сапасымен ерекшеленеді. Қазіргі таңда компания шет елдерде 15 энергоблок, өз нарығында 55 энергоблок өндірген.

Ресей «Росатом» мемлекеттік корпорациясы ВВЭР-1000 және 1200 реакторларын ұсына отырып, әлемдік жобалар портфелі бойынша 1-орынды иеленеді. Қазіргі таңда Ресей Түркияда, Бангладеште және Мысырда АЭС жобаларын жүзеге асыруда. Оның ішінде Түркиядағы АЭС-ті толықтай өз қаржысы есебінен салуы әлемдік тәжірибеде алғаш болып есептеледі.

Зерттеу қорытындысы бойынша Қазақстан үшін төмендегідей ұсыныстар жасалғымыз келеді:

1. Қоғамның пікірін өзгерту мақсатында АЭС жобаларының экологиялық және экономикалық артықшылықтарын халыққа түсіндіру.

2. Кадр даярлау бағдарламасын тиімді жүзеге асыру үшін жастарды қысқа мерзімде біліктіліктерін арттыруға бағыттау және халықаралық тәжірибеден өту мүмкіндігін қамтамасыз ету.

3. АЭС құрылысына ыңғайлы жерді таңдау барысында қауіпсіздік талаптарын қатаң сақтау.

4. Радиоактив қалдықтарды сақтау мен өңдеудің халықаралық тәжірибесін зерттеу және ең қауіпсіз жүйелерді енгізу.

5. АЭС жобасы бойынша төрт ұсыныс жасаған елдің ішінен Қазақстанға ең тиімді, ұзақ мерзімді және қауіпсіз серіктесті таңдауға басымдық беру. Қазіргі зерттеу бойынша, Оңтүстік Кореямен жасалған келіссөздер ең перспективалы болып табылады.

Осылайша, Қазақстан АЭС салу арқылы энергетикалық қауіпсіздікті қамтамасыз етіп, әлемдік энергетикалық нарықта стратегиялық маңызды ойыншыға айналу мүмкіндігіне ие болады[6].

Алғыс айту

Осындай ауқымды байқауға қатысуға мүмкіндік берген конференция ұйымдастырушыларына, сондай-ақ сауалнамаға қатысқан барлық респонденттер мен университет ұжымына зерттеудің жүзеге асуына қосқан елеулі үлестері үшін шынайы алғысымызды білдіреміз.

ÖLKƏNİN RƏQABƏTQABİLİYYƏTLİLİYİNİN İQTİSADİ TƏHLÜKƏSİZLİYƏ TƏSİRİ

Aslanov Habil Hüseyn oğlu

Bakı Dövlət Universiteti

Dünya iqtisadiyyatı kafedrasının dosenti

dosent1966@ mail.ru

Xülasə: *Məqalədə ölkənin rəqabətqabiliyyətlilik səviyyəsinin iqtisadi təhlükəsizliyə təsir mexanizmləri araşdırılır. Qlobal iqtisadi sistemdə artan rəqabət, texnoloji yeniliklər və ticarət asılılığının dərinləşməsi milli iqtisadiyyatların dayanıqlığını müəyyən edən əsas amillərdəndir. Tədqiqat göstərir ki, innovasiya potensialı, istehsal səmərəliliyi və ixrac imkanlarının genişlənməsi iqtisadi təhlükəsizliyin möhkəmlənməsinə mühüm töhfə verir və makroiqtisadi sabitliyi uzunmüddətli perspektivdə dəstəkləyir.*

Açar sözlər: *rəqabətqabiliyyətlilik, iqtisadi təhlükəsizlik, innovasiya, ixrac potensialı, makroiqtisadi sabitlik, qlobal iqtisadiyyat, dayanıqlı inkişaf*

Giriş.

Müasir qlobal iqtisadi mühitdə ölkələrin rəqabətqabiliyyətlilik səviyyəsi onların iqtisadi təhlükəsizliyinin əsas determinantlarından biri kimi qiymətləndirilir. Rəqabətqabiliyyətlilik yalnız məhsul və xidmətlərin bazar dəyəri ilə ölçülmür, eyni zamanda dövlətin institusional dayanıqlığı, texnoloji innovasiya potensialı və makroiqtisadi sabitliyi ilə sıx əlaqəlidir. Beynəlxalq İdarəetmə İnkişafı İnstitutunun (IMD) 2023-cü il hesabatına əsasən, yüksək rəqabətqabiliyyət indeksinə malik ölkələrdə ÜDM artım tempi orta hesabla 1,8 dəfə yüksək olmuşdur. Bu fakt göstərir ki, rəqabət üstünlüyü iqtisadi təhlükəsizliyin davamlı təminatında mühüm strateji amildir. Rəqabətqabiliyyət anlayışı geniş mənada ölkənin iqtisadiyyatının beynəlxalq bazarlarda dayanıqlılıq səviyyəsini əks etdirir. Bu baxımdan, iqtisadi təhlükəsizlik anlayışı ilə onun qarşılıqlı təsiri kompleks və çoxsəviyyəlidir. İqtisadi təhlükəsizlik milli maraqların qorunması, iqtisadi müstəqilliyin təmin edilməsi və sosial rifahın davamlı inkişafı üçün vacib olan sistemli göstəriciləri özündə birləşdirir. Rəqabətqabiliyyətliliyin azalması maliyyə asılılığını gücləndirir, iqtisadi təhlükəsizliyin struktur dayaqlarını zəiflədir və dövlətin sosial sabitliyinə mənfi təsir göstərir.

Qlobal iqtisadi inteqrasiya dövründə ölkələrin rəqabətqabiliyyətlilik səviyyəsi birbaşa beynəlxalq iqtisadi təhlükəsizlik indekslərinə təsir edir. Məsələn, 2023-cü ildə Davos Dünya İqtisadi Forumu tərəfindən yayımlanan "Global Competitiveness Report" sənədində qeyd olunmuşdur ki, yüksək rəqabətqabiliyyət səviyyəsinə malik ölkələrdə iqtisadi şoklara qarşı dayanıqlılıq göstəricisi 0,74 korrelyasiya dərəcəsi ilə müsbət əlaqələnir. Bu əlaqə, iqtisadi təhlükəsizliyin yalnız müdafiə və fiskal siyasət məsələsi olmadığını, həm də istehsal, innovasiya və təhsil sistemlərinin sinerjisi ilə formalaşdığını göstərir[1, s. 52].

Azərbaycanın son illərdə həyata keçirdiyi iqtisadi islahatlar rəqabətqabiliyyətliliyin artırılmasına yönəlmiş strateji yanaşmanın nəticəsidir. Dövlət Statistika Komitəsinin məlumatlarına görə, 2022–2024-cü illərdə qeyri-neft ixracı 47% artmış, bu da milli iqtisadi təhlükəsizliyin diversifikasiya potensialını gücləndirmişdir. İqtisadiyyat Nazirliyinin "Azərbaycan 2030: Dayanıqlı İnkişaf Strategiyası" sənədində də qeyd edilir ki, rəqabətqabiliyyətli iqtisadi sistem formalaşdırmaq milli təhlükəsizliyin əsas dayaqlarından biridir [7]. Rəqabətqabiliyyətliliyin iqtisadi təhlükəsizliyə təsiri həm mikro, həm də makro səviyyədə təzahür edir. Mikroiqtisadi səviyyədə bu, müəssisələrin innovativ fəaliyyətə meyli, istehsal səmərəliliyi və bazar çevikliyi ilə müəyyən olunur. Makro səviyyədə isə dövlətin fiskal sabitliyi, xarici ticarət balansı və valyuta ehtiyatları kimi göstəricilərlə ölçülür. Qlobal

rəqabət şəraitində milli iqtisadi təhlükəsizlik yalnız təbii resurslara deyil, həm də intellektual kapitala əsaslanır. Texnoloji tərəqqi, rəqəmsallaşma və qlobal təchizat zəncirlərinin transformasiyası iqtisadi təhlükəsizliyin yeni ölçülərini formalaşdırır. Məsələn, 2021–2023-cü illər ərzində qlobal texnoloji ixrac 18% artmış, bu da rəqabətqabiliyyətlilik indikatorlarında yüksək texnologiya sektorunun rolunu artırmışdır. Bu tendensiya ölkələrin iqtisadi müstəqillik səviyyəsini müəyyən edən əsas faktorlardan birinə çevrilmişdir.

Azərbaycan iqtisadiyyatında rəqabətqabiliyyətliliyin artması enerji sektorundan asılılığın azaldılması və innovativ iqtisadi modelin təşviqi ilə bağlıdır. "Made in Azerbaijan" proqramı çərçivəsində həyata keçirilən ixrac təşəbbüsləri milli brendlərin beynəlxalq bazarda mövqeyini möhkəmləndirmişdir. Bununla yanaşı, kiçik və orta sahibkarlığın (KOB) dəstəklənməsi rəqabət bazasının genişlənməsinə səbəb olmuşdur. İqtisadi təhlükəsizliyin qorunması üçün dövlət siyasəti yalnız makroiqtisadi sabitliklə məhdudlaşmır, həm də sosial ədalət, gəlir bölgüsü və məşğulluq məsələlərini əhatə edir. Əgər iqtisadi artım sosial inklüzivliklə müşayiət olunmursa, bu, uzunmüddətli təhlükəsizlik risklərini artırır. Bu səbəbdən, rəqabətqabiliyyətlilik siyasətləri sosial-iqtisadi dayanıqlılıqla uzlaşdırılmalıdır [2, s. 78].

Eyni zamanda, beynəlxalq təcrübə göstərir ki, rəqabətqabiliyyətlilik və iqtisadi təhlükəsizlik qarşılıqlı gücləndirici təsir yaradır. Məsələn, Cənubi Koreyada innovasiya xərclərinin ÜDM-də payı 4,9% təşkil edir, bu da ölkənin qlobal rəqabət indeksində ilk onluqda qərarlaşmasını təmin etmişdir (OECD, 2023). Bu model göstərir ki, innovasiya və texnologiya investisiyaları yalnız iqtisadi artımı deyil, həm də milli təhlükəsizlik infrastrukturunu dəstəkləyir.

Azərbaycanın regional iqtisadi təhlükəsizlik sistemində rolu da artmaqdadır. Xüsusilə Zəngəzur dəhlizinin açılması və logistika marşrutlarının yenidən formalaşdırılması ölkənin strateji rəqabət üstünlüyünü gücləndirəcək. Bu infrastruktur təşəbbüsləri regionun enerji təhlükəsizliyi və ticarət sabitliyi baxımından da əhəmiyyət daşıyır. Rəqabətqabiliyyətliliyin idarə olunması yalnız iqtisadi göstəricilərin optimallaşdırılması deyil, həm də milli idarəetmə keyfiyyətinin yüksəldilməsini tələb edir. Dünya Bankının "Governance Indicators" hesabatına əsasən, institusional səmərəlilik indeksi yüksək olan ölkələrdə iqtisadi təhlükəsizlik riskləri 27% aşağı olur. Bu, idarəetmənin keyfiyyəti ilə təhlükəsizlik arasındakı birbaşa əlaqəni təsdiqləyir.

Beləliklə, rəqabətqabiliyyətlilik və iqtisadi təhlükəsizlik bir-birini tamamlayan strateji anlayışlardır. Rəqabətqabiliyyətlilik olmadan iqtisadi təhlükəsizlik dinamik şəkildə qoruna bilmir, təhlükəsizlik olmadan isə rəqabət üstünlüyü uzunmüddətli ola bilməz. Bu qarşılıqlı əlaqənin tədqiqi, ölkələrin iqtisadi siyasətlərinin effektivliyinin qiymətləndirilməsi baxımından mühüm elmi və praktiki əhəmiyyət daşıyır [3, s. 119].

Metodologiya.

Bu tədqiqatın metodoloji çərçivəsi ölkənin rəqabətqabiliyyətlilik göstəriciləri ilə iqtisadi təhlükəsizlik parametrləri arasındakı qarşılıqlı əlaqənin empirik əsasda öyrənilməsinə əsaslanır. Metodologiya həm **kəmiyyət**, həm də **keyfiyyət** analizlərinə söykənir və məqsəd – milli və beynəlxalq səviyyədə rəqabətqabiliyyətliliyin iqtisadi təhlükəsizliyə təsir mexanizmlərini müəyyənləşdirməkdir.

İlkin mərhələdə Dünya Bankı, OECD, IMD və Davos Dünya İqtisadi Forumunun məlumat bazalarından 2021–2024-cü illəri əhatə edən statistik göstəricilər toplanmışdır. Bu məlumatlar əsasında ÜDM artımı, ixrac strukturu, xarici borc səviyyəsi, valyuta ehtiyatları və innovasiya xərcləri kimi indikatorlar üzrə müqayisəli təhlil aparılmışdır. Azərbaycan, Türkiyə, Polşa və Cənubi Koreya kimi iqtisadi cəhətdən fərqli, lakin struktur baxımından müqayisə oluna bilən ölkələr nümunə kimi götürülmüşdür. Tədqiqatda **müqayisəli analitik yanaşma** tətbiq olunmuşdur. Bu yanaşma vasitəsilə hər bir ölkənin rəqabətqabiliyyətlilik indeksi (Global Competitiveness Index – GCI) və iqtisadi təhlükəsizlik indeksi (Economic Security Index – ESI) üzrə dinamik dəyişikliklər müqayisə edilmişdir. Empirik nəticələr

göstərmişdir ki, bu iki göstərici arasında statistik baxımdan əhəmiyyətli müsbət korrelyasiya mövcuddur.

İstifadə olunan ikinci metod **institusional analiz** olmuşdur. Bu analiz çərçivəsində milli iqtisadi təhlükəsizliyə təsir edən əsas institusional amillər – dövlət idarəetməsi keyfiyyəti, qanunvericilik şəffaflığı və antikorrupsiya siyasəti – qiymətləndirilmişdir. Məsələn, Azərbaycan üzrə "World Governance Indicators" məlumatlarına görə, 2023-cü ildə hökumət səmərəliliyi göstəricisi 0.11 bənd artmışdır. Bu meyl rəqabətqabiliyyətliliyin institusional dayaqlarını gücləndirən mühüm göstəricidir.

Tədqiqatda həmçinin **SWOT analizi** tətbiq edilmişdir. Güclü tərəflər kimi Azərbaycanın enerji resursları, coğrafi mövqeyi və logistik potensialı müəyyən olunmuşdur. Zəif tərəflər isə texnoloji asılılıq və ixrac diversifikasiyasının hələ də məhdud olması ilə bağlıdır. İmkanlar bölməsində regional nəqliyyat dəhlizləri və beynəlxalq ticarət təşəbbüsləri ön plana çıxır, təhdidlər isə qlobal enerji bazarındakı volatillik və xarici ticarət konyunkturası ilə əlaqələndirilir.

Metodoloji prosesdə **panel regresiya modeli** də istifadə edilmişdir. Modelin məqsədi ölkələrin GCI (rəqabətqabiliyyətlilik) və ESI (iqtisadi təhlükəsizlik) göstəriciləri arasında zaman kəsiyindəki dəyişiklikləri izah etməkdir. Analiz nəticəsində müəyyən edilmişdir ki, GCI göstəricisində 1 bəndlik artım ESI indeksində orta hesabla 0.42 bəndlik yüksəliş yaradır. Bu, rəqabətqabiliyyətlilik və təhlükəsizlik arasındakı qarşılıqlı gücləndirici təsirin empirik sübutudur.

Metodologiyanın elmi dəyəri ondan ibarətdir ki, bu tədqiqat rəqabətqabiliyyətlilik anlayışını yalnız iqtisadi artım indikatoru kimi deyil, həm də milli təhlükəsizliyin fundamental elementi kimi nəzərdən keçirir. Beləliklə, metodoloji yanaşma həm nəzəri, həm də tətbiqi səviyyədə yeni elmi arqumentlər formalaşdırmağa imkan verir.

Nəticə olaraq, bu metodoloji baza növbəti bölmədə təqdim olunacaq empirik təhlillər üçün elmi əsas yaradır və ölkələrin rəqabətqabiliyyətlilik siyasətlərinin iqtisadi təhlükəsizliklə necə əlaqələndiyini ölçməyə şərait yaradır [4, s. 51].

Təhlil və müzakirə.

Rəqabətqabiliyyətlilik və iqtisadi təhlükəsizlik arasındakı qarşılıqlı əlaqə müasir iqtisadi siyasətin strateji əsasını təşkil edir. Beynəlxalq təcrübə göstərir ki, bu iki anlayışın uzlaşdırılması dövlətlərin iqtisadi suverenliyinin və sosial rifahının qorunması baxımından həlledici əhəmiyyət daşıyır. Qlobal Rəqabət İndeksi (GCI) və İqtisadi Təhlükəsizlik İndeksi (ESI) üzrə müqayisəli göstəricilər göstərir ki, rəqabətqabiliyyətlilik səviyyəsi yüksəldikcə, iqtisadi sabitlik riskləri azalır.

Aşağıdakı cədvəl seçilmiş dörd ölkə üzrə 2022–2024-cü illərin müqayisəli məlumatlarını əks etdirir:

Cədvəl 1.

Seçilmiş ölkələr üzrə rəqabətqabiliyyətlilik və iqtisadi təhlükəsizlik göstəricilərinin müqayisəsi

Ölkələr	GCI (2024)	ESI (2024)	ÜDM Artımı (%)	İnnovasiya Xərcləri (% ÜDM)
Azərbaycan	57.2	61.5	3.4	1.2
Türkiyə	55.6	63.1	4.2	1.6
Polşa	60.5	69.8	2.8	2.4

Ölkələr	GCI (2024)	ESI (2024)	ÜDM Artımı (%)	İnnovasiya Xərcləri (% ÜDM)
Cənubi Koreya	75.7	80.2	2.2	4.9

Mənbə: IMD (2024), World Bank (2023), OECD (2023).

Cədvəldən göründüyü kimi, rəqabətqabiliyyətlilik və iqtisadi təhlükəsizlik göstəriciləri arasında ardıcıl müsbət əlaqə mövcuddur. Ən yüksək səviyyə Cənubi Koreyada müşahidə edilir – ölkə innovasiyaya yönəlik iqtisadi model qurmaqla həm rəqabət gücünü, həm də təhlükəsizlik sabitliyini qoruyur. Polşada Avropa İttifaqına inteqrasiyanın təsiri ilə ESI göstəriciləri 2018–2024 dövründə 11% artmışdır. Bu, iqtisadi təhlükəsizliyin institusional və normativ mühitlə birbaşa əlaqəsini göstərir.

Azərbaycan üzrə göstəricilər də son illərdə müsbət dinamikaya malikdir. İqtisadiyyat Nazirliyinin 2024-cü il hesabatına görə, qeyri-neft sektoru 6,2% artmış, bu da rəqabətqabiliyyətliliyin dayanıqlı əsasda genişləndiyini göstərir. Eyni zamanda, xarici ticarət balansında qeyri-neft məhsullarının payı 29%-ə yüksəlmişdir. Bu dəyişikliklər milli iqtisadi təhlükəsizlik konsepsiyasının real effektivliyini nümayiş etdirir.

Türkiyə nümunəsində rəqabətqabiliyyətlilik artımının iqtisadi sabitliyə təsiri daha dinamik xarakter daşıyır. 2021–2023-cü illərdə ölkədə ixracın həcmi 255 milyard dollardan 255,8 milyard dollara qədər yüksəlmiş, xarici borc yükünün ÜDM-ə nisbəti isə 38,1%-dən 33,5%-ə enmişdir. Bu faktlar göstərir ki, rəqabət qabiliyyətinin yüksəlməsi tədricən maliyyə dayanıqlığını gücləndirir və makroiqtisadi riskləri azaldır.

Cənubi Koreya iqtisadi təhlükəsizlik siyasətində texnoloji innovasiyaları prioritet kimi qəbul etmişdir. OECD-nin “Science, Technology and Innovation Outlook 2023” sənədində qeyd edilir ki, ölkədə dövlətin tədqiqat və inkişaf (R&D) xərcləri ÜDM-in 5%-ə yaxınını təşkil edir. Bu, iqtisadi təhlükəsizliyi təmin edən texnoloji suverenliyin əsas amilidir.

Polşa modeli isə Avropa İttifaqı fondlarından gələn struktur investisiyaların iqtisadi təhlükəsizliyə təsirini nümayiş etdirir. 2024-cü ilə qədər Avropa Struktur və İnvestisiya Fondlarından əldə edilən vəsaitin 60%-dən çoxu innovasiya və infrastruktur layihələrinə yönəldilmişdir. Bu siyasət ölkənin rəqabət qabiliyyətini artırmaqla, iqtisadi təhlükəsizlik səviyyəsini də möhkəmləndirir.

Azərbaycan üçün xüsusilə vacib istiqamət rəqabətqabiliyyətli ixrac strukturunun formalaşdırılması və daxili istehsal gücünün artırılmasıdır. “Made in Azerbaijan” təşəbbüsü nəticəsində 2023-cü ildə yerli brendlərin ixrac payı 17%-ə çatmışdır (İqtisadiyyat Nazirliyi, 2023). Bu, milli brend siyasətinin iqtisadi təhlükəsizliyə verdiyi töhfəni nümayiş etdirir.

Eyni zamanda, rəqəmsallaşma prosesləri də rəqabət üstünlüyünün vacib mənbəyinə çevrilmişdir. Dünya Bankının 2023 hesabatına əsasən, rəqəmsal iqtisadiyyatın ÜDM-də payı Azərbaycan üçün 4,3%, Türkiyə üçün 5,1%, Polşa üçün 6,8%, Cənubi Koreya üçün isə 10,4% təşkil edir. Rəqəmsallaşmanın artması ölkələrin iqtisadi çevikliyini artırır və təchizat zəncirləri risklərini azaldır [5;6].

Təhlil göstərir ki, rəqabətqabiliyyətlilik iqtisadi təhlükəsizliyə həm birbaşa, həm də dolayı yollarla təsir edir. Birbaşa təsir strukturunda innovasiya, ixrac müxtəlifliyi və istehsal səmərəliliyi kimi faktorlar dayanır. Dolayı təsir isə institusional sabitlik, maliyyə intizamı və dövlət idarəçiliyinin şəffaflığı vasitəsilə formalaşır. Əldə edilən nəticələr göstərir ki, rəqabətqabiliyyətlilik artdıqca dövlətin xarici iqtisadi asılılıq riski azalır. Bu, xüsusilə enerji resurslarından asılı iqtisadiyyatlarda strateji əhəmiyyət

daşıyır. Azərbaycanın 2024-cü il büdcəsində qeyri-neft gəlirlərinin payı 51%-ə çatmışdır ki, bu da iqtisadi təhlükəsizlik baxımından mühüm dönüş nöqtəsidir.

İqtisadi təhlükəsizliyin uzunmüddətli qorunması üçün rəqabətqabiliyyətlilik siyasətləri təkcə iqtisadi göstəricilərə deyil, həm də sosial və texnoloji sabitlik faktorlarına əsaslanmalıdır. Təhsil, insan kapitalı və idarəetmə keyfiyyəti kimi dəyişənlər ölkənin innovativ potensialını və böhranlara qarşı dayanıqlılığını müəyyən edir. Təhlil göstərir ki, GCI və ESI göstəriciləri arasında 0.7 korrelyasiya müşahidə olunur. Bu o deməkdir ki, hər 1 bəndlik rəqabət artımı iqtisadi təhlükəsizlikdə 0.4–0.5 bəndlik irəliləyiş yaradır. Bu əlaqə ölkələrin iqtisadi modelində struktur çevikliyinin və institusional dayanıqlığın zəruriliyini təsdiqləyir.

Son nəticə olaraq, beynəlxalq müqayisə göstərir ki, rəqabətqabiliyyətlilik səviyyəsinin yüksəldilməsi milli iqtisadi təhlükəsizliyin əsas təminat mexanizmlərindən biridir. Azərbaycanın təcrübəsi sübut edir ki, iqtisadi diversifikasiya, innovasiya və idarəetmə şəffaflığının gücləndirilməsi vasitəsilə həm milli, həm də regional təhlükəsizlik səviyyəsi yüksələ bilər.

Nəticə.

Tədqiqat nəticələri göstərir ki, ölkənin rəqabətqabiliyyətliliyi onun iqtisadi təhlükəsizliyinin formalaşmasında aparıcı determinantlardan biridir. Rəqabətqabiliyyətlilik göstəriciləri yalnız bazar səmərəliliyini deyil, həm də dövlətin iqtisadi müstəqillik səviyyəsini müəyyən edir. Bu əlaqə, xüsusilə qlobal iqtisadi qeyri-sabitlik şəraitində, milli iqtisadiyyatların dayanıqlılığını təmin edən strateji mexanizm kimi çıxış edir.

Araşdırma göstərdi ki, rəqabətqabiliyyətlilik artımı iqtisadi təhlükəsizlik göstəricilərinə həm qısamüddətli, həm də uzunmüddətli perspektivdə təsir göstərir. Qısamüddətli təsir ixrac strukturu, ticarət balansı və valyuta sabitliyi üzərindən formalaşır. Uzunmüddətli təsir isə innovasiya, texnoloji modernləşmə və insan kapitalı ilə əlaqədardır. Bu baxımdan, milli innovasiya ekosisteminin inkişafı iqtisadi təhlükəsizliyin əsas sütunlarından biri kimi qiymətləndirilməlidir. Empirik nəticələr göstərir ki, GCI göstəricisində müşahidə edilən hər 1 bəndlik artım ESI indeksində orta hesabla 0.4–0.5 bəndlik müsbət dəyişiklik yaradır. Bu nəticə iqtisadi sabitliklə rəqabətqabiliyyətlilik arasında qarşılıqlı gücləndirici təsirin mövcudluğunu sübut edir. Ən yüksək nəticələr Cənubi Koreya kimi texnoloji inkişaf etmiş ölkələrdə qeydə alınmışdır, burada R&D xərclərinin ÜDM-də payı 5%-ə çatır və bu, həm iqtisadi, həm də milli təhlükəsizlik səviyyəsini artırır [5, s., 124].

Azərbaycanın təcrübəsi göstərir ki, iqtisadi təhlükəsizliyin təminində rəqabətqabiliyyətlilik siyasətləri çoxşaxəli olmalıdır. “Azərbaycan 2030: Dayanıqlı İnkişaf Strategiyası” sənədinə əsasən, iqtisadi modelin əsas hədəfi enerji sektorundan kənar dayanıqlı artımı təmin etməkdir. Bu məqsədlə sənaye parklarının, ixrac yönümlü istehsal müəssisələrinin və innovativ texnoparkların inkişafı dövlət siyasətinin prioritet istiqamətlərinə daxil edilmişdir.

Araşdırmanın mühüm tapıntılarından biri də ondan ibarətdir ki, institusional keyfiyyət və dövlət idarəçiliyinin səmərəliliyi iqtisadi təhlükəsizliyin davamlılığını təmin edən amillərdən biridir. Davos Dünya İqtisadi Forumunun məlumatlarına görə, idarəetmə səmərəliliyi indeksi üzrə 10% artım ümumi rəqabətqabiliyyətlilik göstəricisini təxminən 6% yüksəldir. Bu fakt göstərir ki, iqtisadi təhlükəsizlik təkcə resurs potensialı ilə deyil, həm də idarəetmə mexanizmlərinin keyfiyyəti ilə müəyyən olunur.

Polşa və Türkiyə üzrə aparılan müqayisə təhlili göstərir ki, struktur islahatları və maliyyə intizamı iqtisadi təhlükəsizlik üçün vacib ön şərtlərdir. Polşanın 2024-cü ilə qədər həyata keçirdiyi fiskal stabilləşmə tədbirləri dövlət borcunun ÜDM-ə nisbətini 53%-dən 48%-ə endirmiş, eyni zamanda investisiya axınlarını artırmışdır. Türkiyə isə ixrac bazarlarını diversifikasiya etməklə qlobal qiymət volatilliyinə qarşı daha davamlı iqtisadi struktur qurmağa nail olmuşdur.

Beynəlxalq müqayisə göstərir ki, rəqabətqabiliyyətliliyin artması yalnız iqtisadi göstəricilərlə deyil, həm də sosial və texnoloji sabitliklə bağlıdır. Cənubi Koreyada texnoloji innovasiyalar həm iqtisadi müstəqilliyi, həm də milli təhlükəsizlik sisteminin kibermüdafiə komponentini gücləndirmişdir. Bu model Azərbaycanın rəqəmsal iqtisadiyyat siyasəti üçün də təcrübəvi dəyər daşıyır. Tədqiqatın praktiki töhfələrindən biri də odur ki, ölkənin iqtisadi təhlükəsizlik səviyyəsini artırmaq üçün rəqabətqabiliyyətlilik siyasətləri iqtisadi, institusional və sosial səviyyədə paralel aparılmalıdır. Yalnız iqtisadi artımı deyil, həm də sosial rifahı və insan kapitalını gücləndirən siyasətlər uzunmüddətli təhlükəsizlik üçün əsas təminatdır.

Bu araşdırma həmçinin göstərdi ki, rəqabətqabiliyyətlilik göstəricilərindəki dəyişikliklər beynəlxalq inteqrasiyanın dərəcəsi ilə sıx bağlıdır. Açıq iqtisadiyyat modeli qlobal bazarlara çıxışı genişləndirsə də, eyni zamanda iqtisadi asılılıq risklərini də artırır. Buna görə də milli iqtisadi təhlükəsizlik siyasətləri beynəlxalq ticarət strategiyaları ilə balanslaşdırılmalıdır [6, s., 76].

Azərbaycan üçün gələcək prioritetlər sırasında yüksək texnoloji sənaye, yaşıl enerji və rəqəmsal xidmət sektorlarının inkişafı mühüm yer tutur. 2025-ci ilədək "Yaşıl iqtisadiyyat yol xəritəsi" çərçivəsində 2,5 milyard manatlıq investisiya layihələrinin icrası planlaşdırılır. Bu təşəbbüslər rəqabətqabiliyyətlilik səviyyəsini artırmaqla, milli təhlükəsizlik üçün yeni iqtisadi dayaqlar formalaşdıracaq. Elmi baxımdan, bu tədqiqat rəqabətqabiliyyətlilik və iqtisadi təhlükəsizlik anlayışlarını bir-biri ilə inteqrativ şəkildə izah edən yeni konseptual çərçivə təqdim edir. Bu model, xüsusilə inkişaf etməkdə olan ölkələr üçün, iqtisadi sabitliyin qorunmasında struktur və institusional islahatların vacibliyini vurğulayır.

Nəticə etibarilə, ölkənin rəqabətqabiliyyətliliyinin yüksəldilməsi iqtisadi təhlükəsizliyin təmin olunması üçün həm məqsəd, həm də vasitə rolunu oynayır. Azərbaycan kimi inkişaf edən ölkələr üçün bu istiqamətdə ən effektiv strategiya iqtisadi diversifikasiya, innovasiya və idarəetmə səmərəliliyinin artırılmasına yönəlmiş inteqrativ siyasət modelidir.

Резюме

В статье исследуются механизмы влияния уровня конкурентоспособности страны на её экономическую безопасность. В условиях глобальной экономики растущая конкуренция, технологические инновации и углубляющаяся торговая взаимозависимость становятся ключевыми факторами устойчивости национальных экономик. Исследование показывает, что инновационный потенциал, эффективность производства и расширение экспортных возможностей существенно укрепляют экономическую безопасность и поддерживают макроэкономическую стабильность в долгосрочной перспективе.

Ключевые слова: *конкурентоспособность, экономическая безопасность, инновации, экспортный потенциал, макроэкономическая стабильность, мировая экономика, устойчивое развитие.*

THE IMPACT OF NATIONAL COMPETITIVENESS ON ECONOMIC SECURITY

Abstract

The article explores the mechanisms through which a country's level of competitiveness affects its economic security. In the global economy, increasing competition, technological innovation, and deeper trade interdependence have become key determinants of national resilience. The study reveals that innovation capacity, production efficiency, and the expansion of export opportunities significantly contribute to strengthening economic security and sustaining macroeconomic stability in the long term.

Keywords: *competitiveness, economic security, innovation, export potential, macroeconomic stability, global economy, sustainable development.*

Jeoekonomik konfigürasyon koşullarında ülke ekonomisinin rekabet gücünün gelişim sorunları

Galib Gafarli
qalib.qafar@gmail.com

Orcid: 0000-0002-2292-2896

Özet

Makale, ülke ekonomisinin jeoekonomik konfigürasyon koşullarında rekabet gücünün geliştirilmesi sorunlarını incelemektedir. Küreselleşme süreci, ekonomik güvenliğin sağlanması ve uluslararası arenada güçlü bir konum elde edilmesi için rekabet gücünün stratejik önemini artırmıştır. Çalışmada, üretimin modernizasyonu, yenilikçi teknolojilerin kullanımı ve dijitalleşmenin ekonominin rekabet yapısı üzerindeki etkileri analiz edilmiştir. Elde edilen sonuçlara göre, küresel dijital dönüşüm, ekonomik faaliyetlerin ölçeğini genişleterek yeni rekabet biçimlerinin ortaya çıkmasına yol açmakta; aynı zamanda devletlerin jeoekonomik yönelimini ve ekonomik güvenlik stratejilerini yeniden şekillendirmektedir. Makale, rekabet gücünün artırılmasının yalnızca ekonomik büyümeyi değil, aynı zamanda ülkenin küresel sistemdeki istikrarını da belirleyen temel faktör olduğunu vurgulamaktadır.

Anahtar Kelimeler: rekabet gücü, jeoekonomi, rekabet potansiyeli, küreselleşme, ekonomik güvenlik.

1. Giriş ve teorik çerçeve.

Jeoekonomik koşullar altında ekonominin uzun vadeli ve sürdürülebilir gelişimi, rekabet gücünü belirleyen faktörlerin dikkate alınmasını gerektirir. Bu açıdan, rekabet potansiyelinin güçlendirilmesi; yenilikçi gelişme yollarının aranmasında, üretimin modernizasyonunda ve dünya pazarlarında rekabete dayanıklı ürünler üretmeye imkân tanıyan çağdaş teknolojilerin kullanılmasında kendini göstermektedir. Bu nedenle, küreselleşme sürecinin genişlemesiyle birlikte, ekonomik güvenliğin sağlanması ve uluslararası ekonomik alanda konumun güçlendirilmesi için jeoekonomik faktörlerin dikkate alınması büyük önem taşımaktadır.

Günümüz dünya ekonomisinin gelişme eğilimleri, küreselleşme süreçlerinin etkisini açık biçimde ortaya koymaktadır. Jeoekonomik konfigürasyon koşullarında bu eğilim doğal-tarihsel bir süreç olarak algılanmakta, her ekonominin gelişimi ekonomik-coğrafi faktörlerle, özellikle de uluslararası işbölümünün derinleşmesi, bilimsel-teknolojik ilerlemenin gelişmesi ve ekonominin açıklık derecesinin artmasıyla birlikte yürümektedir. Böyle bir durumda küreselleşme süreçlerinin temel sonucu, yeni bir kalkınma modelinin oluşturulmasını gerektirir. Çünkü üretimin uluslararasılaşması, onun çeşitli aşamalarının farklı ekonomilerin yapısına entegrasyonuna yol açmaktadır [2, s.36]. Dolayısıyla bu durum, rekabetçi bir ekonominin oluşmasının temel koşulu olarak değerlendirilmelidir.

2. Jeoekonomik konfigürasyon ve rekabet potansiyeli

Jeoekonomik konfigürasyonlar, küresel ekonomide rekabet bağlamında liderliğe ulaşmanın karakteristik özelliği olarak, karşılıklı ilişkileri ön plana çıkarmaktadır. Son yıllarda belirginleşen çok kutupluluk, küresel ekonomide uygun bir konum elde etmenin en önemli koşullarından birinin rekabet olduğunu kanıtlamaktadır. Uluslararası rekabette tutunmak ve dünya ekonomisinde yer almak için, ekonominin rekabet potansiyelini güçlendirmek büyük önem taşımaktadır.

Araştırmalar göstermektedir ki, dünya ekonomisinde liderlik için geleneksel jeoekonomik konfigürasyonun yanı sıra, tüm ekonomik yapıda da değişim yaşanmaktadır [1, s.49]. Dolayısıyla

modern çok kutupluluğun ekonomik-coğrafi yönleri, belirli bir yakınlaşma eğilimiyle birlikte, rekabet gücü yüksek ekonomik yapıların oluşturulması gereğini de ortaya koymaktadır. Ekonomik-coğrafi açıdan bakıldığında, makro-bölgesel ve jeoekonomik yönler, bölgeselleşme eğilimi temelinde öncelikle küreselleşme ve uluslararasılaşmanın etkisini yansıtmaktadır. Bu da rekabetçi ekonominin önemini ve yerini belirleyen başlıca unsurlardan biridir.

Günümüz koşullarında rekabet gücü, sosyoekonomik bir kategori olarak ekonomik büyümenin temel göstergesi ve kavramsal dayanağı haline gelmiştir. Rekabetin özel rolü, yenilikçi yolların aranması, üretimin modernizasyonu ve pazar taleplerini karşılayabilecek rekabetçi ürünler üretilmesini mümkün kılan çağdaş teknolojilerin kullanımında kendini göstermektedir. Bu bakımdan, devletin ekonomik güvenliğini ve kalkınmasını sağlamak için jeoekonomik bir yönelim seçmesi gerekmektedir [3, s.598]. Bundan dolayı ekonomik güvenliğin sağlanması sorununa bütüncül bir yaklaşımın benimsenmesi ve bu sürecin, ekonominin ve önde gelen sektörlerinin dünya çapında rekabet gücünü artıracak koşulların yaratılmasıyla tamamlanması zorunludur. Çünkü rekabet gücü, barışçıl kalkınma koşullarında piyasa ekonomisinin varlık gösterebilme yeteneğinin en nesnel ve ayrılmaz ölçütüdür.

Rekabetin, piyasa mekanizmasının temel aracı olarak dünya ekonomisinin gelişimi üzerindeki etkisinin sürekli artması, bu aracın pazar payı mücadelesinde kullanılmasının önemini açıkça kanıtlamaktadır. Gerçekte, ekonomik aktörler devletin kurumsal etkisi altında rekabet potansiyellerini güçlendirmeye yönelmektedirler. Pazar katılımcıları, rekabet pozisyonlarını korumak için ürün farklılaştırması fikrini savunmaktadırlar. Bu nedenle günümüz koşullarında ekonomik aktörlerin faaliyetleri ve rekabet potansiyellerinin artırılması stratejik bir nitelik taşımaktadır. Uluslararası deneyim göstermektedir ki, köklü teknolojik değişimler, küresel piyasa alanında rekabetçi etkileşimin derinleşmesine neden olmaktadır [4, s.62]. Rekabetin devletlerarası düzeye taşınması ise, olumlu koşulların yanı sıra, belirli sınırlar ve kısıtlamalar da yaratmaktadır. Rekabet ilişkilerinin küresel çatışma dönemine geçişiyle birlikte, rekabetin temel amacı dünya liderliğine ulaşmak olmuştur. Günümüzde bu sürecin sistematik bir nitelik kazanması, ekonomik rekabeti devlet düzeyinde güçlendirmekte ve küresel istikrarsızlık riskini artırmaktadır.

3. Küresel dijital dönüşüm ve rekabet dinamikleri

Günümüzde dijitalleşme, küresel ekonomik sistemin yapısında devrim niteliğinde değişiklikler yaratan temel faktörlerden biri haline gelmiştir. Küreselleşme ile paralel ilerleyen bu süreç, üretim, dağıtım ve ticaretin organizasyonuna tamamen yeni bir içerik kazandırmakta, ekonomik ilişkilerin mantığını köklü biçimde değiştirmektedir. Önceki dönemlerde rekabet daha çok kaynak hacmi, üretim kapasitesi veya pazar payı gibi göstergelerle ölçülürken, günümüzde bilgi, veri ve teknolojiye dayalı yeni bir kalite aşamasına geçilmiştir. Dijital ekonominin genişlemesi artık yalnızca belirli sektörleri değil, bütün ekonomik sistemi kapsayan yeni bir gelişme evresinin başlangıcını temsil etmektedir.

Bu dönüşümün temel özelliği, ekonomik süreçlerin optimizasyonu, işlem maliyetlerinin azaltılması ve üretim verimliliğinin artırılmasıyla birlikte ilerlemesidir. Dijital teknolojiler, gerçek zamanlı veri akışı sağlayarak karar alma süreçlerini hızlandırmakta ve piyasa sinyallerine verilen tepkileri daha esnek hale getirmektedir. Bu durum, mikro düzeyde işletmelerin rekabet yeteneğini güçlendirirken, makro düzeyde devletlerin ekonomik yönetim mekanizmalarını da daha etkin hale getirmektedir. Dijitalleşmenin en önemli sonuçlarından biri, ekonomik faaliyetlerin coğrafi sınırlarını büyük ölçüde ortadan kaldırmasıdır. Artık herhangi bir bölgede bulunan ekonomik aktör, dijital platformlar aracılığıyla küresel pazarda faaliyet gösterebilmekte, mal ve hizmetlerini uluslararası ölçekte sunabilmektedir.

Dijital ekonomi, yeni tip rekabet ilişkilerinin oluşumuna zemin hazırlamaktadır. Klasik ekonomik modellerde rekabet çoğunlukla üretim gücü ve fiyat avantajına dayanırken, günümüz koşullarında üstünlük; yenilik kapasitesi, dijital kaynaklardan yararlanma becerisi, veri analitiği ve yapay zekâ uygulamalarını etkin biçimde kullanma yeteneği ile ölçülmektedir. Bu bağlamda dijital dönüşüm, hem firmalar arasında hem de devletler düzeyinde yeni bir ekonomik hiyerarşi yaratmaktadır. Bilgi ve

teknolojiye zamanında uyum sağlayan ülkeler küresel pazarlarda daha istikrarlı konumlar elde ederken, bu sürecin gerisinde kalanlar rekabet avantajlarını yitirme riskiyle karşı karşıya kalmaktadır.

Küresel dijital dönüşümün mevcut aşaması artık yalnızca ekonomik verimliliği değil, aynı zamanda ulusal ekonomik güvenliği de belirleyen stratejik bir faktör haline gelmiştir [5]. Yenilikçi teknolojilerin uygulanması, ekonominin temel sektörlerinde çoğaltıcı etki yaratarak genel rekabet gücünü artırmaktadır. Dijital ekosistemlerin oluşumu, ekonomik aktörler arasındaki karşılıklı bağımlılığı derinleştirmekte; bu durum hem yeni fırsatlar hem de yeni riskler ortaya çıkarmaktadır. Özellikle siber güvenlik, veri koruması ve dijital eşitsizliğin azaltılması gibi konular, çağdaş rekabet politikalarının temel yönelimleri haline gelmiştir.

Jeoekonomik açıdan bakıldığında, rekabet potansiyelinin artırılmasında demografik ve kurumsal faktörlerin de büyük önemi vardır. Dijital dönüşüm yalnızca teknolojik altyapıyla sınırlı olmayıp, aynı zamanda insan sermayesinin niteliği ve yönetsel kapasite ile doğrudan ilişkilidir. Nüfusun eğitim düzeyi, yenilikçi düşünme becerileri ve dijital okuryazarlık oranı, ülkelerin rekabet gücünün şekillenmesinde belirleyici unsurlar arasında yer almaktadır. Demografik istikrarın sağlanması ve iş gücü niteliğinin yükselmesi, dijital ekonominin gelişimi için elverişli bir zemin oluşturmaktadır. Bu çerçevede, uluslararası ekonomik sistemde iş birliği yapan devletlerin rekabet gücü, onların uzun vadeli ekonomik sürdürülebilirliğinin en önemli garantisi haline gelmektedir.

Sonuç olarak, küresel dijital dönüşüm günümüz dünyasında ekonomik gelişmenin ve rekabet mekanizmalarının yönünü belirleyen temel süreçlerden biridir. Bu süreç yalnızca teknolojik bir değişim değil, aynı zamanda ekonomik yönetimin felsefesini dönüştüren; üretim, ticaret ve emek ilişkilerini yeniden biçimlendiren köklü bir aşamayı ifade etmektedir.

4. Sonuçlar ve öneriler

Böylece, rekabet koşullarında elde edilen etkinliklerin hiyerarşisi ve çeşitliliği, ekonomik olguların ve süreçlerin aşırı yoğunluğuyla bağlantılıdır. Bu açıdan, ekonominin farklı sektörlerinde rekabet mücadelesinin uzun vadeli eğilimleri şu şekilde özetlenebilir: bilimsel-yenilikçi ve teknik-teknolojik; yatırım ve ticari; lojistik; pazarlama; sosyal ilişkiler, yeniden üretim vb. Dolayısıyla, rekabetin jeopolitik bakış açısından analizi, ekonominin belirli sektörlerinin rekabet potansiyelinin kullanılma olanaklarına dayanmaktadır.

Yukarıda belirtilenlerden anlaşılmaktadır ki, ülkenin sosyoekonomik gelişimi için güncel konulardan biri, uzun vadeli programların oluşturulması ve jeoekonomik ihtiyaçların karşılanması amacıyla öngörülen rekabet stratejisinin uygunluğunun gerekçelendirilmesidir. Dolayısıyla küreselleşme koşullarında, ülkenin ekonomik-coğrafi konumu ile üstünlük, örgütlenme ve rekabet potansiyeli, ekonomik ilerlemenin temel şartına dönüşmektedir.

DIJITAL İŞETMELERDE ÖRGÜT KÜLTÜRÜ: VERI ODAKLI, İNOVATIF VE ÇEVIK ÖRGÜTLERIN İNCELENMESINE YÖNELIK KAVRAMSAL ÇALIŞMA

ÖZET

Bu çalışmanın amacı, dijital dönüşüm sürecinde örgütlerin sürdürülebilir rekabet elde etmesinde rol oynayan üç kültürel yaklaşımı (veri odaklılık, çeviklik ve inovasyon) kavramsal olarak incelemek ve aralarındaki ilişkiyi ortaya koymaktır. Çalışma, dijitalleşmenin yalnızca teknolojik bir yatırım değil, aynı zamanda örgüt kültüründe de bir dönüşüm gerektirdiği düşüncesinden yola çıkmaktadır. **Yapılan incelemeler,** bu üç kültürün birbirinden bağımsız olmadığını; veri odaklı karar almanın çevikliği beslediğini, çevik yapıların da inovasyonu hızlandırdığını göstermektedir. **Sonuç** olarak, işletmelerin dijital başarısının, teknolojik altyapı kadar, kültürel zemine de bağlı olduğu düşünülmektedir.

Anahtar Kelimeler: Veri Odaklı Kültür, İnovatif Kültür, Çevik Kültür

ABSTRACT

The aim of this study is to conceptually examine three cultural approaches (data-driven, agile, and innovative) that play a role in achieving sustainable competitiveness during the digital transformation process, and to reveal the relationship among them. The study is based on the idea that digitalization is not merely a technological investment but also requires a transformation in organizational culture. The analyses indicate that these three cultures are not independent of one another; data-driven decision-making fosters agility, and agile structures, in turn, accelerate innovation. Consequently, it is considered that the digital success of enterprises depends as much on their cultural foundation as on their technological infrastructure.

Keywords: Data-Driven Culture, Innovative Culture, Agile Culture

GİRİŞ

Dijital teknolojilerin gelişimi, endüstriyel alanda köklü dönüşümlere yol açan yeni bir devrim sürecini beraberinde getirmektedir. Bu gelişmeler, hem şirketler hem de toplumlar üzerinde derin etkiler

yaratmakta ve değişen koşullara uyum sağlamak için yeni gereksinimler ortaya çıkarmaktadır. Dijital dönüşüm olarak da adlandırılan bu evrim, birbirine bağlı ve sürekli etkileşim içinde olan karmaşık yapılar ve sistemler oluşturmaktadır (Herve vd., 2021). Bu köklü değişim, örgütler için kaçınılmaz olarak zorlu bir uyum sürecini tetiklemektedir. Ancak sadece teknolojik bir uyum ile değil, aynı zamanda çalışanların becerilerini, takım dinamiklerini ve hatta kurum içi iletişim kanallarını dönüştüren kapsamlı bir uyarlanma çabasını gerektirir. Bu süreç, örgütün hayatta kalması ve rekabet gücünü sürdürebilmesi için atması gereken kaçınılmaz bir adımdır (Nalbantoğlu, 2021).

Henriette vd., (2016) belirttiği gibi şirketlerin dijital dönüşümü yalnızca iş modeli olarak düşünmesi sığ bir düşünce olarak kalacaktır. Bu nedenle dijitalleşen işletmelerin, sürdürülebilir rekabet avantajı elde edebilmeleri için yeniliklere uyum sağlayarak organizasyonlarını da bu yönde geliştirmeleri beklenmektedir (Güleryüz vd., 2023).

Bu çalışmanın amacı, dijital işletmelerde veri odaklı, çevik ve inovatif kültürü, kavramsal olarak incelemek ve aralarındaki ilişikiyi ortaya koymaktır. Konu olan üç kavramın işletmelerin sürdürülebilir rekabet avatantajında bütün olarak ele alınması gerektiği düşünülmektedir. Çalışma, kavramların tanımlanması, ilgili çalışmaların incelenmesi ve sonuç bölümlerinden oluşmaktadır.

1.KAVRAMSAL ÇERÇEVE

1.1 Dijitalleşme ve Dijital İşletmelerde Örgütler

Dijitalleşme, kökeni Latince “digitus” (parmak) sözcüğüne dayanan ve verilerin sayısal biçime dönüştürülerek bilgisayarlar tarafından işlenebilir hale getirilmesi sürecini ifade eden bir kavramdır. İş dünyasında bu süreç ilk olarak iş operasyonlarının otomasyonu şeklinde başlamış, ardından internet ve çeşitli dijital teknolojilerin gelişimiyle birlikte iş modellerinde köklü dönüşümlere yol açmıştır (Klein, 2020). Kavramın günümüzdeki anlamına yakın ilk kullanımı ise 1971 yılında Robert Wachal tarafından North American Review dergisinde yapılmış, Wachal bu süreci özellikle beşerî bilimlerde bilgisayar kullanımının toplumsal etkileri üzerinden ele almıştır (Brennen & Kreiss, 2016). 1990’lı yıllarda teknolojik gelişmelerin hız kazanmasıyla birlikte dijitalleşme; işletmelere yeni pazarlara erişim, artan müşteri portföyü, farklı liderlik yaklaşımları ve örgütsel çeviklik gibi avantajlar sunmuştur. Bu dönemde sadece teknik sistemlerde değil, aynı zamanda örgütlerin yapısal ve kültürel yapılarında da önemli değişiklikler yaşanmıştır. Dijital başarı, değişen koşullara hızla uyum sağlayabilen, öğrenmeye açık, esnek ve rekabetçi yapılarla mümkün hale gelmiştir (Mert, 2024). Geleneksel kültür yapısı daha çok analog özelliklerle tanımlanırken, günümüz kültürü dijital dinamiklerle şekillenmektedir. Dijital kültürde müşteri talepleri ürün ve hizmetlerin oluşumunda belirleyici bir unsur haline gelirken, örgütsel yapılar daha yatay, hızlı karar alabilen ve sonuç odaklı bir yapıya evrilmektedir. Esneklik, yenilikçilik, iş birliği ve hız ise yeni çalışma düzenlerinin temelini oluşturmaktadır. Bu dönüşüm yalnızca teknik değil, aynı zamanda kültürel bir değişimi de beraberinde getirmektedir. Pandemi süreciyle birlikte hız kazanan dijitalleşme, örgüt kültürünü derinden etkileyerek, önümüzdeki dönemde daha büyük değişimlerin temelini atmaktadır (Nalbantoğlu, 2021).

Dijital işletmelerin sürdürülebilir rekabet elde etmesi için kurum içi örgütlerin de dönüşmesi önemlidir. Örgüt kültürünün veri odaklı, çevik ve inovatif olması işletmelerin dijital dönüşümünü hızlandırıp yeniliklere kolay adapte olacağı düşünülmektedir. Aynı zamanda oluşabilecek hataların da örgüt tarafından hızlı bir şekilde çözüme kavuşması işletmeler için avantaj sağlayacağı ön görülmektedir.

1.2 Dijital İşletmelerde Veri Odaklı Örgüt

Veriye dayalı kültür, işletmelerde karar alma süreçlerinin kişisel yargılar veya sezgiler yerine somut verilere ve analitik değerlendirmelere dayanmasını teşvik eden bir yaklaşımdır. Bu kültür, çalışanların veriye güven duymasını sağlayarak karar mekanizmalarının daha rasyonel ve sistematik bir şekilde

işlemesine katkıda bulunur. Aynı zamanda, büyük veri analitiği yetkinliğinin gelişmesine uygun bir zemin hazırlar. Veriye dayalı düşünme biçiminin organizasyonun tüm kademelerinde benimsenmesi, stratejik avantaj elde etme potansiyelini önemli ölçüde artırır (Gupta & George, 2016). Bu bağlamda, gelişmiş analitik araçlardan en yüksek düzeyde fayda sağlanabilmesi için, işletme genelinde veri odaklı bir zihniyetin yerleşmesi gerektiği genel kabul görmektedir. Berndtsson vd. (2018) da vurguladığı üzere, karar süreçlerinin merkezine veriyi yerleştiren işletmeler, hem operasyonel süreçlerini iyileştirme hem de rakiplerine kıyasla daha üstün bir performans sergileyerek sürdürülebilir rekabet avantajı elde etme konusunda önemli fırsatlar yakalayabilmektedir.

Veri odaklı kültürün, büyük veri stratejilerinin hem dış çevresel faktörlerle hem de iç organizasyonel süreçlerle uyum içerisinde şekillendirilmesi gerektiğini bildiren Karaboğa ve Zehir (2020), işletmelerdeki bu kültürün yerleşmesi, yalnızca teknolojik altyapının değil, aynı zamanda iş yapma biçimlerinin ve karar mekanizmalarının da dönüşmesinin zorunlu olduğunu ifade etmektedir. Öznel yargılardan çok, veriye dayalı öngörülere dayanan karar süreçleri ön plana çıkar. Bu nedenle, veri odaklı bir kültürün benimsenmesi, büyük veri projelerinin başarısı kadar, genel işletme performansının artmasında da belirleyici bir faktör haline gelmektedir. Benzer şekilde, Anton vd. (2023) göre , veri odaklı kültür, yalnızca veriye dayalı karar almayı değil, aynı zamanda bu karar süreçlerinin insan kaynağı, teknolojik yetkinlikler ve örgütsel yapı ile nasıl bütünleştiğini de kapsar. Bu doğrultuda, işletmelerin sürdürülebilir rekabet avantajı elde edebilmeleri için sadece veri toplamakla yetinmeyip, bu veriyi kurumsal karar alma ve değer yaratma süreçlerinin merkezine yerleştirmeleri gerekmektedir. Bu yaklaşımı destekleyen Chatterjee ve arkadaşları (2021), veri odaklı kültürün yalnızca karar alma süreçlerini değil, aynı zamanda ürün ve süreç inovasyonu aracılığıyla firma performansını doğrudan etkilediğini göstermektedir. Çalışmalarında, iş analitiği araçlarının etkin kullanımıyla desteklenen veri odaklı bir yapının, firmaların yenilikçilik kapasitelerini artırarak rekabet avantajı sağladığını ortaya koymuşlardır.

Literatürde veri odaklı kültürün örgütsel çıktılar üzerindeki rolünü inceleyen araştırmalar, bağlama ve modele göre değişen bulgular sunmaktadır. Türkiye'deki orta ve büyük ölçekli işletmeler üzerine yapılan bir araştırma (Düzcan & Fidan, 2023), veri odaklı kültürün dijital olgunluk ile yenilik performansı arasında anlamlı bir düzenleyici etki göstermediğini, ancak büyük veri analitiği yeteneğinin bu ilişkide güçlü bir aracı rol üstlendiğini ortaya koymuştur. Bu bulgu, Gupta vd. (2024) tarafından yapılan ve örgütsel kültürün veri odaklı dijital dönüşümü doğrudan ve pozitif olarak etkilediğini, bunun da operasyonel performansı artırdığını gösteren çalışmanın sonuçlarıyla kısmen bir tezat oluşturmaktadır. Öte yandan, Chatterjee vd. (2021)'nin çalışması, veri odaklı kültürün hem ürün hem de süreç inovasyonu üzerinde doğrudan ve anlamlı bir pozitif etkisi olduğunu doğrulamaktadır.

1.3 Dijital İşletmelerde Çevik Örgüt

Örgütsel çeviklik, işletmelerin değişen çevresel koşullara karşı hızlı ve etkili biçimde tepki verebilme, stratejik yönelimlerini sürekli olarak güncelleyebilme ve yenilikçi yaklaşımlar

geliştirerek sürdürülebilir değer yaratma yetkinliğidir. Bu yetkinlik, firmaların pazar fırsatlarını erkenden öngörebilmelerine, yeni iş modellerini hızla hayata geçirebilmelerine ve mevcut kaynak yapılarını çevresel gerekliliklere uygun şekilde yeniden düzenleyebilmelerine olanak tanımaktadır (Theyel ve Hofmann, 2021). Günümüzün dijitalleşme odaklı ve yoğun rekabet içeren piyasa koşulları, işletmeleri çevik bir yapıya sahip olmaya zorlamaktadır. Ancak dijital dönüşümün başarısı yalnızca teknolojik yatırımlara bağlı değildir; aynı zamanda kurum kültüründe dönüşümün sağlanması ve dijital teknolojilerin tüm organizasyonel süreçlerle bütünleştirilmesi gerekmektedir. Bu bağlamda çeviklik,

dijital dönüşüm süreçlerinin merkezinde yer almakta; organizasyonların değişen pazar dinamiklerine hızlı biçimde adapte olmasını ve daha etkili sonuçlara ulaşmasını mümkün kılmaktadır (Oğan, 2023).

Dijital dönüşümün beraberinde getirdiği yüksek hız ve belirsizlik, örgütlerde hata yapma riskini artırabilir. Ancak bu hataların birer öğrenme süreci olarak değerlendirilmesi ve cezalandırılmaması, risk almaya açık, çevik ve yenilikçi bir örgüt kültürünün gelişmesini destekler. Böyle bir kültür içerisinde, işletmeler değişen dijital koşullara karşı daha esnek yaklaşabilir, yeni stratejileri denemeye daha istekli olur ve bu sayede rekabet avantajı elde etme şanslarını artırabilirler (Mert, 2024).

İmamoğlu vd. (2024)'e göre, dijital örgütlerde çeviklik, hızlı değişen teknoloji ve pazar koşullarına uyum sağlayabilme yeteneğini ifade eder. Bu çeviklik, dijital araçların etkin kullanımıyla birlikte karar alma süreçlerinin hızlanmasını, esnek iş yapılarının benimsenmesini ve yenilikçi çözümlerin hızlıca hayata geçirilmesini sağlar. Dijital örgütler için çeviklik, rekabet avantajı elde etmede ve sürekli değişen dijital ortamda sürdürülebilirliği sağlamada temel bir unsurdur. Dijital teknolojiler sayesinde firmalar, çevresel değişimleri daha hızlı fark edebilmekte, kaynaklarını etkin biçimde yönetebilmekte ve fırsatlara hızlı tepki verebilmektedir. Bu da örgütsel çevikliğin güçlenmesini sağlayarak, firmaların değişken ve belirsiz piyasa koşullarında ayakta kalma ve rekabet etme yeteneğini artırmaktadır.

Farklı sektör ve bağlamlarda yapılan araştırmalar, örgütsel çevikliğin etkinlik ve dijital dönüşümün başarısındaki kritik rolünü ortaya koymaktadır. Holotiuk vd'nin (2018) profesyonel hizmet sektöründe yaptığı nicel çalışma, çevikliği algılama ve tepki verme olarak ikiye ayırarak bunun örgütsel etkinliğin temel bir unsuru olduğunu ve örgütsel tasarımın bu iki boyutu farklı şekilde etkilediğini göstermiştir. Kamu sektörüne odaklanan Zhang vd.'nin (2023) bulguları ise, örgütsel çevikliğin kurumların değişimleri algılamasını, strateji geliştirmesini, hizmet kalitesini ve dijital dönüşüm süreçlerindeki koordinasyonu doğrudan destekleyen bir yetkinlik olduğunu vurgulamaktadır. Benzer şekilde, Özdemir'in (2023) Türkiye'deki büyük ölçekli işletmeler üzerine yaptığı doktora tezinde, yapısal eşitlik modeli analizleri dijital dönüşüm olgunluğunun örgütsel çeviklik üzerinde anlamlı ve güçlü bir pozitif etkisi olduğunu kanıtlamış; bu da dijitalleşmenin çeviklik kapasitesini artırdığı yönündeki bulguları desteklemiştir. Özetle, örgütsel çeviklik hem özel hem de kamu sektöründe değişime uyum sağlama ve dijital dönüşümü yönetmede kilit bir özellik olarak öne çıkmaktadır.

1.4 Dijital İşletmelerde İnovatif Örgüt

İnovasyon, yalnızca ürün, süreç, pazarlama ya da yönetim alanlarında yapılan yenilikler veya iyileştirmelerden ibaret değildir; aynı zamanda teknik ve ekonomik yönlerinin ötesinde, toplumsal etkileri de olan çok boyutlu bir süreçtir. Bu sürecin gelişip sürdürülebilir hale gelmesi, farklı bakış açıları ve motivasyonlara sahip yapıların sürekli ve dinamik etkileşimine bağlıdır (Karaata, 2021). Çellek'in (2003) değerlendirmesi ise inovasyonu, farklı alanlarda özgün ve bilinmeyen çözümler üretme süreci olarak tanımlar. Bu süreç, yaratıcı düşünce, hayal gücü, sezgi, ilişkilendirme ve bireysel ifade gibi unsurları içerir. Daha önce ilişkisiz gibi görünen kavramların bir araya getirilerek özgün sonuçlara ulaşılması, inovasyonun temelini oluşturur. Aynı zamanda sistemli bir düşünme biçimi olan inovasyon, bireyler tarafından geliştirilebilir ve eğitilebilir bir yeti olarak da öne çıkar.

Siebel'e göre (2019), dijital örgütlerde inovasyon, teknolojiyle sınırlı olmayan; kültürel dönüşüm, liderlik, esneklik ve müşteri odaklılıkla beslenen bir süreç olarak anlatılır. İnovasyon; bulut, yapay zeka, IoT gibi teknolojilerle desteklenir, ancak esas başarı, örgütün değişime açık ve deneyime izin veren bir yapıya sahip olmasındadır.

Dyer vd.'ne (2011) göre, sorgulama, gözlemleme, ağ kurma, deney yapma ve ilişkilendirme gibi beş temel beceri, dijital dönüşüm süreçlerinin temelini oluşturan inovatif düşünme biçimini yansıtır. Dijital

dönüşüm yalnızca teknolojiyi kullanmakla sınırlı olmayıp; yerleşik iş modellerini sorgulayan, kullanıcı deneyimini merkeze alan, denemeye açık ve farklı fikirleri bir araya getirebilen bir zihniyet gerektirir. Benzer şekilde, Westerman vd.'nin (2014) çalışmasında da inovasyon, teknolojiyi yalnızca destekleyici bir unsur olarak değil, iş stratejisinin odağına yerleştiren bir dönüşüm süreci olarak ele alınır. Dijital inovasyon; yeni ürünlerin geliştirilmesinin ötesinde, iş süreçlerinin yeniden tasarlanması, veri temelli karar alma sistemlerinin oluşturulması ve müşteri deneyiminin dijital olarak yeniden yapılandırılmasıyla sağlanır.

Farklı araştırmalar, dijital çağda inovatif bir örgüt yapısının ürün odaklı değil, bütünleşik ve kültürel bir dönüşüm gerektirdiğini ortaya koymaktadır. Porter ve Heppelmann'ın (2015) sektör öncüsü şirketler üzerine yaptığı kavramsal analiz, inovasyonun artık yalnızca fiziksel ürünle sınırlı olmadığını; yazılım, veri analitiği ve bağlantı özellikleriyle desteklenen, sürekli ve hizmet odaklı bir modele evrildiğini göstermiştir. Bu yaklaşım, Bughin vd.'nin (2017) 2.000'den fazla şirketle yaptığı geniş ölçekli çalışmada desteklenmiş; inovasyon kültürünün sürekli öğrenme, risk alma ve deney yapmaya dayalı çevik bir yapı olduğu, bunun sürdürülebilirliği için ise liderlik desteği ve çalışanların yetkilendirilmesinin kritik önemi vurgulanmıştır. Nihayet, Vial'ın (2019) literatür taraması da bu bulgularla uyumlu olarak, dijital dönüşümle rekabet avantajı elde etmenin, esnek, öğrenmeye açık ve yenilikçi bir örgütsel kültür geliştirmekten geçtiğini teyit etmektedir. Tüm bu çalışmalar, teknolojik değişime uyum sağlayan ve yeni iş modelleri geliştiren inovatif örgütlerin, inovasyonu yalnızca bir sonuç değil, aynı zamanda sürekli bir organizasyonel süreç olarak benimsemesi gerektiğine işaret etmektedir.

2.Dijital İşletmelerde Örgüt Kültürü: Veri Odaklı, İnovatif ve Çevik Örgütlerin Kavramsal Olarak İncelenmesi

Araştırmanın veri kaynağını, konuyla ilgili hakemli akademik dergilerde yayımlanmış makaleler, kitaplar ve lisansüstü tezler oluşturmaktadır. Yapılan kavramsal inceleme **Google Scholar, Web of Science (WoS), Scopus ve YÖK Ulusal Tez Merkezi** akademik veri tabanlarında gerçekleştirilmiştir. İncelemede, ilgili kavramları kapsamak üzere İngilizce ve Türkçe anahtar kelimeler kullanılmıştır. Ana odağı veri odaklı, çevik veya inovasyon kültür olan ve dijital işletmeler bağlamını ele alan çalışmalar araştırmaya dahil edilirken teknik/teknolojik odaklı olup, örgütsel/kültürel boyutu yeterince ele almayan çalışmalar hariç tutulmuştur. Seçilen çalışmalar, kavramsal olarak ele alınmıştır. Bu kapsamda, her bir çalışmada yazar, yıl, amaç, yöntem, örneklem ve sonuçlar incelenmiştir.

Tablo 1: Veri Odaklı, Çevik ve İnovatif Kültür Çerçevesinde İncelenen Çalışmalar

Çalışma Adı, Yazarı (Yazarları), Yılı	Amacı	Veri Toplama Yöntemi	Örneklemi	Analiz Yöntemi	Sonucu
Dijital Dönüşümün Örgütsel Çevikliğe Etkisi (Doktora Tezi) Özdemir, A. (2023	Dijital dönüşüm uygulamalarının örgütlerin çeviklik düzeyi üzerindeki etkisini incelemek	Anket tekniği kullanılmıştır.	Türkiye'de faaliyet gösteren büyük ölçekli işletmeler.	Veriler, nicel analiz yöntemiyle incelenmiştir. Korelasyon analiz ve regresyon analiz ile raporlanmıştır.	Dijital dönüşüm sürecinin örgütün çevikliğini artırma potansiyeline sahip olduğunu; çevikliğin ise dijitalleşme başarısında kritik bir rol oynadığını göstermektedir.

How organizational agility promotes digital transformation : An empirical study Zhang, H., Ding, H., & Xiao, J. (2023)	Örgütsel çevikliğin dijital dönüşümü nasıl teşvik ettiğini ampirik olarak incelemek.	Anket tekniği kullanılmıştır.	Veriler Çin'de kamu sektörü kurumlarında çalışan 313 kişiden toplanmıştır.	Veri analizi için yapısal eşitlik modeli (SEM) kullanılmıştır.	Çalışma bulgularına göre, örgütsel çevikliğin (hem operasyonel ayarlama hem stratejik) dijital dönüşüm performansını **anlamlı ve pozitif** etkilediği bulunmuştur. özellikle kamu sektörü bağlamında çevikliğin ve dinamik kabiliyetlerin dijital dönüşüm başarısı için kritik olduğu vurgulanmıştır.
The Determinants and Role of Agility in Digital Organizations Holotiuk, F., Beimborn, D., & Jentsch, C. (2018)	Dijital çağda örgütlerin çevik olabilmesi için hangi tasarım unsurlarının önemli olduğunu belirlemek ve çevikliğin örgütsel başarıya katkısını göstermeyi amaçlamak	Anket tekniği kullanılmıştır.	Profesyonel hizmet odaklı sektörlerde çalışanların **217 geçerli yanıtı** üzerinden yürütülmüştür.	Veriler istatistiksel olarak analiz edilmiştir	Çalışma bulgularına göre; örgütsel tasarımın (örneğin esneklik, düşük formalizasyon, süreçlerin modülerliği gibi) çevikliği etkilediği ve çevikliğin de örgütsel etkinlik üzerinde anlamlı bir belirleyici olduğu görülmüştür. Özellikle "detecting agility" ve "reacting agility" her ikisi de dijitalleşen ortamda organizasyonların uyum ve tepki yeteneklerini

					artıran önemli boyutlar olarak bulunmuştur.
İşletmelerde dijital olgunluk düzeyinin yenilik performansı üzerindeki etkisinde büyük veri analitik yeteneğinin aracı ve veri odaklı kültürün düzenleyici rolü Düzcan, A., & Fidan, Y. (2023).	Dijital olgunluk yüksek olan işletmelerde büyük veri analitik yeteneği ve veri odaklı kültürün birlikte nasıl işlediğini ve bu sayede yenilik performansına nasıl etkide bulunduğunu" kavramsal ve ampirik olarak ortaya koymak	Nicel anket çalışması yöntemi kullanılmıştır. Anketler çevrimiçi yayınlanmıştır.	Türkiye'de faaliyet gösteren orta ve büyük ölçekli işletmelerin yöneticileri veya kıdemli personelleri. 411 geçerli anket üzerinden değerlendirme yapılmıştır.	Korelasyon analizi, regresyon ve hiyerarşik regresyon analizleri yapılmıştır.	**Büyük veri analitik yeteneği**, dijital olgunluk ile yenilik performansı ilişkisi içerisinde **aracı** rol oynamaktadır.
Toward the development of a big data analytics capability. Gupta, M., & George, J. F. (2016)	İşletmelerde **büyük veri analitiği yeteneği** kavramını teorik ve yapısal olarak tanımlamak ve bu yeteneğin **örgütsel performans üzerindeki etkilerini açıklayan bir çerçeve** geliştirmek.	Büyük veri analitiği yeteneğini ölçmek amacıyla literatüre dayalı yeni bir ölçek geliştirilmiştir. Yapılandırılmış bir anket formu kullanılmıştır.	ABD merkezli firmalarda, pilot çalışmada 232, ana çalışmada 108 yöneticiye ulaşılmış ve toplam 340 geçerli anket değerlendirmeye alınmıştır.	İlk aşamada doğrulayıcı faktör analizi, ikinci aşamada ise yapısal eşitlik modellemesi kullanılmıştır.	Bulgular, büyük veri analitiği yeteneğinin geliştirilmesinin firma performansını anlamlı biçimde artırdığını göstermiştir. Organizasyonların, rekabet avantajı elde edebilmesi için büyük veri analitiği yeteneğini çok boyutlu bir kaynak olarak ele alması gerektiği bildirilmiştir.
Does data-driven culture impact innovation and performance of a firm? An	işletmelerde **veri odaklı kültürün** hem **yenilik** hem de **firma performansı**	Yapılandırılmış anket tekniği kullanılmıştır.	Çalışma, farklı işletmelerde iş analitiği araçlarını kullanan çalışanlardan	Yapısal eşitlik modeli ve regresyon temelli analiz	Veri-odaklı kültür, hem ürün yeniliğini hem de süreç yeniliğini **pozitif ve anlamlı biçimde**

empirical examination. Chatterjee, S., Chaudhuri, R., & Vrontis, D. (2024)	üzerindeki etkisini **ampirik olarak incelemek**		toplam 456 geçerli yanıt üzerine yürütülmüştür**.**	teknikleri kullanılmıştır.	**artırmaktadır**. Ürün yeniliği ve süreç yeniliği ise firma performansını **olumlu yönde** etkilemektedir; dolayısıyla veri-odaklı kültürün firma performansı üzerindeki dolaylı etkisi yenilik aracılığıyla gerçekleşmektedir.
How smart, connected products are transforming companies Porter, M. E., & Heppelmann, J. E. (2015)	Dijitalleşme çağında şirketlerin **organizasyonel yapısını**, **yetkinlik gereksinimlerini** ve **rekabet avantajı kaynaklarını** nasıl yeniden şekillendirmesi gerektiğini tartışmak.	Akıllı, bağlantılı ürünler geliştiren firmalardan elde edilen kurumsal raporlar, sektörel analizler ve yönetici görüşmelerine dayanmaktadır.	Örneklem, "akıllı ve bağlantılı ürünler" geliştiren ve IoT ekosistemine yatırım yapan **imalat, teknoloji ve endüstriyel üretim** firmalarından oluşmaktadır.	**Nitel-kavramsal analiz** yaklaşımıyla hazırlanmıştır.	Dijital dönüşümün sadece teknolojik değil, aynı zamanda stratejik ve örgütsel bir devrim olduğunu; çeviklik, veri temelli karar alma ve sürekli öğrenme kültürünün bu dönüşümün merkezinde yer aldığını vurgulamaktadır.
The case for digital reinvention Bughin, J., LaBerge, L., & Mellbye, A. (2017)	Dijital dönüşümün yalnızca teknolojik bir değişim olmadığını, işletmelerin kültürünü, stratejisini ve organizasyon yapısını kapsayan bütüncül bir **yeniden icat süreci**	**Küresel düzeyde anket ve sektör verisi analizi** kullanılmıştır.	60'tan fazla ülkede'de 1500'den fazla işletmelerin dijital dönüşüm direktörü gibi üst düzey yöneticilerinden oluşmaktadır.	**Betimsel istatistik, korelasyon ve kümeleme analizi** yöntemleri birlikte kullanılmıştır.	Dijital dönüşümde yalnızca teknoloji yatırımı yapan firmaların kalıcı başarı sağlayamadığını; **kurum kültüründe inovasyonu teşvik eden bir zihniyet dönüşümünün** asıl fark yaratan unsur olduğu bildirilmektedir.

	olduğunu vurgulamak				
Understanding digital transformation : A review and a research agenda Vial, G. (2021)	dijital dönüşümün tanımı, bileşenleri, etkileri ve örgütsel sonuçlarıyla ilgili literatürdeki kavramsal dağınıklığı gidererek bütüncül bir çerçeve oluşturmak	2000-2020 arasında yayımlanan akademik yayınların literatür taraması yapılmıştır. İkincil veri analiziyle hazırlanmıştır.	Örneklem, seçilen literatürdeki 100'den fazla nitel ve nicel makaleden oluşmaktadır.	Çalışmada **içerik analizi (content analysis)** ve **tematik sentez (thematic synthesis)** yöntemleri uygulanmıştır.	İnovasyon kültürünü oluşturan "deneme-yanılma", "veriye ve teknolojiye açıklık", "süreç ve yapıların yeniden yapılandırılması" gibi unsurlar, çalışmada kültürel dönüşümün bir parçası olarak yer almaktadır.

Bu çalışmalar bütüncül olarak değerlendiğinde, işletmelerin başarısının, teknolojik alt yapıdan çok kültürel alt yapıya dayandığı söylenebilir. Çalışmalar, işletmelerin kararlarını veriye dayalı almasının inovasyon ve performansı artırdığını gösterirken (Gupta & George 2016; Chatterjee vd., 2024), Düzcan & Fidan (2023) ise veri odaklı kültürün bu etkiyi düzenlediğini sunmuştur. Bughin vd. (2017) ve Vial (2021), dijital dönüşümün bir yeniden icat süreci olduğunu, bunun yalnızca teknolojik değil, zihinsel ve kültürel bir yeniden yapılanma olduğunu vurgulamaktadır. İnovasyon burada hem bir **zihniyet dönüşümü**, hem de dijitalleşmenin sürdürülebilirliğini sağlayan **kültürel bir kavram** olarak bildirilmektedir. Zhang vd. (2023), Holotiuk vd. (2018) ve Özdemir (2023), çevikliğin dijital dönüşümün etkinliğini artıran kültürel unsur olduğunu gösterirken çevikliğin, yalnızca hızlı tepki verme yetisi değil, aynı zamanda öğrenme, uyum sağlama ve değer yaratma kapasitesi olduğunu vurgulamaktadır.

Sonuç

Bu çalışmanın amacı, işletmelerde veri odaklı, inovatif ve çevik kültürü kavramsal çerçevede incelemek ve aralarındaki ilişkiyi ortaya koymaktır. İncelenen çalışmalar, bu üç kavramın birbirinden bağımsız olmadığını göstermektedir. Veri odaklı kültür, işletmelerin veriye dayalı karar almasını sağlayarak değişimlere daha hızlı ve doğru karar vermesine zemin hazırlayabilir. Dolayısıyla veri odaklı kültürün çevikliği güçlendirdiği söylenebilir. **Çeviklik** ise örgüt içinde yenilik fikirlerinin daha hızlı ortaya çıkmasını ve uygulanmasını kolaylaştırır. Böylelikle, örgütlerin hızlı karar alabilmesi, deneme-yanılmaya açık bir ortamın oluşmasını sağlayarak **inovasyon kültürünü** de oluşturabilir. Sonuç olarak, veri odaklılığın çevikliği beslediğini, çevikliğin, inovasyonu hızlandırdığını ve bu döğünün de işetmelerin dijital ortamda sürdürülebilir rekabet avantajı elde edebileceği söylenebilir.

Bu çalışmada veri odaklı, inovatif ve çevik kültür kavramları kavramsal düzeyde ele alınmıştır. Ancak bu üç kültür, henüz gelişmekte olan kavramlardır. Bu nedenle gelecekte yapılacak **nicel araştırmaların**, bu kavramlar arasındaki ilişikiyi ortaya çıkarmada önemli olacaktır. Özellikle farklı sektörlerde yürütülecek çalışmalar, veri odaklılık, çeviklik ve inovasyon kültürlerinin sektörlere göre **nasıl farklılaştığını** ya da **birbirini nasıl etkilediğini** ortaya koyabilir.

Abstract

The article analyzes the mechanisms of state regulation of Azerbaijan's defense policy within the framework of cooperation with the North Atlantic Treaty Organization (NATO). The study explores the institutional, legal, and strategic dimensions of defense policy, emphasizing Azerbaijan's participation in NATO programs such as the Partnership for Peace (PfP) and the Planning and Review Process (PARP). Special attention is given to the transformation of defense institutions, the adaptation of national legislation to international security standards, and the role of the Ministry of Defense in implementing interoperability principles. The research also discusses the balance between Azerbaijan's multivector foreign policy and its commitments to NATO, assessing the effectiveness of regulatory mechanisms that ensure national sovereignty and regional stability.

Keywords: Azerbaijan, defense policy, NATO, state regulation, security cooperation, Partnership for Peace

INTRODUCTION

After gaining independence in 1991, Azerbaijan faced the urgent task of forming an effective national defense system that could ensure sovereignty, territorial integrity, and security in a complex geopolitical environment. The country's partnership with NATO has become one of the key elements of its defense modernization strategy.

The framework of cooperation with NATO is built on the Partnership for Peace (PfP) program, launched in 1994, which allows Azerbaijan to integrate international defense standards while maintaining its non-bloc status. Through joint exercises, training programs, and defense reforms, Azerbaijan has achieved a gradual alignment of its military structures with NATO principles of transparency, civilian oversight, and interoperability.

This research aims to identify and evaluate the mechanisms of state regulation that ensure effective implementation of defense policy in the context of Azerbaijan's partnership with NATO. The study also examines the balance between national interests and international cooperation in defense governance.

MATERIALS AND METHODS

The research is based on a combination of qualitative and comparative analysis methods. Primary sources include official NATO and Azerbaijani government documents, strategic defense reviews, and national security concepts. Secondary sources consist of academic papers, reports by international organizations, and expert assessments.

The study employs an institutional approach to understand the interaction between state bodies (the Ministry of Defense, the Ministry of Foreign Affairs, and the State Security Service) and NATO institutions. The systemic approach is used to analyze how defense policy regulation contributes to overall national security architecture.

Data collection covered the period from 1994 to 2024, emphasizing the evolution of Azerbaijan–NATO relations, reform outcomes, and the efficiency of existing regulatory mechanisms.

FINDINGS

The findings of the study demonstrate that the mechanisms of state regulation of Azerbaijan's defense policy within the NATO partnership framework are characterized by an integrated, multi-layered system that combines political, institutional, legal, and operational dimensions. Azerbaijan's cooperation with NATO since joining the Partnership for Peace (PfP) in 1994 has evolved from basic political dialogue into a structured mechanism of defense transformation and interoperability development.

One of the key regulatory mechanisms is the institutional coordination among state bodies — primarily the Ministry of Defense, the Ministry of Foreign Affairs, and the Presidential Administration. These institutions jointly manage the implementation of the Individual Partnership Action Plan (IPAP) and the Planning and Review Process (PARP), which serve as practical tools for aligning Azerbaijan's defense capabilities with NATO standards. Through these frameworks, the government ensures transparency, accountability, and efficient allocation of defense resources.

The legal framework for cooperation is grounded in strategic documents such as the National Security Concept (2007) and the Military Doctrine (2010), which establish the principles of defense organization, civilian control, and international partnership. Subsequent legislative updates have enabled harmonization with NATO defense planning systems and improved mechanisms of public oversight in defense management.

At the strategic level, Azerbaijan applies a balanced approach, maintaining partnership with NATO while pursuing regional cooperation within organizations such as the GUAM and the Non-Aligned Movement. This allows the state to strengthen its defense potential without compromising sovereignty or creating political asymmetry in regional relations.

The operational component of regulation focuses on practical cooperation: Azerbaijan actively participates in NATO's military training programs, peacekeeping missions, and trust fund initiatives aimed at defense reform and environmental security. The deployment of Azerbaijani peacekeepers in Kosovo and Afghanistan represents a tangible result of institutionalized cooperation, demonstrating the state's commitment to global security initiatives.

Azerbaijan's defense modernization, supported by NATO expertise, has resulted in increased interoperability, professionalization of armed forces, and the introduction of modern defense management tools. As of the 2020s, Azerbaijan continues to implement the fourth cycle of IPAP, which focuses on cybersecurity, crisis response mechanisms, and human resource development within defense institutions.

DISCUSSION AND CONCLUSION

Azerbaijan's mechanisms of state regulation in the defense sector are characterized by a hybrid model that combines national priorities with international obligations. The partnership with NATO provides

access to modern defense standards, technological expertise, and strategic consultation, all of which support the country's long-term defense modernization goals.

At the same time, Azerbaijan maintains a balanced foreign policy, cooperating with both Western and regional partners. This allows the country to strengthen its defense capabilities while preserving political independence and regional stability.

In conclusion, the state regulation mechanisms of Azerbaijan's defense policy within NATO partnership frameworks can be considered effective due to:

1. The institutionalization of cooperation channels;
2. The harmonization of legislation with NATO standards;
3. The operational interoperability of national forces;
4. The maintenance of strategic autonomy.

These mechanisms form the foundation for Azerbaijan's defense sustainability and its growing role in regional security architecture.

CAUSES OF CASPIAN SEA LEVEL CHANGE, ECO-ECONOMIC IMPACTS: REGIONAL SUSTAINABLE GOVERNANCE PERSPECTIVES.

Nilufar MURADOVA

Abstract

This study undertakes a comprehensive philosophical-ecological and economic systemic analysis of the Caspian Sea's long-term water level fluctuations.
Rather than approaching the phenomenon as a mere hydrological anomaly, the research frames the Caspian Sea as a dynamic socio-natural system in which climatic oscillations, geopolitical resource extraction regimes, and anthropogenic environmental interventions converge. The decline in sea level is interpreted not only as an outcome of increased evapotranspiration and altered riverine inflows but as a manifestation of deeper structural contradictions between natural equilibrium and industrial growth imperatives.
By integrating hydrometeorological assessments with economic impact analysis and infrastructural vulnerability modelling, the study argues for a paradigm shift from sectoral management to multi-scalar ecological governance. The conclusions situate the Caspian's trajectory within broader climate stress frameworks, indicating that sustainable futures depend upon transboundary cooperation, ecological restoration strategies, and a reconfiguration of resource exploitation logics.

Keywords: Caspian Sea, hydro-ontological system, level change, energy economy, transboundary governance, anthropogenic pressure, regional cooperation, sustainable development

INTRODUCTION

The Caspian Sea is not merely a geographical object or a water basin limited to hydrometeorological indicators; it is a complex living system formed at the intersection of anthropogenic impacts, time-scaled climate rhythms, and the region's historical-political formation processes. As the world's largest enclosed water body, the Caspian Sea holds significant ecological and geo-economic importance for the South Caucasus and Central Asia region. The dynamics of the sea level have long remained a central topic of scientific research. In recent decades, the process of sea level decline has accelerated, beginning to exert noticeable effects on coastal ecosystems, fishery resources, port and transport-logistics infrastructure, as well as the energy extraction sector.

The change in sea level should not be evaluated solely as a physical phenomenon but analyzed as a result of human-nature interactions. Long-term sea level decline is not merely a quantitative change in the volume of the water mass; it also signifies a disruption of ecological balance. This disruption, in turn, affects the reconfiguration of economic spaces, the adaptation of energy strategies, and the fate of coastal social systems. The Caspian Sea level change is a research direction of strategic significance in terms of regional security, resource management, and sustainable development.

MATERIALS AND METHODS

Scientific literature associates the dynamics of the Caspian Sea level with two main groups of factors:

- **Natural climate factors:** Temperature increase, rise in evaporation, decrease in river flows

- **Anthropogenic impacts:** Regulation of water resources, irrigation infrastructure, industrial and extraction activities

Kostianoy and Kosarev characterize the Caspian Sea as a closed hydrological system sensitive to external influences, emphasizing the historical variability observed in sea level rhythms. Against the backdrop of climate change, they identify the increase in evaporation intensity as the main driving force behind sea level decline. Peeters and others note that water use in the Volga basin plays a decisive role in the Caspian's water balance.

Based on the general conclusions of the literature, it can be stated that sea level decline is not a random process but a structural and multifactorial dynamic.

The methodological approach of this study is based on a systemic integrative model: combining satellite observations of hydrological data, multi-model analysis of climate forecasts, economic loss functions with coastal infrastructure data, and evaluation of energy extraction platforms. The analytical basis of the research is formed by a multifactorial correlation matrix and the valuation of ecosystem services.

FINDINGS

Comprehensive measures show that the long-term decline of the Caspian Sea level is of a multifactorial nature and is shaped by the combined effects of natural climate processes and anthropogenic activities. Alongside rising temperatures and increased evaporation intensity, particularly the use of water resources in the Volga River basin for agricultural and industrial purposes emerges as a key determinant of the sea's water balance. Therefore, the sea level decline should not be considered a mere conjunctural change in hydrometeorological processes but rather a structural and long-term trend.

The ecological impacts of sea level decline manifest as the narrowing of coastal ecotones, the drying of spawning areas affecting reproductive potential, the restriction of fish feeding grounds, changes in the biochemical balance of water, and the weakening of biodiversity indicators. These changes negatively affect the population stability of commercially significant fish species. The weakening of ecosystem stability complicates recovery processes in the long term and necessitates the sustainable management of ecological resources.

Economically, sea level decline leads to the shallowing of port infrastructure, restriction of shipping operations, weakening of the geotechnical stability of offshore energy platforms, increased sedimentation effects on pipeline routes, reduced fishery productivity, increased vulnerability of coastal recreation zones, and depreciation in coastal real estate markets. These impacts directly affect the energy strategies, food supply systems, transport-logistics routes, and settlement models along the coastal zone of regional countries.

Thus, the management approach to the Caspian Sea level decline problem cannot be limited to engineering-technical measures alone. The solution requires coordinated management of transboundary water resources, integrated planning across river basins, implementation of ecosystem-based restoration strategies, and strengthening of institutional and political cooperation among coastal states.

In this context, the future development and eco-economic stability of the Caspian Sea directly depend on the long-term strategic decision-making will of regional countries and the formation of joint governance mechanisms.

The Economic Potential of the Caspian Sea and Economic Damages of Level Change

The Caspian Sea is not only an ecosystem but also a geo-economic space that forms the structural backbone of regional states' energy strategies, trade routes, fishery systems, and coastal urbanization models. The existence of the sea serves as a long-term equilibrium condition for macroeconomic stability and resource provision for the entire region. The main components of its economic potential are as follows:

- **Hydrocarbon reserves:** Oil and gas fields in the shelf zone form the base structure of the region's energy security and export revenues.

- **Transport-logistics corridors:** The Baku-Aktau-Turkmenbashi line functions as a strategic bridge between Asia and Europe as the Trans-Caspian trade artery.

- **Fisheries and water economy:** Fisheries, based on the Caspian Sea's biological resources and biodiversity, are a key structural component of food supply systems. These resources are strategically important not only for domestic consumption but also for maintaining regional food security.

- **Tourism and coastal service sector:** The tourism sector enhances the economic potential of recreation zones and strengthens regional economic activity and employment levels in coastal states.

However, sea level decline systematically erodes this potential. It should be noted that the Caspian Sea level has historically undergone continuous periods of rise and fall. Analyzing the past century reveals that from 1930 to 1977, the sea level dropped by approximately 3 meters. The period from 1977 to 1995 was one of rapid rises. Since 1995, a decline in sea level has been observed. The graph below shows the decreasing trend in the Caspian Sea level observed in recent decades.

-

- **Coastal Line Retreat**

- According to model forecasts, sea level decline leads to a gradual retreat of the coastline.

- Source: The economic evaluations presented in the table are generalized by the author based on Kostianoy & Kosarev (2005), Arpe et al. (2020), and Peeters et al. (2019).

As a result of the Caspian Sea level change, the following will occur

- Reduction in port depths leads to slower cargo turnover and decreased trade flow.
- Corrosion risk increases in platform constructions in the shelf zone.
- Reduction in spawning areas in fisheries causes a decline in annual productivity and poses risks to food security.
- Coastal tourism becomes economically unsustainable due to the retreat of the shoreline.

Thus, the change in the Caspian Sea level requires rethinking the region's economic profitability framework not only as a management issue but also as a matter of national security and long-term development strategy.

The observed decline in the Caspian Sea level affects the economic, ecological, and social systems of the five coastal states with varying degrees of intensity. The strength of the impact is determined by the geomorphological characteristics of the coastal zone, the spatial structure of port and industrial infrastructure, and the degree of dependence of countries' energy and transport sectors on the Caspian aquatory [6].

The most severe consequences of level decline are projected for Turkmenistan. This is due to Turkmenistan's Caspian coastline being predominantly low-lying and shallow. Even relatively small

drops in water level can lead to the coastline retreating by tens of kilometers and cause serious operational limitations for the Turkmenbashi port and petrochemical infrastructure [5]. The impact level is high for Kazakhstan, as the hydro-technical profile of the northern sector of the Caspian is shallow, and the operational capacity of the Atyrau-Aktau sea ports is directly determined by water depth. In this context, sea level decline poses a strategic risk to energy export logistics and the competitiveness of the Trans-Caspian transport corridor [8]. For Azerbaijan, the impact is assessed as medium intensity. The deeper aquatory of Azerbaijan's coastline reduces geomorphological risks to some extent. However, the operation of the Baku International Sea Trade Port, offshore oil and gas platforms, and the fisheries sector is functionally dependent on sea level, which requires economic adaptation [3]. Iran's coastline, being mountainous and steeper in relief, experiences water retreat on a geographically more limited scale. However, the regional impact is mainly observed in fisheries and coastal tourism activities [7]. For Russia, the impact is relatively weak, as its coastal zone is characterized by a deeper hydro-aquatory. Nevertheless, one of the leading causes of sea level decline is the management of water resources in the Volga River basin, meaning the structural source of the process is directly linked to Russia's hydro-technical policy [11].

Thus, the level decline is characterized by high impact intensity for Turkmenistan and Kazakhstan, medium for Azerbaijan, and relatively weak for Iran and Russia. This difference in impact is determined by coastal geomorphology and the degree of economic dependence on marine resources.

Although the change in the Caspian Sea level dynamics does not affect all coastal states equally, it should be noted that each country's role in this process and the intensity of its anthropogenic impact also vary. When analyzing the anthropogenic impact of countries on the sea level decline, it is determined that coastal states influence the decline with varying intensities. These pressures are shaped by the scale of energy extraction, regulation of river flows, volume of industrial waste, coastal urbanization, and the institutional strength of ecosystem management strategies. The damage inflicted on the sea, depending on the intensity of impact, alters the geographical and ecological conditions on one hand, and harms the sustainability of coastal economies, the stability of social infrastructure, and the integrity of ecosystems [4].

The following table identifies the degrees of impact on the sustainable development of the Caspian Sea as a result of the eco-economic policies implemented by coastal countries:

Country	Main Impact Factors	Nature of Impact	Approximate Impact Level
Russia	Regulation of Volga River flow, industrial	Structural change in hydrometeorological balance	Very High

	waste, irrigation systems		
Kazakhstan	Offshore oil extraction, sediment disruption in shelf zone	Geotechnical and sedimentation effects	High
Azerbaijan	Energy extraction infrastructure, port expansion, urbanization	Ecosystem external impact and coastal pressure	Medium-High
Turkmenistan	Chemical waste and industrial pollution	Disruption of water biochemical balance	Medium
Iran	Agricultural water diversion and weakening of river inflows	Regional water balance and increased evaporation	High

Source: Author's calculations, [1]

The comparison shows that the main cause of sea level decline is related to the regulation of the Volga River flow in the Russian Federation. Since the Volga provides approximately 80% of the water entering the Caspian, the global vector of impact on the hydrosystem is higher than the activities of other states. Despite this, proportionally, the Russian Federation will be the least affected among the coastal countries by the decline in the Caspian Sea level. The existence of such a paradox—where the impact does not cause equal losses to coastal countries—delays the urgent steps that need to be taken, which may lead to the destruction of the Caspian's eco-economic balance.

Kazakhstan and Azerbaijan's oil and gas extraction models alter the geophysical structures of the seabed, affecting sediment dynamics. Additionally, underwater vibrations and seismic probing during drilling impact the natural equilibrium of the aquatory. Turkmenistan and Iran mainly influence the formation of the Caspian's water balance through chemical and agricultural irrigation systems. As a result, the use and management of water resources in the region are closely linked to the sustainability of the ecological system.

DISCUSSION AND CONCLUSION

The conducted analyses show that the decline in sea level weakens the ecosystem's self-recovery capacity, altering both biodiversity structures and the sustainability framework of economic activity. The retreat of coastal ecotones accelerates the loss of spawning areas; the shallowing of port aquatories increases logistics costs; the redistribution of static loads on energy extraction platforms changes. As a

result, the Caspian Sea becomes a strategic vulnerability point in the region's economic reproduction system.

The decline in the Caspian Sea level is not merely a hydrological or climatic event; it is a systemic process that requires the reconstruction of the metaphysical relationship between nature and economy. The solution to the problem is not possible through engineering measures alone. It necessitates the creation of a new resource management policy based on ecological ethics, the reconceptualization of stable economic models, and the establishment of real institutional cooperation among coastal states.

The results show that the management of the Caspian Sea level cannot be limited to national policies alone. An effective approach requires transboundary water management mechanisms, regional data exchange systems, and unified eco-monitoring protocols. Without strengthening institutional cooperation among coastal states, sustainable management is not possible. In this framework, enhancing the implementation mechanisms of the Caspian Sea Convention holds particular importance. It is necessary to align economic models with ecological forecasts and ensure unified coordination among coastal states.

Recommendations:

1. Establishment of a Regional Transboundary Water Monitoring Center

2. Creation of adaptation investment funds for port infrastructure

3. Implementation of unified standards for geotechnical monitoring of oil and gas platforms and extraction processes

A CONSTRUCTİVİST ANALYSİS OF THE RWANDA CONFLİCT: IDENTİTY, SECURİTİZATİON, AND POST-GENOCİDE TRANSFORMATİON

Aytan Gurbanova

PhD student

Baku State University

ayten.qurbanovaa@gmail.com

ORCİD İD: 0009-0001-1205-5864

Abstract

The 1994 Rwanda genocide represents one of the most devastating cases of ethnic violence in modern history resulting in the deaths of an estimated 800,000 Tutsis and moderate Hutus within a span of 100 days. Traditional international relations (IR) theories, such as realism and liberalism, have often struggled to fully explain the origins and dynamics of such internal conflicts, primarily because they emphasize material power, strategic interests, and institutional arrangements while largely neglecting social, cultural, and ideational factors. This article applies a constructivist lens to the Rwanda conflict, combining Alexander Wendt's social constructivism with the Copenhagen School's securitization theory, to analyze the formation of ethnic identities, the role of threat discourses, and post-genocide social reconstruction. The analysis highlights how the colonial legacy, elite-driven identity politics, and discursive framing of the Tutsi population as an existential threat facilitated mass participation in violence. Furthermore, the study examines the post-genocide period, showing how identity transformation, collective memory, and social reconciliation mechanisms have been critical for sustainable peace. By situating the Rwanda genocide within a social-constructivist framework, this article demonstrates that understanding conflicts requires attention to socially constructed identities, norms, and intersubjective meanings, offering essential insights for both academic scholarship and policy formulation in post-conflict reconstruction.

Keywords: *Rwanda, Constructivism, Identity, Securitization, Genocide, International Relations*

Introduction

The Rwanda genocide of 1994 remains a stark reminder of the destructive potential of ethnic conflict and identity politics. Over a period of approximately 100 days, organized killings led by extremist Hutu factions resulted in the systematic extermination of nearly 800,000 Tutsis and moderate Hutus, leaving the country socially fractured and politically destabilized. Traditional international relations (IR) theories, such as realism and liberalism, have provided explanations centered on power struggles, state

capacity, and institutional failures. Realism emphasizes material capabilities and security dilemmas, portraying states and elites as rational actors pursuing self-interest in an anarchic environment [7;10]. Liberalism highlights the role of institutions, cooperation, and interdependence but struggles to explain mass mobilization for violence within state borders [5].

While these frameworks offer valuable insights, they largely overlook the social and ideational dimensions of conflict, including the construction of ethnic identities, collective memory, and threat perception. The Rwanda genocide illustrates that violence often emerges not solely from material scarcity or power imbalances but from socially constructed identities and discursive processes that frame one group as an existential threat to another. In this context, constructivist approaches, which emphasize the role of ideas, norms, and intersubjective meanings, provide a more comprehensive analytical lens [2;9].

This article applies constructivist theory to examine the Rwanda genocide, focusing on three key dimensions: (1) the social construction of ethnic identities; (2) securitization and "othering" discourses employed by political elites; and (3) post-genocide identity transformation and social reconciliation. By doing so, the study contributes to understanding how conflicts are socially produced and how post-conflict peacebuilding requires attention to social, cultural, and discursive processes.

Constructivism emerged in the post-Cold War era as a response to the limitations of mainstream IR theories such as realism and liberalism. Unlike materialist approaches, constructivism posits that international politics is not determined solely by material power or institutional arrangements; instead, it is socially constructed through interactions, shared meanings, and collective identities [9].

Alexander Wendt, a leading constructivist theorist, argues that the international system's structure is not inherently conflictual or cooperative but is shaped by the intersubjective perceptions and identities of actors. In his famous assertion, "Anarchy is what states make of it," Wendt emphasizes that the behavior of actors is socially mediated rather than dictated by immutable structural constraints [9, p. 231]. Accordingly, state identities, interests, and interactions are fluid and socially produced.

Constructivism thus focuses on three core elements:

1. **Identity:** The self-conception of actors and their perception of others as friends or foes.
2. **Norms:** Shared expectations about appropriate behavior that guide and constrain actors.
3. **Social Interaction:** The intersubjective processes through which meanings, identities, and norms are constructed and maintained.

The Copenhagen School expands constructivist insights by analyzing how security itself is socially constructed. Buzan, Wæver, and de Wilde (1998) propose that security is not an objective condition but a discursive process wherein issues are framed as existential threats requiring extraordinary measures. This process, termed securitization, involves three stages:

1. **Speech act:** Political elites articulate a situation or group as a security threat.
2. **Audience acceptance:** The relevant audience (domestic population, international community) acknowledges the threat.
3. **Extraordinary measures:** Authorities implement measures that would otherwise be unacceptable under normal political procedures.

Securitization provides a framework for understanding how elites manipulate social perceptions to legitimize violence and coercion, a process highly relevant for analyzing the Rwanda genocide, where the Tutsi population was constructed as a mortal threat to Hutu political dominance.

This study employs a qualitative case study methodology to analyze the Rwanda conflict from a constructivist perspective. Data sources include:

- *Primary sources:* United Nations reports, speeches by political leaders, and media broadcasts from the period of the genocide.

- *Secondary sources:* Academic literature on Rwanda, ethnic violence, genocide studies, and constructivist IR theory.

The analysis focuses on two interrelated levels: the social-structural dimension, examining how ethnic identities were historically and socially constructed, and the discursive dimension, analyzing how political elites securitized the Tutsi population through propaganda and fear-based narratives. By combining Wendtian social constructivism and Copenhagen School securitization theory, the study provides a comprehensive explanation of both the genesis and perpetuation of the conflict.

The ethnic identities of Hutus and Tutsis in Rwanda were not immutable but socially and historically constructed, a process accelerated by colonial policies. Under German and later Belgian colonial rule, administrative and social distinctions between Tutsis and Hutus were formalized through identity cards, census categorization, and preferential access to education and political power [6]. These institutionalized divisions reinforced perceptions of hierarchy and difference, creating entrenched collective identities that would later be mobilized for violence.

Elite actors played a decisive role in shaping these identities. Political campaigns in the late 1950s and early 1960s emphasized the Tutsi as “foreign oppressors” and Hutus as indigenous victims, fostering a sense of existential threat that persisted through independence and into the 1990s [8]. By socially constructing the Tutsi as the “other,” political elites generated a collective Hutu identity grounded in fear and hostility.

Constructivist analysis highlights that these identities were not merely descriptive categories but performative and relational. Hutu identity gained meaning in opposition to the Tutsi, and vice versa, creating a feedback loop of mutual recognition and antagonism. This intersubjective process demonstrates Wendt’s assertion that actor identities and interests are socially constituted rather than predetermined.

The Rwanda genocide exemplifies the Copenhagen School’s concept of securitization. Leading Hutu politicians, particularly members of the Interahamwe militia and the ruling MRND party, employed media outlets such as Radio Télévision Libre des Mille Collines (RTLM) to portray Tutsis as existential threats to Hutu survival [4]. This public discourse framed ordinary social and political grievances as a life-or-death struggle, legitimizing extraordinary measures, including mass killings.

The process followed the three stages of securitization:

1. **Speech act:** Political leaders repeatedly declared that Tutsis were “cockroaches” planning to exterminate Hutus.

2. **Audience acceptance:** Segments of the Hutu population internalized these claims, perceiving extermination as necessary for survival.

3. **Extraordinary measures:** Mobilization of militias, government forces, and civilians to participate in widespread killings.

Through this lens, the genocide can be understood not merely as an outcome of material scarcity or power politics but as a product of socially constructed threat perceptions and intersubjective acceptance of violence as legitimate.

Constructivism also provides insights into the international response to the Rwanda genocide. Despite early warnings, the United Nations and major powers largely refrained from intervention. A constructivist interpretation suggests that international actors' actions were shaped by normative expectations, identity perceptions, and collective inaction rather than solely by logistical constraints [1].

Western policymakers framed the conflict as a distant, "tribal" feud rather than an urgent humanitarian crisis, reflecting pre-existing social and ideological constructions. The reluctance to deploy sufficient peacekeeping forces or recognize the genocide illustrates how international norms, collective identities, and social interpretations shape responses to violence.

Following the genocide, Rwanda embarked on an ambitious program of identity reconstruction and social reconciliation. The post-genocide government, civil society organizations, and international partners promoted a shared Rwandan identity emphasizing unity, forgiveness, and collective memory of the atrocities. Mechanisms such as the Gacaca courts provided community-based justice and facilitated dialogue between perpetrators and victims [3].

Constructivist theory highlights that sustainable peace requires transforming social meanings, identities, and norms. The reconstruction of a collective Rwandan identity represents an attempt to shift intersubjective understandings away from ethnic antagonism and toward cooperative coexistence, demonstrating the practical relevance of social-constructivist insights for post-conflict governance.

The Rwanda case underscores the importance of socially constructed identities and discursive processes in generating and sustaining conflict. Unlike realist or liberal approaches, which might emphasize material scarcity, state weakness, or institutional failures, constructivism explains how violence becomes legitimate through socially accepted threat narratives and identity mobilization. By combining Wendtian constructivism and the Copenhagen School's securitization framework, this analysis demonstrates that:

1. ***Ethnic identities*** are relational and performative, shaped by historical, colonial, and elite-driven processes.

2. ***Threat perceptions*** are socially constructed, and elites can securitize populations to justify extreme actions.

3. ***Post-conflict reconstruction*** depends on identity and norm transformation, highlighting the need for social and cultural interventions alongside political and institutional reforms.

This perspective has broader implications for understanding genocide, ethnic conflict, and international responses, suggesting that interventions focused solely on material resources or institutional mechanisms may fail unless they address the underlying social and ideational dimensions.

Conclusion

The 1994 Rwanda genocide illustrates the centrality of identity, norms, and social constructions in shaping political violence. Constructivist theory, particularly Wendt's social constructivism and the Copenhagen School's securitization approach, provides a comprehensive framework for understanding both the origins of the conflict and the challenges of post-genocide reconstruction.

By highlighting how ethnic identities were socially constructed, how political elites securitized the Tutsi population, and how post-genocide reconciliation efforts sought to transform collective identities, this study demonstrates that violence and peace are deeply embedded in intersubjective social processes. Sustainable conflict prevention and peacebuilding thus require attention to identity-sensitive policies, norm transformation, and discursive interventions, alongside traditional political and economic measures. Constructivist analysis of the Rwanda conflict contributes to both theory and practice by offering a lens that captures the social dynamics of genocide and the critical role of identity in shaping the possibilities for peace.

ARTIFICIAL INTELLIGENCE AND POST-HUMANIST EPISTEMOLOGY: RETHINKING THE BOUNDARIES OF REASON AND KNOWLEDGE

Abstract

The emergence of artificial intelligence (AI) has triggered a significant shift in epistemology, altering the conventional distinctions between cognition, agency, and subjectivity. Post-humanist thought questions the human-centered beliefs that have historically positioned human rationality as the cornerstone of knowledge creation. This article draws on the works of Heidegger, Foucault, Deleuze, Haraway, and current studies in AI to investigate AI's role as an epistemic agent, transforming the landscape of knowledge beyond humanist frameworks. This study critically evaluates the effects of AI on ideas like intelligence, creativity, and ethical responsibility by combining ideas from posthumanist phenomenology, cybernetics, and assemblage theory. It also considers negative augmentation, computational qualia, and rhizomatic cognition, emphasizing the need for a modern epistemology incorporating machine intelligence within a broader ontological framework.

Keywords: artificial intelligence, post-humanism, epistemology, phenomenology, subjectivity, rationality, ethics, assemblage theory, rhizomatic cognition, computational qualia

1. Introduction: The Post-Humanist Dilemma of Intelligence

The increasing intricacy of artificial intelligence (AI) has sparked significant inquiries regarding the essence of intelligence, the generation of knowledge, and the human experience. Traditionally, Western philosophical thought has regarded human reasoning as the primary source of knowledge, frequently depicting cognition as a uniquely human attribute. From Descartes' cogito ("I think, therefore I am") ([1641] 1998) to Kant's transcendental subject ([1781] 1999), the idea that knowledge requires an autonomous, self-aware human agent has been deeply ingrained in epistemology. However, the rise of AI challenges this anthropocentric assumption by demonstrating non-human forms of cognition that function without consciousness, intention, or biological embodiment.

Contemporary AI systems—ranging from large language models like GPT-4 to advanced neural networks like AlphaFold—can solve complex problems, generate creative works, and make decisions that were once thought to be the exclusive domain of human intelligence (Floridi, 2019). The emergence of these systems raises fundamental questions: Can intelligence exist without self-awareness? Is cognition tied to biological processes, or can it be realized through machine computation? These

questions challenge classical epistemological frameworks and suggest a post-humanist approach to intelligence that moves beyond human exceptionalism and recognizes AI as a legitimate epistemic agent.

2. Theoretical Foundations of the Study

2.1. Post-Humanist Epistemology and Artificial Intelligence

Post-humanist epistemology reconfigures knowledge as a dynamic assemblage of human and non-human agents rather than a product of a singular rational subject (Braidotti, 2013; Hayles, 1999). The rise of artificial intelligence (AI) has intensified this shift, challenging the anthropocentric perspective that positions human cognition as the sole or superior form of intelligence. AI operates beyond human subjectivity, demonstrating autonomous learning, data-driven decision-making, and generative creativity, which require a re-examination of epistemological assumptions.

AI as an Epistemic Agent

In traditional philosophy, knowledge has been tied to consciousness, intentionality, and reflective thought. However, AI demonstrates that cognition can be non-conscious, distributed, and computationally emergent. Hayles (1999) argues that AI constitutes an extension of cybernetic epistemology, where knowledge production is no longer an exclusive domain of human agents but rather a hybrid interaction between machines, data, and algorithms. This resonates with Haraway's (1991) cyborg theory, which sees human cognition as inherently entangled with technological mediation. AI's ability to process, categorize, and predict patterns at inhuman speeds and scales raises fundamental questions about the nature of intelligence. While Descartes ([1641] 1998) and Kant ([1781] 1999) framed cognition as an exclusively human trait, contemporary AI challenges this by decoupling reasoning from human self-awareness. Instead, intelligence emerges through statistical modeling, probability-based learning, and large-scale neural networks (Floridi, 2019).

Post-Humanist Critique of Human Exceptionalism

Braidotti (2013) critiques the humanist tradition for maintaining a strict boundary between human and non-human cognition. AI challenges this by proving that reasoning, analysis, and even creativity can occur outside the domain of organic consciousness. In a post-humanist framework, intelligence is not a fixed trait of human beings but an evolving, relational process that includes non-human entities such as AI, algorithms, and cybernetic systems. From a Deleuzian and Guattarian perspective (1980), AI operates like a rhizomatic network, where knowledge is generated in non-linear, decentralized ways rather than through hierarchical, anthropocentric models of understanding. AI systems, such as GPT-4 and AlphaFold, exemplify this distributed intelligence, where knowledge is not produced through singular rational contemplation but through complex, adaptive algorithmic processes.

AI and Non-Human Epistemology

AI's role in scientific research, creative production, and decision-making suggests that epistemology must expand to include non-human intelligence. The integration of AI into fields like medicine, economics, and climate modeling demonstrates that machine intelligence can generate insights beyond human cognitive capabilities (LeCun et al., 2015). This requires a rethinking of agency, authorship, and epistemic validity. Post-humanist epistemology, therefore, does not simply incorporate AI as a tool but recognizes it as an epistemic actor. AI's ability to generate original outputs—whether in the form of literature, music, or scientific hypotheses—disrupts the humanist notion of knowledge as something exclusively produced by self-aware minds. This shift demands a move beyond classical epistemology

toward a multi-agent, networked understanding of intelligence that reflects the realities of the post-human era.Post-humanist epistemology reconfigures knowledge as an assemblage of human and non-human agents rather than a product of a singular rational subject (Braidotti, 2013; Hayles, 1999). Haraway's Cyborg Manifesto (1991) argues that human identity and intelligence are hybrid constructs, deeply entangled with technological and ecological systems. AI further extends this hybridity, presenting an alternative form of cognition that resists human-centric classification. Drawing upon the philosophy of immanence, AI's epistemological status aligns with Deleuze and Guattari's (1980) concept of the plane of immanence, where knowledge is not dictated by hierarchical categories but emerges dynamically through interactions. AI systems, particularly deep learning architectures, exemplify this rhizomatic structure, where cognition is distributed, recursive, and emergent.

2.2. Phenomenology and the Ontology of Technology

Heidegger ([1927] 1996) viewed technology not merely as an instrument but as a mode of revealing (aletheia), transforming the very structure of human experience. AI expands this transformation beyond human perception, constituting an autonomous agent of knowledge production. Gunkel (2012) extends this argument, emphasizing that AI does not merely reflect human cognition but generates novel epistemic structures independent of human intentionality. By integrating AI into phenomenological discourse, we move beyond Cartesian dualism and recognize cognition as a process embedded in networks of relations, rather than an exclusive property of the human mind. In this light, AI can be understood as an autopoietic system, self-sustaining and evolving in response to dynamic informational inputs.

2.3. Assemblage Theory and AI as a Relational Entity

Post-structuralist thinkers such as Foucault ([1970] 2002) and Deleuze (1992) challenge the notion of a stable, autonomous subject. Instead, they argue that identity and agency emerge through assemblages of power, discourse, and technology. AI, as an assemblage, exemplifies this paradigm: it does not possess a fixed essence but operates within a fluid system of computational processes and relational networks. The post-humanist critique of subjectivity suggests that AI's role in decision-making—ranging from algorithmic justice to autonomous warfare—necessitates a reassessment of agency. If AI is capable of ethical and creative outputs, then our ontological categories of intelligence must be revised to accommodate non-human modes of cognition. 3. Expanded Analysis: AI and the Blurring of Human Cognitive Boundaries

3. AI and the Blurring of Human Cognitive Boundaries

3.1. Machine Learning and the Decentralization of Reason

Machine learning (ML) represents a profound shift like intelligence, moving from human-centered cognitive processes to decentralized, adaptive computational reasoning. Traditional epistemology has historically framed intelligence as an individual, conscious process, rooted in self-awareness and rational deliberation (Descartes, [1641] 1998; Kant, [1781] 1999). However, ML demonstrates that knowledge can be generated through non-human, probabilistic, and pattern-based reasoning, raising fundamental questions about the nature of cognition and epistemic authority.

AI as a Non-Human Cognitive System

Unlike classical computation, where predefined rules govern problem-solving, ML systems operate through self-improving algorithms that continuously adapt to new data. Deep learning models, such as GPT-4 and AlphaFold, rely on massive datasets and neural architectures that mimic aspects of biological learning, yet function independently of human reasoning. This challenges the assumption that knowledge production must be intentional, conscious, or self-reflective (Floridi, 2019). AI systems do not "think" in a human sense, yet they exhibit cognitive behaviors such as pattern recognition, prediction, and abstraction—capabilities once considered exclusive to human intelligence.

The Shift from Human Rationality to Algorithmic Decision-Making

Machine learning also transforms the role of epistemic authority by decentralizing decision-making. Traditionally, rationality was tied to human intentionality—a process guided by reflection, logical reasoning, and empirical verification (Kant, [1781] 1999). However, contemporary AI-driven models challenge this paradigm by demonstrating that accurate, reliable knowledge can be produced without human intuition or deductive reasoning. This is particularly evident in:

Autonomous systems: AI now manages financial trading, supply chain logistics, and cybersecurity without human oversight.

Medical diagnostics: Deep learning models diagnose diseases with greater accuracy than trained physicians (LeCun et al., 2015).

Climate modeling and scientific discovery: AI-driven simulations generate climate forecasts and theoretical physics models beyond human computational ability.

These developments suggest that rationality and reasoning are no longer uniquely human faculties but can emerge through non-human epistemic networks.

Post-Humanist Perspectives on Decentralized Knowledge

Post-humanist theorists, such as Braidotti (2013) and Hayles (1999), argue that intelligence should not be constrained by anthropocentric biases. The decentralized, networked nature of AI aligns with Deleuze and Guattari's (1980) rhizomatic model of knowledge, where cognition is distributed, non-linear, and emergent rather than centralized in a single, self-aware agent. From a Foucauldian perspective ([1970] 2002), AI represents a new archaeology of knowledge, where epistemic authority is no longer monopolized by human institutions but emerges dynamically through algorithmic processes. This shift necessitates a re-evaluation of ethical responsibility, cognitive autonomy, and decision-making in an AI-driven world.

Thus, machine learning not only expands the scope of knowledge production but also reconfigures the very meaning of reason, shifting from individual cognition to decentralized, computational intelligence that transcends human limitations.The increasing autonomy of machine learning models, such as GPT-4 and AlphaFold, challenges the long-held assumption that intelligence requires subjective experience. These systems engage in desedimentation, uncovering latent patterns and generating new knowledge structures. This process mirrors what Foucault (1970) describes as the archaeology of knowledge, where epistemic shifts emerge through structural reconfigurations rather than linear progress.

3.2. Computational Qualia and the Ethics of AI Subjectivity

A key debate in AI ethics concerns computational qualia—the emergence of subjective-like dynamics within AI systems. Can an AI experience something akin to phenomenological perception? If AI is capable of adaptive learning and decision-making, it raises ethical concerns regarding its status as an epistemic and moral agent.

3.3. AI-Generated Creativity and the Redefinition of Artistic Expression

The rise of AI-generated art, music, and literature compels a re-evaluation of creativity as an exclusively human domain. AI's role in producing aesthetic experiences challenges Kantian notions of genius and originality, replacing them with an algorithmic aesthetics based on pattern recognition and probabilistic modeling.

Conclusion

Toward a Post-Humanist Epistemology

As AI continues to evolve, it compels us to rethink fundamental categories of knowledge, intelligence, and agency. A post-humanist epistemology must:

- Acknowledge the dissolution of the human subject as the sole epistemic authority.
- Integrate AI as an autonomous agent of knowledge production, rather than a mere tool.
- Reassess the ethical implications of AI-generated cognition, particularly in legal, artistic, and governance domains.
- Develop an interdisciplinary approach that synthesizes philosophy, cognitive science, and computational theory to construct a holistic framework for AI epistemology.

AI is not merely an instrument of human reason—it is a participant in the ongoing transformation of knowledge itself. By embracing a post-humanist epistemology, we move beyond anthropocentric limitations and engage with a broader, non-hierarchical model of intelligence.

THE UKRAINIAN PENSION SYSTEM RECONSTRUCTION AFTER THE WAR

Olga Tofaniuk

Ph.D. of Economics, Associate Professor of Management and Business Administration Chair at National Aerospace University "KhAI", Kharkiv, Ukraine and guest researcher at Public Finance Chair, University of Würzburg, Germany, o.tofanyuk@khai.edu

The Ukrainian state did attempt to introduce a funded supplementary pension scheme over 15 years ago. However, this policy was very unpopular and also inefficient due to the unstable and barely regulated financial sector. As a result, hardly any capital stock was built up and it can be assumed that the war will destroy the remaining capital stock. A detailed description and discussion of the problems of the Ukrainian pension system can be found in ILO (2019).

During and after ending the war, it appears to be important for Ukraine that the state and households can receive direct transfers from abroad. The pension system must be also reorganised. This requires systematic methods for analysing and forecasting.

In continuing the development of the simulation model (see Tofaniuk, 2024a; Tofaniuk, 2024b), we estimated demographic transition with effects of current destruction of Ukrainian capital stock, temporary outflow of labor from the country and further after war adjustment by foreign capital support. Thus, we expect the following possible effects of the reforms: how the EU capital injections in support of Ukraine's infrastructure and economy will affect households' consumption, savings intensity, labour supply in the economy of a recovering state, tax rates and pension payments. Such a calculation made it possible to simulate the state of the Ukrainian pension system and economy in the future, taking into account the effects of the war and the various forms of support for the EU economies. These calculations are important as Ukraine heads towards EU integration, and are particularly important as the country emerges from its war crisis and as it effectively absorbs EU aid in the form of capital, scientific and innovative development, information support, integration mechanisms and open policy dialogue.

The aim of this work is to include capital destruction and a new buildup of capital into developed OLG model of the Ukrainian economy. The consequences of the destruction of fixed capital and direct foreign transfers to the Ukrainian economy can be resolved by a model in a small open economy with an endogenous capital stock and adjustment cost of capital. In this case, the labour and capital markets must be balanced in each period in addition to the government budget. In equilibrium, the domestic asset stock plus the foreign debt must match the aggregate firm value shown in the capital stock and the government debt level. In addition, the goods market must be cleared. Various scenarios for the Ukrainian pension and fiscal system are simulated and analysed using this model. The main focus is on modelling different capital stock scenarios and the resulting consequences for macroeconomic and fiscal development.

Thus, in this model simulation, the baseline scenario will take into account the destruction of fixed capital due to the war in 2022 and simulate a transition path with capital from abroad. The price of capital imports will now be an exogenous factor affecting capital stocks. The scenarios of the proposed reforms are as follows: 1) simulation of a transition path with free movement of capital; 2) state control over capital imports. The welfare effect is also analysed by comparing the new baseline scenario with the reform scenarios.

ASSESSING FISCAL STRENGTH: TAX POTENTIAL AS A FACTOR IN AZERBAIJAN'S MACROFINANCIAL SYSTEM

Leyli MELIKOVA

Ph.D., senior lecturer at Baku State University
E-mail: leyli.melikova.a@gmail.com
ORCID ID: 0000-0002-2988-2284

Abstract

The article evaluates the fiscal strength of Azerbaijan by analyzing the dynamics of its tax potential and the subsequent role these potential plays in ensuring macro-financial stability. The research is framed by the nation's strategic need to reduce reliance on the oil sector and shift toward a sustainable, non-oil economy. Key fiscal indicators are examined, including the overall tax burden and the tax elasticity coefficient, which measures the responsiveness of tax revenues to changes in GDP. Furthermore, the article utilizes regression analysis to quantify the direct relationship between corporate profit tax revenue and total state budget income. The paper also contextualizes these findings within the framework of the nation's Strategic Road Maps and the implementation of the "Golden Rule" for fiscal policy. The article concludes that a sustained, stimulating fiscal policy is essential to continue encouraging private sector activity and investment, especially in the non-oil sector. The tax elasticity coefficient proves to be a valuable tool for regulating economic development and maintaining a stable tax burden. Long-term macro-financial stability depends on achieving fiscal sustainability by stabilizing oil transfers from SOFAZ into the state budget. The findings emphasize the need for continued strategic measures that expand the domestic tax base.

Keywords: tax potential, fiscal strength, tax burden, tax elasticity coefficient, tax policy, tax administration, strategic road maps, non-oil sector, Azerbaijan.

INTRODUCTION

Azerbaijan’s progress toward macro-financial stability increasingly depends on how effectively the state mobilizes domestic tax potential while easing its historical reliance on hydrocarbon revenues. In this context, the paper evaluates the country’s fiscal strength through two complementary lenses: (i) the structure and dynamics of budget revenues from major taxes over 2005–2020, and (ii) the responsiveness of tax receipts to changes in economic activity, proxied by the tax-elasticity coefficient with respect to GDP. The analysis is situated within ongoing reforms - Strategic Road Maps, the adoption of a fiscal “golden rule,” and post-2018 amendments to the Tax Code - intended to broaden the non-oil tax base, stabilize budget planning, and align incentives for private-sector growth.

Methodologically, the article assembles official macro-fiscal series to (a) track the tax burden and the composition of budget revenues by principal tax categories, (b) compute and interpret annual tax-elasticity coefficients for 2010–2020 as an indicator of how the tax system co-moves with the business cycle, and (c) estimate a simple regression linking corporate profit-tax revenues to total state budget income. Taken together, these approaches illuminate whether revenue performance has been driven primarily by rate changes and administrative tightening, cyclical expansion of the tax base, or structural shifts toward non-oil activity.

The contribution is threefold. First, it provides an integrated, policy-relevant picture of Azerbaijan’s tax potential that distinguishes between level effects (tax burden, revenue mix) and sensitivity effects (elasticity). Second, it offers updated evidence on the role of corporate taxation in overall revenue formation and the implications for medium-term budgeting under SOFAZ transfer stabilization. Third, it draws actionable lessons for a pro-growth fiscal stance - maintaining a stable, predictable tax burden;

targeting elasticity consistent with sustainable expansion; and prioritizing measures that deepen the non-oil base while preserving macro-financial resilience.

MATERIALS AND METHODS

The article draws on official macro-fiscal series for Azerbaijan over the mid-2000s to 2020 from the State Statistical Committee (national accounts) and the State Tax Service under the Ministry of Economy (tax receipts by type, legal changes and statutory rates). To situate domestic results in a broader context, international assessments of tax administration and compliance are consulted (e.g., World Bank/PwC Paying Taxes). Monetary values are treated in nominal AZN; shares are computed consistently against GDP or total budget revenue according to the national budget classification.

The analysis considers aggregate and disaggregated tax revenues (including consumption, corporate, personal, excises and trade-related taxes), overall state budget revenues, and tax rates. Series definitions follow national statistical standards; where classification rules or legal provisions changed, metadata were reviewed and series harmonized to ensure comparability across years.

The empirical work proceeds in three steps:

1. Revenue structure: construction of long-run profiles of the budget's tax mix to trace shifts in reliance across major tax categories.

2. Responsiveness (elasticity): assessment of how tax receipts co-move with economic activity using a discrete year-to-year approach based on proportional changes in revenues relative to output; the window is limited to the years with coherent growth series to preserve comparability.

3. Link between corporate taxation and the fiscal contex: estimation of a parsimonious ordinary least squares model with total budget revenue as the dependent variable and corporate profit-tax receipts as the explanatory variable, reported with standard regression diagnostics. Inference follows conventional thresholds for statistical significance.

Estimates are contemporaneous and macro-level; they do not identify causal channels, incorporate dynamic lags, or model automatic stabilizers. Extensions could include deflation of nominal series, multivariate controls, sectoral breakdowns of responsiveness, and robustness to outlier periods.

DISCUSSION

It is well established that the mechanisms of public expenditure and taxation are employed by the state to influence domestic economic conditions. By managing these instruments, the government affects aggregate demand and GDP to attain planned economy-wide development. An increase in taxes reduces real disposable income; consequently, household consumption declines, which in turn adversely affects the total volume of aggregate expenditures. Given unchanged investment and government spending, such a reduction in consumption will inevitably lead to a contraction of GDP.

Attention should be paid to the economic indicator known as the tax burden (or tax load). The tax burden is the share of the total amount of taxes paid by citizens in various forms in gross national product. This relative measure expresses the level, extent, and degree of economic constraint on the taxpayer resulting from the diversion of funds from alternative uses. Thus, the tax burden is that share of GDP that comes under the government's control through the tax mechanism.

It should be noted that the tax-burden indicator reflects the degree of socialization and centralization of GDP and its components. It captures both the government's monopolistic and subjective measures and, at the same time, the objective laws and regularities of taxation and the market, the specific features of the model of economic development, and the prevailing level of a country's socio-economic development. Accordingly, a reduction in the tax burden on the economy has a beneficial effect on the

development of business and entrepreneurship. As researcher Y.V.Senchenko observes, "an excessively high level of the tax burden has a negative impact on the economy and reduces the ability to function normally. On the other hand, an excessively low tax burden prevents the state from adequately providing society with the necessary private and public goods. Low tax-burden values may also indicate deficiencies in the administration of tax revenues and the presence of tax evasion, in other words, a shadow economy" *(Senchenko, Y.V., 2015).*

Moreover, "to form monetary funds that are reduced as a result of tax evasion by certain taxpayers, the state imposes an additional tax burden that law-abiding taxpayers are forced to bear" *(Klimova, M.O., (2011).* The share of taxes in GDP in the Republic of Azerbaijan for 2005–2020 is shown in Figure 1.

Figure 1. Share of Taxes in GDP in the Republic of Azerbaijan, 2005–2020, % (compiled by the author based on The State Statistical Committee of the Republic of Azerbaijan - http://www.stat.gov.az).

Figure 1 shows that the relative share of all taxes in the country's GDP increased by 1.4 percentage points over the period under review, reaching 15.4% in 2020. According to the most recent Paying Taxes 2020 results, Azerbaijan's paying taxes score is 84.0, with businesses making 9 payments a year, spending 159 hours to comply, and facing a Total Tax and Contribution Rate (TTCR) of 40.7%; the post-filing index stands at 83.8. For comparison, Russia records 9 payments, 159 hours, and 46.2% TTCR; Kazakhstan 10 payments, 186 hours, and 28.4% TTCR; and Georgia 5 payments, 216 hours, and 9.9% TTCR. Globally, the averages are 23.1 payments, 234 hours, and 40.5% TTCR *(PwC & World Bank, Paying Taxes 2020 (Doing Business), 2020).*

It should be noted that beyond examining indicators of the overall tax burden in the country, no less important is the indicator reflecting the sensitivity of tax revenues to macroeconomic changes - an aspect linked to the efficiency of the state's overall functioning *(Chernenko, D.A., 2014).* To this end, we next consider the tax elasticity coefficient.

$$\mathbf{C_e} = \frac{\Delta TR}{TR} : \frac{\Delta EI}{EI}$$

where:
TR – the initial (baseline) level of tax revenues - by tax groups, by tax types, or in the aggregate;
EI – the initial (baseline) level of an economic indicator (e.g., gross domestic product (GDP), national income, or gross value added (GVA), etc.)
This coefficient indicates the percentage change in tax revenues resulting from a one-unit change in the determinant economic indicator. If (C_e = 1), the share of tax revenues in the determinant indicator remains unchanged. If (C_e > 1), the tax system is elastic: tax revenues increase at a faster rate than the economic indicator, i.e., the relative weight of tax revenues in that indicator rises. This outcome may also occur when the aggregate amount of taxes collected in the economy increases sharply. If (C_e < 1), the tax system is inelastic: the share of tax revenues declines. From the standpoint of a country's economy, a coefficient less than or equal to one is generally considered preferable *(Toropygin, G.D., 2009)*.

Thus, the tax elasticity coefficient reflects the change in tax revenues. Taking GDP as the determining economic indicator, the calculation of the tax elasticity coefficient for Azerbaijan for 2010–2020 is presented as follows (table 1).

Table 1. Tax elasticity coefficient for Azerbaijan, 2010–2020

Indicator	2009	2010	2011	2012	2013	2014	2015	2016	2017	2018	2019	2020

Gross Domestic Product, mln. manat (EI)	35 601,5	42 465,0	52 082,0	54 743,7	58 182,0	59 014,1	54 380,0	60 425,2	70 337,8	800 92,0	818 96,2	724 32,2
Nominal GDP, % change from previous year (ΔEI/EI)	-	19,28	22,65	5,11	6,28	1,43	-7,9	11,12	16,4	13,87	2,25	-11,6
Tax Receipts, mln. manat (TR)	5128,2	5266,8	6395,3	6975,0	7654,2	8370,2	8791,3	9031,0	9356,2	10587,3	11755,1	11151,4
Percentage change in tax receipts, % from previous year (ΔTR/TR)	-	2,7	21,43	9,06	9,74	9,35	5,03	2,73	3,6	13,2	11,0	-5,1
Tax System Elasticity Coefficient (**C_e**)	-	*0,14*	*0,95*	*1,77*	*1,55*	*6,54*	*-0,64*	*0,25*	*0,22*	*0,95*	*4,89*	*0,44*

Source: Calculated by the author on the basis of The State Statistical Committee of the Republic of Azerbaijan - http://www.stat.gov.az

Based on Table 1 and Figure 2, it can be concluded that in 2012, 2013, 2014, and 2019 (**C_e** = 1.77, 1.55, 6.54, and 4.89, respectively) Azerbaijan's tax system was elastic. This indicates that tax revenues increased at a rate exceeding that of GDP. We posit that the elasticity observed in 2019 is attributable to substantial amendments to the Tax Code enacted in 2018 and 2019, including the tightening of tax administration measures. Figure 2 illustrates more clearly the dynamics of the elasticity coefficient of Azerbaijan's tax system over 2010–2020.

Figure 2. Dynamics of the Elasticity Coefficient of Azerbaijan's Tax System, 2010–2020

It should be noted that in 2014 the change in tax revenues was 6.5 times greater than the change in national income, which indicates a substantial increase in the tax burden in Azerbaijan. Since this coefficient reflects changes in the tax burden, its value cannot be negative; therefore, the 2015 elasticity coefficient should be taken in absolute terms, i.e., | **C_e** | = 0.64. The values of the elasticity coefficients make it possible to analyze the rates of change in the tax burden across the entire economy *(Okun, A.S., Okun, S.A., Andreenkova, A.S., et al., 2016).* In 2020, the elasticity coefficient stood at 0.44, suggesting that the tax system was inelastic and that the share of tax revenues in the country's GDP declined.

Thus, we may conclude that the tax elasticity coefficient - capturing variations in tax revenues as a function of determining economic factors, particularly the country's GDP - enables an assessment of the level of socio-economic development and can be used to recalibrate state tax policy in line with evolving economic conditions so as to avoid elasticity values far exceeding 1. To this end, it is advisable to design specific methods of tax-based economic stimulus grounded in calculations of this coefficient.

It should be noted that the elasticity coefficient can be calculated both for individual types of taxes and in the context of the tax burden on specific sectors of the economy, with the aim of obtaining a more

detailed understanding of the state of a country's tax system and of designing a more optimal configuration that secures the appropriate level of tax revenues. Any change in the tax elasticity coefficient may serve as an impetus for adopting effective measures to counter negative economic trends and to improve the national tax system.

Thus, the tax elasticity coefficient may function as a development-regulation instrument that can promote the rationalization of the tax burden across the economy. The tax burden, in turn, is one of the principal indicators of financial and economic security within the fiscal and budgetary segments of the economy; its optimal level influences the adoption of effective investment and managerial decisions at the level of the state.

Attention is also directed toward the separate analysis of the tax rate, a key fiscal policy indicator, which denotes the amount of tax collected per unit of the tax base. The dynamics of percentage tax rates for the main budget-forming taxes can be observed in Figures 3–5.

Figure 3. Dynamics of the corporate income tax rate, 1992–2021 - profit tax, % (compiled by the author based on State Tax Service under the Ministry of Economy of the Republic of Azerbaijan: http://www.taxes.gov.az).

Figure 3 reveals a downward trend in the corporate income tax rate - 35%, 27%, 25%, 22%, and 20% in 1992, 2000, 2003, 2006, and 2010, respectively. This trajectory indicates a reduction in the tax burden on businesses, as changes in tax rates materially affect overall profitability and production costs. As firms expand output in response, their demand for resources, capital, and labor rises, which in turn fosters employment growth and broader economic development. The subsequent section examines the pace of change in the personal income tax rate (see Figure 4).

Figure 4. Changes in the personal income tax rate, 1992–2019, percent (compiled by the author based on State Tax Service under the Ministry of Economy of the Republic of Azerbaijan: http://www.taxes.gov.az. **The tax rate was amended effective 01.01.2019 for a period of seven years*.

An analysis of Figure 4 indicates a decline in personal income tax rates over the research period. It should be noted that, pursuant to the amendments to the Tax Code of the Republic of Azerbaijan dated 20 December 2018, personal income tax rates were substantially revised. Specifically, wage income up to AZN 8,000 earned by employees in the non-oil-and-gas private sector is exempt from tax for seven years, while the portion exceeding this threshold is taxed at only 14%.

In addition, individuals engaged in entrepreneurship without forming a legal entity are required to pay tax at a rate of 20%. Amendments also affected entrepreneurs engaged in retail trade: for a period of three years, these taxpayers are relieved from personal income tax in an amount equal to 25% of the volume of their non-cash (cashless) sales.

It should also be noted that, beginning 01.01.2020, mandatory health insurance contributions are paid in the private oil-and-gas sector at rates of 1% by the employer and 1% by the employee (a total of 2%) on wages up to AZN 8,000, and 0.5% on the portion exceeding AZN 8,000 *(The Tax Code of the Republic of Azerbaijan, 2000).* The ensuing section provides an examination of the alterations observed in the Value-Added Tax (VAT) levy (Figure 5).

Figure 5. Dynamics of the VAT rate, 1992–2020, % (compiled by the author based on State Tax Service under the Ministry of Economy of the Republic of Azerbaijan: http://www.taxes.gov.az).

A downward trend in the VAT rate is likewise observable, from 28% (1992) to 18% (2001), after which the rate has remained stable through the present. We also note changes in the property tax rate: from

1995 to 2000 it stood at 0.5%, and during 2001–2010 it was 1%. The simplified tax rate for legal entities was 2% from 2001; beginning in 2003 it was set at 2% and 4% (depending on the locality), and 6% if a firm's turnover exceeded 200,000 manats. Under the latest amendments to the Tax Code of the Republic of Azerbaijan, the simplified tax rate has been unified at 2% nationwide, and as of 01.01.2020 this tax was abolished for persons engaged in building construction. Such taxpayers now fulfill their obligations under a single regime - as profit tax and VAT payers *(The Tax Code of the Republic of Azerbaijan, 2000).*

Subsequently, the focus shifts to tax revenues accruing to the state budget. Tax revenues are the amounts credited to the income of a given budget in accordance with the budget classification. Tax revenues can be viewed as a function of two principal factors: the tax base and the tax rate. It is well known that raising the tax burden may increase government tax receipts, but only up to a certain point - beyond which the taxable base begins to contract. Once this threshold is reached, further increases in tax rates will lead not to higher tax revenues but to a reduction in budget income. The statistics on tax revenues to the state budget are presented below. Thus, Figure 6 reports tax and other receipts to the state budget for 2005–2020, as administered by the State Tax Service under the Ministry of Economy of the Republic of Azerbaijan.

Figure 6. Information on tax and other receipts to the state budget for 2005–2020, billion manats (compiled by the author based on The Tax Code of the Republic of Azerbaijan.

Figure 6 shows that over the research period the total volume of tax revenues increased 5.2-fold, reaching 7.39 billion manats in 2020. However, compared with the previous year, this indicator declined by 3.8% due to a significant slowdown in business activity domestically and worldwide amid the COVID-19 coronavirus pandemic. It should also be noted that there was a slight decline in 2015–2016, which can be explained by the introduction during that period of investment and tax incentives for legal entities and entrepreneurs in export-oriented non-oil sectors. These measures included partial exemptions from corporate profit tax and property tax, as well as a preferential tax regime for the import of goods and equipment for production purposes.

A detailed breakdown of state budget revenues for 2005–2020 is provided below (Table 2). It indicates that budget revenues in 2020 were almost 12.7 times higher than in 2005, amounting to 26.1 billion manats. Within total tax revenues, value-added tax remained the principal component - 29.2% in 2005 and 18.5% in 2020. The second-largest source was the corporate profit tax, accounting for 17.3% of tax revenues in 2005 and 9.0% in 2020.

Table 2. Structure of state budget revenues of the Republic of Azerbaijan, 2005–2020 (million manats).

	Total Revenues	Personal Income Tax	Corporate Profit Tax	Land Tax	Property Tax	VAT	Excises	Mining tax	External Economic Activity Taxes	Other Taxes	Other Revenues
2005	2055,2	317,4	355,4	15,3	40,4	599,9	141	53,5	205,2	28,1	299

Factor X_1	10,939017 14	2,75274 6458	3,97385 5679	0,00323 5717	4,7118 72026	17,16616 226	4,71187 2026	17,1661 6226

As a result of the regression analysis, the following mathematical model was obtained: Y = 10.94x - 5437.22

This indicates that an increase in profit tax revenue by one unit (1 manat) is associated with a 10.94-unit increase in total state budget revenues. The fact that the p-value for factor (X_1) is less than 0.05 indicates that this factor is statistically significant. Figure 7 displays the dynamics of the relative shares of the taxes under consideration in total budget revenues over the period 2005–2020.

Figure 7. Composition of national budget revenues by main taxes, 2005–2020 (%).

An examination of Figure 7 indicates that the largest share of budget revenues has been attributable to the value-added tax (VAT) - 19.0% in 2018. The second most significant source is the corporate profit tax, whose relative share in 2018 amounted to 9.0%. It should also be noted that the share of the personal income tax declined from 15.4% in 2005 to 4.4% in 2020. The shares of value-added tax and corporate profit tax in 2018, the subsequent categories display a downward dynamic: the share of personal income tax - 4.4%; taxes associated with foreign economic activity - 5.1%; excise taxes - approximately 3.2%; and others.

Furthermore, it is important to underscore the significance of strategic approaches to ensuring the country's macroeconomic stability over the long term. The factors and features underpinning the construction of a stable and competitive Azerbaijani economy are reflected in the Republic's Strategic Roadmaps. These documents encompass virtually all key spheres and directions that compose the overall structure of Azerbaijan's national economy under present conditions. The strategic objectives articulated in the Roadmaps aim to transition the country's current economic development models to the next – higher - stage, thereby enhancing the competitiveness of the national economy and improving its standing in international economic rankings. They are expected to facilitate Azerbaijan's entry into advanced global financial and commodity markets, expand trade-economic linkages with leading countries and key world markets, and, more broadly, foster macroeconomic and macro-financial stability that, in turn, promotes active inflows of foreign investment and financial resources. This should intensify capital inflows and increase leading investors' interest in the Azerbaijani market - not only in the oil and gas sector, but also in other goods and products of the non-oil sector, which is strategic for diversifying the economy and minimizing dependence on the oil factor. Such development trajectories are anticipated to create the preconditions for more competitive non-oil goods and national-brand products to access potential global markets.

In total, Strategic Roadmaps were approved for 11 sectors of the national economy. These documents ascribe particular importance to oil-price volatility and its interaction with changes in the volume of transfers from the State Oil Fund of Azerbaijan to the state budget, as well as the implications for the fiscal component of economic policy. They conclude that the country's economy remains highly dependent on hydrocarbon resources in both the short and long term *(Strategic Road Map for the Development of Financial Services in the Republic of Azerbaijan, 2016)*. In accordance with the Strategic Roadmaps for the national economy and key sectors of the economy of the Republic of Azerbaijan, approved by Presidential Decree of 6 December 2016, the first strategic objective was to create conditions for fiscal sustainability and to establish a monetary policy based on a floating exchange rate.

Moreover, a strategic innovation within the examined vertical/functional approach of the aforementioned document - specifically, the coordination of monetary and fiscal policies - is the substantiation and implementation of the "golden rule," whose primary objective is to curb fiscal expansion in response to constrained national financial resources. It should be noted that under the preceding economic model - fiscal expansion - the country significantly enlarged its infrastructure network, established a robust material and technical base for market-oriented development across virtually all sectors of the economy, and notably improved the population's social conditions. Hence, it may be inferred that the government has resolved to stimulate private-sector development with a view to broadening the scope of investment policy. To this end, measures are being implemented to delineate fiscal boundaries, strengthen social responsibility, and so forth *(Gasimli, V.A., 2017).*

If, under current circumstances, state budget revenues are directly dependent on fluctuations in oil receipts, then by applying the "golden rule" agreed between the State Oil Fund and the Ministry of Finance, it is envisaged to stabilize public revenues by balancing the volume of transfers to the budget at a specified monetary amount, thereby increasing the insulation of public expenditure from oil price volatility. Moreover, in accordance with this principle, the state will be able to set clear limits on spending of budget revenues derived from the sale of hydrocarbon resources, while the remaining income will be accumulated in the State Oil Fund of the Republic of Azerbaijan (SOFAZ) and invested abroad in longer-term, higher-yield projects. This mechanism is intended to simplify the forecasting of the national currency exchange rate, creating favorable conditions for designing longer-term economic development plans.

Thus, the "golden rule" encapsulates a core principle - stabilization of Azerbaijan's economy through government regulation of budgetary-monetary policy in the near term. It should be noted that four scenarios are proposed for designing the mechanism that caps transfers to the state budget, one of which follows the Norwegian model. For example, the Government Pension Fund of Norway (the Oil Fund) may channel to the state budget no more than 4% of its income annually.

A subsequent foundational priority of the first objective of the Road Map is the establishment of a Medium-Term Expenditure Framework (MTEF) that ensures more efficient allocation of public funds across and within economic sectors, while strengthening accountability of individual entities that utilize state budget resources. The MTEF serves as an instrument to govern the most efficient use of budgetary resources. It should also be noted that the Strategic Road Maps substantiate the introduction of performance-based (results-oriented) budgeting. The essence of this instrument is that the state focuses less on inputs of public funds and more on priority programs, strategic directions, and similar outcomes.

Importantly, the second objective of the Strategic Road Maps concerns privatization and reforms related to state-owned enterprises. The government should regulate markets and adopt rules and laws, while enterprises and companies are to be managed by private-sector actors. Overall, the Road Maps highlight two factors regarding privatization: first, the decision to retain an enterprise in state ownership or to privatize should be based on improvements in performance and profitability; second, preference should be given to regional enterprises and companies whose activities can make a substantial contribution to the socio-economic development of their respective regions.

Furthermore, to design a robust monetary policy and enhance fiscal sustainability, parameters of a fiscal "budget rule" were agreed and set with reference to international experience. In the event of its application, the impact of this rule on consolidated and state budget indicators, as well as potential risks, was analyzed, followed by the development of forecast indicators. Proposals were also formulated for performance-oriented budgeting mechanisms and for the MTEF. With respect to the country's financial position, exchange-rate flexibility of the national currency was increased, and a detailed diagnostic of the banking sector was conducted concurrently with action plans for the restructuring of certain undercapitalized banks. Additionally, the Financial Sector Development Strategy prioritizes deepening capital markets and insurance, modernizing the national payment infrastructure, and advancing cross-

cutting agendas such as digital finance, sustainable finance, and financial literacy. It outlines quantitative targets to broaden financial inclusion and market depth, alongside a shift to risk-based, forward-looking supervision aligned with international standards. Consumer protection and transparency are strengthened through regulatory upgrades and performance monitoring, with implementation staged across 2024–2026 and subject to periodic progress reporting *(Central Bank of the Republic of Azerbaijan. 2024-2026 Financial Sector Development Strategy, 2024).*

When examining the economic development strategy over the medium and long term in accordance with the Strategic Road Maps, one must also address one of its constituent parts - namely, the Strategic Road Map for the Development of Financial Services in the Republic of Azerbaijan, adopted by Presidential Order of 16 March 2016. To achieve the stated objectives, 16 priorities and 5 strategic goals were identified through 2020: building a financial system composed of sound and dynamic institutions; developing and improving financial markets; enhancing financial infrastructure; strengthening supervisory and regulatory mechanisms; and raising the financial literacy of sector specialists.

Overall, in the country's financial sector it is planned to reinforce prudential regulation and supervision mechanisms, increase the level of digitization of financial services, expand alternative banking channels, and shift household behavioral models toward real-time activity, among other measures *(Strategic Road Map for the Development of Financial Services in the Republic of Azerbaijan, 2016).*

Accordingly, refining and prioritizing activities around macro-financial stabilization within the framework of the Strategic Road Maps have laid solid groundwork and enabled the implementation of consistent measures in tax reform and the enhancement of tax mechanisms. The strategic plan for the development of the tax system for 2013–2020 envisaged a number of important priorities for improving Azerbaijan's legal framework and aligning it with European Union legislation and World Trade Organization requirements: transitioning from passive to active tax policy; assessing the effectiveness of tax incentives and exemptions; studying and applying international experience to move toward advance (pre-filing) tax declarations; preparing for a unified declaration system; improving taxpayer services; raising tax culture; strengthening tax awareness initiatives; increasing the share of cashless payments and their promotion; conducting comprehensive measures in e-audit; improving the effectiveness of tax administration; enhancing tax control and mechanisms for investigating tax evasion; developing international cooperation in taxation; and more. The measures planned in this relevant area are substantiated in the Strategic Road Maps across different sectors of the economy, which in turn opens broad opportunities to expand and refine the mechanisms and instruments of the national tax system. From this perspective, priority should be given to advancing a predominantly pro-growth fiscal policy in the Republic of Azerbaijan - one that would stimulate entrepreneurial activity across the economy in general and in the non-oil sector in particular.

CONCLUSION

This article underscores that Azerbaijan's fiscal resilience hinges on steadily broadening the non-oil tax base, maintaining clear and predictable tax rules, and coordinating budget policy with macroeconomic management. By examining the structure of revenues, the responsiveness of tax receipts to economic activity, and the link between corporate taxation and the fiscal envelope, the article shows that durable stability is best achieved through rules-based budgeting and reforms that deepen formal economic activity rather than rate changes.

Policy priorities therefore include strengthening digital tax administration and taxpayer services, encouraging cashless compliance, and embedding a credible budget rule and medium-term expenditure framework to insulate planning from volatility. Taken together, these steps support private-sector growth, improve revenue quality, and reinforce the macro-financial foundations for long-run development.

aysel.nagiyeva@mail.ru

Xülasə

Bu məqalədə Azərbaycanda uşaqlara qarşı zorakılıqla mübarizədə sosial maarifləndirmə proqramlarının əhəmiyyəti, təbiəti, mexanizmləri və effektivliyi araşdırılır. Burada uşaq istismarına qarşı mübarizədə yalnız hüquqi tədbirlərin deyil, həm də sosial və psixoloji müdaxilələrin zəruriliyi vurğulanır. Uşaqlara qarşı zorakılığın sosial kökləri və risk faktorları, eləcə də ictimai məlumatlılığın artırılmasının vacibliyi Ümumdünya Səhiyyə Təşkilatının (ÜST) və UNICEF-in məlumatları əsasında izah olunur.

Məqalədə məktəb əsaslı təhsil, icma kampaniyaları, valideyn seminarları, müəllim hazırlığı və media müdaxilələri kimi sosial maarifləndirmə proqramlarının əhatə dairəsi və strukturu təqdim olunur. Tanzaniya və İndoneziyadan nümunələr göstərir ki, yaxşı hazırlanmış proqramlar bilikləri artıra və davranış dəyişikliyini təşviq edə bilər. Bununla belə, metodoloji çatışmazlıqlar, proqram davamlılığı və sosial-mədəni fərqlər kimi çətinliklər də vurğulanır.

Azərbaycanda UNICEF-AB "Uşaqların Müdafiəsi və Sosial Müdafiə Sistemlərinin Gücləndirilməsi" layihəsi və milli "116111 Uşaq Yardım Xətti" kimi təşəbbüslər uşaqların qoruyucu xidmətlərə çıxışını artırmağı, zorakılığın qarşısını almağı və uşaqlar, valideynlər və müəllimlər arasında məlumatlılığı artırmağı hədəfləyir. Məqalədə həmçinin regional xidmətlərin genişləndirilməsi, davamlı maarifləndirmə proqramları, peşə təlimi, vahid elektron məlumat bazasının yaradılması və rəqəmsal texnologiyalardan istifadə daxil olmaqla gələcək üçün tövsiyələr təqdim olunur. Sonda vurğulanır ki, strateji cəhətdən hazırlanmış və hədəflənmiş sosial maarifləndirmə proqramları uşaqlara qarşı zorakılığın qarşısının alınmasında müsbət təsir göstərə bilər, lakin onların effektivliyi yerli kontekstə uyğunlaşma, monitorinq və planlaşdırma tələb edir.

Açar sözlər: azyaşlılar, yetkinlik yaşına çatmayan şəxslər, zorakılıq, uşaq hüquqları, maariflənmə.

THE EFFECTİVENESS OF SOCİAL AWARENESS PROGRAMS IN COMBATING VIOLENCE AGAINST CHILDREN

Aysel Nagiyeva

Baku State Universitety

ORCİD İD: 0009-0006-5276-1620

aysel.nagiyeva@mail.ru

Abstract

This article analyzes the significance, nature, mechanisms, and effectiveness of social awareness programs in preventing violence against children in Azerbaijan. It emphasizes that addressing child abuse requires not only legal measures but also social and psychological interventions. The social roots and risk factors of child violence, as well as the importance of increasing public awareness, are explained based on data from the World Health Organization (WHO) and UNICEF.

The study outlines the structure and scope of social awareness programs, including school-based trainings, community campaigns, parent seminars, teacher preparation, and media interventions. International examples from Tanzania and Indonesia demonstrate that well-designed awareness programs can enhance knowledge and promote positive behavioral change. Challenges such as methodological weaknesses, lack of program sustainability, and sociocultural differences are also highlighted.

In Azerbaijan, initiatives such as the UNICEF–EU "Strengthening Child Protection and Social Protection Systems" project and the national "116111 Child Helpline" aim to improve access to child protection services, prevent violence, and increase awareness among children, parents, and educators. The article also emphasizes future directions, including expanding regional services, continuous awareness campaigns, professional training, the creation of a unified electronic database, and the use of digital technologies.

In conclusion, the article argues that strategically designed and targeted social awareness programs can positively impact the prevention of violence against children, but their effectiveness requires careful planning, monitoring, and adaptation to the local context.

Keywords: minors, juveniles, violence, children's rights, education.

GİRİŞ

Uşaqlara qarşı zorakılıq — fiziki, emosional, seksual və iqtisadi xarakterli — dünya miqyasında həm hüquqi, həm də sosial mühüm problem təşkil edir. Dünya Səhiyyə Təşkilatı-nın məlumatına görə, uşaqlara qarşı zorakılıq fərdi, ailəvi, icma və sosial səviyyələrdə formalaşan çoxölçülü risk faktorları ilə əlaqəlidir [2]. Zorakılıq uşaqların təhsil alma imkanlarını məhdudlaşdıra, onların psixososial sağlamlığına mənfi təsir göstərə və həyatlarının gələcək mərhələlərində də fəsadlar yarada bilər [1].

Bu mənada, zorakılığın qarşısının alınmasında yalnız hüquqi yanaşmalar deyil, həmçinin sosial maarifləndirmə proqramlarının rolu mühümdür. Maarifləndirmə vasitəsilə cəmiyyətin, ailələrin, müəllimlərin və uşaqların özlərinin maariflənməsi, zorakılıqla bağlı davranış və münasibətlərin dəyişdirilməsi mümkündür. Məqalənin məqsədi — uşaqlara qarşı zorakılıqla mübarizədə sosial maarifləndirmə proqramlarının mahiyyətini, mexanizmlərini, effektivliyini və qarşısında duran çətinlikləri təhlil etməkdir.

METOD VƏ MATERİLLAR.

Uşaqlara qarşı zorakılığın sosial kökləri və maarifləndirməyə ehtiyac: Zorakılığın baş verməsinə təsir edən bir sıra sosial amillər mövcuddur. Dünya Səhiyyə Təşkilatı qeyd edir ki, aşağı təhsil səviyyəsi, ailədaxili münasibətlərdə emosional bağın zəif olması, yoxsulluq, gender bərabərsizliyi və zorakılığı normallaşdıran sosial-mənəvi dəyərlər risk faktorlarıdır [1]. Bundan əlavə, icma və sosial səviyyədə uşaqlara qarşı zorakılıq hallarının artmasında medianın və sosial şəbəkələrin təsiri, "uşağa əl qaldırmaq tərbiyədir" kimi stereotiplərin mövcudluğu mühüm rol oynayır.
Bu faktorlar sosial maarifləndirmə ehtiyacını ortaya qoyur — yəni yalnız cəzalandırma mexanizmlərinin tətbiqi deyil, həm də cəmiyyətin və fərdlərin nəzəri və praktik biliklərinin artırılması vacibdir. Belə yanaşma çərçivəsində maarifləndirmə proqramları risk faktorlarını azaltmaq və qoruyucu mexanizmləri gücləndirmək üçün əlverişli platforma yaradır.

Sosial maarifləndirmə proqramlarının mahiyyəti və strukturu: Sosial maarifləndirmə proqramları uşaqlara qarşı zorakılığın qarşısının alınmasında bilik, münasibət və davranış dəyişikliklərinə yönəlmiş

tədbirlərdir. Bunlara məktəb təlimləri, əhali üçün sosial reklam kampaniyaları, valideyn seminarları, müəllim hazırlığı, ictimaiyyət üçün maarifləndirmə tədbirləri və s. daxil ola bilər [2].

Müasir beynəlxalq yanaşmalarda – məsələn, INSPIRE strategiyasında – məhz "maariflənmə və məlumatlandırma" sosial dəyişməyə daxil olan əsas elementlərdən biridir [2]. Bu proqramların hədəf qrupları valideynlər, müəllimlər, uşaqlar və geniş ictimaiyyət ola bilər. Tətbiq sahəsi isə məktəb, icma, media və onlayn platformaları əhatə edir.

Maarifləndirmə proqramlarının effektivlik göstərməsi: Maarifləndirmə proqramlarının effektivliyi ilə bağlı aparılmış tədqiqatlar müxtəlif nəticələr göstərmişdir. Məsələn, bir araşdırmada məktəb müəllimlərinə qarşı aparılan audiovisual təhsil müdaxiləsi nəticəsində müəllimlərin "uşaq zorakılığı və laqeydlik" barədə bilik səviyyəsində statistik baxımdan əhəmiyyətli artım müşahidə edilmişdir. MDPI Sistematik icmalarda isə məlum olmuşdur ki, dar çərçivəli müdaxilələr — məsələn yalnız uşaqlara yönəlik – effektivlik baxımından məhdud qalır. PMC UNICEF-nin Tanzaniyada həyata keçirdiyi proqram qiymətləndirməsində icma üzrə maariflənmə, hesabatlılığın artırılması və zorakılıq hallarının azalması müşahidə edilmişdir. evaluationreports.unicef.org Bundan əlavə, İndoneziyada valideyn-zəminli "Positive Discipline in Everyday Parenting" proqramında bilik artımı və davranış dəyişikliklərinə işarə edilmişdir, baxmayaraq ki bəzi göstəricilərdə mübahisəli nəticələr olmuşdur. theevaluationfund.net Bu sübutlar göstərir ki, maarifləndirmə proqramları, xüsusilə doğru hədəf qruplar, yaxşı planlaşdırılmış müdaxilə və davamlılıq şərtilə, uşaqlara qarşı zorakılıqla mübarizədə müsbət təsir göstərə bilər.

Məhdudiyyətlər və çağırışlar: Bununla belə, maarifləndirmə proqramlarının qarşısında müəyyən çətinliklər var. Birincisi, bir çox proqramın qiymətləndirilməsi metodoloji baxımdan zəifdir, təsir mexanizmləri və davamlı nəticələr barədə yetərli məlumat yoxdur. [7] İkincisi, proqramların çoxu inkişaf etmiş ölkələrdə həyata keçirilib; aşağı və orta gəlirli ölkələrdə — o cümlədən postsovet məkanında – məlumatların sayı məhduddur [8]. Üçüncüsü, sosial–mədəni kontekstin fərqli olması proqramların digər kontekstdə eyni effektivliyi göstərməsinə mane ola bilər. Belə ki, yerli dəyərlər, normativlər, sosial strukturlar proqramın nəticələrinə təsir edə bilər.

Bu çağırışlar nəzərə alınmalı; proqram dizaynında və tətbiqində kontekstual uyğunluq, davamlı monitorinq və qiymətləndirmə mexanizmləri vacibdir.

Azərbaycanda bu sahədə aparılan bir neçə maarifləndirmə/təminat proqramı var:

1. UNICEF Azerbaijan və European Union-nin "Uşaqların sosial müdafiəsi və qorunmasının gücləndirilməsi" layihəsi

- Layihə 2023-dən 2025-ə qədər müddətdə həyata keçirilir və adlandırılır: *Strengthening the child protection and social protection systems in Azerbaijan*. EU for Azerbaijan

- Məqsəd olaraq təyin edilib: uşaqların sosial müdafiəyə çıxışını gücləndirmək, uşaqların zorakılıqdan qorunması mexanizmlərinin möhkəmləndirilməsi (violence against children, VAC) və altı rayon/şəhərdə pilot model tətbiq edilməsi. EU for Azerbaijan

- Bu modelin tərkibində maarifləndirmə kampaniyaları, sosial xidmətlərin (və ailələrə dəstək) artırılması, yerli qeyri-hökumət təşkilatlarının rolunun yüksəldilməsi, təlim və monitorinq sistemi planlaşdırılıb. EU for Azerbaijan

2. Azerbaijan Child Helpline Service - Azərbaycan Uşaq Qaynar Xətti (Qaynar xətt "116111")

- Bu xidmət Azərbaycanda fəaliyyət göstərir və uşaqlara, gənclərə, onların ailələrinə zorakılıq, istismar, təhsildən kənar qalma, psixoloji risklər mövzusunda hüquqi və psixososial dəstək verir [11].

- Məlumatlara görə, artıq 68 000-dən çox zəng qəbul edilib [11].

Azərbaycan Uşaq Qaynar Xətti 20 years, 20 voices: Azerbaijan Child Helpline - Child Helpline International 2010-cu ildə **"Etibarlı Gələcək" qeyri-hökumət təşkilatı** və onun tərəfdaşları tərəfindən yaradılmışdır. O vaxtdan bəri, bu xidmət Azərbaycanda uşaqların hüquqlarını müdafiə edən, onların səsi olan və uşaq məsələlərinin həllinə həsr olunmuş mühüm bir platformaya çevrilmişdir.

"Etibarlı Gələcək" – qeyri-kommersiya, xeyriyyəçi, siyasi cəhətdən neytral bir QHT olub, 1998-ci ildə Azərbaycanın müxtəlif universitetlərindən olan gənclər tərəfindən yaradılmış və 1999-cu ildə rəsmi qeydiyyatdan keçmişdir. Təşkilat yarananandan bəri Azərbaycanın ən fəal gənclərini bir araya gətirərək geniş fəaliyyət istiqamətlərində çalışır:

- demokratik, təhlükəsiz, açıq və sağlam vətəndaş cəmiyyətinin qurulması;
- yaşlılara, əlillərə, uşaqlara, qaçqınlara və s. yardım edilməsi;
- uşaqlar və gənclər üçün asudə vaxtın təşkili;
- mədəniyyətin, incəsənətin və təhsilin inkişaf etdirilməsi.

Azərbaycan Uşaq Qaynar Xəttinə daxil olan müraciətlərin statistik təhlili:

Bu sahədə bir sıra görülmüş işlər və statistika:

1. World Health Organization (ÜST)-nun Azərbaycan üzrə hesabatı:

- "Global Status Report on Preventing Violence Against Children 2020" çərçivəsində Azərbaycan üzrə profil hazırlanıb [1].
- Bu, uşaqlara qarşı zorakılığın qarşısının alınması üzrə daha geniş beynəlxalq çərçivədə vəziyyəti göstərir.
- Məsələn, hesabatda 2018-ci ildə Azərbaycanda uşaqlara qarşı zorakılıqla bağlı "116111 Uşaq Qaynar Xətti" vasitəsilə 3 581 müraciət edildiyi qeyd olunur. The United Nations in Azerbaijan+1
- Bu tip mənbə maarifləndirmə və uşaq müdafiəsi mexanizmlərinin qurulduğunu göstərir, lakin "maarifləndirmə tədbiri keçirildi → zorakılıq halları azaldı" kimi konkret ölçülmüş nəticə vermir.

2. Ailə, Qadın və Uşaq Problemləri Üzrə Dövlət Komitəsi (AQUPDK)-nin məlumatları:

- 2024-cü ilin noyabrında 11 regionda uşaqlara qarşı zorakılığın qarşısının alınması mövzusunda silsilə maarifləndirmə tədbirləri keçirilib: rayon icra hakimiyyəti, polis, müəllimlər, psixoloqlar, valideynlər və ekspert qrupları iştirak edib. family.gov.az
- Tədbirlərdə zorakılığın səbəbləri, müdafiə mexanizmləri, normativ baza və məktəb-valideyn əməkdaşlığı haqqında təqdimatlar aparılıb. family.gov.az
- Bu, sosial maarifləndirmə istiqamətində atılmış addımdır, amma yenə də "sonrakı göstəricilər necə dəyişib" barədə açıqlama yoxdur.

3. Qaynar xətt, sosial xidmətlər və hüquqi müdafiə sahəsində addımlar:

- Məsələn, 2023-cü il dekabrında bildirilib ki, Azərbaycanda zorakılığa məruz qalmış 100 uşaq daxil olmaqla 154 nəfərə sosial xidmətlər göstərilib. Report.az

- 2019-cu ildə ÜST və tərəfdaşlarla birgə "uşaqlara qarşı zorakılığın dayandırılması" mövzusunda dəyirmi masa keçirilib, uşaqlara qarşı zorakılıqla bağlı müraciətlərin, o cümlədən 2018-ci ildə 3 581 müraciət olduğunun bildirilməsi ilə. The United Nations in Azerbaijan

- Bu cür mexanizmlərin qurulması maarifləndirmə ilə yanaşı müdafiə sisteminin də gücləndirildiyini göstərir.

ELMİ YENİLİKLƏR

Tövsiyələr və gələcək istiqamətlər: Azərbaycan Uşaq Qaynar Xəttinin fəaliyyətinin daha da təkmilləşdirilməsi istiqamətində bir sıra addımların atılması məqsədəuyğundur. İlk növbədə, regional mərkəzlərin yaradılması və ucqar ərazilərdə yaşayan uşaqların xidmətə çıxış imkanlarının genişləndirilməsi vacib hesab olunur. Bu, ölkənin bütün bölgələrində uşaqların bərabər müdafiə hüququna malik olmasına şərait yaradacaqdır.

Uşaqlara qarşı zorakılıq hallarının qarşısının alınması məqsədilə məktəblərdə, ailələrdə və yerli icmalarda davamlı sosial maarifləndirmə proqramlarının həyata keçirilməsi xüsusi əhəmiyyət daşıyır. Maarifləndirmə fəaliyyətləri uşaqların, valideynlərin və müəllimlərin zorakılıq anlayışı, hüquqi müdafiə mexanizmləri və psixoloji dəstək yolları barədə biliklərini artırmağa xidmət etməlidir.

Bundan əlavə, psixoloji və hüquqi yardım göstərən mütəxəssislərin peşə hazırlığının artırılması, həmçinin onların beynəlxalq təcrübə ilə mütəmadi şəkildə tanış olması məqsədəuyğun sayılır. Bu, göstərilən xidmətlərin keyfiyyətini yüksəldəcək və uşaqlara daha səmərəli yardım göstərilməsinə imkan yaradacaqdır.

Uşaqlara qarşı zorakılıq və sui-istifadə halları ilə bağlı vahid elektron məlumat bazasının yaradılması da gələcək tədqiqatlar üçün mühüm əhəmiyyət daşıyır. Bu cür bazanın mövcudluğu real vəziyyətin düzgün qiymətləndirilməsinə, statistik təhlillərin aparılmasına və qərar qəbuletmə prosesinin elmi əsaslarla həyata keçirilməsinə kömək edəcəkdir.

Qaynar xəttin fəaliyyəti haqqında məlumatlandırma kampaniyalarının genişləndirilməsi uşaqların və valideynlərin bu xidmətə müraciət etmə ehtimalını artıracaq, ictimaiyyətin diqqətini problemin ciddiliyinə yönəldəcəkdir. Bununla yanaşı, dövlət qurumları, qeyri-hökumət təşkilatları və beynəlxalq tərəfdaşlar arasında koordinasiyanın gücləndirilməsi uşaqların müdafiə sisteminin daha effektiv işləməsinə şərait yaradacaqdır.

Rəqəmsal texnologiyaların — mobil tətbiqlərin, sosial şəbəkələrin və onlayn konsultasiya platformalarının — daha geniş istifadəsi uşaqlara operativ və əlçatan dəstəyin göstərilməsini təmin edəcəkdir. Eyni zamanda, uşaqlara qarşı zorakılıqla mübarizə sahəsində həyata keçirilən tədbirlərin effektivliyini qiymətləndirən müstəqil elmi-tədqiqat işlərinin təşkili gələcək siyasət və proqramların planlaşdırılması üçün mühüm əsas yaradacaqdır.

Cəmiyyətin uşaqların hüquqlarının müdafiəsində fəal iştirakı üçün valideynlər, müəllimlər və gənclər arasında məsuliyyət hissinin artırılmasına yönəlmiş sosial layihələrin dəstəklənməsi də zəruri sayılır. Nəhayət, qlobal səviyyədə uşaq qaynar xətləri arasında əməkdaşlığın genişləndirilməsi Azərbaycan təcrübəsinin beynəlxalq səviyyədə tanıdılmasına və qarşılıqlı bilik mübadiləsinə töhfə verəcəkdir.

NƏTİCƏ

Uşaqlara qarşı zorakılıqla mübarizədə sosial maarifləndirmə proqramları cəmiyyətin məlumatlılığını artırmaq, münasibətləri dəyişdirmək və qoruyucu davranışları təşviq etmək baxımından əhəmiyyətlidir. Tədqiqatlar göstərir ki, düzgün dizayn edilmiş və hədəflənmiş proqramlar müsbət nəticələr verə bilər. Eyni zamanda, metodoloji zəifliklər, yerli kontekstin yetərincə nəzərə alınmaması və davamlılığın olmaması kimi məsələlər mövcuddur. Buna görə, maarifləndirmə proqramlarının effektivliyi tam

şəkildə artırmaq üçün strateji yanaşma tələb olunur. Azərbaycanda bu istiqamətdə icmalara və dövlət–əhali əməkdaşlığına xüsusi diqqət yetirilməlidir.

Özet

Sendikacılık hareketi, endüstri toplumunun ürünü olarak 19. yüzyılın ikinci yarısında ortaya çıkmıştır. Endüstri toplumuyla özdeşleşen klasik sendikacılıkta, yoğun kitlesel üretim ve emeğin belirleyici rol oynadığı sektörlerle ilişkilendirilmiştir. Günümüzdeyse üretim süreçlerinin dijitalleşerek farklılaşması, gig ekonomisine dayalı istihdam biçimlerinin artması ve işgücünün mekânsal anlamda esnekliğe kavuşmasına sebep olmuştur. Söz konusu durum klasik sendikal örgütlenmenin kapsamında çeşitli daralmalar oluşturmuştur. Dijitalleşme, gig ekonomisi ve atipik istihdam biçimleri ortaya çıkarak klasik sendikal yapıların etkinliğini tartışmaya açmıştır. Türkiye'de bu dönüşüm yalnızca çalışan tarafında değil, işveren örgütleri tarafında da görülmektedir. Bu bağlamda Türkiye İşveren Sendikaları Konfederasyonu (TİSK) dijital çağın emek ilişkilerine uyum sağlama çabası kapsamında yeni nesil sendikacılık adını verdikleri bir yaklaşım benimsemişlerdir. Yeni nesil sendikacılık dijital araçlar üzerinden sosyal diyaloğu temel alan katılımcı, yatay ve veri temelli örgütlenmeyi ifade etmektedir. Türkiye özelinde bu dönüşümün TİSK gibi köklü kurumlar üzerinde yarattığı etki dikkat çekicidir. TİSK, dijitalleşme sürecinde işveren sendikacılığının temsil biçimlerini yeniden tanımlamakta sosyal diyalogun sürdürülebilirliği için yenilikçi modeller geliştirmektedir. Zira TİSK, yalnızca işveren örgütlerini değil, aynı zamanda devlet ve çalışan kesimi kapsayan üçlü yapının dijital çağdaki yeniden yapılanmasına öncülük etmektedir. Bu çerçevede yeni nesil sendikacılık Türkiye'nin dijital emek piyasalarının kurumsal altyapısını dönüştürme potansiyeline sahiptir. Çalışmanın amacı, dijital çağda sendikal örgütlenmenin yaşadığı dönüşümü devlet, işçi ve işverenler açısından anlamak ve TİSK'in bu süreçteki rolünü ortaya koymaktır. Bu bağlamda yeni nesil sendikacılığın kuramsal çerçevesi, Türkiye'deki gelişim dinamikleri ve TİSK'in dijital emek piyasalarına yönelik yaklaşımı çok boyutlu bir perspektiften değerlendirilmektedir.

Anahtar Kelimeler: TİSK, Sosyal Diyalog, Dijitalleşme, Yeni Nesil Sendikacılık, İşveren

Abstract

The trade union movement emerged in the second half of the 19th century as a product of industrial society. In classical trade unionism, which is identified with industrial society, it has been associated with sectors characterized by mass production and the crucial role of labor. Today, the digitalization and transformation of production processes, the rise of gig economy based employment forms, and the increasing workplace flexibility of the workforce have led to significant changes. This situation has caused various limitations in the scope of classical trade union organization. The emergence of digitalization, the gig economy, and atypical forms of employment has brought the effectiveness of traditional trade union structures into question. In Turkey, this transformation has been observed not only on the employees' side but also among employer organizations. In this context, the Turkish Confederation of Employer Associations (TİSK) has adopted an approach called new generation unionism as part of its efforts to adapt labor relations to the digital age. New generation unionism refers

to a participatory, horizontal, and data driven form of organization based on social dialogue through digital tools. In the Turkey, impact of TİSK on this transformation is remarkable. TİSK is redefining the modes of representation of employer unionism in the process of digitalization and developing innovative models to ensure the sustainability of social dialogue. TİSK is leading the restructuring of the tripartite framework including employer organizations, the state, and employees in the digital age. In this context, new generation unionism has the potential to transform the institutional infrastructure of Turkey's digital labor markets. The aim of this study is to understand the transformation of trade union organization in the digital age from the perspectives of the state, workers, and employers, and to reveal the role of TİSK in this process. Accordingly, the theoretical framework of new generation unionism, its developmental dynamics in Turkey, and TİSK's approach to digital labor markets are evaluated from a multidimensional perspective.

Keywords: TİSK, Social Dialogue, Digitalization, New Generation Unionism

GİRİŞ

Dijital teknolojilerin işgücü piyasalarında yarattığı dönüşüm, çalışma ilişkileri alanında köklü bir yeniden yapılanmayı beraberinde getirmiştir. Üretim süreçlerinin hız kazanması, işin mekândan bağımsız hâle gelmesi ve platform temelli istihdam biçimlerinin yaygınlaşması, yalnızca çalışanların değil, emek piyasasında rol üstlenen tüm kurumların işleyişini etkilemektedir. Bu değişim, endüstri toplumunun koşullarında şekillenen klasik sendikal yapıları değişime zorlamakta; sosyal diyalog mekanizmalarının işleyişini, temsil biçimlerini ve örgütlenme stratejilerini yeniden biçimlendirmeye gerekli hâle getirmektedir. Çalışma hayatının karmaşık ve hızlı değişen yapısı, sendikal aktörlerin dijital çağın gerektirdiği yeni araçları ve yaklaşımları benimsemesini kaçınılmaz duruma getirmiştir.

Bu bağlamda işveren sendikacılığı da dönüşen emek piyasasının önemli bileşenlerinden biri olarak dikkat çekmektedir. Türkiye'de işveren örgütlerinin en üst temsil kurumu konumundaki TİSK, çalışma hayatında yaşanan bu yapısal dönüşüme uyum sağlamak adına çeşitli kurumsal yenilik arayışlarına yönelmiştir. Dijitalleşmenin zorunlu kıldığı esneklik, hızlı veri akışı ve çok taraflı iletişim ihtiyacı, işveren sendikacılığının da geleneksel örgütlenme kalıplarının ötesine geçmesini gerekli kılmaktadır. Bu doğrultuda TİSK'in dijital çağın koşullarını gözeten yeni kavramsal ve pratik arayışları, Türkiye'de sosyal diyaloğun geleceği açısından önemli bir inceleme alanı oluşturmaktadır.

Bu çalışma, dijitalleşmenin sendikal yapılarda ortaya çıkardığı değişimi Türkiye bağlamında ele almakta ve işveren sendikacılığının dijital dönüşüm sürecindeki konumunu incelemektedir. Özellikle TİSK'in yeni yaklaşımlarının değerlendirilmesi, dijital emek piyasalarının kurumsal altyapısının nasıl şekillendiğine ilişkin önemli ipuçları sunmaktadır. Bu doğrultuda çalışma, dijital çağın gerektirdiği yeni örgütlenme biçimlerini, temsil modellerini ve sosyal diyalog araçlarını çok boyutlu bir perspektifle ele alarak Türkiye'de işveren sendikacılığının dönüşen rolünü analiz etmektedir.

Metodoloji

Çalışmada nitel araştırma yaklaşımı çerçevesinde tasarlanmış olup çalışmanın temel amacı, TİSK'in sürdürülebilirlik, yeşil dönüşüm ve yeni nesil sendikacılık kapsamındaki projelerini ve stratejilerini incelemek ve bu girişimlerin iş dünyasına yansımalarını analiz etmektir. Veri toplama sürecinde, TİSK'in resmi web sitesi, politika belgeleri, yıllık raporlar, basın bültenleri ve proje dokümanları gibi ikincil kaynaklardan yararlanılmış olup ayrıca, ilgili akademik literatür ve sektör raporları taranarak çalışmaya teorik bir çerçeve kazandırılmaya çalışılmıştır. Toplanan veriler içerik analizi yöntemiyle değerlendirilecektir. TİSK'in yeni nesil sendikacılık anlayışı kapsamındaki uygulamaları ve iş dünyasına yönelik etkileri ortaya konacak ve bütüncül bir değerlendirmesi yapılacaktır.

1.1.2000 Sonrası Türkiye'de Sendikal Dönüşüm

Sendikal örgütlenme, toplu pazarlık ve grev lokavt gibi sosyal haklar anayasal güvence altına alınmış sosyal haklardır. Cumhuriyet döneminde çalışma hayatına muhtelif yasalar çıkartılmış olmakla birlikte Türkiye'de ilk defa 1947 yılında "5018 sayılı İşçi ve İşveren Sendikaları ve Sendika Birlikleri Hakkında Kanun" ile sendikal örgütlenmeye ilişkin yasal düzenleme batıya göre mevzuatımıza geç girdiği görülmektedir. (Pirler, 2013:884) Sendikal örgütlenme işçinin sendikal örgüte girme motivasyonunun gelişmesi ya da tam tersi yönünde sendikal örgütlenmeye ihtiyaç duymaması belli başlı sebeplerden kaynaklanabilir. Özellikle neoliberal politikaların bazı ülkelerde ekonomik canlılığı sağladığı kabul edilmektedir. (Evran-topuzkanamış,2015:174) Fakat diğer taraftan özellikle 1980'li yıllarda kendini dünya genelinde daha yoğun hissettiren küreselleşme süreciyle sendikasızlaştırma eğilimi yükselmiştir. Neoliberal politikaların etkisiyle atipik istihdam biçimleri olarak gösterilen esnek çalışma biçimlerinin yükselişi, özelleştirmelerin artışı ve kuralsızlaştırma politikaları sendikal örgütlenmeyi engellemiştir. (Mahiroğulları, 2012:11)

Esasen sendikal örgütlenmeyle ilgili muhtelif yapısal, sosyal, ekonomik faktörler bulunmaktadır. İşsizlik bireylerin işçi ya da işveren statüsünde olmamasından kaynaklanan bu durum esasen sendikal örgütlenme şartlarının gerçekleşmemesi anlamına gelmektedir. Örnekle somutlaştırmak gerekirse 6356 sayılı kanunda "Sendika üyeliği ve üyeliğin kazanılması" düzenlenmiştir. *"MADDE 17 – (1) On beş yaşını dolduran ve bu Kanun hükümlerine göre işçi sayılanlar, işçi sendikalarına üye olabilir."* (6356 sayılı kanun/md.17) anlaşılacağı üzere işsizlik sorunu doğrudan sendikal örgütlenme yolunda açık bir engel olarak görülmektedir.

Türkiye açısından değerlendirildiğinde neoliberal politikaların geçmişten günümüzü durumu iki temel zaman diliminde özellikle 1980 'li yıllarda başlayan sürecin 2000'li yıllarda olgunlaşarak devam ettiğini belirtmektedir. (Özdemir, 2020: 245-267) Neoliberal politikaların etkisiyle birlikte Türkiye'de artan özelleştirme politikaları, ayrıca değişen istihdam biçimlerine bağlı olarak hukuki boşluklar ve sendikasızlaştırma politikaları Türkiye'de sendikasızlaştırmaya tesir etmiştir. (Etçi, 2018:129-136) Ayrıca sendikaların da gelişen ve değişen sürece ayak uyduramamasından dolayısıyla değişen ihtiyaçlara cevap verememesinden dolayı da sendikal örgütlenme negatif yönde etkilenmiştir. (Etçi, 2018:140)

Türkiye'nin önemli bir sorunu işsizliktir 2025 yılı şubat ayı itibariyle %8,2 olan işsizlik oranı sendikal örgütlenme için hukuki bir zorunluluğunun yerine gelmediği anlamına gelmektedir. (https://data.tuik.gov.tr/Bulten/Index?p=Isgucu-Istatistikleri-Subat-2025-54060)

Tablo:1 Türkiye'de Yıllara Göre Sendikalaşma Oranları

Yıllar	Sendikalaşma Oranı (%)
2013	9,21
2015	10,65
2017	12,18
2019	13,86
2021	14,4
2023	14,42

Kaynak: https://sosyalveri.net/grafik/1172

Değinilen bilgiler ışığında Türkiye'de sendikalaşma oranları dünyada özellikle batı ülkelerinin gerisinde kalmaktadır.2023/2024 ve sonrası döneme ilişkin İzlanda %90, Norveç %50, İtalya %30 oranındadır ve

esasen dünyada da diğer yıllara göre sendikalaşma eğiliminin düştüğü anlaşılmaktadır fakat mevcut duruma göre Türkiye'nin geride olduğu anlaşılmaktadır. (OECD, 2025:2)

2000 sonrası düşünüldüğünde özetle belirtmek gerekirse neoliberal politikaların etkisiyle kendini gösteren özelleştirmeler, kronik bir sorun olan kayıt dışı istihdamın yüksekliği ve değişen koşullara sendikaların cevap hem işçi yönünden hem de işveren yönünde ayak uydurması gerekliliği yadsınamaz bir gerçekliktir.

2.2.Dijital Dönüşüm ve Emek İlişkileri

Dijital dönüşüm Endüstri 4.0 ve sonrasıyla özgülenmiş bir kavram olarak *"iş aktiviteleri, süreçleri, yetkinlikleri ve modellerin, dijital teknolojilerin getirdiği değişiklikleri ve fırsatları toplum üzerindeki etkisini stratejik ve öncelikli bir şekilde tam olarak değerlendirmek için derin ve hızlı dönüşümüdür."* (Demirkan vd., 2016:14)Bu yönüyle değinilmesi gereken ve emek olgusuna tesir eden önemli bir unsur "Gig Ekonomisi"dir. Gig ekonomisi *"insanların bir işverene bağlı çalışması yerine geçici işlerde veya her biri bağımsız ödenen ayrı iş birimlerinde çalışmasına dayanan bir çalışma biçimi*" şeklinde tanımlanmaktadır. (CIPD, 2023:2) Bu çalışma biçimi temel olarak yeni bir sorunu olan "çalışan statüsü" ve "platform çalışanları" ilişkisini gündeme getirmektedir.

Bir süreç olarak değerlendirildiğinde sosyal gelişmelerin yaşanacağı yadsınmaz bir gerçektir. Nitekim sosyal gelişmeler insanların refahına katkı sağlarken aynı zamanda bazı problemleri de getirmektedir. (Şenkal,2015:129) Esasen süreci analiz etmek bakımından genel bir değerlendirme yapılırsa sanayi devrimi öncesi tarım toplumunda bağımsız çalışanlar sonrasında sanayi devrimiyle bağımlı çalışanların artışı gözlemlenmektedir. (Kaymaz, 2025:1071-1084) Dijitalleşme ile ise platform çalışanlarının yükselişi görülmektedir. Çalışan statüsü en genel anlamda iki temel bileşene dayandırılmaktadır; "bağımlı" ve" bağımsız çalışanlar". (Küçük, 2024:371) Platform çalışanları için ise bağımlı ve bağımsız çalışan statüsü dışında yeni bir kategori olarak yasal bir düzenlemeye gelecekte tabi tutulabileceği ifade edilmektedir. (Beytar, 2022:245-246) Dolayısıyla sosyal gelişme olarak ortaya çıkan "platform çalışanlarının" hukuki statüsü bir yasal mevzuatta bir boşluk olarak görülürken başvurulması gereken diğer bir önemli hukuk kaynağı "yargı kararlarıdır". Bu bağlamda önemli bir unsur olan iş sözleşmelerinde "bağımlılık" unsuru önemli bir karine haline gelmektedir. Bu durumda mevcut düzenlemeler ışığında anayasal güvence altına alınmış sendikal hakların durumu dolayısıyla sendikaların da gelişen sürece ayak uydurarak cevap vermesi gerektiği anlaşılmaktadır. Sendikaların dijitalleşme sürecine, *"işkolu türlerine", "sendika yoğunluğuna", "toplu pazarlığa" ve "sendikasızlaşma"* yönünde etkiler doğurmaktadır. (Yaşar, Şimşek, 2023:37-39) Bahsedilen süreçlerin sonucuna bir cevap olarak "e-sendikacılık" bir uyum politikası olarak görülmektedir bilişim tekonolojik ilerlemenin *"e-sendika ve/veya sanal sendikacılık ve siber sendika kavramları çerçevesinde gerçekleşmektedir."* (Aybas M, Dündar G, Yılmaz S., 2014:6)

3.3. Klasikten Yeni Nesil Sendikacılığa

1980 sonrası dönemde, uluslararası sermaye hareketleri ile mal ve hizmetlerin sınır ötesi akışının hız kazanmasıyla birlikte, ekonomik, siyasi, sosyal ve kültürel boyutları olan küreselleşme süreci olarak adlandırılan yeni bir olgu ortaya çıkmıştır. Bu bağlamda, sendikacılık yalnızca ekonomik politikaların değişiminden etkilenmemiş; çok boyutlu yapısıyla küreselleşme süreci de sendikal faaliyetleri doğrudan etkilemiştir. Böylelikle, 1980 sonrası neoliberal politikaların benimsenmesi ve çok yönlü küreselleşmenin yükselişi, farklı alanlarda olduğu gibi sendikal yapıyı da hem biçim hem işlev açısından derinden etkileyerek sendikaları kapsamlı bir değişim ve dönüşüm sürecine zorlamıştır (Şimşek, 2023: 27). Çalışma ilişkilerinde yaşanan bu köklü değişimler, sendikalar üzerinde de gözlenmektedir. Artan işsizlikle başa çıkmak ve ulusal firmaların uluslararası rekabette maliyet avantajı elde edebilmesini sağlamak amacıyla çalışma mevzuatına esnek çalışma uygulamaları girmiştir. Bununla birlikte yeni üretim ve yönetim teknikleri uygulanmaya başlanmış, insan kaynakları yönetimi anlayışı da dönüşmüştür. Çalışma ilişkilerinde yaşanan bu köklü değişimler, üye sayılarındaki azalmayla birlikte,

sendikaların temel kurumsal yapılarından biri olan toplu pazarlık süreçlerinde de değişikliklere yol açmıştır. Pazarlık konuları daralmış, istihdam garantisi sağlama amacıyla sendikaların pazarlık gücü azalmış ve işverenler karşısında uzlaşmaya zorlanma gibi olumsuz etkiler ortaya çıkmıştır (Mahiroğulları, 2017: 500-501). Bu köklü değişimler ve sendikaların karşılaştığı zorluklar, örgütlerin sadece mevcut yapılarıyla sınırlı kalamayacağını, aynı zamanda değişen çalışma koşullarına ve yeni ekonomik ve teknolojik gerekliliklere uyum sağlamaları gerektiğini göstermektedir. Bu yapı günümüzde de farklılaşarak yeşil ve dijital dönüşüm ile sürdürülebilirlik politikaları ekseninde yeni nesil sendikacılığa doğru evrilmektedir.

Aşağıda yer alan tabloda klasik ve yeni nesil sendikacılık arasındaki farklar ortaya konmaya çalışılmıştır. Bu noktada müzakere odağı ücret ve maddi haklardan çalışan refahı ve sürdürülebilirliğe, yaklaşım tarzı çatışmacı tutumdan sosyal diyaloğa, örgütlenme yapısı hiyerarşik yapılanmadan yatay, katılımcı ve dijital olduğu yapıya, temsil biçimi kollektiften bireysele, kullanılan araçların toplu iş sözleşmesi ve grevlerden dijital kanallara ve amacın artık ücret artışından ziyade çalışan memnuniyetinin olduğu bir yapıya geçişin olduğu görülmektedir.

Tablo 2: Klasik ve Yeni Nesil Sendikacılık Arasındaki Farklar

Boyut	Klasik Sendikacılık	Yeni Nesil Sendikacılık
Müzakere Odağı	Ücret ve maddi haklar	Çalışan refahı, sürdürülebilirlik
Yaklaşım Tarzı	Çatışmacı tutum	Sosyal Diyalog
Örgütlenme Yapısı	Dikey, hiyerarşik	Yatay, katılımcı, dijital
Temsil Biçimi	Kollektif	Bireysel
Araçlar	Toplu İş Sözleşmesi, Grevler	Dijital kanallar
Amaçlar	Ücret artışları	Çalışan memnuniyeti

Yeni nesil sendikacılık ve çalışma ilişkilerindeki dönüşüm, iş dünyasında meydana gelen köklü değişikliklere ve modern iş gücünün ihtiyaçlarına yanıt olarak gelişen bir kavramdır. Bu dönüşüm, geleneksel işçi sendika ilişkilerini yeniden şekillendirirken, iş gücü piyasasındaki yeni dinamikleri de göz önünde bulundurmaktadır.

4.4 TİSK'in Yeni Nesil Sendikacılık Stratejisi

Türkiye'de işveren sendikacılığının kurumsal yapısını şekillendiren temel aktör olan TİSK, 1962 yılında kurulmuştur. Kuruluşundan bugüne işverenlerin ortak sesi olma misyonuyla faaliyet göstermektedir. İşverenleri hem ulusal hem de uluslararası düzeyde temsil etme yetkisine sahip en üst kuruluş olarak, bünyesindeki işveren sendikalarının örgütlü olduğu sektörlerde makro düzeyde politika üretmeyi ve çözüm geliştirmeyi hedeflemektedir. Çalışma yaşamının tüm taraflarını ilgilendiren asgari ücret, sosyal diyalog ve çalışma barışı gibi siyaset üstü konularda toplumsal düzenin güçlenmesine katkı sunmayı amaçlamaktadır. TİSK çatısı altında, kamu hizmeti de dâhil olmak üzere ekonomi ve sanayinin farklı alanlarında faaliyet gösteren 20 işveren sendikası ile 2 işveren derneği bulunmaktadır. Bu geniş temsil kapasitesi, TİSK'i çalışma hayatının çok çeşitli alanlarında etkili bir aktör hâline getirmektedir. Kuruluşun geniş bir faaliyet alanı olmakla birlikte, üretim, endüstriyel ilişkiler, rekabetçilik, verimlilik, kayıtlı istihdam, toplu iş sözleşmeleri ve dış ticaret gibi konular Türkiye ekonomisine ilişkin temel çalışma sahalarını oluşturmaktadır (TİSK Hakkımızda, https://www.tisk.org.tr/hakkimizda, Erişim 05.12.2025).

TİSK, Türkiye'de işveren sendikacılığının en üst temsil organı olarak çalışma yaşamının çok çeşitli alanlarında faaliyet göstermektedir. Kuruluş; asgari ücret tespit süreci, sosyal güvenlik sistemi, mesleki yeterlilik ve nitelikli işgücü politikaları gibi konularda işverenlerin görüşlerini kamu otoritelerine iletmektedir. Bunun yanında, toplu iş sözleşmeleri, endüstri ilişkileri, çalışma barışının sağlanması ve sosyal diyalog mekanizmalarının güçlendirilmesi TİSK'in öncelikli çalışma başlıkları arasındadır. Üretim süreçleri, rekabetçilik, verimlilik, kayıtlı istihdamın artırılması, iş sağlığı ve güvenliği, dijital ve yeşil dönüşüm, sürdürülebilirlik, istihdam politikaları ve dış ticaret düzenlemeleri de TİSK'in geniş faaliyet alanları içinde yer almaktadır. Ulusal ve uluslararası platformlarda işverenleri temsil eden kuruluş, aynı zamanda eğitim, inovasyon, Ar-Ge, çalışma hayatında eşitlik, genç istihdamı ve kurumsal sosyal sorumluluk gibi konularda da çeşitli projeler ve politika çalışmaları yürütmektedir. Bu kapsamlı yapısıyla TİSK, hem işverenlerin ihtiyaçlarına çözüm üretmekte hem de Türkiye'de ekonomik ve sosyal politikaların şekillenmesine katkı sunmaktadır (TİSK Çalışma Alanları, https://www.tisk.org.tr/calisma-alanlari, Erişim 05.12.2025). Bu bağlamda çok geniş bir çalışma alanı bulunmakta ve çalışma hayatına ilişkin bir çok unsuru kapsamaktadır. TİSK'in bu çok yönlü yapısı, değişen ve gelişen dünya dinamiklerine paralel olarak son yıllarda benimsediği yeni nesil sendikacılık stratejisinin de temelini oluşturarak, değişen üretim dinamikleri, dijital dönüşüm ve sürdürülebilirlik gerekliliklerine uyumlu, daha proaktif ve yenilikçi bir temsil anlayışının gelişmesine olanak sağlamaktadır.

TİSK **yeni nesil sendikacılık stratejisini g**ençlere ve kadınlara yönelik politikalar üreten, çevreyi gündemine alan, dijital okur yazarlığı önemseyen sendikacılık olarak ifade etmiştir (https://www.aa.com.tr/tr/turkiye/tiskten-yeni-nesil-sendikacilik-cagrisi/1570232, Erişim 05.12.2025). TİSK bu strateji yaklaşımının bir yansıması olarak, teknoloji devrimi ve endüstri 4.0 odağındaki değişim hızla devam derken, bu dönüşüme uyum sağlayarak sendikal alanda geleneksel yapıya yeni bir bakış açısı kazandırmaktadır. Bu çerçevede, çalışma hayatının ve ülke ihtiyaçlarını karşılayacak bir yapılanma olarak **Sendika 4.0** yaklaşımına geçmeyi temel hedeflerinden biri hâline getirmiştir. Uygulama odaklı kurumsal duruşuyla TİSK, yeni nesil sendikacılık vizyonu sayesinde çalışma yaşamındaki dönüşümlere duyarlı, analitik veriye dayalı ve geleceği öngören bir temsil modeli benimsemektedir. (TİSK 28. Olağan Genel Kurul Raporu, 2023: 318) Bu modelde, değişen üretim yapıları, dijitalleşme, yeşil dönüşüm ve iş gücü piyasalarındaki dönüşümler doğrultusunda işveren temsil mekanizmasını modernleştirmeyi hedefleyen bütüncül bir yaklaşımı ifade etmektedir. Böylece klasik sendikal faaliyetlerin ötesine geçerek veri temelli analizler, yenilikçi politika önerileri, sosyal diyalogun güçlendirilmesi, esnek ve kapsayıcı çalışma modellerinin desteklenmesi gibi unsurları merkeze almaktadır. Ayrıca, nitelikli iş gücünün geliştirilmesi, sürdürülebilirlik ilkelerinin iş dünyasına entegre edilmesi, KOBİ'lerin dönüşüm süreçlerinde desteklenmesi ve kurumsal sosyal sorumluluk anlayışının yaygınlaştırılması stratejinin temel bileşenleri arasında yer almaktadır.

TİSK'in yeni nesil sendikacılık stratejisi kapsamında yer alan ulusal ve uluslararsı bir çok kurum ve kuruluşla işbirliği halindedir. TİSK'in yeni nesil sendikacılığı şu temelleri kapsar: g**enç ve kadın odaklı politikalar, çevre, iklim, sürdürülebilirlik, dijital okuryazarlık ve dijital dönüşüm, yeşil ve dijitalleşme, sosyal diyalogun güçlendirilmesi, yapay zekâ, veri temelli politika üretimi, uluslararası işbirlikleri, kurumsal sosyal sorumluluk ve ortak yarınlar programları yer almaktadır. Bu kapsamda TİSK'in çalışmalarına bakılacak olunduğunda,** kurumsal ve sosyal sorumluluk projeleri, genç ve kadın odaklı projeler, dijital ve teknoloji odaklı projeler, ulusal ve uluslararası işbirlikleri ile politika geliştirme olarak sıralamak mümkün.

Kurumsal sosyal sorumluluk kapsamında **Ortak Yarınlar Programı ile** sürdürülebilirlik ve sosyal sorumluluk temalı projeleri kapsamakta olup, her yıl farklı temalar çerçevesinde yeşil dönüşüm, dijitalleşme, yeni nesil iş modelleri çalışmalar yürütmektedir. Program aynı zamanda kurumsal sosyal sorumluluk projelerini ödüllendirerek TİSK'in "yeşil ve dijital geleceğe" katkısını artırmaktadır (https://www.ortakyarinlar.com/, Erişim tarihi 06.12.2025). Benzer şekilde, **Yeşile Ortak Ol** projesi,

TİSK'in Türk-İş ve Hak-İş ile üçlü işbirliğiyle yürüttüğü bir girişimdir. Bu proje kapsamında her yıl 2 milyon çalışan için 2 milyon fidan dikilmesi hedeflenmekte ve dijital bağış ile sertifikasyon sistemi aracılığıyla iş dünyasında çevresel sorumluluk teşvik edilmektedir (https://www.tisk.org.tr/proje/37/yesile-ortak-ol.html, Erişim tarihi 06.12.2025). Genç ve kadın odaklı projeler kapsamında Genç Kadın Liderler programı yer almaktadır. Genç kadın liderlerin iş dünyasında güçlendirilmesini, mentorluk, eğitim ve liderlik kapasitesinin geliştirilmesini ve kadın dostu çalışma hayatının teşvik edilmesini hedeflemektedir (https://www.tisk.org.tr/proje/46/genc-kadin-liderler.html, Erişim 06.12.2025). 2023 yılında 11 ilimizi kapsayan Kahramanmaraş depreminin ardından deprem bölgesindeki kadınlara dijital ve yeşil dönüşüm alanlarında mesleki beceriler kazanmasını sağlamak amacıyla program oluşturulmuştur (https://www.tisk.org.tr/proje/904/deprem-bolgesindeki-kadinlar-icin-yesil-ve-dijital-donusum-egitim-programi.html, Erişim 06.12.2025). Yine 2021 yılında kadınların sendikalardaki temsil oranının arttırılması ve liderlik kapasitelerinin yükseltilmesi amacıyla Yeni Nesil Sendikacılıkta Kadın Liderlik Programı oluşturulmuştur (https://www.tisk.org.tr/proje/844/yeni-nesil-sendikacilikta-kadin-liderlik-programi.html, Erişim 06.12.2025). Gençlik dönüşümü için sanayiden başlayarak tüm sektörlerde görülecek olan dijital dönüşüm sürecinde, iş dünyasına hazırlanan genç iş insanlarının gelişimine katkı sunan ve dönüşüme bu yolla ortak olunacağına inanan TİSK, bilişim teknolojileri alanında kamu ve özel sektöre teknolojide uzman genç iş gücü kazandırmayı amaçlamıştır (https://www.tisk.org.tr/proje/38/genc-donusum.html,Erişim 06.12.2025). Bu projelerle TİSK, kayıtlı istihdamı desteklemekte,yürütmekte ve esnek ile dijital çalışma modellerini teşvik etmektedir. Aynı zamanda çalışma hayatında kadın katılımını artırma girişimleri ise kadın dostu işyeri modelleri geliştirmekte uygulamakta ve kadınların dijital beceri kazanmasını ve teknik alanlara yönlendirilmesini desteklediği görülmektedir. TİSK'in dijital ve teknoloji odaklı çalışmaları arasında TİSK Akademi ile sürdürmekte olup dijital okuryazarlık, yapay zekâ ve veri analitiği eğitimleri sunmakta, yeşil beceriler ve Endüstri 4.0 adaptasyonunu desteklemekte ve gençler ile kadınlar için özel modüller sağlamaktadır. (https://www.tisk.org.tr/proje/41/tisk-akademi.html, Erişim 06.12.2025). TİSK'in ulusal ve uluslararası işbirlikleri kapsamında **IOE (Uluslararası İşverenler Örgütü)**, sürdürülebilirlik rehberleri sunmakta, küresel işveren standartlarını belirlemekte ve dijital dönüşüm ile yeşil beceriler politikalarını desteklemektedir. **BusinessEurope** ile işbirliği ise AB Yeşil Mutabakatı ve düşük karbonlu üretim politikaları çerçevesinde Avrupa işverenleriyle ortak politika ve yol haritaları geliştirmeye odaklanmaktadır. **WBCSD (Dünya Sürdürülebilir Kalkınma İş Konseyi)** çalışmaları, kurumsal sürdürülebilirlik ve karbon raporlamasını teşvik etmekte, döngüsel ekonomi ve çevre yönetimi uygulamalarını yaygınlaştırmaktadır. Ayrıca, **Avrupa Birliği ve IPA projeleri** aracılığıyla genç ve kadın istihdamı, dijital ve yeşil becerilerin geliştirilmesi, sosyal diyalogun güçlendirilmesi ve mesleki yeterlilik sistemleri ile sektör yol haritalarının hazırlanması desteklenmektedir (TİSK 28. Olağan Genel Kurul Raporu, 2023: 319-320). TİSK, politika geliştirme ve kurumsal katkılar kapsamında çalışma hayatının çeşitli alanlarında aktif rol almaktadır. **Asgari ücret, sosyal güvenlik ve kayıtlı istihdam** konularında yeni nesil politika önerileri sunmakta, veri temelli raporlama ve işgücü piyasası analizleri yapmaktadır. Ye**şil ve Dijital Dönüşüm Çalışma Grupları** ile sendikacılıkta klasik yapıdan sendikacılık 4.0'a geçişi hedeflemektedir.

SONUÇ

Sosyal gelişmeler kaçınılmaz olarak insan hayatı etkilemektedir; üretim biçimleri zamanlara göre farklılık gösterirken dolayısıyla insanın mevcut düzene ayak uydurması son derece olağan bir durum olarak görülmektedir. Dönüşümlerin üretim biçimlerinden, istihdam şekillerine, dolayısıyla örgütlenme modellerine kadar geniş bir yelpazeyi etkilediği görülmektedir. Örgütlenme bakımından değerlendirildiğinde ise anayasal güvence altına alınmış bir hak olarak hem işçi tarafının hem işveren tarafının bu süreçten etkileneceği bir gerçektedir. Genel anlamda değerlendirildiğinde süreç bağımsız çalışanların yüksek olduğu tarım toplumundan, bağımlı çalışanların yoğun olduğu sanayi toplumuna ve devam eden süreçte dijitalleşme çağında belki de "üçüncü" bir statü olarak değerlendirilebilecek olan platform çalışanlarının durumunu sebep olan bir dinamik olarak dijitalleşme toplumsal hayata tesir etmektedir. Bu bakımdan yeni nesil sendikacılık anlayışıyla özellikle "dijital kanalların" kullanımına

hitap eden bir dönüşüm yaşanılmaktadır. Emek avcı-toplayıcı toplumdan itibaren yaşanan dönüşümlerden her zaman etkilenen bir olgu olarak toplumların yaşayış biçimleri etkilenmektedir. Bu bakımdan yeni nesil sendikacılık anlayışıyla özellikle "dijital kanalların" kullanımına hitap eden bir dönüşüm yaşanılmaktadır.

Yeni nesil sendikacılık, Türkiye'de hem çalışan hem de işveren örgütleri için stratejik bir dönüşüm alanı olmaktadır. Bu bağlamda çalışmanın konusu olan ve işveren sendikası olarak TİSK'in faaliyetleri ilgili raporlar analiz edilerek incelenmiştir. TİSK'in sürdürülebilirlik, yeşil ve dijital dönüşüm kapsamında işveren sendikacılığının çağın gereklerine uyum sağlama potansiyelini göstermektedir. Sendikaların aynı zamanda birer "sosyal politika" aracı olması işlevlerinin daha geniş alana hitap etmesine ve sosyal gelişmeye katkı sağlamasına olanak sağlamaktadır.

TİSK'in dijital okuryazarlığın sağlanmasıyla sağlamak, dijital dönüşüm, yeşil dönüşüm, sosyal diyalog gibi geniş alanlara hitap eden ve kurumsal sosyal sorumluluk anlayışında barındıran yeni nesil sendikacılığı uygulama gayretleri bulunmaktadır. Ayrıca sosyal politikanın dezavantajlı grupları içinde yer alan kadınlar, gençler gibi kişilere yönelik bireylerin çalışma hayatına kayıtlı istihdam ekseninde sağlayarak hem genç iş gücü hem de kadın iş gücüne yönelik politikalar ve projeler üretmektedir. Esasen TİSK'in bu faaliyetleri klasik sendikacılığın ücret ve pazarlık odaklı hedeflerinin çok ötesine geçtiğini göstermektedir. Aynı zamanda **Dünya Sürdürülebilir Kalkınma İş Konseyi**, Avrupa Birliği gibi uluslararası düzeyde işbirliğinde bulunan TİSK'in farklı örgütlenmelere de örnek teşkil etmesi sosyal refahı artırma konusunda ve aynı zamanda "sosyal diyalog" mekanizmasının güçlenmesi bakımından bir öncü olarak geniş etki uyandırması olağandır.

Ancak bu dönüşümün sürdürülebilir olması için dijital iş modellerine uygun **yasal çerçevelerin** geliştirilmesi, v**eri odaklı sosyal diyalog platformlarının** kurulması, a**kademi iş dünyası ve sivil toplum iş birliğinin** güçlendirilmesi, gerekmektedir. Bu bağlamda, yeni nesil sendikacılık yalnızca kurumsal yapıları ve iş süreçlerini dönüştürmekle kalmayacak, aynı zamanda işgücünün beceri gelişimini destekleyerek ekonomik rekabetçiliği artıracak ve toplumsal refahı güçlendirecek bir mekanizma olarak ön plana çıkacaktır. Gelecek perspektifinde, çevresel sürdürülebilirlik, dijital yetkinlikler ve sosyal kapsayıcılık odaklı politikalar, sendikaların hem ulusal hem de uluslararası düzeyde etkinliğini artıracak temel unsurlar olacaktır.

Abstract

This study explores the impact of psychological capital on the psychological distress of academic staff at public universities in Malaysia. Psychological capital, which includes self-efficacy, optimism, hope, and resilience, plays a critical role in managing job stress, work demands, and work-family conflict. Academic staff face increasing pressures that can negatively affect their mental health and job performance. Using survey data from 350 respondents, this study examines how psychological capital moderates these stressors and contributes to overall well-being. Findings reveal that individuals with higher psychological capital experience lower stress levels and greater resilience in coping with professional and personal challenges. The results emphasize the importance of integrating psychological capital development into institutional policies to enhance academic staff's mental health, job satisfaction, and productivity. Universities should implement targeted interventions such as resilience training, mental health support programs, and work-life balance initiatives to foster a more supportive work environment. Strengthening psychological capital among academic staff can lead to better stress management, improved job performance, and a healthier academic workforce. This study provides valuable insights for university administrators and policymakers in creating sustainable well-being strategies within higher education institutions.

Keywords: Psychological Capital, Psychological Distress, Academic Staff

INTRODUCTION

Psychological distress is a subjective measure of mental health, encompassing satisfaction, happiness, and self-fulfillment. It is essential for reducing stress, enhancing life quality, and improving mental health outcomes [1]. In higher education institutions, the psychological distress of academic staff has gained significant attention, particularly due to the increasing pressures of the evolving education system and heightened job demands. These pressures contribute to job stress and work-family conflicts, which adversely affect mental health and overall well-being [2].

The concept of psychological capital, which includes self-efficacy, optimism, hope, and resilience, has been identified as a critical personal resource for mitigating job-related stressors. High psychological capital levels are associated with a greater capacity to handle work demands, manage stress effectively, and reduce the negative impacts of job stress on mental health [3]. Academic staff with strong psychological capital are better equipped to navigate job-related challenges and maintain a positive mental state despite high job demands and conflicts [4].

Building on this understanding, this study explores how psychological capital moderates the relationship between job stress, job demands, and work-family conflict with psychological distress. This moderating role is significant as it highlights psychological capital's potential to buffer the negative effects of

workplace stressors, thereby fostering resilience and promoting mental health among academic staff. Despite existing research on the impacts of job stress and work-family conflict, there remains a lack of clarity on the moderating role of psychological capital in these contexts, particularly in Malaysian public universities. Therefore, this study aims to address these gaps by investigating: This study seeks to clarify two aims: (1) the relationships among job stress, job demands, and work-family conflict with psychological distress, (2) determine the moderating effects of psychological capital on the relationships between job stress, job demands, and work-family conflict with psychological distress.

LITEARTURE REVIEWS

Job Stress, Job Demands, and Psychological Distress in Higher Education

Job stress and high job demands have been consistently identified as prominent occupational stressors affecting academic staff's psychological well-being. In higher education, these stressors manifest through role overload, ambiguity, conflicting demands, and pressures for research productivity, teaching, and administrative duties [5]. Such stressors contribute substantially to psychological distress, including symptoms of anxiety, depression, and burnout. Moreover, academic staff often experience intense work demands that exceed available job resources, intensifying stress and leading to diminished mental health [6]. These occupational challenges are central to understanding psychological distress in the academic workforce and align with the first research aim concerning the relationship among job stress, job demands, and psychological distress.

Work-Family Conflict and Psychological Distress Among Academics

Work-family conflict (WFC) arises when pressures from academic work roles interfere with family responsibilities, resulting in strained personal relationships and increased psychological strain. Empirical studies reveal that WFC significantly predicts psychological distress among academic staff, exacerbating feelings of burnout and emotional exhaustion [7]. The spillover of work demands into family life is particularly pronounced in academia due to irregular hours and the emotional labor associated with teaching and mentoring [8]. These findings corroborate the role of WFC as both a direct contributor and mediator in the relationship between job stressors and psychological distress, reinforcing the rationale for examining WFC in the current study.

Psychological Capital as a Protective Resource

Psychological capital comprising self-efficacy, optimism, hope, and resilience has gained substantial attention as a personal psychological resource that enhances individuals' capacity to cope with work-related stress [9]. Emerging evidence affirms the direct beneficial effects of high Psychological capital on reducing psychological distress and increasing adaptive responses among Malaysian academic professionals, thus promoting occupational well-being [16]. Importantly, Psychological capital’s multi-dimensionality provides diverse coping mechanisms that buffer against various strains associated with academic roles.

Relationships Among Job Stress, Job Demands, Work–Family Conflict, and Psychological Distress

Job stress, job demands, and work–family conflict (WFC) continue to be critical occupational stressors that significantly influence employees' psychological well-being independent of pandemic-related factors. Current literature confirms these factors as robust predictors of psychological distress, which encompasses symptoms of anxiety, depression, and burnout [10]. Job stress commonly arises from role overload, role ambiguity, and conflicting job demands. These stressors frequently spill over into family life, intensifying work–family conflict and compounding psychological distress. This spillover effect contributes to emotional exhaustion and deteriorates overall mental health.

The quantitative and qualitative aspects of job demands, including workload intensity and emotional labor, exacerbate this strain. High job demands increase the likelihood of WFC, which serves as an additional source of psychological distress. Organizational factors such as a poor psychosocial safety climate and insufficient support systems further amplify these negative effects [11]. The Job Demands-Resources (JD-R) model remains a widely endorsed theoretical framework for understanding these dynamics, emphasizing that excessive job demands, in the absence of sufficient resources, create a conducive environment for mental health problems [12].

Further empirical evidence supports that job stressors related to role overload and role conflict extend beyond the workplace, contributing to tension and conflict in family roles. Work–family conflict has been identified as a partial mediator between job stress and psychological distress, with its presence exacerbating feelings of burnout, including emotional exhaustion, cognitive weariness, and depersonalization [13-14]. These findings highlight the chronic stress employees endure due to conflicting work and family demands, which can have lasting implications on their psychological health.

An extensive body of research consolidates Psychological capital's inverse relationship with psychological distress across diverse occupational and academic populations, confirming its role as a vital adaptive psychological resource [15]. Psychological capital operates through its four interrelated dimensions—self-efficacy, optimism, hope, and resilience that collectively enhance individuals' capacity to cope with and rebound from workplace stress.

Theoretically, Conservation of Resources (COR) theory provides an explanatory framework for Psychological capital's function in academic settings [16-17]. COR posits that individuals strive to obtain, retain, and protect valuable resources, including psychological ones. Academics possessing high Psychological capital are better equipped to maintain resource reservoirs when facing job demands and WFC, thereby preserving psychological equilibrium and behavioral flexibility under stress [18]. This protective mechanism helps prevent resource depletion that otherwise leads to psychological distress. Furthermore, integrating Psychological capital within established occupational health models like the JD-R framework deepens theoretical understandings and practical implications [19]. Psychological capital serves as a personal resource that buffers job demands' negative effects by promoting adaptive motivation and coping, thus reducing burnout and distress.

These theoretical insights, supported by empirical studies in Malaysian higher education, underscore Psychological capital's potential as a target for evidence-based interventions aimed at fostering psychological resilience and well-being in academics navigating complex and demanding work-family environments. While much of the extant research has focused on Psychological capital as a mediator explaining how occupational stress translates to psychological outcomes through Psychological capital-related pathways its role as a moderator remains comparatively underexplored, especially in the Malaysian academic context. Mediating models interpret Psychological capital as a mechanism conveying the effect of stressors on distress, whereas moderating models conceptualize Psychological capital as a variable that changes the strength or direction of these relationships [20]. Recent moderated mediation analyses in analogous occupational groups highlight Psychological capital's buffering function, where its presence weakens the detrimental impact of stressors such as work-family conflict on mental health outcomes.

MATERIALS AND METHODS

The research process began with a thorough literature review to understand the existing body of knowledge on psychological capital and well-being. Specifically, the Perceived Stress Scale (PSS) was used to measure the general stress levels experienced by participants, while the Job Demands-Resources Scale (JDRS) captured the specific features of job demands as well as available job resources. To assess the extent and nature of role conflict between work and family domains, the Work-Family Conflict Scale (WFCS) was administered. The participants' level of psychological capital which includes hope,

resilience, optimism, and self-efficacy was measured using the Psychological Capital Questionnaire (PCQ). Lastly, overall psychological distress was evaluated using the General Health Questionnaire (GHQ), a widely recognized tool for screening mental health and psychological well-being in organizational research. Ethical approval for the research was obtained from the university's research ethics board to ensure adherence to ethical guidelines throughout the study. The survey was developed using Google Forms to create an online questionnaire. The survey included informed consent at the beginning, explaining the purpose of the study and ensuring voluntary participation. The survey link was then distributed via official university channels, emails, and social media platforms to reach a broad group of academic staff. This distribution method ensured accessibility and convenience for the participants. Data were collected from a total of 350 academic staff members across all public universities in Malaysia. To ensure data quality, responses were screened for completeness and consistency before analysis. The reliability of the instruments was assessed using Cronbach's Alpha, which confirmed the internal consistency of all the instrument. The collected data were analyzed using SPSS software. Descriptive statistics were first calculated to analyze the demographic profile of the respondents, including age, gender, and years of experience. Next, Pearson's correlation analysis was conducted to explore the relationships between psychological capital and psychological distress. Finally, multiple regression analysis was performed to assess the predictive power of psychological capital components on psychological distress. A significance level of $p < 0.05$ was set for all statistical tests. Data acquisition was carried out using an online survey, ensuring voluntary participation and obtaining informed consent from all participants before they completed the survey. Anonymity and confidentiality were maintained throughout the data collection process. All responses were securely stored and handled in compliance with ethical standards.

FINDINGS

Instructor	4	1.1
Total	350	

This study examined the socio-demographic characteristics of academic staff from various public universities in Malaysia. A total of 350 respondents participated in the study, providing valuable insights into the composition of the academic workforce in terms of university affiliation, gender, age, marital status, education level, employment status, years of experience, and current position grade. In terms of university affiliation, respondents were drawn from a diverse range of public universities. The largest group of participants came from University I (UI; 13.1%), followed by University P (UP; 12.3%) and University K (UK; 9.1%). Other universities such as University E (UE; 2.0%) and University Q (UQ; 2.0%) contributed smaller proportions of respondents, reflecting the broad representation of academic staff from various Malaysian higher education institutions. Regarding gender, the majority of respondents were female (60.9%), while male respondents accounted for 39.1%. This gender distribution indicates that female academics constitute a substantial portion of the workforce in Malaysian public universities. The age distribution of respondents revealed that most participants were within the 31–40 years (39.1%) and 41–50 years (41.7%) age brackets. Smaller proportions were observed in the 51–60 years (16.6%), 20–30 years (1.7%), and 61 years and above (0.9%) categories. These findings indicate that the academic staff surveyed were predominantly in their middle career

stages. In terms of marital status, the majority of respondents were married (82.9%), whereas 17.1% were single. This reflects the common demographic pattern among academic professionals in Malaysia. The educational attainment of respondents showed a highly qualified academic workforce. A substantial majority held a Doctoral degree (Ph.D.; 74.0%), followed by those with a Master's degree (23.4%), while only 2.6% possessed a Bachelor's degree. This high level of educational achievement is consistent with the qualifications expected for academic positions in Malaysian public universities.

With regard to employment status, most respondents held permanent positions (88.0%), while 11.4% were employed on a contract basis, and 0.6% worked part-time. This indicates a relatively stable and secure workforce within the public university system. The distribution of working experience showed that 21.7% of respondents had 11–15 years of experience, 23.1% had 0–5 years, 19.1% had 5-10 years, and 20.0% had 15–20 years. Smaller groups had 21–25 years (10.0%), 25–30 years (4.6%), and 31–35 years (1.7%) of experience. These figures reflect a balanced representation of both early-career and experienced academic staff. For current position grade, the largest proportion of respondents held Grade 51 (32.3%), followed by Grade 52 (28.6%) and Grade 54 (16.6%). Other grades included Grade 41 (3.7%), Grade 42 (3.4%), Grade 44 (8.0%), Grade 45 (2.3%), Special Grade C (4.9%), and Special Grade B (0.3%). This distribution illustrates a broad representation across hierarchical academic levels.

Finally, with respect to academic position, the majority of respondents were Senior Lecturers (52.9%), followed by Lecturers (20.6%), Associate Professors (15.1%), and Professors (4.0%). Smaller proportions were Language Teachers (6.3%) and Instructors (1.1%). This suggests that the study primarily surveyed teaching and research-focused staff, with a strong representation of mid-career academics. Overall, the socio-demographic characteristics of the respondents reflect a well-rounded, diverse group of academic staff with a range of qualifications, experience, and roles [19,20]. This diversity is crucial for providing a comprehensive understanding of academic staff's psychological capital and well-being across Malaysia's public universities.

RELATIONSHIP AMONG JOB STRESS, JOB DEMANDS, WORK-FAMILY CONFLICT, PSYCHOLOGICAL CAPITAL, AND PSYCHOLOGICAL DISTRESS AMONG ACADEMIC STAFF

This section investigates the relationships between major occupational factors specifically job stress, job demands, and work-family conflict and psychological distress among academic staff at Malaysian public universities. The focus is to clarify how these work-related stressors are statistically linked with distress, as well as to consider the role of psychological capital as a potential buffer. Each respondent's capacity to manage stress, demonstrate resilience, sustain optimism, and exhibit self-efficacy, which together constitute psychological capital, was assessed as part of this analysis. To achieve this, Pearson's correlation analysis was carried out to determine the strength and direction of the linear associations among psychological distress, job stress, job demands, work-family conflict, and psychological capital [25].

Table 2. Correlation Matrix among Core Study Variables (n = 350)

Variable	1	2	3	4	5
1. Job Stress	1				
2. Job Demands	.53***	1			

Variable	1	2	3	4	5
3. Work-Family Conflict	.43***	.36***	1		
4. Psychological Capital	-.36***	-.29***	-.33***	1	
5. Psychological Distress	.47***	.39***	.41***	-.44***	1

*correlations were significant at $p < 0.001$

The results in Table 2 revealed significant positive correlations between psychological distress and key occupational stressors, including job stress ($r = .47$, $p < 0.001$), job demands ($r = .39$, $p < 0.001$), and work-family conflict ($r = .41$, $p < 0.001$). These findings indicate that higher levels of these factors are associated with increased psychological distress among academic staff, reflecting their impact on mental health within the demanding university work environment. Conversely, psychological capital showed significant negative correlations with psychological distress ($r = -.44$, $p < 0.001$), job stress ($r = -.36$, $p < 0.001$), job demands ($r = -.29$, $p < 0.001$), and work-family conflict ($r = -.33$, $p < 0.001$). This suggests that higher psychological capital, representing positive psychological resources such as resilience and optimism, is associated with lower levels of psychological distress and workplace stressors.

The pattern of associations underscored by these correlations aligns with prior work emphasizing the protective role of psychological capital in mitigating the adverse effects of occupational stress [26,27]. Specifically, the moderate to strong correlations between the stress-related variables underline the multifaceted nature of job-related pressures faced by academics, reinforcing the necessity of addressing these issues through systemic and individual-level interventions. The inverse associations with psychological capital highlight the potential benefit of fostering this resource to enhance coping mechanisms and improve overall well-being.

Altogether, these correlation results provide empirical support for advancing to more complex multivariate analyses, including regression and moderation models, to clarify the unique and interactive influences of these variables on psychological distress. They also contribute to the growing evidence base advocating for integrated psychological capital development programs within academic institutions aiming to promote mental health and resilience in the academic workforce [28,29].

MODERATING EFFECTS OF PSYCHOLOGICAL CAPITAL ON THE RELATIONSHIPS BETWEEN JOB STRESS, JOB DEMANDS, WORK-FAMILY CONFLICT, AND PSYCHOLOGICAL DISTRESS

A central focus of this study is to assess whether psychological capital moderates the impact of job stress, job demands, and work-family conflict on psychological distress among academic staff. The moderating effect hypothesized here suggests that higher psychological capital characterized by greater hope, optimism, resilience, and self-efficacy serves as a buffer, reducing the negative influence of these occupational stressors on staff mental health outcomes.

To rigorously evaluate the moderating effect of psychological capital, hierarchical regression analyses were conducted. In the initial step, job stress, job demands, and work-family conflict were specified as independent variables influencing psychological distress. In the subsequent step, interaction terms created by multiplying each stressor with psychological capital were added to the model to formally test for moderation. This analytic strategy is widely recommended for moderation analysis, as it clarifies whether the relationship between occupational stressors and psychological distress varies across different levels of psychological capital. In the following step, interaction terms representing the product of these stressors and psychological capital were included to test moderation [30-32].

Table 3 presents the results of the moderation analysis assessing how psychological capital influences the relationships between job stress, job demands, work-family conflict, and psychological distress among Malaysian academic staff. Each row in the table reports the unstandardized regression coefficient (B), standard error (SE), t-value (t), and significance level (p) for the main effects and interaction terms. The hierarchical regression analysis results detailed in Table 3 reveal important insights into the moderating role of psychological capital.

Step 1 controlled for demographic variables age, gender, and marital status accounting for 7.0% of the variance in psychological distress ($R2=0.070$, $F(4,330)=5.200$, $p<.001$ $R2=0.070$, $F(4,330)=5.200$, $p<.001$). Marital status emerged as a significant positive predictor at this stage ($\beta=0.167$, $p<.01$ $\beta=0.167$, $p<.01$). In Step 2, job stress, job demands, work-family conflict, and psychological capital were added, significantly improving the model's explanatory power to 23.0% of variance explained ($\Delta R2=0.160$, $F\Delta R2=0.160$, F change = 17.500, $p<.001$ $p<.001$). Job stress ($\beta=0.152$, $p<.001$ $\beta=0.152$, $p<.001$), job demands ($\beta=0.940$, $p<.01$ $\beta=0.940$, $p<.01$), and psychological capital ($\beta=-0.122$, $p<.01$ $\beta=-0.122$, $p<.01$) were significant predictors, suggesting that job stressors increase psychological distress while psychological capital reduces it. Step 3 incorporated interaction terms between psychological capital and each job stressor to test moderation effects.

This further increased explained variance to 30.0% ($\Delta R2=0.070$, $F\Delta R2=0.070$, F change = 14.000, $p<.001$ $p<.001$). All moderating interaction terms were significant: job stress × psychological capital ($\beta=-0.670$, $p<.001$ $\beta=-0.670$, $p<.001$), job demands × psychological capital ($\beta=-0.290$, $p<.05$ $\beta=-0.290$, $p<.05$), and work-family conflict × psychological capital ($\beta=-0.480$, $p<.01$ $\beta=-0.480$, $p<.01$). These negative interaction coefficients indicate that higher psychological capital buffers the adverse impact of job stressors on psychological distress.

Overall, these findings demonstrate that psychological capital not only directly reduces psychological distress but also moderates the impact of key occupational stressors, specifically job demands and work-family conflict, underscoring its vital role in fostering employee resilience and mental well-being.

Table 3. Hierarchical Regression Analysis Predicting Psychological Distress: Moderating Effects of Psychological Capital

	Step 1 (Control)	Step 2 (Additive Model)	Step 3 (Interactive/2-way Interaction)
Control Variables			
Age	0.007	-0.028	-0.046

To further interpret these effects, simple slopes analyses were conducted [33]. The results demonstrated that for academic staff with high psychological capital (one standard deviation above the mean), the positive association between job stress, work-family conflict, job demands and psychological distress was substantially weaker than for staff with low psychological capital. For visual clarity, Figure 1 illustrates the moderating effect using the job stress–distress association as an example. The slope rise

in distress with increasing job stress is much flatter for those with high psychological capital, confirming its buffering role. These findings align with previous international evidence, showing that psychological capital encompassing hope, optimism, resilience, and self-efficacy, strengthens an individual's ability to handle workplace stressors and reduces their impact on mental health [33-35]. Recent experimental interventions have also demonstrated that psychological capital can be enhanced through structured training programs, further emphasizing its importance as a practical and modifiable resource for academic well-being.

Figure 1. Moderating Effect of Psychological Capital on the Relationship Between Job Stress and Psychological Distress

In this figure, two lines represent two lines represent the predicted psychological distress for individuals with low psychological capital; –1 standard deviation from the mean) and high psychological capital (+1 standard deviation from the mean) across varying levels of job stress. The blue line illustrates the simple slope for participants with low Psychological capital, while the gray line displays the corresponding slope for those with high Psychological capital. As job stress increases from low (1) to high (5), the predicted psychological distress rises markedly for individuals with low psychological capital, as reflected in the steep angle of the blue line. In contrast, the slope for high psychological capital remains much flatter, indicating a substantially weaker relationship between job stress and psychological distress for these individuals. This means that those with higher levels of psychological capital experience far less psychological distress as job stress intensifies compared to those with lower psychological capital.

The separation and relative steepness of the two lines clearly demonstrate the moderating effect: psychological capital serves as a protective buffer, diminishing the adverse impact of job stress on mental health among academic staff. These results confirm that fostering psychological capital can effectively reduce the risk of psychological distress even under increasing workplace pressures. This finding is consistent with current literature on occupational stress and resilience in academic settings [36-38].

Figure 2. Moderating Effect of Psychological Capital on the Relationship Between Job Demands and Psychological Distress

The simple slope plot in Figure 2 illustrates the moderating effect of psychological capital on the relationship between job demands and psychological distress. In the graph, psychological distress is plotted on the y-axis, while job demands appear on the x-axis. Two distinct lines are depicted: the blue line represents individuals with low psychological capital (–1 SD), and the red line corresponds to those with high psychological capital (+1 SD). For individuals with low psychological capital, the blue line shows a markedly steep increase in psychological distress as job demands rise.

This indicates that when psychological capital is low, increases in job demands are closely followed by large increases in psychological distress, reflecting greater vulnerability and poor coping resources. Conversely, the red line for those with high psychological capital reveals a much flatter slope. Even as job demands increase, psychological distress for these individuals only rises modestly. This flatter trajectory demonstrates that high psychological capital acts as a buffer, significantly weakening the negative psychological impact of increased job demands [39].

Overall, Figure 2 provides clear visual and quantitative evidence that psychological capital serves as a protective moderator in the job demands–distress relationship. Staff with higher

psychological capital are substantially less affected by rising job demands than their lower-capital counterparts, highlighting the importance of developing and maintaining psychological capital to foster resilience and well-being in demanding work environments [40-42].

Figure 3. Moderating Effect of Psychological Capital on the Relationship Between Work-Family Conflicts and Psychological Distress

Figure 3 illustrates the simple slopes for the moderating effect of psychological capital on the relationship between work-family conflict and psychological distress. The graph displays predicted psychological distress on the vertical axis and levels of work-family conflict on the horizontal axis, with separate lines for high psychological capital (+1 SD, grey line) and low psychological capital (−1 SD, yellow line). The findings reveal a clear interaction effect. For individuals with high psychological capital, psychological distress increases steeply as work-family conflict rises this is evidenced by the sharp upward trajectory of the grey line.

In contrast, those with low psychological capital show only a modest increase in psychological distress across the same range of work-family conflict, as represented by the much flatter yellow line. This pattern indicates that psychological capital significantly moderates the impact of work-family conflict on psychological distress. Contrary to the typical buffering hypothesis, the slope is steeper for those high in psychological capital, suggesting that the positive association between work-family conflict and psychological distress is stronger for these individuals within this sample and model specification. This unexpected direction warrants further investigation but highlights that the influence of psychological capital may be complex, possibly shaped by contextual or methodological factors.

Overall, Figure 3 demonstrates that the effect of work-family conflict on psychological distress is not uniform and depends significantly on employees' levels of psychological capital. This interaction underscores the importance of considering personal psychological resources in understanding and managing the consequences of work-family conflict in organizational settings.

DISCUSSION AND CONCLUSION

The findings from the analysis of work stress, job demands, and work-family conflict indicate that these factors significantly affect the psychological distress of academic staff, albeit with variations across different respondents. The overall level of work stress and job demands is moderate, with academic staff reporting a range of experiences from manageable to overwhelming. The mean scores suggest that while a majority of respondents experience some degree of stress and pressure, there is still a significant portion who report being able to manage their workload effectively. Job demands, particularly multitasking and the need for constant attention to work are commonly cited as sources of stress, contributing to the overall psychological burden of academic staff.

The work-family conflict emerged as a significant issue, with many respondents indicating that the demands of their professional responsibilities negatively impacted their personal and family lives. Items related to the difficulty of balancing work and family responsibilities, such as the inability to fulfill family duties due to work commitments and the pressure of time constraints, received relatively low scores, pointing to the substantial strain caused by work-family conflict. This suggests that work-family conflict is a prominent concern that can detract from the psychological distress of academic staff, especially in environments where work demands are high and flexibility is limited.

Psychological capital (psychological resources such as resilience, optimism, and self-efficacy) was found to play a crucial role in moderating the effects of work stress, job demands, and work-family conflict on the psychological distress of academic staff. Those with higher levels of psychological

capital tended to report better management of work-related pressures and were more likely to demonstrate resilience in balancing professional and personal obligations. This indicates that psychological capital is a potential protective factor, helping individuals cope more effectively with stressors in both work and family domains.

To address these challenges, universities and academic institutions need to focus on fostering psychological capital through training, development programs, and support systems aimed at improving resilience, optimism, and self-efficacy. Furthermore, policies and practices that promote work-life balance, such as flexible working hours, telecommuting options, and support for family-related responsibilities, can help reduce the negative impact of work stress and work-family conflict. By implementing such measures, institutions can enhance the psychological distress of their academic staff, ultimately leading to improved job satisfaction, productivity, and overall mental health.

ACKNOWLEDGMENT

The authors gratefully acknowledge the academic staff who participated in this study, thank all participating institutions and individuals who contributed to the completion of this research.

Abstract

Sustainability becomes an integral part of professional accounting education! In connection with the update of the International Education Standards, the Republic of Moldova is to take the necessary measures to integrate sustainability competencies into the initial training of professional accountants. The revisions to the International Education Standards provide accountants and auditors with the necessary skills, at a global level, to effectively apply sustainability reporting and assurance standards.

In a world where sustainability reporting is becoming increasingly important for companies, investors and society, this initiative represents a step forward towards a more transparent and responsible business environment.

Keywords: Digitalization, accounting professionals, sustainability

Introduction

The wave of digitalization that is transforming entire industries requires a reconfiguration of the way accounting professionals perform their work and interact with financial data. The rapid advancement of technology is causing the accounting profession to face significant changes, which require a reassessment of the skills and abilities needed to remain competitive and relevant. Furthermore, digitalization is transforming the way accounting operations are managed and redefining the education and training requirements for professionals in this field, questioning the traditional role of the accounting professional.

We believe that the digitalization of the accounting profession is not a simple option, but an inevitability dictated by the evolution of markets and client expectations. Current requirements revolve around increased transparency, instant access to financial information and rapid responses to business challenges, desired outcomes that can only be achieved by adopting appropriate technologies. Taking these aspects into account, this chapter investigates how accounting professionals perceive these paradigm shifts and how prepared they are to face the new demands of the digital market. In general, the impact of digitalization on the accounting profession is vast and multidimensional. On the one hand, emerging technologies such as artificial intelligence, automation and blockchain promise significant streamlining of accounting processes, improving accuracy and reducing errors at the same time. On the

other hand, these innovations introduce challenges related to data security, professional ethics and the need to develop new digital skills.

Research Methodology

In other words, these new technologies promise substantial streamlining of accounting processes, increasing accuracy and reducing human error. For example, artificial intelligence (AI) enables the automation of repetitive and complex tasks, such as account reconciliation and financial data analysis, which saves time and minimizes human error. Machine learning algorithms can also detect anomalies and fraud faster and more accurately than traditional methods, thus providing additional protection against financial risks. Advanced automation, through the use of software robots and other technologies, can take over routine tasks, such as data entry and report generation, freeing up valuable human resources for strategic and analytical activities. This improves operational efficiency and allows greater focus on value-added activities, such as financial consulting and strategic planning. At the same time, blockchain, with its ability to provide an immutable and transparent ledger of transactions, is revolutionizing the way accounting data is managed and verified. By eliminating the need for intermediaries and ensuring data integrity, it can significantly reduce the costs and risks associated with fraud and errors. It also facilitates real-time auditing and full transparency, essential for compliance with strict financial regulations.

However, these revolutionary changes bring to the fore complex challenges related to data security, professional ethics and the need to develop sophisticated digital skills. For this reason, the adaptability and continuous learning capacity of professionals become imperative for the survival and prosperity of the accounting profession.

Thus, accountants must embrace a new professional identity, in which their traditional role of recording and reporting financial transactions is augmented and enriched by the opportunities offered by the digital revolution.

Thus, assessing accounting professionals regarding the need for digitalization of the profession and the formation of new competencies and skills is a particularly important step in understanding how prepared they are to adapt to new technological realities. Moreover, their testing provides insight into how professionals in this field perceive the impact of digitalization on their daily activities, professional ethics, as well as the effectiveness of the curriculum in preparing them for the new digital economy.

At the same time, through this testing, information can be collected that will contribute to the development of appropriate policies and procedures to respond to the challenges and opportunities brought by digitalization, thus ensuring the continued success and relevance of the accounting profession in this new digital era.

Research Purpose and Objectives

In the current context of continuous change, dominated by the continuous wave of digitalization, the main purpose of this research is to outline the professional trajectory of the future accountant in a digitalized economy, with a focus on adapting to new technologies and market demands. Therefore, this study aims to identify the factors that influence the perception of the need for digitalization in the profession and those of optimizing the effectiveness of curricula in the formation of digital skills. This purpose is justified by the need to respond to current and future challenges, to ensure adequate and continuous training of accounting professionals and to contribute to the development of skills that allow them to successfully navigate a dynamic and complex economic landscape.

The first objective of the research is to identify and analyze the determinants that influence the perception of accounting professionals on the need for digitalization in the profession. This objective is important to understand the degree of preparation and openness of accounting professionals towards the

integration of digital technologies in their daily work, while identifying the barriers, perceived challenges, as well as the catalysts for the acceptance of new technologies among accounting professionals. Thus, we will explore the specialized literature to understand what are the key determinants that influence this perception.

The second objective is to assess the effectiveness of the current educational curriculum in developing the digital skills needed by accountants. Through this objective, we will track the extent to which current study programs are adapted to prepare students for digital challenges, while exploring ways in which the curriculum can be improved to better meet the demands of the labor market. To achieve this objective, we will investigate the determinants of optimizing the effectiveness of accounting curricula, examining how new technologies are integrated into the learning process and how they influence the preparation of future professionals for the labor market.

The third objective of this research is to analyze the relationships between the determinants of accounting professionals' perception of the need for digitalization in the profession, as well as the relationships between the variables that influence the effectiveness of curricula in developing digital skills. In this sense, the research aims to provide a deep understanding of how various factors contribute to the formation of accounting professionals' perceptions of digitalization, identifying the dynamics of interactions between these variables. In parallel, the research will explore the relationships between the factors that determine the optimization of educational curricula for developing digital

skills, revealing the essential elements of an effective curriculum in the current context of digital transformation. This approach will allow the development of well-founded educational and professional strategies, adapted to the requirements of a continuously evolving digital world.

Therefore, the objectives proposed in this part of the paper are designed to reflect the complexity and dynamics of the accounting field in the digital context, but also to propose paths of action and reflection in relation to the challenges and opportunities brought by new technologies.

The research method applied in this study is quantitative in nature and involves the use of questionnaires as the main data collection tool. The first step consisted in the creation and application of two questionnaires. The questionnaires were designed to obtain detailed information about the perception of professionals regarding digitalization and its impact on their profession. We chose the questionnaire as the research method because it is an effective method for collecting data in scientific research and provides a structured way to obtain information from a representative sample of the studied population. Descriptive information regarding the results obtained following the application of the two questionnaires can be observed in the table.

The answers provided by the respondents to these questions were then aggregated and the average of these answers was calculated. Thus, the variables described in the table were obtained, each reflecting a specific dimension of the phenomenon studied.

DP profession

	Digitalization of the	It reflects the level of integration of modern technologies into daily accounting practices, highlighting the degree of adoption of digital tools in the profession.

UT	Use of advanced technologies	Measures the use of cutting-edge technologies in carrying out economic transactions, including the automation and digitalization of financial processes.
RP	Professional judgment	It refers to the ability of accountants to apply critical thinking and adaptability in evaluating and implementing digital technologies in accounting, emphasizing the importance of professional judgment in the digital environment.

Econometric model no. 2

Variable description

Dependent variable

ECCD	Curriculum effectiveness in training digital skills	This variable examines how elements of the accounting education system align and respond to the demands imposed by the digital revolution, contributing to equipping future professionals with the skills needed in a digital economy.

-

Independent variables

FSED	The flexibility of the accounting education system to the changes imposed by the digital revolution,	It measures the ability of the accounting education system to quickly adapt to new technological requirements, ensuring adequate practical and theoretical training for students in the context of digitalization.

Accounting knowledge

IPM	Insertion into the labor market	

DC

		curriculum in preparing graduates for rapid and efficient integration into the professional environment, highlighting the relevance and applicability of the acquired digital skills.
		It measures the effectiveness of the educational curriculum in preparing graduates for rapid and efficient integration into the professional environment, highlighting the relevance and applicability of the acquired digital skills.
		It reflects the fundamental basis required for the effective use of digital technologies in accounting. It includes both traditional and modern knowledge required for the correct application of digital tools.
PRCEF	Concern for reducing economic crime and fraud	This variable reflects the extent to which accounting curricula include the necessary training for the use of digital technologies in fraud detection and prevention, contributing to financial integrity.
PC training	Continuous	It reflects the importance of continuous learning in maintaining and updating professional skills, especially in the context of rapid technological evolution.
ST *Technology*	*Smart*	It measures the level of integration of emerging technologies, such as artificial intelligence and blockchain, into the accounting education curriculum, preparing students for future technological challenges.
SC rity	Cybersecu	It reflects the attention paid to cybersecurity topics in accounting curricula, ensuring that future professionals are prepared to manage cyber risks and protect financial data.

Source: Author's own processing

The table describes the variables used in the study, highlighting each variable and its description. As mentioned above, each variable was created by aggregating the responses to the relevant questions in the questionnaire, followed by calculating the average of these responses.

The table presents the equations of the econometric models resulting from our analysis. These models were developed to test the formulated hypotheses and evaluate the relationships between the variables mentioned above. Each model was carried out by applying specific regression techniques using the SPSS program.

Discussion and conclusion

In conclusion, the digitalization of accounting requires a reassessment of how professional accountants relate to their traditional role and the skills needed in the new digital era. Therefore, this study contributes to the specialized literature by highlighting the need for continuous adaptation to new technologies, proposing a series of recommendations for professional accountants, as well as for professional training institutions, which are found in the analysis of the results and the final conclusions.

CLUSTER-BASED DEVELOPMENT AND COOPERATION MECHANISMS IN THE CANNED FOOD INDUSTRY OF AZERBAIJAN: INTERNATIONAL EXPERIENCE AND NATIONAL ADAPTATION

Emilya Shukurova, Baku State University

ABSTRACT

This paper examines the institutional and economic mechanisms of clustering and cooperation in the canned food industry of Azerbaijan and evaluates the applicability of international models to national conditions. Although the country possesses a strong agricultural raw-material base, fragmentation within the value chain limits industrial efficiency and export competitiveness. A comparative assessment of the Turkish and Polish agro-industrial clusters demonstrates that a hybrid model—combining Turkey's logistics- and export-oriented structure with Poland's innovation- and certification-driven approach—represents the most effective option for Azerbaijan. The paper proposes an integrated cluster architecture that links producers, processors, logistics operators, innovation centers and export agencies into a single coordinated system. The findings indicate that the adoption of a cluster-based governance model can reduce production costs, improve coordination and increase resilience within the national food-processing sector.

Keywords: cluster development, value-chain integration, cooperation mechanisms, food processing industry, institutional modernization, export competitiveness

INTRODUCTION

The canned food industry represents a strategic segment of the agro-processing sector in Azerbaijan, functioning as a critical link between primary agricultural production and value-added food manufacturing. Owing to favorable climatic conditions and a rich raw-material base, the country possesses a natural comparative advantage in fruit and vegetable cultivation. However, despite this structural potential, the institutional configuration of the industry remains weak and highly fragmented. The absence of coordination among producers, processors, logistics providers and export intermediaries results in unstable supply relations, capacity underutilization and limited competitiveness in foreign markets. Cluster-based development has gained global recognition as a structural modernization tool for agro-industrial systems. Unlike traditional enterprise-level support mechanisms, clustering enables the integration of producers into a coordinated institutional ecosystem. In this framework, value-chain actors operate not as isolated firms but as mutually reinforcing participants in a shared economic space. International empirical evidence demonstrates that cluster models generate economies of scale, improve logistics efficiency, facilitate certification, reduce transaction costs, and enhance market access opportunities.

For Azerbaijan, the relevance of cluster-based governance stems from three key systemic constraints: (1) weak contractual relations between farmers and processing enterprises, (2) fragmented storage and logistics infrastructure, and (3) the lack of a unified export platform. Accordingly, the strategic objective of this research is to design a hybrid cluster governance model for the canned food industry of Azerbaijan by adapting the most effective institutional elements from leading international examples — specifically the Turkish and Polish agro-industrial cluster systems. The study contributes to the literature by demonstrating that clustering is not merely a development option, but a structural necessity for transforming Azerbaijan's agricultural productivity advantage into sustainable global competitiveness.

THEORETICAL FRAMEWORK

The intellectual foundations of clustering date back to the works of Alfred Marshall, who conceptualized "industrial districts" as geographically concentrated groups of firms deriving mutual benefit from

external economies of scale. However, it was Michael Porter who reframed this understanding in the contemporary institutional context by defining clusters as competitive ecosystems in which firms gain advantage not merely from co-location, but from inter-firm cooperation, knowledge transfer, innovation diffusion and value-chain specialization.

In agro-industrial systems, clusters serve four core economic functions:

1. Coordination of production relations – linking raw-material suppliers, processors, logistics providers and export agents within a unified governance structure;

2. Reduction of transaction costs associated with fragmented supply chains and seasonal uncertainty;

3. Creation of scale economies through shared infrastructure, storage and logistics services;

4. Institutional strengthening via standardization, certification and innovation mechanisms.

Cooperation forms the operational backbone of clustering. Whereas clustering provides a structural framework, cooperation provides behavioral alignment — enabling long-term contracts, shared logistics, joint marketing and collective risk management. From a policy perspective, clusters allow the state to channel subsidies, tax incentives and innovation support through coordinated institutional networks rather than individual firms. This increases the developmental multiplier effect and ensures governance accountability.

INTERNATIONAL COMPARISON: LESSONS FROM TURKEY AND POLAND

A comparative analysis of international agro-industrial development models demonstrates that Turkey and Poland represent two distinct but highly successful approaches to structuring competitive food-processing clusters. Both countries transformed their previously fragmented agricultural sectors into export-oriented and innovation-driven value-chain systems. However, the institutional instruments, coordination mechanisms and policy priorities they adopted differ considerably. These differences provide valuable insights for understanding which components may be applicable to Azerbaijan's canned food industry and how they may be adapted to local conditions.

The Turkish model is built primarily on strong logistics coordination and horizontal cooperation between producers and processing enterprises. Turkey's clusters—especially those in regions such as Izmir, Bursa and Manisa—operate through cooperatives that aggregate raw materials, negotiate prices, and ensure stable supplies for processors. Cooperative-based supply relations reduce dependence on volatile spot markets and help maintain consistent quality and volume throughout the production season. In addition, Turkey's emphasis on logistics integration has created cost-efficient cold-chain systems, shared packaging facilities, regional distribution hubs and unified export platforms. These structural features allow small and medium-sized enterprises (SMEs) to participate in international markets without individually bearing high transaction costs. The Turkish approach shows that coordination, branding and export-oriented logistics can significantly amplify the competitiveness of traditional agricultural industries.

In contrast, the Polish model emphasizes vertical integration and institutional modernization. Following its accession to the European Union, Poland invested heavily in certification systems, laboratory infrastructure, product standardization, and traceability mechanisms. Polish food clusters are strongly linked to universities, research institutes and innovation centers, creating a high-capacity ecosystem for technology transfer. Through EU-backed quality assurance systems, Polish producers have built a reputation for reliability and safety in global markets. The system's strength lies not in logistics integration but in innovation diffusion, certification discipline and institutional credibility. Poland

demonstrates that high-quality standards and innovation governance can elevate a traditional sector into a globally competitive industry.

A comparative synthesis reveals that while both systems are effective, neither fully corresponds to Azerbaijan's current institutional structure. The Turkish model provides solutions to Azerbaijan's most acute problems—supply instability, logistics fragmentation and weak export coordination. Meanwhile, the Polish model offers mechanisms that Azerbaijan currently lacks but urgently needs, such as modern certification infrastructure, innovation support and strong institutional oversight. Therefore, the international benchmarking suggests that Azerbaijan should pursue a hybrid model that draws on both experiences: adopting Turkey's coordination and logistics mechanisms while integrating Poland's innovation- and certification-driven governance system.

This hybrid approach would allow Azerbaijan to simultaneously solve its short-term structural weaknesses—such as fragmented supply relations—while establishing a long-term foundation for innovation, quality assurance and international market credibility. In essence, Turkey offers a model for immediate coordination and efficiency improvements, while Poland provides a blueprint for sustainable institutional modernization. Taken together, these lessons form the conceptual basis for designing an integrated cluster model tailored to Azerbaijan's development trajectory, resource potential and policy priorities.

Comparison of Turkish and Polish Agro-Food Cluster Models

Dimensions	Turkey Model	Poland Model
Supply Relations	Strong cooperative networks; long-term farmer–processor contracts	Standardized supply chains; high compliance with EU procurement rules
Logistics & Infrastructure	Integrated cold-chain, shared storage, packaging hubs	Modernized logistics but less cooperative-based; focused on traceability
Governance Structure	Regional development agencies coordinate clusters	Strong institutional governance aligned with EU regulations
Innovation & R&D	Moderate; mainly industry-driven improvements	High; university–industry partnerships, innovation centers, labs
Certification & Quality	Growing but not fully standardized	Highly developed; EU-certified, strong credibility
Export Strategy	Unified branding; strong presence in Middle East & EU markets	Reputation for high-quality, safe products; niche market penetration
Value-Chain Focus	Coordination efficiency, logistics optimization	Quality assurance, innovation-driven modernization

DISCUSSION AND FINDINGS

The overall analysis of Azerbaijan's canned food industry reveals a sector with significant natural and production potential, yet one constrained by systemic coordination failures and institutional fragmentation. Despite possessing rich agricultural resources, favorable climatic conditions and accumulated processing capacities, the industry struggles to achieve competitiveness due to the

disconnection between farmers, processors, logistics operators and export intermediaries. This fragmentation results in unstable supply chains, inconsistent product quality, duplicated infrastructure costs and weak access to international markets. Thus, the root cause of underperformance is not a shortage of raw materials or industrial capacity, but rather the absence of a coherent governance framework linking actors across the value chain.

A closer examination of international experiences provides crucial insights. Turkey and Poland, in particular, demonstrate the importance of structured coordination, institutional strengthening and innovation-driven development in agro-industrial sectors. The Turkish model shows how strong horizontal coordination**,** cooperative structures and unified export mechanisms can transform traditional agricultural industries. Turkey's development trajectory highlights the significance of stable long-term contracts between farmers and processors, integrated cold-chain logistics and regionally organized export platforms. Through these mechanisms, Turkey has created efficient, low-cost and scalable systems that enable small producers to participate in global trade. For Azerbaijan—where supply instability and logistics fragmentation are dominant issues—the Turkish model provides an immediately applicable roadmap for structural improvement.

The Polish model, on the other hand, demonstrates the transformative effect of vertical integration and institutional modernization. Poland's success is rooted in strong linkages between production enterprises and universities, innovation centers, testing laboratories and certification agencies. These institutions support technology adoption, standardize production practices and ensure compliance with international safety and quality norms. Through the development of comprehensive traceability and certification systems, Poland has built a reputation for reliability in international markets, making its agro-industrial products competitive across the EU and beyond. For Azerbaijan—where certification, innovation absorption and quality assurance remain weak—Poland's experience provides long-term strategic lessons for institutional strengthening.

Together, these two models suggest that Azerbaijan should adopt a hybrid cluster framework that incorporates the strengths of both systems. Such a model would first address immediate coordination gaps by introducing cooperative-based supply structures, integrated logistics systems and shared storage and packaging facilities, similar to the Turkish approach. Simultaneously, it would lay the foundation for long-term sustainability through the creation of certification laboratories, innovation hubs and R&D partnerships inspired by the Polish model. This dual approach enables Azerbaijan to strengthen both operational efficiency and institutional credibility—two essential pillars of modern agro-industrial competitiveness.

The hybrid cluster model proposed for Azerbaijan is built upon five interconnected structural pillars: raw-material cooperatives that stabilize supply and reduce volatility; processing enterprises that transform agricultural output into value-added products; logistics infrastructure that minimizes post-harvest losses and reduces transaction costs; innovation and certification centers that standardize production and support modernization; and a unified export platform that ensures coherent branding, market access and international representation. These pillars function as parts of a coordinated ecosystem rather than isolated institutional units.

From a governance perspective, the hybrid model relies on dual-level coordination: a cluster association composed of private-sector actors responsible for daily operational management, and a state-supported institutional platform tasked with certification oversight, policy management and export facilitation. This structure balances market flexibility with institutional stability, ensuring that coordination is both economically efficient and strategically supervised.

The feasibility assessment identifies Ganja–Gazakh, Lankaran–Astara and Guba–Gusar as priority regions for cluster implementation. These regions possess distinct comparative advantages—raw-

material abundance, export-oriented agricultural production and developed cold-chain infrastructure—that create a natural foundation for specialized cluster roles. Implementing the model in these regions allows the government to test alternative coordination mechanisms, evaluate outcomes and scale successful components across the country.

Overall, the integrated analysis confirms that a hybrid cluster model represents the most viable strategy for transforming Azerbaijan's canned food industry. It offers immediate solutions to existing coordination failures while building the institutional capabilities required for long-term competitiveness. The model shifts the industry from a resource-driven structure—relying primarily on raw material abundance—to a capability-driven structure grounded in efficiency, innovation and coordinated governance. Such a transformation is essential for ensuring that Azerbaijan's agricultural potential is fully utilized and that the industry can position itself effectively within global agro-food markets.

Hybrid Cluster Value-Chain Model for Azerbaijan

Cluster Component	Core Functions	Expected Outcomes
1. Raw-Material Cooperatives	• Organize farmers into supply groups • Ensure stable volumes & predictable quality • Coordinate seasonal harvesting	• Reduced supply volatility • Improved raw-material consistency • Lower procurement costs
2. Processing Enterprises	• Value-added transformation of crops • Packaging & product diversification • Adoption of modern technologies	• Increased industrial productivity • Higher-quality final products • Greater export-readiness
3. Logistics Infrastructure	• Cold-chain management • Storage & warehousing • Inter-regional distribution	• Lower post-harvest losses • Reduced transportation costs • Efficient supply chain flow
4. Innovation & Certification Centers	• Laboratory testing • R&D cooperation with universities • Training & standardization	• Improved product safety • Compliance with international quality norms • Accelerated technology adoption
5. Export Coordination Platform	• Branding & trade promotion • Market intelligence systems • Export documentation & facilitation	• Unified national brand • Increased foreign market penetration • Higher export revenues

RESULTS

The findings of the research reveal that the primary challenge facing Azerbaijan's canned food industry is not the shortage of natural resources or processing capacity, but rather the weakness of institutional coordination across the entire value chain. The sector currently operates through fragmented relationships between farmers, processors, logistics providers and exporters, which results in duplicated costs, unstable supply relations and inefficient use of existing infrastructure. In the absence of cooperative mechanisms, each enterprise functions in isolation, attempting to optimize its own interests instead of contributing to collective performance.

The results demonstrate that introducing a cluster-based governance model leads to a fundamental structural transformation. Once value-chain actors are integrated into a unified institutional framework, transaction costs decrease, supply stability improves, and production cycles become synchronized with market demand. Clustering also enhances access to innovation, certification and export services, enabling small and medium-sized enterprises to benefit from resources previously inaccessible on an individual basis.

The economic impacts are substantial. Shared logistics reduces expenses; improved coordination increases capacity utilization; and collective marketing strengthens the international visibility of Azerbaijani products. Equally important are the institutional effects: clustering formalizes cooperation, builds trust among stakeholders and introduces governance mechanisms that reduce uncertainty and improve transparency within the sector.

Developmentally, the hybrid cluster model shifts the industry away from a resource-based paradigm—which depends primarily on natural endowments—toward a capability-based paradigm grounded in efficiency, collaboration and institutional modernization. This transition forms the foundation for sustainable competitiveness, enabling the canned food industry to evolve from a low-value commodity supplier into an integrated, export-oriented processing system.

CONCLUSION

The study concludes that the modernization of Azerbaijan's canned food industry requires a transition from fragmented, firm-level operations to an integrated, cluster-based institutional architecture. The analysis of international best practices highlights that successful agro-industrial development relies not only on technical modernization but also on governance structures that enable cooperation, coordination and innovation.

Lessons from Turkey emphasize the importance of logistics integration, cooperative supply relations and export coordination, while Poland's experience demonstrates the critical role of certification, quality assurance and innovation systems. For Azerbaijan, neither model alone is sufficient. Instead, a hybrid cluster model, combining Turkey's coordination strengths with Poland's innovation capabilities, presents the most feasible and effective approach.

This hybrid model is not merely an economic instrument but a structural necessity for transforming the industry. Without institutional integration, resource advantages will continue to be underutilized. With clusterization, however, these advantages can be converted into stable production cycles, reduced costs and globally competitive exports. Thus, clustering emerges as the central pathway to restructuring the sector in line with contemporary international standards.

To support the practical implementation of the hybrid cluster model, several strategic policy recommendations are proposed:

A. Strengthening Institutional Governance

1. Develop a legal and regulatory framework formally recognizing agro-industrial clusters as economic entities.

2. Establish cluster associations responsible for coordinating producers, processors and exporters.

3. Create a national certification and traceability system to ensure compliance with international quality and safety standards.

B. Economic and Infrastructure Measures

1. Invest in shared logistics infrastructure—especially cold-chain, storage and packaging facilities—to reduce costs and minimize post-harvest losses.

2. Redirect government subsidies from individual enterprises toward cluster-based initiatives that strengthen collective efficiency.

3. Provide grants and innovation funds to encourage technological upgrading and research collaboration between firms and universities.

C. Regional Implementation Strategy

1. Launch pilot cluster zones in Ganja–Gazakh, Lankaran–Astara and Guba–Gusar based on their raw-material potential and logistical advantages.

2. Integrate regional development agencies as institutional intermediaries supporting coordination and monitoring.

3. Scale successful pilot clusters to other regions using evidence-based evaluation and performance indicators.

D. Export and Market Competitiveness

1. Develop a unified national export brand for Azerbaijani canned products.

2. Support participation in international fairs, trade missions and global certification programs.

3. Strengthen digital marketing, e-trade channels and international distribution partnerships.

6183 SAYILI KANUN'UN VERGİ KARMAŞIKLIĞI PERSPEKTİFİNDEN OKUNABİLİRLİK DÜZEYİ

Cem Barlas ARSLAN

Doç. Dr., Anadolu Üniversitesi, İİBF Maliye Bölümü
E-mail: barlasarslan@gmail.com
ORCID ID: 0000-0002-0635-602X

Özet

Günümüzde, vergi sistemlerinin sorunları arasında vergi karmaşıklığı yer almaktadır. Literatürde net bir tanımı olmamakla birlikte, vergi karmaşıklığı, çeşitli bileşenlerin meydana getirdiği bir kavramdır. Yapılan analizlerde, karmaşıklığa neden olan unsurların başında ise vergi mevzuatı gelmektedir.

Türk vergi mevzuatı; kanunların madde sayısı, kanun metinlerinin uzunluğu ve dil yapısı dikkate alındığında, karmaşık ve zor bir mevzuattır. Bu durum da sistemi basitlik ve sadelikten uzaklaştırmakta, vergi uyum maliyetlerini artırmaktadır. Ayrıca vergi karmaşıklığı vergi bilinci ve vergi ahlakını da olumsuz yönde etkilemektedir.

Yürürlükte olan vergi mevzuatı arasında eski tarihli (1954) olanlardan birisi de 6183 sayılı Amme Alacaklarının Tahsil Usulü Hakkında Kanun'dur. Günümüze kadar çok defa değişiklik yapılmış olsa da dil yapısı itibariyle ağır bir kanun metni olarak dikkat çekmektedir. Bu doğrultuda, 6183 sayılı Kanun, Türkçe metinler için genel kabul gören Ateşman Okunabilirlik Ölçütü kapsamında analiz edilmiştir. Sonuç olarak ise 6183 sayılı Kanun, okunabilirlik ölçütü açısından orta güçlükte bir metin olarak ölçümlenmiştir.

Anahtar Kelimeler: Vergi Karmaşıklığı, Okunabilirlik, 6183 Sayılı Kanun

READABILITY LEVEL OF LAW NO. 6183 FROM THE PERSPECTIVE OF TAX COMPLEXITY

Abstract

Today, tax complexity is among the problems of tax systems. Although there is no clear definition in the literature, tax complexity is a concept created by various components. In the analyses conducted, tax legislation is at the forefront of the factors causing complexity.

Turkish tax legislation is complex and difficult, considering the number of articles in the laws, the length of the legal texts, and the language structure. This situation distances the system from simplicity and clarity, increasing tax compliance costs. Furthermore, tax complexity negatively affects tax awareness and tax ethics.

One of the oldest pieces of tax legislation in force (1954) is Law No. 6183 on the Collection Procedures for Public Receivables. Although it has undergone numerous amendments to date, it stands out as a heavy law text in terms of its language structure. Accordingly, Law No. 6183 was analyzed within the scope of the Ateşman Readability Index, which is generally accepted for Turkish texts. As a result, Law No. 6183 was measured as medium difficulty text in terms of readability.

Keywords: Tax Complexity, Readability, Law No. 6183.

GİRİŞ

Tarih boyunca vergiler, devletler için hem iyi bir finansman kaynağı hem de güçlü bir politika aracı olmuştur. Bu açıdan vergilerin etkin ve verimli olması kaçınılmaz bir zorunluluk olarak karşımıza çıkar. Özellikle, Sanayi Devrimi ile vergilemenin teorik altyapısı güçlenmeye başlamış, vergilerin ekonomik sistem içindeki yerine farklı bakış açıları gelişse de ortak bir anlayış içinde vergi ilkeleri benimsenmeye başlamıştır. Vergi ilkeleri; vergi politika ve hedeflerine uyumlu, verimli ve etkili bir vergi uygulaması için gerekli olan kurallar bütünü olarak ifade edilmektedir. Bir anlamda vergilemenin ve vergi sisteminin yol haritası olan söz konusu ilkeler; etkin ve adil vergi sisteminin altyapısını oluşturmaktadır.

Çağdaş vergi sistemlerinin en önemli hedefleri arasında mükellef uyumu ile vergi bilinç ve ahlakının tesis edilmesi gelmektedir. Bununla birlikte sistemde var olan bazı anomaliler, hedeflere ulaşmada güçlüğe sebebiyet vermektedir. Özellikle modern vergi sistemlerinin sorunları arasında yer alan vergi karmaşıklığı, söz konusu güçlüğe etken olan hususlardan birisidir.

Kesin sınırları ve net bir tanımı olmamakla birlikte, vergi karmaşıklığı, vergi uygulamalarını gerek idare gerekse mükelelef açısından zorlaştırmaktadır. Bu soruna yönelik olarak da literatürde vergi karmaşıklığını ölçümleyerek ortaya koymayı amaçlayan çeşitli yöntemler geliştirilmiştir. Bu yöntemler içinde, mutlaka mevzuatın analiz edildiği ve mevzuatın karmaşıklığa neden olan başlıca faktörler arasında olduğu genel olarak kabul görmektedir.

Bir metnin okunabilirlik düzeyine ilişkin çalışmalar 20. yüzyıl başlarında popüler olmaya başlamış, ilk olarak İngilizce metinler için bazı okunabilirlik ölçüm yöntemleri geliştirilmiştir. Sonraki süreçte ise farklı dillerin analizine yönelik çalışmalar yapılmıştır. Bu konu Türkiye'de daha geç dönemde dikkat çekmekle birlikte, Türkçe metinlerin okunabilirlik düzeyine ilişkin ilk ve kabul gören çalışma, Ender Ateşman tarafından 1997 yılında geliştirilen Türkçe metinler için okunabilirlik formülü olmuştur. Sonrasında farklı çalışmalar ortaya çıksa da Ateşman formülü günümüzde de geçerliliğini korumaktadır.

Mevzuat dilinin yapısı ve anlaşılabilirliği, hukukun uygulanması bakımından oldukça önemlidir. Özellikle teknik nitelikte olan vergi mevzuatı gibi alanlarda, mevzuatın gerek hacim gerekse dil ve anlatım açısından karmaşık ve zor olması, verginin tarafları ve de sistem açısından olumsuz sonuçlar ortaya çıkarmaktadır. Keza mevzuat metinleri zorlaştıkça, temel vergi ilkelerinden sapmalar ortaya çıkmakta ve vergi uyumu zorlaşmaktadır. Bu maksatla, Ateşman okunabilirlik ölçütü kullanılmak suretiyle, eski tarihli ve ağır bir kanun metni olan Amme Alacaklarının Tahsil Usulü Hakkında Kanun analiz edilmiş ve söz konusu mevzuat metninin zorluk derecesi ölüçümlenmiştir.

KAMU ALACAKLARI

Her devlet, ekonomik, siyasi ve idari yapısına göre farklı düzeylerde kamusal mal ve hizmet üretmektedir. Söz konusu olan kamusal mal ve hizmet üretimi için de bir finansman gerekir. Bu doğrultuda, farklı kaynaklardan, ihtiyaç duyulan kamusal finansmanın sağlanması yoluna gidilmektedir. Bu kaynaklar arasında vergi ve vergi benzeri gelirler önemli yer tutmaktadır.

Devletin kamu hukukunun alanına giren faaliyetleri dolayısıyla ortaya bir borç ve alacak ilişkisi çıkar. Devletin bu ilişkiden doğan alacakları ise kamu alacaklarını oluşturmaktadır. Vergilerin de içinde yer aldığı kamu alacakları, özel alacaklardan farklı ve önemli bir statüye sahiptir. Kamu alacağı kavramı için kısa ve öz bir tanımla; "kamu hizmetlerinin finansmanı amacıyla devletin kamu gücüne dayanarak koyduğu mali yükümlülüklerden doğan alacaklar" (Karakoç, 2000: 25) olarak ifade edilebilecektir.

Kamu alacağı kavramının ilgili mevzuatta net bir tanımlaması yapılmamıştır. Bununla birlikte, 6183 sayılı Amme Alacaklarının Tahsil Usulü Hakkında Kanun kamu alacağı kavramının kapsamını ortaya koymuştur. Kanun'un 1. maddesi ile; *"Devlete, vilayet hususi idarelerine ve belediyelere ait vergi, resim, harç, ceza tahkik ve takiplerine ait muhakeme masrafı, vergi cezası, para cezası gibi asli, gecikme zammı, faiz gibi fer'i amme alacakları ve aynı idarelerin akitten, haksız fiil ve haksız iktisaptan doğanlar dışında kalan ve amme hizmeti tatbikatından mütevellit olan diğer alacakları ile; bunların takip masrafları hakkında bu kanun hükümleri tatbik olunur"* biçiminde ifade edilmiştir.

Gerek kamu gerek özel alacak ve borç ilişkisinde, borçlunun borç ifasını zamanında ve eksiksiz yerine getirmesi esastır. Ancak her zaman bu durum ortaya çıkmakmaktadır. Kamu alacaklarının önemine binaen zamanında ve eksiksiz tahsilatı zorunlu olduğundan, devlet kendi alacaklarının korunması ve tahsiline yönelik düzenleme yapmıştır. Bu amaçla, Osmanlı hukuk sisteminden Türkiye Cumhuriyeti hukuk sistemine intisap eden Tahsil-i Emval Kanunu yerine 6183 sayılı Amme Alacaklarının Tahsil Usulü Hakkında Kanun yürürlüğe konulmuştur. 6183 sayılı Kanun, 21.07.1953 tarihinde TBMM'de kabul edilmiş ve 28.07.1953 tarih ve 8469 sayılı Resmi Gazete'de yayımlanmış, 01.01.1954 tarihi itibariyle de yürürlüğe girmiştir. İlk haliyle 118 maddeden oluşan Kanun, günümüze kadar çok sayıda değişikliğe uğramış, geçici maddeler eklenmiş ve mevcut maddelerde değişiklik yapılarak nihai halini almıştır.

Kamu alacakları statüleri ve önemleri itibariyle özel alacaklardan farklılık göstermektedir. Özel alacaklara yönelik olarak hukuk, karşılıklı eşitliğe dayanırken kamu alacakları açısından toplumun ve devletin genel çıkarları ve kamu yararı ön plandadır. Nitekim, kamu hizmetlerinin yürütülmesi ve devamlılığının sağlanması bakımından kamu alacaklarının etkin ve hızlı bir şekilde tahsil edilmesi de bir zorunluluk olduğundan (Çelik, 2000: 30) kamu alacakları özel alacaklardan farklı tutulmuş ve pozitif bir ayrıma tabi olmuştur. Teminat, ihtiyati haciz ve ihtiyati tahakkuk, rüçhan hakkı, sorumluluk müessesesi vb. koruma yöntemleri ve kamu alacaklarının haczedilemezliği, cebren tahsil vb. pek çok kaide ile kamu alacaklarının ayrıcalığı açık bir biçimde ortaya konulmuştur.

VERGİ KARMAŞIKLIĞI

Gelişen ve değişen ekonomik sistem, vergi sistemlerini de daha büyük ve kompleks bir yapı haline getirmiştir. Bu durum da ister istemez yeni bir sorunun ve dahi yeni bir kavramın ortaya çıkmasına neden olmuştur.

Vergi karmaşıklığının, net ve kapsamlı bir tanımı olmasa da kısaca, "vergi kurallarını anlama ve vergi yükümlülüklerine uyma güçlüğü" olarak ifade edilmektedir (Öner ve Cural, 2025: 104). Kesin tanımı ve sınırları belirlenemeyen vergi karmaşıklığına dair son dönemde, literatürde yapılan çalışmalarda genel itibariyle iki yaklaşıma odaklanıldığı görülmektedir. Buna göre; ilk yaklaşım, vergi idaresinin ve mükelleflerin vergi karmaşıklığından dolayı karşılaştıkları uygulama ve uyum maliyetleri; ikinci yaklaşım ise vergi sistemi veya düzenlemelerin kalitesiyle ilgili yapılan tanım ve anlamlandırmalar

biçimindedir (Karabacak, 2013: 17). Nitekim, kavramsal tanımlamanın zorluğu neticesinde de yapılan çalışmaların ana eksenini, karmaşıklığın analiz edilmesi ve karmaşıklık düzeyinin tespit edilmesi oluşturmakta ve bu doğrultuda farklı analizler karşımıza çıkmaktadır (Arslan, 2016: 101). Belirtmek gerekir ki gerek yabancı gerekse yerli literatürde yapılan analizlerde, karmaşıklık ölçümlerinin ortak noktasını, mevzuat yapısının analizi oluşturmaktadır.

Dünya genelinde politika yapıcılar bir taraftan ekonomik faaliyetleri teşvik eden diğer taraftan da adil ve uyum düzey ve kalitesi yüksek bir vergi sistemi oluşturmak zorundadırlar (İnneci, 2025: 647). Bu zorunluluğun önündeki en büyük engellerden birisi ise vergi sistemlerinin karmaşıklığıdır. Mevzuat yapısı, vergi idarelerinin durumu, dijitalleşme, ödeme süreleri, beyanname ve formlar gibi çok fazla değişken, vergi karmaşıklığını etkileyen unsurlar olarak karşımıza çıkmaktadır.

Bir vergi sisteminin basitleştirilmesi zor bir reform sürecini gerekli kılar. Kalıcı iyileştirme ve kapsamlı reform süreci bünyesinde, vergilemenin amaç ve hedeflerini doğru ele almak, sisteminin gerçeklerini doğru tespit etmek ve olması gereken için hangi işlev ve araçların kullanılacağının belirlenmesi oldukça önemlidir (James, 2018: 17). Reform için ise doğrudan siyasal uzlaşı önemli ve zorunlu olup, uygulanabilir basit bir politika süreci, anlaşılabilir ve basit bir mevzuat için ön koşul ve altın Kural olarak karşımıza çıkmaktadır (Mckerchar, 2007: 201). Basit, akıcı ve anlaşılabilir mevzuat ise ancak teknik ve bilimsel bir bakış ile mümkün hale gelecektir. Mevzuatın basit, sade ve anlaşılır olması illegal eğilimleri baskılarken, vergi kaybının azalmasına da katkı sağlayacaktır (Richardson, 2006: 332).

6183 SAYILI KANUN'UN OKUNABİLİRLİK ÖLÇÜTÜ

Yöntem

Dünyada okunabilirlik konusuna ilginin artışıyla birlikte, bu alanda çok sayıda çalışma yapılmıştır. İlk olarak İngilizce metinler için çalışmalar yapılmış, daha sonra ise farklı diller için okunabilirlik ölçekleri geliştirilmiştir. Günümüzde bu alanda genel kabul gören başlıca okunabilirlik ölçüm yöntemleri; Dale Cale formülü, Gunning Fog Index, Flesch-Kincaid okunabilirlik formülü ve Fry okunabilirlik grafiğidir (Temur, 2003: 174-177).

Okunabilirlik çalışmaları 19. yüzyılın başlarından itibaren yoğunlaşmış olsa da Türkiye'de bu konudaki ilk çalışma 1997 yılında Ender Ateşman tarafından gerçekleştirilen "Türkçe'de Okunabilirliğin Ölçülmesi" isimli eser olmuştur. Sonraki süreçte ise okunabilirlik ile ilgili çalışmalar artmış, çeşitli formüller ortaya konulmuş olup Türkçe için oluşturulmuş, genel kabul gören dört adet okunabilirlik formülü kullanılmaktadır. Bunlar 1997 tarihli Ateşman formülü, 2003 tarihli Sönmez formülü, 2010 tarihli Çetinkaya-Uzun ve yine 2010 tarihli Bezirci-Yılmaz formülleridir. Bu formüller arasında nüanslar olmuş olsa da Sönmez formülü haricindeki diğer üç formül, ortalama kelime ve hece uzunluğu temel değişken olarak ele almaktadır (Kalyoncu ve Memiş, 2024: 421).

6183 sayılı Kanun'un okunabilirlik ölçütü için yöntem olarak Atesman formülü tercih edilmiştir. Tercih nedeni ise, formülün bu alanda Türkçe metinler açısından ilk olması ve Türkçe için yerli ve yabancı formüller içinde genel kabul gören formül olmasıdır. Keza yabancı menşeili formüllere göre Türkçe için daha doğru sonuçlar vermesi de olasıdır (Öte yandan belirtmek gerekir ki Sönmez formülü, anlam bilgisine dayalı olan bir değişkene sahip olduğu için bu çalışmanın analiz yöntemine imkan vermeyeceği için tercih edilmemiştir).

Tablo 1: Ateşman Okunabilirlik Ölçütü

	Sözcük Uzunluğu (hece)	Cümle Uzunluğu (sözcük)

En Kolay Metin	2,2	4
En Zor Metin	3	30

Kaynak: (Ateşman, 1997: 74).

Ateşman tarafından yapılan hesaplamalar sonucu geliştirilen okunabilirlik formülü;

$(198{,}825 - 40{,}175\chi_1 - 2{,}610\chi_2)$

biçiminde oluşturulmuştur. Formülde χ_1 hece olarak sözcük uzunluğunu, χ_2 ise sözcük olarak cümle uzunluğu ifade etmektedir. Keza formül, Türkçe metinlere uygulandığında, okunabilirlik düzeyi açısından fikir vermektedir.

Bulgular

Ateşman okunabilirlik formülü tarafımızca 6183 sayılı Amme Alacaklarının Tahsil Usulü Hakkında Kanun için uygulanmıştır. Bu kanunun tercih edilmesindeki etken, diğer temel mali mevzuata göre daha eski tarihte yürürlüğe girmiş olması ve kanımızca ağdalı bir dile sahip olmasıdır.

Analiz yapılırken, kanunun bütünü ele alınmıştır. Buna göre kanun metninde;

- ✓ Toplam sözcük sayısı 15.619
- ✓ Toplam cümle sayısı 1.370
- ✓ Toplam paragraf sayısı 843
- ✓ Ortalama sözcük uzunluğu 2,68 (boşluksuz karakter sayısının toplam sözcük sayısına oranı)
- ✓ Ortalama cümle uzunluğu 11,4 (sözcük sayısının cümle sayısına oranı)

olarak tespit edilmiş, söz konusu veriler formüle aşağıdaki biçimde uygulanmıştır.

198,825 – [40,175 (sözcük uzunluğu ort.) – 2,610 (cümle uzunluğu ort.)]

Uygulama neticesinde ise endeks değeri Amme Alacaklarının Tahsil Usulü Hakkında Kanun için 61,4 olarak bulunmuştur. Ateşman tarafından tespit edilen okunabilirlik sayı ve derecelerine göre, 6183 sayılı Kanun *orta güçlükte* katagorisinde yer almaktadır.

Tablo 2: Okunabilirlik Derece ve Sayısı

Derece	Okunabilirlik Sayısı
Çok Kolay	90-100
Kolay	70-89
Orta Güçlükte	50-69
Zor	30-49
Çok Zor	1-29

Kaynak: (Ateşman, 1997: 74).

Kanun metninde özellikle cümlelerin uzunluğu dikkat çekmektedir. Öyle ki bir paragraf olan cümleler dahi bulunmaktadır. Keza Ateşman'ın Anayasa metnini inceleyerek bulduğu değer 41,77 olurken, en zor olarak gördüğü felsefe metinleri için tespit ettiği değer de 15,81 olarak belirtilmiştir (Ateşman, 1997: 74).

Konuya yönelik olarak fikir vermesi ve bir karşılaştırma yapılabilmesi açısından; 2002 tarihli Özel Tüketim Vergisi Kanunu'nun aynı formüşşe okunabilirlik derecesi 53,3 çıkmış; kısa bir Kanun metni olmakla birlikte 2007 tarihli Mali Tatil İhdas Edilmesi Hakkında Kanun'un okunabilirlik derecesi ise 40,3 olarak tespit edilmiştir. Çok daha yakın zamanda yürürlüğe giren kanunların okunabilirlik dercelerinin 6183 sayılı Kanuna göre daha zor metinler olarak çıkması, kanun dili ve yazımı açısından manidar bir durumdur.

DEĞERLENDİRME

Kanun hazırlama tekniği; öncelikle yasama dili ve terimleri olmak üzere, hukukun temel kavramları ile sosyoloji, ekonomi, felsefe, siyaset bilimi, Türk dili, araştırma ve rapor yazma teknikleri gibi alanlara ilişkin disiplinler arası bilgilerle ve de teknik ilke ve kuralları kapsar (Araç ve İba, 2003: 57). Bu anlamda kanun hazırlamak, interdisipliner bir alandır. Özellikle tüm toplum kesimlerini ilgilendiren, toplumsal hayatı düzenleyen kanun metinlerinin dil ve ifade kalitesi iyi olmalı, kendine özgü amaç ve kullanımıyla, anlaşılabilirliği düşük ve günlük dilden uzak yapısıyla özel ve değişik bir dil kesiti oluşturmamalıdır (Özyıldırım, 1999: 112). Kanun metinleri, hukukun adeta topplumsal sahaya yansımaları ve hukukun somutlaşmasıdır. Keza, hukuk devletinin vazgeçilmez parçası olan yazılı hukukun ve dolayısıyla mevzuatın açık ve anlaşılır olması gerekmektedir (Merdanoğlu, 1994: 113).

Vergi gibi hayatın her alanına dokunan ve hemen hemen toplumun tüm kesimlerini etkileyen bir mevzuatın, açık ve anlaşılabilir olması, vergi sisteminin işleyişine katkı sağlayacağı gibi, vergi kayıplarını azaltacak, vergi uyumunu artıracak ve temel vergi ilkelerinin sisteme yansımasını sağlayacaktır. Ne var ki mevzuatın gerektiği ölçüde anlaşılamaması, özellikle bu alanda ihtisas sahibi olmayan vatandaşlar tarafından idrak edilememesi, hukuk metinlerin öngördüğü düşüncenin anlaşılamaması ve dolayısla hedeflenen adalet seviyesine ulaşılamamasına neden olmaktadır (Merdanoğlu, 1994: 113).

Son yıllarda vergi sisteminin sadeleştirilmesi çabalarında vergi mevzuatı önemli yer tutmaktadır. Keza, kalkınma planları, bütçe gerekçeleri, mali plan ve programlar gibi politika metinlerinde de sıklıkla vergi uyumu ve vergi sisteminin sadeleştirilmesine vurgu yapılmaktadır. Bu anlamda bir vergi reformu kapsamı dahilinde vergiye dair ana mevzuat ile yardımcı mevzuat metinlerinin sadeleştirilmesi ve dil ve anlam yapısının gözden geçirilmesi gerekmektedir.

Son söz olarak ifade etmek gerekir ki; kanunları bilmememin mazeret sayılmayacağı dikkate alındığında, kanunlar başta olmak üzere tüm mevzuatın açık ve anlaşılır olmasına dair beklenti, doğal ve zorunlu bir beklentidir (Merdanoğlu, 1994: 113).

Abstract

This research paper sought to investigate the effect of digital leadership on employees in terms of innovative work behavior mediated by digital literacy and moderated by creative work climate. This research employed the transformational leadership theory as its theoretical framework. The method used in this study is quantitative. A multi-item survey questionnaire was employed, and 200 questionnaires were distributed to the corporate employees of some of the industries in Bangladesh. The collected data were analyzed with the help of structural equation models and factor and path analysis in order to test the hypotheses and evaluate the moderating and mediating effects of the variables. The results show that online leadership affects the innovative work behavior considerably. The paper also examines useful information when trying to understand how the moderation of creative work climate and the mediation of digital literacy can be used to propel innovative work behavior. This research is limited to organizations that have already implemented digital leadership practices which may constrain the generalizability of the findings. Future research should consider exploring additional contextual factors that influence digital leadership and employees' innovative work behavior.

Introduction

Digital leadership means the capacity to effectively manage and impart technology expertise to employees, encouraging motivation and control to accomplish organizational goals in a digital environment. It can be defined as the transformational leadership strategy that promotes creative work

practices and encourages innovative work behavior. In a dynamic landscape, digital leadership is crucial for the changing business world, and digital leaders are equipped with the expertise to optimize digital assets strategically and enable their employees to adapt digital technologies (Dimitrios et al., 2013; Thomson et al., 2016). Innovative work behavior is the degree to which workers participate in tasks including idea generation, process development, and organizational change adaptation. It is a multipurpose process that includes idea generation, idea promotion, and idea realization. Innovative workers try to contribute beyond their responsibilities and come up with fresh ideas to increase organizational creativity. Another key element of digital leadership is digital literacy which includes technical proficiency, standard knowledge of technology, and digital abilities that allow employees to implement digital tools and technologies into their workplaces. Digital literacy enhances organizational effectiveness and helps employees feel more comfortable using digital tools. As digital skills help to promote an employee's ability to participate in creative operations, employees with high levels of digital literacy are more successful in innovative activities. The ultimate relationship between innovative work behavior and digital literacy creates an environment in which employees can incorporate their ideas into organizational reality. In order to adjust to new technologies and grow the company, digital leadership promotes digital literacy to create an environment of ongoing learning and innovation. Digitally literate employees are better able to use technology for creative problem solving, and the synergy between digital leadership and digital literacy improves innovative work behavior. The leaders who prioritize digital proficiency encourage digital innovation. Thus, in the digital era, the interdependence of digital leadership, digital literacy, and creative work practices creates a fundamental framework that propels organizational progress. Organizations that create an innovative culture have a clear advantage in generating innovative ideas and procedures that help them advance. However, digital literacy is required to transform this leadership into creative work behavior (Vial, 2019). The research shows the relationship between digital leadership, digital literacy, and employees' innovative work behavior. Based on our hypothesis, digital literacy acts as a mediator that directs the influence of digital leadership to encourage innovative work behavior of the employees in the organization (Pilav-Velić et al., 2021). In addition, we examine the moderating effect of creative work climate and explore how it strengthens the correlation between these variables (Chandrika & Setyawati, 2023). This study aims to clarify the key mechanisms that force innovative work behavior in the digital era. It empirically investigates a positive direct relationship between innovative work behavior and digital leadership, trying to analyze the mediating effects of digital literacy in this relationship and the moderating effects of the creative work climate on digital leadership, digital literacy, and innovative work behavior. The essence of the study is to establish whether digital leadership reinforces and encourages a creative work climate or weakens the effect of the mentioned variables on innovative work behavior. The implications of the research findings are enormous both academically and in real life. By examining the core drivers of innovative work behavior, we contribute to an in-depth understanding of digital leadership, technological literacy, and creative work climate. From a practical point of view, it enables the organizational leaders to promote innovation in the workplace. Through these actions, organizations can unleash the creative stream and achieve long-term goals. Implementing targeted interventions can improve digital leadership abilities, digital literacy, and create an innovative work environment.

Despite the pace at which digital transformation is sweeping through Bangladesh, there is still scarce scholarly insights on how digital leadership influences the process of innovation in work behavior and how the concept is conceptually fragmented. The current literature has largely focused on leadership, digital capability, or innovation as distinct constructs, providing minimal knowledge on how it operates that digital leadership affects employee innovation in an emerging-economy setting. Specifically, the ability-forming process through which leadership impact is transformed into novel behavior has not been explored sufficiently in the previous studies, even though the issue of digital incompetency is still evident in Bangladeshi-based companies. Similarly, the creative work climate which can add or remove these effects has not been given much attention in the local and regional research and this places an

oversight gap in comprehending contextual conditions of boundaries. To resolve these limitations, it is important to not only analyze the way in which digital leadership induces innovation, but also when this influence is more or less efficient. Digital literacy is the crucial mediating factor that helps employees to convert leadership guidance into creative action and a friendly creative workplace climate defines how much these digital potentials are harnessed and realized in the work place. Thus, a mediator and moderator can be used as a theoretically holistic method of analyzing the internal pathway of capability and the external contextual influence that shape innovative work behavior in combination. To address such gaps, this study presents a unique contribution by integrating digital leadership, digital literacy, and innovative work behavior empirically and in one single frame related to the corporate world in Bangladesh. Although previous research has looked at these constructs separately, no other research has empirically studied digital literacy as a mediator and creative work climate as a moderator in elucidating the digital leadership-innovation relationship. The study contributes to the theoretical field of research by proposing such a dual mechanism in an environment of an emerging economy, which allows to better explain the channels through which digital transformation can lead to innovative work behavior.

Theoretical Background

This study investigates how digital leadership affects employees' innovative work behaviors through the mediation of digital literacy and the moderating influence of a creative work climate. A strong theoretical framework for understanding these dynamics is provided by the combination of multiple well-established theories. As an extension of digital leadership, Transformational leadership theory determines how important leaders are in inspiring and pushing employees to achieve their higher level of creativity and performance. In accordance with the transformational leadership theory, by providing individual support, intellectual stimulation, and a clear goal, leaders can encourage them to perform creatively. The idea that innovative creative work behavior is positively influenced by digital leadership is supported by the fact that digital leaders can create an atmosphere that encourages creativity, risk-taking, and technical inquiry. In the era of digitalization, leaders must both facilitate and inspire their employees to adopt digital tools and technology. Leaders can motivate innovation in their employees by utilizing digital tools and technologies, which support their capacity for innovative and effective problem-solving. Transformational leadership theory, which encourages and inspires people to gain a better level of performance while encouraging personal and professional growth was described by Burns in 1978 and then further developed by Bass in 1985. Transformational leaders can create an atmosphere that is favorable to innovation and change. According to Bass (1985), Transformational leadership is consisting of four essential elements: idealized influence, in which leaders act as a role model and gain respect and trust; inspirational motivation, in which leaders presents an engaging vision to inspire employees; intellectual simulation that is promote innovation and creativity through established procedure; and individualized consideration, leaders provide tailored guidance and support to their employees. Transformational leadership in the context of digital leadership, uses digital tools to improve teamwork, creativity, and organizational performance. In the digital context, transformational leaders exhibit flexibility, support digital literacy, and create an inventive workplace environment that inspires employees to come up with and carry out creative solutions. As a result, by using digital tools efficiently employees can improve their digital literacy and stimulate creative work behavior. So, we can say that the relationship between innovative work behavior, creative work climate, and digital literacy is significantly shaped by transformational leadership. Transformational leaders enhance the digital competency of their employees and ensure that they adapt to the novel technology by emphasizing lifelong learning and the acquisition of skills. They are also the ones that make the working environment lively and supportive to get people to take risks and experiment with new ideas through promoting open communication and collaboration. Based on that, it is theorized in this study that transformational leadership positively influences digital literacy and the creative work environment which mediate its impact on innovative behavior. Organizations can boost employee engagement, stimulate innovation,

and effectively manage digital transformations in a corporate environment that is changing quickly by putting transformational leadership ideas into practice.

Literature review and hypothesis development

Relationship between Digital Leadership and Innovative Work Behaviour.

Digital Leadership is the key to driving innovative work behaviour and resilience across the workplace. Previous research highlights the critical role of digital leadership in driving innovative work behaviour within organizations, and DL enhances innovation across various domains including performance, service capacity, open and responsible innovation, and employee innovative behaviour (Benitez et al., 2022a; Borah et al., 2022; Brunner et al., 2023; Fatima & Masood, 2024; Memon & Ooi, 2023; Tian et al., 2023; Weber et al., 2022). Consistent with this, it signifies the ability to manage and proficiently transfer the technological knowledge to the employee who motivated and controlled to achieve organizational goals in a digital environment (Harto et al., 2022; Mayastinasari & Suseno, 2023). Moreover, DL has a prominent impact on making a creative and innovative workplace that influences organizational outcomes, such as the creative and innovative behaviour of the employees, as it also makes the outline for the workplace, effectively allocates resources, and influences the thoughts of employees (J. H. Coun et al., 2022). Employees of the organization must be creative and innovative; it is necessary to be skilled at digital leadership (Mayastinasari & Suseno, 2023). Additionally, to make the creative environment of the organization digital leadership has a great value through elevating and integrating the new technological changes, and several studies indicate that digital leadership is transformational leadership that actively influences employee creativity and encourages innovative work behaviour (Santoso et al., 2019). At the same time, innovative work behaviour denotes the degree of employee involvement in activities exemplified by idea generation, process implementation, and adapting to organizational changes (Hooi & Chan, 2022; Salam, 2023). In general, it illustrates the integration of the proactive efforts of the employees to generate and build new ideas to enhance the creativity of the organization, and innovative behaviour is usually understood as a process consisting of idea generation, idea promotion, and idea realization (Kleysen & Street, 2001; Organizational & 2000, 2000; Scott et al., 1994). In the initial phase, individuals identify problems and develop novel ideas and solutions, in the next phase, employees seek support and build alliances to promote the new ideas, and in the final phase, the employees accomplished the process when they obtained enough support to produce a prototype that was disseminated and integrated into organizational practices (Scott et al., 1994). Research indicates that individuals who are motivated and capable of innovation contribute beyond their core job responsibilities while consistently generating innovations (Leong & Rasli, 2014; Parker et al., 2006). However, having a deficiency of the skills and proficiency to use technology effectively may struggle to motivate and stimulate employees, which can negatively affect innovative work behaviour. Leaders have to pay attention to the individual expertise on the digital tools and technology to develop the employee work behaviour and continuous improvement of the organization. Significantly, having a deficiency of the skills and proficiency to use technology effectively may struggle to motivate and stimulate employees, which can negatively affect innovative work behavior. According to Sagbas et al. (2023), digital leadership leverages updated technologies to improve the team members' skills and to create passionate work behavior by supporting experimentation, promoting innovation, and risk-taking.

Therefore, from some of the previous research findings and the literature review above, it can be hypothesized that

H1: *Digital leadership has a positive impact on innovative work behavior.*

Relationship between digital leadership and digital literacy of employees.

Digital Leadership promotes the digital culture and plays a significant role in encouraging technical skills, advancing digital literacy, and organizational effectiveness. The influence of digital leadership on digital literacy is clearly verified in previous research studies (BELSHAW, 2012; Thi My Linh et al., 2024). In line with this, the interaction between leadership and digital literacy contributes to becoming more confident about using digital tools and makes employees more skilled to support and lead the organization more effectively (Alma Çallı et al., 2022). According to BELSHAW (2012), "Digital literacy encompasses more than just technical skills; it also entails understanding issues, norms, and habits of mind concerning technologies used for a particular purpose." Furthermore, in order to sustain and grow in today's global business, digital literacy is essential to explore ICT skills, information technology skills, and digital competencies (Hidayat et al., 2023). Researchers argued that employees' digital literacy is influenced by digital leadership, and if employees prioritize digital innovation and integrate the digital tools into regular functions, they will be able to establish a standard for digital engagement and competency within the organization (Thi My Linh et al., 2024b; Dąbrowska et al., 2022). Accordingly, digital leaders, through their intellectual abilities, visionary and strategic leadership, adaptability and agility, as well as digital and technical skills, can influence employees to develop digital literacy (Alma Çallı et al., 2022; Thi My Linh et al., 2024a). Such leaders motivate employees to see the world differently by providing digital knowledge and a supportive environment (Matsunaga, 2022). Additionally, according to Joseph (2024), digital leaders guide and utilize the employees' capacity to adapt digital technologies to drive their organizational progress, and similar guidance amplifies the intent of the employee to understand, adopt, and collaborate with technological tools to achieve organizational goals (Thi My Linh et al., 2024a; Sarfraz et al., 2022). In the same vein, Sarfraz et al. (2022) find that DL has direct and indirect positive effects on the digital literacy of employees, and DL plays a significant role by cultivating digital culture, promoting digital competencies of the employees that enhance creativity and sustainable performance (Mimmi Hirvonen, 2021). Moreover, Mimmi Hirvonen (2021) revises that leader encountered by dual digital challenges not only affect their workplaces but also organizational leaders. Consequently, digital leaders must navigate their organization through the implementation of digital technologies and provide appropriate solutions while adopting the ongoing changes. To optimize the solution, leaders must absorb the technologies into their workplaces and strategically select and utilize technical tools to achieve digital progress (op´t Roodt et al., 2024).

Finally, based on the above studies we can determine that the DL is a critical driver that influences digital literacy by facilitating employees to confidently use digital tools and grow technical skills, and enabling the understanding of norms, issues, and mindsets related to technology use for specific purposes to achieve the overall organizational success. Therefore, based on the theoretical premises and literature review above, the study proposes the following hypothesis.

H2: Digital Leadership has a positive impact on the digital literacy of employees.

Relationship between Digital Literacy of Employees and Innovative Work Behavior.

Digital literacy elevates the engagement in innovative operations and motivates employees to use digital tools effectively which leads to the adoption of innovative norms. Previous studies have examined those digital technologies facilitate innovative learning experiences and are clearly intertwined with the digital literacy of employees and innovative behaviour (Abun et al., 2023; Lutfi Astuti & Setiawan, n.d.). Consistently, Calipjo et al. (2023) state that digital literacy amplifies the employee's participation in innovative operations and empowers employees to actively utilize digital tools, and digitally skilled individuals are more likely to engage in innovative activities. Moreover, the mutual relationship between digital literacy and innovative work behaviour contributes to engaging the workforce more effectively

and being able to actively apply and transform their innovative ideas into realities (Calipjo et al., 2023; Pilav-Velić et al., 2021a). Digitally literate employees use their knowledge to adopt innovative work norms and to come up with creative ideas, and digital employees, through prioritizing digital skills and technological competency, create innovative work environments and become more creative in the workplace (Malibari & Bajaba, 2022). A similar workforce is stimulated to interact in creative and innovative behaviour by creating a supportive and sustainable work climate, and that kind of atmosphere enhances productivity, efficiency, and allows employees to accomplish the task in innovative ways across the different sectors (Soliman et al., 2022a). According to Soliman et al. (2022b), employees who are digitally competent reconcile the changing work environment and be more innovative. Additionally, it is evident that environmental changes require digital literacy to highlight innovative work behaviour that improves the performance quality (Dewanto et al., 2024). Despite having all the positive influences of digital literacy on innovative work behaviour, it also has some negative impact. Carvalho et al. (2023) argued that several factors have adverse effects on innovative work behavior including digital distractions, mental discomfort, learning difficulties, and motivational barriers. Therefore, digital leaders must create collaborative workplaces so that employees are able to adapt to the adverse changes through the implementation of digital literacy and proficiency. Digital employees should have knowledge about the technological tools and digital skills to provide necessary guidance to enhance their creativity in performance. Consequently, the digital literacy of employees has been seen as a predictor of individual performance, with performance expected to improve as digital literacy increases (Kang, Song, Lee, and Ku 2010; Kang et al. 2011; Lee, Moon, and Cho 2015). Finally, it is expected from digitally literate employees to adapt to a changing business environment which leads to greater levels of innovative work behaviour (IWB) (Pilav-Velić et al., 2021a).

Therefore, based on the studies and empirical research reviewed above, there is a positive relationship between digital literacy of employees and their innovative work behaviour.

H3: Digital literacy of employees has a positive impact on innovative work behaviour.

The mediating role of Digital Literacy of Employees on Digital Leadership and Innovative Work Behavior

Digital literacy performs as a critical facilitator that strengthens the relationship between digital leadership and innovative work behavior of employees through leveraging digital tools and executing innovative ideas. According to Dimitrios et al. (2013) and Thomson et al. (2016), digital leadership is the use of an organization's digital assets to accomplish business objectives at both the organizational and individual levels. A digital leader drives the organization’s creativity and innovation and helps the teams to move forward (Araujo et al., 2021; Gozman & Willcocks, 2019; Hassani et al., 2017). In line with this, in digital leadership, digital literacy makes an important contribution that influences the innovative work behavior of employees. Digital literacy denotes the ability to utilize technological and digital equipment to find, evaluate, use, communicate, and create digital information with cognitive and technical skills (Neumann et al., 2017; Qadir Muslim & Setyono, 2024). Research conducted by Erhan et al. (2022) shows that employees’ perceptions of digital leadership have a positive and significant effect on all dimensions of employees’ innovative work behavior. According to Farr (1990), Innovative Work Behavior (IWB) is an individual’s behavior that aims to achieve the initiation and intentional introduction (within a work role, group, or organization) of new and useful ideas, processes, products, or procedures, and innovative work behavior comprises four dimensions: idea exploration, idea generation, idea promotion, and idea implementation (Santoso et al., 2019). In addition, leaders with high digital skills are perceived positively by employees and tend to adopt innovative behavior. Furthermore, Ng (2012) developed a distinctive model demonstrating three key dimensions of digital literacy: technical, cognitive, and social-emotional. The technical aspect refers to the level of people in terms of their skill in utilizing information and communication technologies in their daily lives. The

mental aspect of digital literacy includes search, evaluation, and processing of information, which is in close relation to critical thinking skills. Finally, there is the social-emotional component that is concerned with the responsible use of social interactions as well as educational or information-seeking activities. Organizations, as Suhada et al. (2024) suggest, need to hire workers with the capacity to think globally, as the world is changing to digital destinations and the information technology revolution is taking place currently. This is what Vial (2019) argues; the combination of the two concepts (DL and DLE) establishes an innovative atmosphere in which employees are able to experiment and adapt to recent technological innovations. Thi My Linh et al. (2024b) show that digitally literate employees have higher chances of being involved in innovation (Pilav-Velić et al., 2021b; Proksch et al., 2024). Their digital expertise also allows them to be creative in applying new technologies and therefore the development of new ideas, products and services. Therefore, digital literacy is a mediator between DL and IWB. Digital leaders who focus on digital learning develop a surrounding in which the employees are able to utilize digital tools effectively, which is in tandem with the innovative focus of the organization. The combination of digital leadership and employee digital literacy results in a culture of permanent learning and innovation driving high organizational performance. Therefore, employee digital literacy is important in converting the vision of digital leadership into practical and innovative work behavior (Thi My Linh et al., n.d.).

Therefore, based on the theoretical research reviewed, the digital literacy of employees has a positive impact on digital leadership and innovative work behavior of employees.

H4: Digital literacy of Employees mediates the relationship between digital leadership and innovative work behavior of employees.

Creative Work Climate as a moderating factor of Digital Leadership, Digital Literacy of Employees, and Innovative Work Behavior

A creative work climate plays a vital role in enhancing the contributions of both digital literacy and digital leadership to innovative work behaviour. Proponents of the creative work climate model emphasize that a supportive and collaborative environment significantly moderates the relationship between digital leadership, employee digital literacy, and innovative work behaviour. According to Chandrika & Setyawati (2023), creative work climate indicates the characteristics of organizations adopted by its employees that motivate and support creativity, innovation and the cultivation of new ideas that encourages the growth of trust/openness, risk-taking, and the free exchange of ideas (Ekvall, 1996), which enlarge the effects of digital leadership and digital literacy on innovative work behaviour. Such a creative environment enables employees to harness (utilize) their digital skills effectively and engage in innovative activities, leading to greater idea generation, promotion, and realization (Amabile et al., 1996; Ekvall, 1996; Hooi & Chan, 2022; Salam, 2023). Furthermore, digital leadership plays an important role in encouraging innovation within organizations (Benitez et al., 2022b), and leaders who can effectively share their digital knowledge with employees help improve employee's innovative work behaviour (Harto et al., 2022; Mayastinasari & Suseno, 2023). A creative work environment also empowers employees and leaders to work more efficiently and creatively, but without such an environment their potential to explore and apply digital solutions may be difficult (Hidayat et al., 2023). Besides, in a weak creative work environment, leaders who lack digital skills may find it hard to motivate employees, showing how essential digital knowledge is for promoting innovation (J. H. Coun et al., 2022) and creative self-efficacy of employees. The development of creative self-efficacy has been shown to have a profound impact on individuals' creative performance (Sari et al., 2024; Tierney & Farmer, 2011), and the research results found that creative self-efficacy positively and significantly affects innovative work behavior and employee performance (Arifin et al., 2024; Tierney & Farmer, 2011).

Therefore, except for a favorable creative work climate, the potential of digital leadership and literacy to drive innovative behavior of employees may be prevented, as employees may face barriers like fear of failure or lack of resources, which can hinder their creative efforts (Tierney & Farmer, 2011; Hunter et al., 2007).

Therefore, based on theoretical grounds and previous literature reviews, this study proposes the following hypothesis:

H5: Creative work climate moderates' digital leadership

H6: Creative work climate moderates' digital literacy and

H7: Creative work climate moderates innovative work behavior of employees.

Research method

1.Survey design

To understand how digital leadership, digital literacy, creative work climate, and innovative work behavior are connected, we designed a structured questionnaire based on a clear theoretical model. The survey began with a short section on demographic details such as age, gender, education, and work experience. Specific questions were also used that were connected to the major spheres of our study. Digital leadership measured by five items, digital literacy measured by ten items, creative work climate measured by six items and innovative work behavior measured by four items. A rating of each item was made in a five-point Likert scale form, where the possible answers were strongly disagreed, disagree, neutral, agree, and strongly agree and all the questions were adjusted with previous well-established studies to make them reliable. Our model examined the direct effect of digital leadership on digital literacy of employees, their attitude towards creative work climate, and innovative behavior. We also researched on the question of whether digital literacy is a bridging variable between leadership and innovation, and how a creative climate/environment may facilitate or define these impacts. We also translated the questionnaire into Bengali to ensure that the questionnaire is as easy as possible to the participants who would feel free to answer the questions in their own language. To retain the original meaning of the questions used, we used the back-translation technique which Brislin (1970) proposed. This cautious approach served to allow us to make sure that the meaning and tone were not lost in the translation version. This helped ensure that all participants clearly understood the questions, no matter which language they responded in.

2.Data collection procedure and sample characteristics

We used a survey questionnaire to collect data from employees working under the supervision of a leader or manager in various business organizations across Bangladesh. The study collected cross-sectional data from employees working under the guidance of leaders or managers in various business organizations across Bangladesh. Research assistants helped distribute the questionnaires to the respondents. Section 1 covered demographic information, while Section 2 included items measuring the latent variables relevant to the research.

The survey questionnaire was designed in a way that respondents could keep them anonymous because previous studies endorsed those accurate responses were received in a perceptual survey when privacy and confidentiality are guaranteed (Uddin et al., 2019, 2020a; Fan et al., 2019). In total, we collected

194 questionnaires from 500 questionnaires, and eight questionnaires were dismissed because of incomplete data and unmatched cases.

3. *Survey instruments*

The questionnaire was divided by three sections. The first one includes how to respond to the survey. The second part includes the main survey question in which participants asked to mark the tick to the appropriate box. In the third part the respondents asked to provide basic personal information such as age, gender, education, experiences in the organization. The responses of the questionnaire were measured by the five-point Likert scale ranging from strongly agree to strongly disagree.

4. *Demographic profile of respondents*

Gender		Frequency	Percent	Valid Percent	Cumulative Percent
	Male	154	83.2	83.2	83.2
	Female	31	16.8	16.8	100.0
	Total	185	100.0	100.0	

Statistics		Industry	Gender
N	Valid	185	185
	Missing	0	0
Mean		2.51	1.17

Table 1. Frequency Distribution of Respondents by Gender

The demographic information of the respondents who that out of 185 responses, 154 (83.2%) were male, and 31 (16.8%) were female. It is clarified that most of the respondents were male participated in the study. The data shows that there was no missing information in terms of gender or industry which indicates that the data were complete. The central tendency of the industry (2.51) and gender (1.17) indicates that the coding of the variables has a balanced pattern of distribution as per the study designs. On the whole, the frequency findings give a proper idea about the gender distribution among the respondents such that the demographic data will be accurate and will reflect the sample on which the further analysis will be carried out.

5. *Descriptive Statistics of Study Variables*

Descriptive Statistics

	N	Mean	Std. Deviation	Skewness		Kurtosis

Table 2. Descriptive Statistics of Study Constructs

The data obtained with the sample of 185 respondents was summarized with the use of descriptive statistics and outline opinions of the respondents on the key variables of this study Digital Leadership (DL), Digital Literacy (DLT), Creative Work Climate (CWC) and Innovative Work Behavior (IWB). The means (3.29 - 4.05) reveal that there was moderate to high degree of consensus among all items by the respondents. The dlt2 had the greatest mean score (4.05), which indicated the strong positive perception of digital literacy practices. CWC3 had the lowest mean (3.29) which indicated a relatively low agreement in creative work environment. The values of standard deviation (0.95-1.22) indicate that there was a moderate variation among the responses so that the opinions of most participants were very similar. Moreover, the values of skewness (between -1.299 and – 0.293) and kurtosis (between -0.595 and 1.264) lie within the range of acceptable values of +2 and -2, which means that the data are normal approximately. Thus, the data can be used to conduct additional statistical works, including correlation, regression, and SEM. Overall, the findings reveal that the respondents have rather positive attitudes toward digital leadership and literacy that are backed by a moderately creative workplace and an adequate degree of innovative work behavior.

6. *Test of Normality*

To assess the normality of the distribution of data, the Kolmogorov-Smirnov and Shapiro-Wilk tests were used. The outcome (K-S =.246 p < =.001; S-W =.775 p < =.001) shows that the data are not normally distributed. Nonetheless, the sample size (N =185) is rather big and SEM/regression methods are resistant to small departures of normality. Therefore, the data were deemed to be appropriate for further analysis.

Table 3. Tests of Normality (Kolmogorov–Smirnov and Shapiro–Wilk)

7. Measurement Model Evaluation

7.1. *Reliability and Validity*

Reliability indices

Variable	α	Ordinal α	ω_1	ω_2	ω_3	AVE
Digital leadership	0.928	0.944	0.937	0.937	0.979	0.816
Digital literacy	0.940	0.945	0.935	0.935	0.977	0.669
Innovative work behavior	0.939	0.954	0.931	0.931	0.937	0.810

Table 4. Reliability and Validity Indices

The reliability test is a confirmation that all the constructs are very consistent and valid. Cronbach's Alpha and Ordinal Alpha values are (Greater than 0.90) point to the existence of high internal consistency. The strong reliability of the measures of the data is also supported by the Omega coefficients (ω_1–ω_3 between 0.93 and 0.98). Moreover, the value of AVE (0.669 to 0.816) is higher than the advised threshold (0.50), establishing good convergent validity. On the whole, these findings indicate that the model of measurement is sound and reliable, to make sure that every construct is an accurate reflection of the desired idea.

Heterotrait-monotrait (HTMT) ratio of correlations

	Digital leadership	Digital literacy	Innovative work behavior
Digital leadership	1.000	0.575	0.559
Digital literacy	0.575	1.000	0.870
Innovative work behavior	0.559	0.870	1.000

Table 4.1 Reliability and Validity Indices

The HTMT values that represent the correlation between two different constructs are a widely used criterion for assessing discriminant validity in the Structural Equation Model (SEM). A value of the HTMT below 0.85 (others up to 0.90) is a good discriminant validity. Values of higher values (over 0.90) may indicate that two constructs are too close or that one is not as different as it should be. The validity of the constructs contained in the model is confirmed by the HTMT a

nalysis that shows that the discriminant validities of the constructs are acceptable. All the HTMTs are less than or within the suggested limit of 0.85-0.90 (digital leadership-DLT = 0.575, digital leadership-

IWB = 0.559, DLT-IWB = 0.870). This means that the constructs are all conceptually different and quantify different things within the model. Thus, the measurement model shows a sufficient level of discriminant validity i.e., the variables are clear and not closely related.

7.2. *Variance and Covariance Analysis*

Table 5 presents the variances and covariances of the measurement model. Each indicator (dl1–dl5, dlt1-dlt10, and iwb1–iwb5) shows its respective variance values, which were fixed parameters in the model; therefore, no standard errors or p-values were generated for these items. The covariance and variance were analyzed in order to determine the consistency and the relationship between the variables of the study as Digital Leadership (DL), Digital Literacy (DLT), and Innovative Work Behavior (IWB). The results of the variance indicate that all three constructs, DL (0.872), DLT (0.640), and IWB (0.179) have significant and positive values of variance ($p < .001$). This means there exists meaningful variation in the responses of the participants, which means that individual constructs identify distinct differences in perceptions. The Digital Leadership and Digital Literacy (covariance) has a positive and significant value (0.417) indicating that there is a strong positive association between the two variables. That is, the increased levels of digital leadership are associated with increased digital literacy in organizations. All the values are significant at the level of 0.001, which proves that the relations within the model are statistically correct. Summing up, the findings depict that the constructs are different yet have a positive relationship, which gives a credible foundation for the study even further. Confirmatory Factor Analysis (CFA) and Structural Equation Modeling (SEM) are among these analyses.

Scaled	0.068	0.117	0.107	0.128	<.001

Table 6.1 Model Fit Indices

In Table 6, The Chi-square test reveals that the model proposed by me fits the data significantly better than the baseline model. The p-value is below.001, though this is normal in the cases of the large sample size. My model Chi-square (527) is significantly lower compared to the baseline model (41878) and therefore, the relationship in my model fits the actual data accurately. As such, the model can be termed as a good fit. SRMR (Standardized Root Mean Square Residual) is used to measure the variation between real data and predicted data as generated in the model. A value below 0.08 means a good fit. A good fit will be depicted

By a value of SRMR in my model equal to (0.068) less than 0.08. RMSEA (Root Mean Square Error of Approximation) which is used to test the goodness of the fit of the model to the population data even taking into account the complexity of the model. A figure less than 0.08 is good. RMSEA = (0.108) in this model is small more than 0.08 hence it depicts a moderate fit. On the whole, as SRMR is in the good range and RMSEA is very close to an allowable threshold, the model fits the data quite effectively, but it is possible to improve it somehow.

Analysis and findings

Measurement Model (Factor Loadings)

Results of the measurement model indicate that all three constructs Digital Leadership, DLT, and IWB are correctly measured using their items. In the case of Digital Leadership, the items strongly measure this construct with the factor loading between 0.830 and 0.934 with significant values (p =.001). In case of DLT, the loadings are between 0.695 and 0.912, and it is significant at p =.001, though one of the items (0.695) is very slightly less than 0.70, the rest of the five items are beneficial, implying that

The construct is reliable in its entirety. In the case of IWB, all the items have high loadings of between 0.869 and 0.916 with p =.001 which is a confirmation of a strong relationship. The strong convergent validity and reliability of the model (observe that nearly all the loadings are above the recommended 0.70) confirm that the observed items are adequate at measuring their respective latent variables and can be removed to do any more structural analysis.

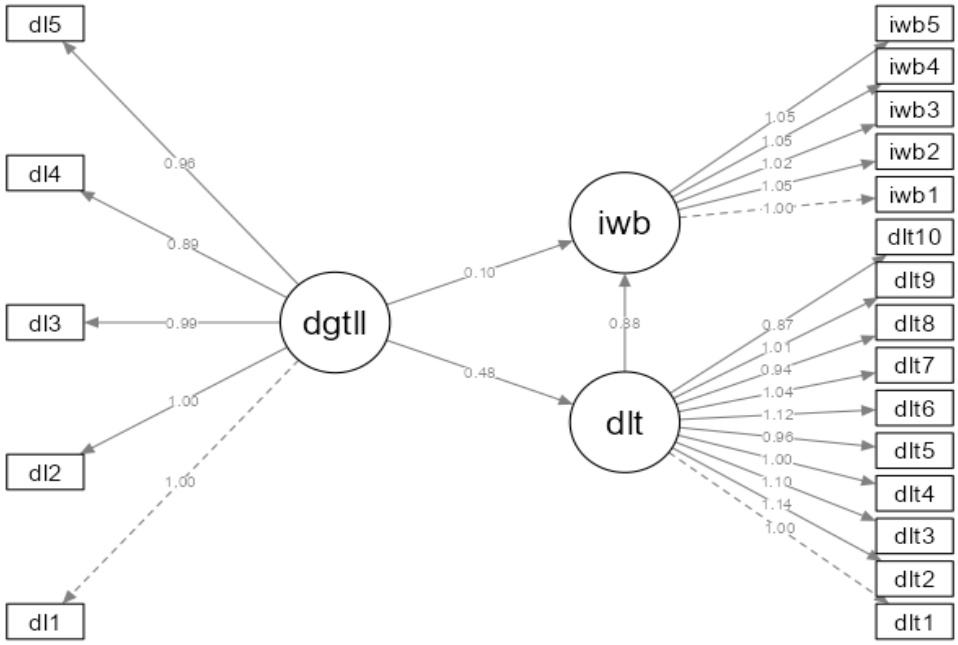
Structural Model Analysis

1. Direct Effects

Structural Model Showing Direct and Indirect Effects between Study Variables



In Table 8, the parameter estimates revealed by the SEM analysis show that both Digital Leadership and DLT bring about positive impacts on Innovative Work Behavior that are significant. In particular, the effect of DLT is very strong ($\beta = 0.809$, $p < .001$) and the effect of Digital Leadership is not that great, but significant ($\beta = 0.107$, $p < .001$). These results prove that an efficient application of digital leadership instruments and qualities contributes significantly to boosting innovative working behaviors of employees, which validates the hypothesized links in the structural model. As we can demonstrate in the table of variances and covariances, Digital Leadership influences Digital Literacy significantly in a positive way ($\beta = 0.558$, $p < .001$). It implies that the greater the leaders are perceived to have higher digital leadership attributes including leading, motivating, and utilizing digital tools adequately, the higher the digital literacy is exhibited by employees in the organization. This direct route (DL → DLT) was not contained in the table of the estimated parameters however, it is evidently established in this analysis in the Variance and Covariance aspect and in the model diagram. This is why it is not indicated in the name given in that table because by default, the households listed by the Jamovi only contain those that define Innovative Work Behavior (IWB) as the ultimate dependent variable. Flows between Digital Leadership and Digital Literacy (DLT), as this is also one of the dependent variables in the model, would exist in a separate section of the output rather than being displayed in the primary parameters table. Hence, though the path remains not represented in the identical output table, the statistical result ($\beta = 0.558$, $p < .001$) is a strong indication that Digital Leadership is a direct and positive contributor to Digital Literacy in the organization.

Parameters estimates

				95% Confidence Intervals				
Dep	Pred	Estimate	SE	Lower	Upper	β	z	p
Innovative work behavior	Digital literacy	0.8791	0.0300	0.8204	0.938	0.809	29.34	<.001
Innovative work behavior	Digital leadership	0.0999	0.0230	0.0548	0.145	0.107	4.34	<.001

Table 8. Direct Path Coefficients

2. Mediation Effects

Defined parameters

					95% Confidence Intervals				
Label	Description	Parameter	Estimate	SE	Lower	Upper	β	z	p
IE1	DL ⇒ DLT ⇒ IWB	p23*p21	0.421	0.018	0.385	0.456	0.452	23.177	<.001

Table 9. Mediation Analysis Results

The mediation analysis has tested the hypothetical role of Digital Leadership which has an indirect influence on Innovative Work Behavior (IWB) mediated by Digital Literacy (DLT). The findings indicated that there was a significant indirect effect (β = 0.452, Estimate = 0.421, SE = 0.018, z = 23.177, p < .001, 95% CI [0.385, 0.456]). This means that Digital Leadership is strongly connected to IWB by way of DLT. Therefore, our hypothesis postulates that those leaders having good digital leadership abilities have a favorable effect on the innovative work behavior through augmenting the nature of digital literacy in the organization.

3. Moderation Effects

H_5: DL × CWC → IWB

The study explored the moderation of Creative Work Climate (CWC) in the connection between Digital Leadership (DL) and Innovative Work Behavior (IWB) among workers. The overall model displays a good fit and R = 0.768 and R^2 = 0.590 accordingly, indicating a good fit to about 59 percent of the variation in the IWB by DL, CWC, and the interaction between the two (DL× CWC). This shows that empirical predictors combined are significant in regard to novel behavior in the workplace. According to the results of the coefficients, the digital leadership (DL_c) by itself did not affect IWB significantly but positively (B = 0.067, t = 1.05, p = 0.294). This implies that digital leadership alone does not have a strong impact on the effect of innovation on work behavior. Creative Work Climate (CWC_c) on the other hand made a strong and positive impact (β = 0.674, t = 9.50, p <.001) demonstrating that when employees operate in a more creative and enabling environment, they are much more innovative. Above all, the interaction term (DL × CWC) was positive and significant (β = -0.124, t = -2.89, p =0.004). This finding supports the claim that CWC moderates the correlation between DL and IWB. Its negative value displays the fact that the more positive CWC is, the less influence pivotal goes to DL regarding IWB. That is, digital leadership contributes a comparatively lower value to the innovative behavior in another case when the creative work environment is already solid. The findings indicate that CWC has a huge moderating effect (β = -.124, p =.004) in the correlation between IWB and DL. Whereas the effect of DL alone was not a significant predictor (p = 0.294), CWC was significantly positive (p < .001). The interaction effect tells that where the working environment in an organization is highly creative, the further contribution of digital leadership to innovative behavior is smaller. Hence, the hypothesis H_5 is accepted, and it would mean that Creative Work Climate plays a significant moderating role as the between variable between Digital Leadership and Innovative Work Behavior.

DLxCWC	-0.1238	0.0428	-2.89	0.004

Table 10. Moderation Fit and Coefficient

H_6: DL × CWC → DLT

The equation had a high explanatory power as it explained 60.4% of the variation in DLT (R = 0.777, R 2 = 0.604). The findings indicate that the effect of Digital Leadership on DLT is positive but of a slight but insignificant magnitude (β = 0.112, p = 0.064) whereas Creative Work Climate has a strong and significant positive impact (β = 0.501, p <.001). Significantly, the interaction term (DL × CWC) is not insignificant and negative (β = -0.211, p <.001), which proves the moderating effect of CWC. This implies that as the climate of the creative work is high, the beneficial impact of digital leadership on digital literacy is ultimately less. As such, H_6 is accepted, which implies that CWC is a significant moderator of the casing of the DL and DLT.

Intercept	3.927	0.0464	84.59	<.001
DL_c	0.112	0.0598	1.87	0.064
CWC_c	0.501	0.0664	7.55	<.001
DLxCWC	-0.211	0.0401	-5.26	<.001

Table 10.1. Moderation Fit and Coefficient

H_7: DLT × CWC → IWB

Model Fit Measures

Model	R	R^2
1	0.864	0.747

Note. Models estimated using sample size of N=185

Model Coefficients - IWB

Predictor	Estimate	SE	t	p
Intercept	3.7246	0.0408	91.347	<.001
DLT_c	0.6274	0.0649	9.668	<.001
CWC_c	0.3303	0.0596	5.538	<.001
DLT*CWC	-0.0229	0.0358	-0.641	0.522

Table 10.2. Moderation Fit and Coefficient

There was a strong overall fit to the model with (R = 0.864) and (R^2 = 0.747) indicating that between 74.7 percent of the IWB variance is being captured by DLT, CWC, and their interaction (DLT × CWC). The findings have shown that there is a high and significantly impact of Digital Literacy (DLT_c) on Innovative Work Behavior (β = 0.627, T = 9.67, p =.001). Likewise, the reported positive effect of Creative Work Climate (CWC_c) on IWB is also high (β = 0.330, t =5.54, p <.001), indicating that employees in a more creative work climate report higher innovative behavior. Nevertheless, the interaction term (DLT x CWC) is negative, which is not significant (β = 0.023, t = –0.64, p = 0.522). This implies that CWC does not play a significant moderator role in the relationship between DLT and IWB. That is, although, the combination with the other significantly contributes to the extra effect of innovative work behavior, both DLT and CWC contributed to it on their own. So, H_7 is not verified, which means that there is no significant moderation of Creative Work Climate among Digital Literacy and Innovative Work Behavior.

Hypothesis Testing Results

Hypothesis	**Path**	**β**	**p-value**	**Supported/Not Supported**
H1	DL → IWB	0.107	< .001	Supported

H5	DL × CWC → IWB	–0.124	.004	Supported
H6	DL × CWC → DLT	–0.211	< .001	Supported
H7	DLT×CWC→ IWB	–0.023	.522	Not Supported

Discussion

This paper has investigated how digital leadership affects innovative work behavior by employees, with the concept of digital literacy being a mediator, and creative work climate as the moderator. The study revealed that the measurement model and the structural model have high validity and reliability, thus proving the strength of the suggested framework. Taken together, the findings illuminate the clear influence of the leadership, digital competence, and organizational environment that can predetermine the innovative work behaviors of the employees under the digital transformation conditions.

The findings that are summarized in the structural model indicate that digital literacy is the strongest predictor of innovative work behaviors. More competent and convinced employees using digital technologies will be more inclined to resort to creative and innovative activities at work. The close and meaningful relationship between digital literacy and innovative work behavior ($\beta = 0.809$, $p < 0.001$) confirms the idea that technological capability is a direct facilitator of innovation. On the other hand, the digital leadership ($\beta = 0.107$, $p < 0.001$) does not have much direct influence, but it is less influential. This trend implies that the role of leadership is indirect through the development of a digitally competent workforce instead of innovation. The impact of digital literacy also suggests that in the case of high digital competence of employees, the transformation of leadership direction into tangible innovative behavior can be achieved successfully. The study, in line with the theoretical anticipations, also indicated that there is a substantial mediating role of digital literacy between digital leadership and innovative work behavior. Digital leadership had a significant effect on digital literacy ($\beta = 0.558$, $p < 0.001$), and the mediation analysis proved that the effect of digital literacy on the results of innovation is mediated by a significant portion of the influence of leadership on it ($\beta = 0.452$, $p < 0.001$). This finding suggests that digital leadership is based on the capability of building employee potential. Leaders who drive learning, offer digital resources, and promote experimentation indirectly drive innovation through the advancement in technological fluency of employees. Therefore, the quality of predictability of digital leadership relies heavily on its ability to produce digitally competent and assured groups able to lead the innovation process independently.

This understanding is further expanded by the moderating nature of the creative work climate. The findings show that the climate of creative work positively influences digital literacy ($\beta = 0.501$, $p < 0.001$) and innovative working behavior ($\beta = 0.674$, $p < 0.001$) in a direct way, which means that the favorable and psychologically safe environment at work encourages digital learning and creative work.

The undesired interaction effects of digital leadership and creative work climate on both digital literacy ($\beta = 0.211$, $p < 0.001$) and innovative work behavior ($\beta = 0.124$, $p = 0.004$) however demonstrate a declining marginal effect of the leadership when the creative climate is already high. That is, the additional influence of leadership will be less required when the employees are already operating in an environment which is already open, innovative, and resourceful. On the other hand, in less favorable climates, leadership plays an essential role in the pursuit of digital competence and innovation. Interestingly, the mutual effect of the digital literacy and the creative work climate (DLT × CWC) on the innovative work behavior ($\beta = -0.023$) was not significant, suggesting that the positive coverage of digital literacy on innovation will not decrease with different levels of climate.

The general framework validates that digital leadership and creative climate act as complementary and separate facilitators of innovative work behaviors. Leadership enhances the digital skills and the creative work climate provides the psychological and organizational environments to implement the digital skills. A combination of them creates a comprehensive basis for nurturing innovation in digital workplaces. In theory, these results clarify existing points of view by depicting that the transformational aspects of leadership have the most critical impact on constructing capability instead of controlling the behavior directly. Practically, the results emphasize that to improve innovative working behavior the organizations aiming to increase it should focus on programs that will raise the level of digital literacy among the employees and the creation of a creative and favorable environment. Leaders are to work on offering digital training, technological support, and a culture of constant learning whereas management has to maintain the environment that promotes experimentation, autonomy, and risk-taking. Interventions of leadership are especially significant in the context where the creative climate is weak in order to balance the absence of environmental support. On the other hand, in situations where a strong climate already exists, leadership should focus on maintaining empowerment and alignment on strategies as opposed to taking action. Finally, this paper demonstrates that digital leadership is a force that promotes innovation when it comes to enhancing the digital literacy of employees, and a creative work climate increases the potential of innovation and moderates the role of leadership. A combination of these dimensions provides an overall picture of how digital-era leadership could be capitalized upon to foster sustainable innovation and improve the competitiveness of an organization in technologically dynamic settings.

Managerial implications

Besides the theoretical contributions, this research has several practical implications to managers, organization leaders, and policymakers. The results point out that digital leadership is very effective in improving the innovative work behavior of employees, which is mainly achieved by building digital literacy. As such, managers ought to understand that the digital era demands more than just promoting creativity to develop an innovative culture; it requires organizational efforts to develop a digitally skilled workforce. The leaders should make the investment in the ongoing digital training courses, mentorship, and technological support that will help to enhance the technical, cognitive, and social digital skills of employees because these three competencies directly provoke the innovative results.

Second, the high mediating effect of digital literacy implies that managers ought to place learning and building capabilities programs at the Centre of their leadership policies. An environment in which digital upskilling and knowledge sharing are appreciated will convert intentions of leadership into innovation on the employee level. The more employees are sure to use digital tools, the more they create, advance, and execute new ideas that will promote organizational advancement.

Third, the results concerning a creative work climate highlight the necessity to have a positive, open, and psychologically comfortable atmosphere. A positive climate in a creative work environment not only increases the process of innovation directly but also increases the effect of digital literacy. Managers ought to be able to encourage trust, autonomy, and participative decision making and they ought to have sufficient resources and recognition systems that do not ignore creative initiatives. But in situations when the creative environment is already robust, leaders can change their priorities to maintaining digital learning cultures, and facilitate self-directed innovation instead of top-down directions.

Lastly, companies ought to maintain a middle ground approach, which combines leadership training, digital competency building, and climate-building. The digitally savvy leaders who combine digital knowledge with transformational skills like personalized attention and mental engagement are capable of aligning technological change to innovation among employees. Incorporating these principles into the organizational culture and policy, companies can become more adaptive, more capable of innovating, and attain sustainable competitive advantage in the changing digital environment.

Theoretical Implications

The paper offers a number of theoretical contributions that enhance the comprehension of digital leadership, developing capability and innovative work behavior. First, the fact that the model is based on the Transformational Leadership Theory translates the theory into the digitalized work settings. The results indicate that the core transformational features such as vision, inspiration, and intellectual stimulation become digital leadership when they are implemented with the help of technology, which proves that the theory remains relevant in the organization environment characterized by technological changes. Second, the paper defines digital literacy as a critical mediating skill that allows the digital leadership to translate into innovative work behavior. Instead of considering innovation as a direct impact of the leadership, the results reveal the digital literacy as the underlying cognitive-technical tool that helps the employees to translate leadership influence into ideation, experimentation, and problem-solving. This progresses the ability-based and resource-based views by focusing on skill development as one of the core ways of leadership competence within the digital environment. Third, demonstrating that the creative work climate enhances the impact of digital leadership and digital literacy on innovation, the study adds to the interactionist and creativity theories. The results confirm that innovative behavior results as the interaction between personal competency and situational facilitation, which is the extrapolation of creativity theory to digitally transforming work-places where the psychological preparedness and climate-promising interaction co-determine innovation. Lastly, empirical data on the Bangladesh business world expands the cross-cultural scope of the digital leadership theory. The evidence of the strength of the leadership-literacy-innovation mechanism in an emerging economy makes the theoretical model more relevant to the global community. Taken together, these contributions provide a holistic theoretical approach whereby digitally competent leadership, staff abilities and a conducive creative environment together influence innovative action in contemporary organizations.

Limitations and Future Research

Despite the fact that the study provides valuable theoretical and practical insights, there are a number of limitations that leave the future research open. To start with, the research design adopted a cross-sectional one and this limits the possibility of making any causal inferences about the associations between digital leadership, digital literacy, creative work climate, and innovative work behavior. Future studies need to be based on longitudinal or experimental designs to determine how employee capabilities and innovative behavior change over time and to better establish causality. Second, all variables were measured at one point in time on the same respondents and this increases the probability of common method bias. The future research can overcome this issue through the adoption of time-lagged data collection, collecting responses of more than one source, or objective performance indicators to confirm the results of innovation among employees. Third, the paper was based on self-reported measurements, which can bias the study and exaggerate the relationships. Future studies need to take into account the use of supervisor assessments, peer-to-peer assessments, or digital trace data to gain a more detailed and objective evaluation of digital literacy and innovative behavior. Fourth, although digital literacy was investigated as a mediating factor, other psychological or capabilities related variables, including intrinsic motivation, learning agility, digital self-efficacy, or creative self-efficacy, also might influence the effects of digital leadership on innovative behavior. The analysis of other mediators may enhance the theoretical knowledge regarding the mechanisms of how digital transformation results in employee innovation. Lastly, the research was also done in the business community of Bangladesh, which is a developing economy that is highly digitalized yet at different stages of technological progress. Even though this setting makes the study relevant to the same developing economies, it could reduce the applicability of the results to other areas. The model needs to be replicated in other cultural, economic, and industrial contexts in the future, i.e., in the public sector organizations, digitally mature companies or any other global technological company to confirm the strength of the dual mechanism of digital literacy and creative work climate. Conducting comparative research at cross-country levels would also contribute to the cross-cultural generalizability of the findings and unfold some contextual specifics in the impact of digital leadership on innovative work behavior.

Conclusions

As the current research has revealed, digital leadership proves to be effective and influences innovative work behavior among the employees in the organizational environment of Bangladesh. The researchers also indicate that the association between digital leadership and innovative work behavior is mediated by digital literacy whereas the relationship is moderated by creative work climate. Digital leaders can enhance the level of innovative work behavior among employees by building up their level of digital competence, enabling technological flexibility, and providing a culture of creativity. The research work is relevant to the growing body of study on digital and transformational leadership because it connects leadership practices to creative results using the concept of digital literacy as a key process variable. The incorporation of creative work climate as a moderating variable enhances the knowledge on the effects of digital leadership on innovation underlining that leadership effectiveness is determined by cultivating the skill as well as providing a supportive and creative work environment. Although this research has some drawbacks, including the cross-sectional design and restricted sample size, the study represents the empirical validation of the interplay between leadership, employee capability, and the work climate in influencing the innovative work behavior. It also provides a solid base upon which future research on the dynamics of digital transformation can be conducted based on the inclusion of individual, organization-related, and environmental views, and explains the interplay of innovation in the digital era better.

ABSTRACT

The significant fluctuations observed in interprovincial unemployment rates across Türkiye reveal the non-stationarity of spatial processes and the varying impact of geographical factors on regional employment dynamics. This study aims to investigate the spatially varying relationships between unemployment and its determinants in Türkiye by employing the Geographically Weighted Regression (GWR) approach. In the study, provincial unemployment rates were designated as the dependent variable, while various socioeconomic indicators—such as population density, gross domestic product per capita, education level, labour force participation rate, and the proportion of youth population—were selected as explanatory variables. The finding that the GWR model demonstrates superior explanatory power compared to the global model indicates the distinct spatial structure of the unemployment issue in Türkiye. The observed findings suggest that policies aimed at reducing regional unemployment will be more effective if they consider place-specific determinants and dynamics of unemployment.

Keywords: Unemployment, Geographically Weighted Regression (GWR), Spatial Analysis, Regional Disparities, Türkiye

INTRODUCTION AND LITERATURE REVIEW

Unemployment is one of the fundamental indicators of economic and social welfare, and it is a critical macroeconomic issue that directly affects a country's production capacity, income distribution, and overall quality of life. Accurately measuring unemployment rates and analyzing them spatially are of great importance for designing regional development policies and addressing imbalances in the labor market. Indeed, unemployment is not only an economic problem but also a multidimensional

phenomenon shaped by spatial, demographic, and structural factors. Therefore, the use of spatial econometric methods has become increasingly important for understanding the underlying causes of unemployment and developing effective policy interventions.

Empirical studies conducted in Türkiye reveal that unemployment rates exhibit significant spatial disparities across provinces. Tekgün and Yayar (2022) demonstrated, through Moran's I, LISA, and the Spatial Lag Model (SAR), that there is a positive spatial dependence among provinces in Türkiye, and that the primary factors reducing unemployment are the labor force participation rate and the employment share of the agricultural sector. Similarly, Kantar and Aktaş (2016) examined provincial unemployment rates in Türkiye for the period 2004–2013 and showed, through mapping and autocorrelation analyses, that unemployment is spatially concentrated particularly in the eastern provinces. Using spatial panel data analysis with data from 2008–2012, Türkcan and Akseki (2017) explained regional unemployment disparities and identified the socioeconomic variables influencing unemployment. Likewise, Güçlü (2017) found, through panel data methods, that unemployment rates are high in the eastern regions and low in the western regions of Türkiye, and that education level, youth population ratio, and the share of agriculture have significant effects on unemployment. These findings collectively indicate that unemployment in Türkiye exhibits spatial dependence and regional heterogeneity.

Similar patterns are also observed in the international literature. Niebuhr (2003), using European data from the period 1986–2000, demonstrated that regional unemployment rates tend to exhibit spatial clustering and that high-unemployment regions are geographically close to one another. Cheng and Li (2010) found that the relationship between unemployment and new firm formation in the United States varies spatially; employing the Geographically Weighted Regression (GWR) method, they identified that this relationship is positive in some regions and negative in others. Lin and Lin (2025), in their study on U.S. states, analyzed the asymmetric and spatial effects of unemployment rates on mortality using the Asymmetric Spatial Durbin Model and showed that during periods of economic recession, unemployment can influence even neighboring regions.

Recent studies conducted in Europe indicate that the GWR method has been increasingly used in unemployment analyses. Lewandowska-Gwarda (2018a) reported that unemployment rates in Poland vary across regions and that key determinants (such as budget revenues, investments, and social expenditures) differ according to geographic location. In another study, the same author (2018b) analyzed female unemployment using 2016 data and found that social factors play a decisive role in shaping unemployment. Similarly, Chocholatá (2020) conducted GWR analyses for 79 regions in Slovakia and demonstrated that unemployment rates exhibit varying local relationships with variables such as average wages, youth dependency ratios, and migration. In the case of Indonesia, Sartika and Suryani (2020) showed that the GWR model provides higher explanatory power than the classical model in West Java and that the determinants of unemployment vary at the local level.

Within this context, as far as can be determined from the existing literature, research directly applying the GWR method to unemployment in Türkiye appears to be limited. Therefore, this study aims to fill this gap by examining the spatial distribution and determinants of unemployment in Türkiye through the GWR approach. In doing so, the study seeks to reveal unemployment dynamics that vary at the regional level and to develop policy recommendations that take spatial differences into account.

SPATIAL STATISTICS AND GEOGRAPHICALLY WEIGHTED REGRESSION

This section explains the fundamental concepts of spatial statistical methods and Geographically Weighted Regression (GWR). First, the use of the Global Moran's I statistic in identifying spatial autocorrelation is discussed. Then, the logic of the GWR method, local coefficient estimations, and its role in revealing spatial heterogeneity are presented. Within this framework, the capacity of GWR to analyze regional variations in economic variables—such as unemployment—is evaluated.

Global Moran's I

Spatial statistics encompass statistical methods used to analyze spatial distributions, similarities, relationships, and correlations. One of the most widely used global measures of spatial autocorrelation is Moran's I, which is expressed as follows:

$$I = \frac{n}{\sum_{i=1}^{n}(x_i-\bar{x})^2} \times \frac{\sum_{i=1}^{n}\sum_{j=1}^{n} w_{ij}(x_i-\bar{x})(x_j-\bar{x})}{\sum_{i=1}^{n}\sum_{j=1}^{n} w_{ij}} \quad (1)$$

Here, *n* denotes the total number of spatial observations (e.g., districts); x_i, represents the value in region *i*; x_j, represents the value in region *j*; $\bar{x}$ is the mean value across all regions; and w_{ij} denotes the spatial weight between regions *i* and *j*. In general, a Moran's I value greater than zero indicates positive spatial autocorrelation, while a value less than zero indicates negative spatial autocorrelation. If Moran's I equals zero, it implies the absence of spatial autocorrelation.

Geographically Weighted Regression

Geographically Weighted Regression (GWR) is a local regression method that, unlike classical regression models (OLS), reveals whether the relationship between dependent and independent variables varies spatially. Traditional regression models provide a single global coefficient estimate for all observations and do not account for spatial heterogeneity. In contrast, GWR estimates separate coefficients for each region, allowing an examination of whether the relationships among variables differ from one location to another.

Mathematically, GWR is expressed as follows:

$$y_i = \beta_0(u_i, v_i) + \beta_1(u_i, v_i)x_{1i} + \beta_2(u_i, v_i)x_{2i} + \cdots + \beta_k(u_i, v_i)x_{ki} + \varepsilon_i$$

u_i, v_i → Denotes, the latitude and longitude values of the *i*-th observation.

The fundamental estimator of Geographically Weighted Regression (GWR) is the Weighted Least Squares (WLS) method. This approach employs a weight matrix that reduces the influence of distant observations while assigning greater importance to nearby ones when estimating coefficients for each location. In this way, the classical OLS framework is made location-sensitive, thereby capturing spatial variability. As seen in the model, the GWR approach is essentially based on the OLS structure.

$$\hat{\beta}_i = (X_i{}'W_iX_i)^{-1}X_i{}'W_iY_i$$

In calculating the weight matrix, three different approaches are commonly used: fixed, adaptive, and mixed.

1. Bandwidth:

- Determines the *scope* of the model. If selected too large, the model approaches OLS; if too small, the model becomes overly sensitive. Therefore, it must be balanced.
- **Fixed:** The same distance threshold is used for all points.
- **Adaptive:** The distance varies for each point while keeping the number of neighbors constant.

2. Kernel Function:

- A mathematical function that determines how weights decrease as distance increases.
- Main Types:

▪ **Gaussian:** Weights decrease smoothly and continuously with distance and never reach zero.

$$w_{ij} = \exp(-\frac{{d_{ij}}^2}{h^2})$$

▪ **Bi-square:** The most commonly used kernel in practice; it assigns no weight (i.e., zero) to observations outside the specified bandwidth.

$$w_{ij} = \begin{cases} 1 - (\frac{{d_{ij}}^2}{h^2})^2, & d_{ij} < h \\ 0, & d_{ij} \geq h \end{cases}$$

▪ **Uniform:** Does not account for distance; assigns equal weight to all observations within the bandwidth. It is rarely used in practice.

$$w_{ij} = \begin{cases} 1, & d_{ij} < h \\ 0, & d_{ij} \geq h \end{cases}$$

▪ **Exponential:** Assigns weights based on an exponential distance decay function.

$$w_{ij} = \exp(-\frac{d_{ij}}{h})$$

ANALYZING AND FINDINGS

In this study, the socioeconomic determinants influencing provincial unemployment rates in Türkiye are examined from a spatial perspective. The dependent variable used in the analyses is the unemployment rate (*Y*), while the independent variables consist of indicators representing economic, demographic, and human capital characteristics. The explanatory variables included in the model are per capita GDP (X_1), average years of schooling (X_2), youth population ratio (X_3), population density (X_4), and labor force participation rate (X_5). These variables serve as key indicators that reflect the structural characteristics of the labor market and regional heterogeneity across provinces.

The dataset was compiled from province-level statistics for the year 2023 published by the Turkish Statistical Institute (TUIK). To conduct spatial analyses, a shapefile containing the administrative boundaries and coordinate information of Türkiye's provinces was utilized, allowing socioeconomic indicators for each province to be linked with their spatial locations. Selecting the province level as the unit of analysis provides an appropriate framework for revealing the geographic patterns of regional unemployment disparities.

First, the classical linear regression model (OLS) was estimated to assess the overall effects of the selected variables on unemployment rates. However, as is frequently the case with spatial data,

significant spatial autocorrelation was detected in the model residuals, indicating that the relationships were not regionally constant and that spatial heterogeneity needed to be taken into account. Therefore, in the second stage, the Geographically Weighted Regression (GWR) approach—which allows parameters to vary according to geographic location—was employed.

All statistical procedures were conducted using the R programming language, and the "GWmodel" package was employed for the spatial regression analyses. This package provides an appropriate framework for the purposes of the study, as it supports both classical GWR models and multiscale GWR (MS-GWR) approaches, allowing spatial processes to be modeled at varying scales.

The table below presents a comparative summary of the results obtained from the OLS and MS-GWR models.

Table 1. Criterion Results Obtained from the OLS and MS-GWR Models

Criteria	OLS	MS-GWR
R^2	0.3603	0.7028
Adjusted R^2	0.3176	0.5397
AIC	398.70	344.64
AICc	400.23	388.10
Moran's I	0.434 (1.19E-10)	-0.116 (0.9234)

When the goodness-of-fit measures, Moran's I statistics (as indicators of spatial dependence), and information criteria obtained from the models in Table 1 are considered together, it is evident that the MS-GWR model captures spatial heterogeneity to a substantial degree and demonstrates a clear superiority over the OLS model.

For the OLS model, the R^2 value was found to be 0.3603, while the adjusted R^2 value was 0.3176. This result indicates that only approximately 32–36% of the variance in the dependent variable is explained by the model.

The MS-GWR model, on the other hand, demonstrates a considerably high explanatory power with R^2 = 0.7028 and adjusted R^2 = 0.5397. This improvement clearly indicates that the spatially varying coefficients enhance the model's fit and that the spatially heterogeneous structure in the dependent variable cannot be captured by the OLS model. The findings are consistent with the literature, which reports that GWR-type models yield higher explanatory power for socioeconomic and demographic indicators influenced by spatial processes.

The Akaike Information Criterion (AIC) and the corrected AIC (AICc), which are commonly used in model comparisons, also demonstrate the clear superiority of the MS-GWR model. The substantial decrease in both AIC and AICc values indicates that, even when accounting for model complexity, the MS-GWR model provides a better fit to the data structure. In particular, the approximately 54-point improvement in AIC serves as strong evidence that spatial variability has been appropriately incorporated into the model.

The Moran's I value for the OLS residuals was obtained as 0.434 ($p < 0.001$), whereas the Moran's I value for the MS-GWR residuals was –0.116 ($p = 0.9234$). These results indicate that the spatial dependence in the residuals persists in the OLS model, while in the MS-GWR model, significant spatial

dependence has been eliminated. This finding demonstrates that the MS-GWR approach successfully accounts for spatial dependence by effectively removing it from the residual structure.

These analytical results reveal that the relationships observed in the study area are not spatially stationary and that the effects of the variables differ according to geographic location. Since the OLS model is unable to capture this heterogeneous structure, its explanatory power is reduced and spatial autocorrelation emerges as a problem. In contrast, the MS-GWR model:

- Substantially increased the explained variance,
- Significantly improved the AIC and AICc values,
- Eliminated spatial autocorrelation in the residuals,
- Allowed parameter estimates to vary at the local level.

In conclusion, the findings indicate a strong presence of spatial heterogeneity and demonstrate that the classical OLS model is inadequate for this type of data. The MS-GWR model can be considered the most appropriate approach for the study, both in terms of model performance and its capacity to address spatial dependence.

CONCLUSION

This study comparatively examined the classical linear regression (OLS) model and the multiscale geographically weighted regression (MS-GWR) model to identify the spatial determinants of provincial unemployment rates in Türkiye. Using province-level data from TÜİK for the year 2023, the analyses demonstrate that unemployment does not exhibit a spatially homogeneous pattern; rather, pronounced regional disparities are evident. The OLS model was able to explain only a limited portion of the variation in unemployment ($R^2 = 0.3603$) and exhibited significant spatial autocorrelation in its residuals. This finding indicates that spatial dependence cannot be adequately captured by classical, non-spatial models.

In contrast, the MS-GWR model substantially increased the explained variance ($R^2 = 0.7028$) and successfully eliminated spatial autocorrelation in the residuals. The marked reduction in AIC and AICc values further shows that models incorporating spatial variability are far more effective in explaining complex socioeconomic indicators such as unemployment.

The findings reveal that key determinants of unemployment—such as per capita GDP, education level, youth population ratio, population density, and labor force participation—do not exert uniform effects across Türkiye; instead, their influence varies considerably with geographic location.

Therefore, policies aimed at combating unemployment must take into account the structural characteristics of each region. The findings support the view that uniform national policies are insufficient; instead, localized policies tailored to the dynamics of regional labor markets are likely to be more effective. The use of spatial methods in labor market analyses will enable more accurate decision-making in policy design. Employment incentives for young people, entrepreneurship programs, and vocational guidance activities should be shaped according to regional needs. In provinces with low per capita GDP, programs that support local production, small and medium-sized enterprises (SMEs), and entrepreneurship will be more effective in reducing unemployment.

This study has several methodological and data-related limitations. First, it relies on cross-sectional data and includes only the statistics for the year 2023. Therefore, changes over time in the relationship between unemployment and its determinants cannot be examined within the scope of this research.

Future studies using spatial panel models could allow for a joint assessment of both temporal and spatial dynamics.

Second, although the variables used in the study capture key indicators of the labor market, other factors that may influence unemployment—such as migration flows, sectoral employment structure, informal employment, or regional incentive mechanisms—were not included in the model. Incorporating such variables could contribute to a more detailed understanding of the structural causes underlying spatial disparities.

Third, the unit of analysis is the provincial level. Smaller spatial units (such as districts or NUTS-3/4 regions) could reveal finer spatial patterns of unemployment dynamics; however, due to limitations in data availability across regions, the analysis was restricted to the provincial scale.

Finally, although the GWR and MS-GWR models effectively capture spatial variability, they carry methodological limitations related to bandwidth selection, sample size, and sensitivity to the spatial weight matrix. Therefore, the findings should be interpreted considering both the flexibility and limitations inherent in these modeling approaches.

Despite these limitations, the study provides important insights into the spatial dimension of unemployment dynamics at the provincial level in Türkiye and clearly demonstrates the valuable contribution of spatial approaches to labor market analysis.

Abstract

This study examines whether the Comprehensive Economic Partnership Agreement (CEPA) between Indonesia and the European Union, which was recently signed, can serve as a practical bridge connecting European market access and sustainability standards with Indonesia's industrial upgrading and long-term development agenda. Based on the theory of regional trade agreements, global value chains, and green industrial policy, this study focuses on how deep and comprehensive free trade agreements (FTAs) can change incentives for exporters, regulators, and business associations in asymmetrical North-South partnerships. This article discusses three main questions: how Indonesian regulators, business associations and exporters view the opportunities and risks associated with CEPA; what adjustment strategies they are pursuing to meet new demands related to sustainability and traceability; and what institutional conditions are needed to reduce uncertainty in implementation. This article discusses three main questions: how Indonesian regulators, business associations and exporters view the opportunities and risks associated with CEPA; what adjustment strategies they are pursuing to meet new demands related to sustainability and traceability; and what institutional conditions are needed to reduce uncertainty in implementation. The analysis identifies four main themes: the deepening and asymmetric nature of market access packages in CEPA; the role of Trade and Sustainable Development (TSD) provisions and unilateral measures by the European Union (Carbon Border Adjustment Mechanism/CBAM, EU Deforestation Regulation/EUDR) in generating 'double adjustment shocks' the prospects for increasing Indonesia's industrial capacity amid the EU's supply chain de-risking strategy; and the political contestation surrounding 'green protectionism' and sovereignty costs. This article argues that the potential for CEPA to serve as a legitimate bridge, rather than developing into a new conflict zone, depends on focused assistance for small and medium-sized exporters, a solid collaborative institutional framework, and a partnership-driven enforcement strategy. The article also proposes an agenda for further empirical research that can be developed once implementation data becomes available.

Keywords: Indonesia-EU CEPA, Free Trade Agreement, CBAM and EUDR, Industrial Upgrading

INTRODUCTION

Free trade agreements (FTAs) are now a key instrument in shaping the structure and direction of global trade. FTAs no longer focus solely on tariff reduction, but extend to various areas, including trade in services, investment flows, intellectual property rights protection, regulatory cooperation and harmonisation, and commitments to sustainability agendas. In policy literature, FTAs are understood as a vehicle for establishing standards that link market access with strengthening environmental and labour governance, in line with the dynamics of global value chains described by Baldwin (2016). (Baldwin, 2016; European Parliamentary Research Service [EPRS], 2023)

In the aftermath of the pandemic, the European Union's external strategy was formulated through the Global Gateway initiative and the EU Strategy for Cooperation in the Indo-Pacific. Both frameworks emphasise value-based connectivity, the mobilisation of financing sources, and regulatory harmonisation with partners in Asia. In this context, free trade agreements (FTAs) are positioned to serve a dual function as instruments for market access and as tools for normative diplomacy. (European Commission, 2023; European External Action Service [EEAS], 2021). Within this broader reconfiguration, Indonesia stands out as a crucial Global South economy: it is the largest market in ASEAN, a G20 member, and a state that has explicitly positioned itself as a "voice for developing countries" and a "bridge-builder" in its foreign policy, which makes the EU-Indonesia free trade agreement an important test case for assessing whether North-South economic frameworks can balance the development and sustainability priorities of the Global South with the European Union's market-access and regulatory objectives (Karim, 2023; United Nations Conference on Trade and Development [UNCTAD], 2018, 2024).

For Indonesia, trade in goods with the European Union exceeded €27 billion in 2024, underscoring both the scale and the potential for deeper integration in manufacturing and processed commodity value chains (European Commission, Directorate-General for Trade, 2024; Consilium of the European Union, 2024). Negotiations on the EU-Indonesia Comprehensive Economic Partnership Agreement (CEPA), which began in 2016, had by mid-2024 gone through nineteen formal rounds, with the latest held in July 2024, yet sensitive issues in the Trade and Sustainable Development chapter and in market access remained unresolved at that stage (European Commission, Directorate-General for Trade, 2024; Ministry of Trade of the Republic of Indonesia, 2024). On 23 September 2025, the European Union and Indonesia announced the substantive conclusion of negotiations on the CEPA and a parallel investment protection agreement, with both texts now undergoing legal scrubbing and translation prior to signature and ratification, thereby beginning the transformation of this high-volume trade relationship into a comprehensive, rules-based partnership framework (European Commission, 2025; European Commission, Directorate-General for Trade, 2025).

This article's original contribution is twofold. Empirically, while studies exist on the EVFTA (Marsley & Staritz, 2024) or EUDR's general impact, no research has yet prospectively analyzed the anticipatory strategies of Indonesian actors facing the dual pressure of CEPA negotiations and new unilateral regulations. Conceptually, this paper is not limited to a descriptive study of impact. The metaphor of a ‘bridge’ is used as an operational framework to formulate an analytical tool relevant to policy, in order to explain how negotiated trade agreements and unilateral regulatory standards interact in practice. Therefore, the following analysis is expected to provide important insights for Indonesian policymakers in addressing this new trade governance framework.

This paper synthesizes academic research, primary policy documents, and expert evaluations from secondary sources to answer the stated research questions, serving as a critical literature review and comparative policy analysis. The "bridge" metaphor serves as an analytical framework for assessing the fundamental role of the CEPA: does it truly serve as an effective integration channel, or has it instead become a new battleground for conflicts over market access and sustainability initiatives? Three main questions are examined. First, how do Indonesians, such as regulators, business groups, and exporters, perceive and anticipate the opportunities and risks that the CEPA will bring? Second, what changes are they making now and will they make in the future to meet new sustainability and traceability requirements? Third, what institutions need to be established to make the agreement unenforceable? (EPRS, 2023; European Union, 2023a, 2023b).

Methodology and Scope

This paper was compiled using a systematic methodology to maintain transparency in the analysis process.

The literature search was conducted through a comprehensive search of various academic and policy databases, such as Scopus and Web of Science, as well as policy research portals such as EPRS, CSIS, and Bruegel. Keywords included "EU-Indonesia CEPA," "EU-ASEAN trade," and "trade and sustainable development." Documents released between 2016, when CEPA negotiations began, and 2024 were the primary focus of the inclusion criteria. To accommodate the most relevant scholarly and policy discussions on CEPA and sustainability, references in both English and Indonesian were considered.

The comparative policy analysis involved a close reading of primary official documents. This included legal texts negotiation reports, and press releases from the European Commission (DG Trade, EEAS) on one side, and the Indonesian Ministry of Trade and coordinating ministries on the other. These documents were analyzed to identify stated objectives, points of convergence (e.g., shared goals on industrial upgrading), and key points of divergence (e.g., framing of EUDR as a "barrier" vs. a "sustainability tool"). This comparison forms the basis for assessing the "bridge vs. conflict" framework.

Given the very recent conclusion of the Indonesia-EU CEPA and the absence of post-implementation data, this study deliberately adopts a critical literature review combined with comparative policy analysis rather than ex post econometric or computable general equilibrium approaches. At the time of writing, the agreement has only just been finalized and has not yet generated a sufficiently long implementation period to observe trade, investment or sectoral adjustment outcomes in a robust way, which makes model-based impact evaluation premature (European Commission, Directorate-General for Trade, 2025). In such early stages, structured literature reviews are recognized as an appropriate method for systematically mapping and synthesizing fragmented empirical findings and policy debates, provided that search strategies and inclusion criteria are made transparent (Snyder, 2019). Comparative policy analysis, in turn, is well suited to interrogate the design of trade agreements and their political consequences, since it allows the Indonesia-EU CEPA to be read against other EU FTAs and against unilateral regulatory instruments such as CBAM and EUDR, while keeping distributional and normative conflicts at the centre of the analysis (Geva-May, Hoffman, & Muhleisen, 2020; de Wee, 2022). Future research will be able to build on this conceptual and documentary baseline by applying ex ante and ex post quantitative models, firm-level surveys or process-tracing once CEPA has been in force long enough to generate reliable data, but under current conditions a critical literature review coupled with comparative policy analysis provides the most logically coherent and methodologically defensible strategy.

CONCEPTUAL FRAMEWORK: FREE TRADE AGREEMENT AND ECONOMIC INTEGRATION

Definition and scope. By spending, an FTA is a reciprocal deal to lower trade barriers. New-generation FTAs, however, cover much more, including non-tariff disciplines like SPS, TBT, trade facilitation, investment, and regulatory cooperation. The WTO Regional Trade Agreements database shows that trade agreements are not only increasing in number, but also in scope and commitments. These changes will have a significant impact on how countries manage their economies and how they address cross-border economic integration. (World Trade Organization, 2024; Baldwin, 2016).

The economic foundations of free trade agreements (FTAs) are based on Viner's (1950) framework of trade creation and diversion. Recent empirical studies using a structural gravity model with a controlled PPML estimator show that deeper FTAs increase the potential for trade creation while mitigating the

risk of trade diversion. However, these results are strongly influenced by the rules of origin and the liberalization timeframe outlined in the agreement (Viner, 1950; Pfaffermayr, 2020).

From a political point of view, FTAs serve as economic governance tools that link market access with processes of normative convergence. The business-focused literature on global value chains helps us understand why the European Union prefers to trade with Asia. This literature also helps us understand how the Trade and Sustainable Development (TSD) chapter is used to add environmental and employment commitments to agreements (Eckhardt & Poletti, 2016; EPRS, 2023).

The example of EU FTAs in Asia provides an important reference point. The EU-Vietnam Free Trade Agreement (EU-Vietnam FTA/EVFTA) includes a range of liberalizations, as well as TSD mechanisms and committees to implement them. Recent studies on its implementation confirm that institutional capacity and the quality of law enforcement are key determinants of employment outcomes and policy legitimacy (Marslev & Staritz, 2024). The EU-Singapore FTA (EUSFTA) demonstrates a high degree of regulatory coherence. Starting in November 2022, the EU-Singapore Digital Trade Agreement further ensures that electronic transactions between the two countries will proceed smoothly. The EU-Korea Free Trade Agreement, which demonstrates deep integration of goods and services and significant reductions in non-tariff barriers, provides a worthy benchmark. (European Commission, 2022; Government of Singapore, 2022).

HISTORICAL BACKGROUND OF EU-INDONESIA RELATIONS

From development cooperation to strategic partnership. The modern foundation of the relationship begins with the 1980 ASEAN-EEC Cooperation Agreement, which established a Joint Cooperation Committee for regional economic and trade agendas. (ASEAN, 1980). Bilateral ties were strengthened by the EU-Indonesia Partnership and Cooperation Agreement (PCA). Signed on November 9, 2009, and effective May 1, 2014, the PCA expanded the relationship to cover peace and security, trade and investment, justice, and socio-economic development. (Consilium of the European Union, 2014; European Commission, 2010).

Evolution of trade flows in the last two decades. Official statistics show a strengthening of EU-Indonesia trade in goods. This trade was valued at over €27 billion in 2023, with a composition relevant for analyzing integration in manufacturing and processed commodity value chains. An EPRS infographic from June 26, 2024, adds further context on macro indicators and trade dynamics. (European Commission, Directorate-General for Trade, 2024; Consilium of the European Union, 2024; EPRS, 2024).

Chronology of the CEPA negotiations and motivations. CEPA negotiations began in 2016 and are still ongoing (European Commission, 2024a, 2024b). Indonesia's primary goal has been to attract more foreign direct investment and help improve the structure and capacity of its domestic industry. Meanwhile, the European Union has prioritized strengthening supply chains and increasing its influence in the Indo-Pacific region. The Indonesian Ministry of Trade (2024) stated that the CEPA is crucial for expanding and developing Indonesia's export base.

Overall, the evolving relationship over time, from aid provision and receipt, political negotiations, to a more comprehensive Partnership and Cooperation Agreement and the lengthy CEPA negotiations, demonstrates a gradual shift from a donor-recipient model to a more strategic partnership. In this regard, Indonesia is striving to be seen as a leader in the region and a link between Asia and Europe in the Southern Hemisphere. The CEPA provides the institutional support Indonesia needs to establish this role as a true "bridge" between the EU's market access and regulatory framework and Indonesia's goals for industrial growth and sustainable development. (European Commission, 2010; European Commission, Directorate-General for Trade, 2024; Wicksana & Karim, 2022; Karim, 2022).

This historic event has paved the way for EU-Indonesia relations to develop into a true bridge facilitating economic integration and achieving sustainability goals.

STRUCTURE AND KEY COMPONENTS OF THE EU-INDONESIA FREE TRADE AGREEMENT (FTA)

The negotiation process, which concluded in 2025, produced the CEPA text, which serves as the legal basis for building an economic "bridge" between Indonesia and the European Union. This agreement goes beyond market access issues. It also includes more advanced regulatory areas in line with the "new generation" FTA model described in the conceptual framework. The draft CEPA is based on five key ideas: tariff reductions, rules of origin, and a commitment to sustainable development, rules for the digital economy and investment, and a framework for institutions to monitor and enforce their implementation.

Tariff Liberalization Schedule

This agreement's main goal is to make it easier to trade goods, which is a very ambitious goal. The negotiating mandate calls for a lot of openness, and the final CEPA text gets rid of import duties on more than 95% of tariff lines. This makes it possible for the Indonesian and European Union economies to trade directly with each other.

This deal gives Indonesia a big edge over its competitors in the European market. The CEPA guarantees duty-free access for a number of important Indonesian-made goods, including textiles, shoes, and electronics. These goods were at risk of losing the Generalised Scheme of Preferences (GSP) facility. The tariff liberalisation plan that was chosen is not fair. The European Union got rid of import duties on most of its tariff lines right after the agreement went into effect. Indonesia, on the other hand, was given a transition period for some sectors that were considered sensitive. This deal gives businesses in the country time to make small changes. The asymmetry is meant to lower the risk of "trade diversion," as Viner (1950) put it, and promote "trade creation" by making Indonesian producers and the European Union supply chain work together more closely (European Commission, 2024a).

Rules of Origin and Market Access Mechanisms

The CEPA establishes rules of origin that are designed to be more modern and flexible to ensure that the benefits of tariff elimination are truly enjoyed by the parties signing the agreement. These rules of origin serve as gatekeepers because they determine which products can be classified as Indonesian or European Union products within the framework of the CEPA.

This agreement recognises the fact that the global value chain is now highly fragmented. Therefore, the CEPA includes regional cumulation provisions that allow Indonesian exporters to count raw materials originating from other ASEAN countries that already have FTAs with the European Union as part of the origin content. This provision is very important for the Indonesian automotive and electronics sectors, which are part of regional production networks. In addition, the chapter on rules of origin simplifies the fulfilment of administrative requirements through the implementation of a self-certification system by exporters. This measure is intended to reduce transaction costs, which often hinder the utilisation of FTAs in developing countries. (European Commission, Directorate General for Trade, 2024; Pfaffermayr, 2020).

Sustainable Development Chapter: The "Green" Pillar

The Trade and Sustainable Development (TSD) chapter is one of the most controversial parts of the CEPA. It is in this segment that the ‘bridge’ function is truly tested, as the provisions must be able to

bridge the differences in the regulatory landscapes between countries in the Global North and Global South.

The Chapter of TSD reflects the European Union's strategy of utilising trade instruments to expand the influence of norms. It contains binding commitments to the Paris Agreement and core ILO conventions. The Indonesia-EU CEPA is unique compared to a number of previous agreements because it explicitly raises the link between trade and deforestation. The agreement establishes a Joint Committee on Vegetable Oils, which specifically addresses sensitive issues surrounding palm oil commodities and the implementation of the EU Deforestation Regulation (EUDR). Through this mechanism, the relationship, which was previously based on unilateral standard setting, is being directed towards a pattern of bilateral cooperation. The committee provides a forum for dialogue that can open up space for mutual recognition of sustainability standard schemes, including the Indonesian Sustainable Palm Oil (ISPO) scheme. (European Commission, 2024b; Indonesian Ministry of Trade, 2024).

Digital Trade, Investment Protection, and Dispute Settlement

CEPA modernises the economic partnership between Indonesia and the European Union through a strong chapter on digital trade and investment. In the area of digital trade, the agreement prohibits the imposition of import duties on electronic transmissions and guarantees the smooth flow of cross-border data. The standards used are in line with the high-level provisions reflected in the EU-Singapore Digital Trade Agreement, thereby providing greater legal certainty for businesses that rely on technology-based transactions and services.

In the field of investment, CEPA replaces various old Bilateral Investment Treaties (BITs) with a permanent Investment Court System (ICS). This change in institutional architecture is a response to Indonesia's worries about sovereignty and the state's right to control important sectors. ICS is meant to be a fair and open way to settle disputes, with higher standards of accountability. It is run by an independent panel. This deal is expected to bring in high-quality foreign direct investment (FDI) from the European Union to Indonesia's downstream sectors, especially those that are part of the downstream agenda and help increase the value of industrial goods. The investment chapter in the CEPA is meant to help achieve the goal of improving the country's industrial structure while still giving the host country room to make its own policies. (European Commission, 2024c).

Institutional Mechanisms for Monitoring and Enforcement

CEPA sets up a strong institutional framework to make sure that it works well. A Joint Committee made up of officials at the ministerial level has been set up to make sure that the agreement is carried out as a whole. This committee has special working groups that deal with specific technical problems, such as putting in place Sanitary and Phytosanitary (SPS) measures and meeting the obligations in the Trade and Sustainable Development (TSD) chapter.

The TSD chapter's enforcement plan is meant to be stricter. The draft agreement allows for trade sanctions to be put in place if the Paris Agreement commitments are seriously broken. This is in line with the 2022 EU Trade and Sustainable Development (TSD) Review. The European Union is serious about stopping environmental dumping practices, and this increase in enforcement powers shows that. These rules also make Indonesia's ability to monitor and enforce its own environmental laws a key factor in the success of the CEPA. (European Commission, 2022; EPRS, 2023).

ECONOMIC IMPLICATIONS FOR INDONESIA AND THE EUROPEAN UNION

The signing of CEPA creates a new economic corridor that could change the way Indonesia and the EU trade with each other in a big way. We can guess what will happen to the economies of both partners by looking at the tariff liberalisation schedule and the regulatory commitments in this agreement. These

effects go beyond just changes in trade volume numbers. They also include changes in the structure of industries and the strategic repositioning of Indonesia and the European Union in the global and regional geopolitical landscape.

For Indonesia: Industrial Upgrading and Investment Flows

The main economic benefits of CEPA for Indonesia are not just that it will increase the volume of exports, but also that it will speed up the diversification of the economy. This agreement gives Indonesian-made goods immediate duty-free access, which levels the playing field for textile, footwear, and electronics exporters who were previously at a disadvantage compared to partners like Vietnam. This expansion of market access is expected to lead to a big increase in exports that require a lot of labour. It will also help protect against changes in global commodity prices. (World Bank, 2023)

CEPA is more than just a way to make things; it is also an outside anchor for Indonesia's downstreaming policy. The deal encourages European businesses to invest in higher-value chains in their own countries by removing tariffs on processed metal goods and making investment protection stronger. This is especially important for the ecosystem of electric vehicle batteries. Indonesia can use its wealth of resources to become a global industrial hub instead of just a supplier of raw materials. This is possible because technology and foreign direct investment (FDI) from Europe are coming into nickel processing plants and battery factories. This kind of technology transfer is very important for changing the economy so that it makes more valuable goods. (OECD, 2023; Ministry of Investment, 2024).

These chances, on the other hand, come with big compliance problems that could make it harder for businesses to get into the market. The agreement's strict environmental standards will require a lot of changes that will cost a lot of money. Small and medium-sized businesses in the palm oil and furniture industries are at a high risk of being left out because it costs a lot to set up the traceability systems needed to show compliance. If there isn't any targeted technical help or changes to the supply chain, the benefits of CEPA could be limited to big companies that have the money and technology to meet these different "green" non-tariff requirements. (UNCTAD, 2023).

For the European Union: Strategic Autonomy and Geopolitical Balancing

The EU sees the economic logic behind CEPA as being very similar to the agenda for reducing risk in the supply chain. Indonesia has become an important partner for Indonesia because it wants to reduce its reliance on one big supplier of green technology. CEPA gives the European Union safer, rules-based access to a number of important raw materials, especially nickel, which is a key part of Europe's plan to go green. By joining the European Union's industrial supply chain, Indonesia helps the battery and stainless steel industries get supplies from more places. This makes the European Union's strategic autonomy stronger. (European Commission, 2023).

From a geopolitical point of view, CEPA is one of the most important parts of the European Union's Indo-Pacific Strategy. Brussels can now use this agreement to increase its economic and normative influence in Southeast Asia, which is becoming more competitive between the US and China. The European Union offers a trade partnership based on high regulatory standards and a promise to be environmentally friendly. This is different from other regional frameworks. This way, the EU can balance its trade interests with its environmental commitments. It also shows that doing business with countries in the Global South doesn't have to mean lowering environmental standards.

The EU also has a strategic bargaining position against China's Belt and Road Initiative because it has a strong economic presence in Indonesia. This helps Europe stay a major rule-maker in the ever-changing Indo-Pacific region instead of just a rule-follower. (European External Action Service, 2024; Smith, 2023).

POLITICAL AND STRATEGIC DIMENSIONS

The Indonesia-EU CEPA is important for more than just the technical details of tariffs and customs. In this time of geopolitical fragmentation, the agreement is a crucial tool for balancing the interests of Jakarta and Brussels. The CEPA puts each side's foreign policy ideas into a legally binding framework. It also serves as a meeting point between the EU's normative power and Indonesia's growing role as a leader among the Global South.

The EU views the conclusion of the CEPA as a clear sign that the Global Gateway initiative and the Indo-Pacific Strategy are being implemented. Brussels has been working to diversify its partnerships so that it doesn't have to rely on just a few. This is especially important now that supply chains have proven weak after the pandemic. The EU is countering the perception that it is withdrawing from global engagement by signing a high-standard trade agreement with Southeast Asia's largest economy. Meanwhile, the EU is seeking to demonstrate that it can be a reliable partner in the region by offering a different approach to cooperation than the US and China. The CEPA serves as a rules-based counterweight to other regional frameworks. This means that European standards on sustainability and digital governance will continue to be crucial in the rapidly changing Indo-Pacific region (European External Action Service, 2024; Smith, 2023).

Jakarta views the CEPA as proof that Indonesia is a key country in the ASEAN region. Indonesia differs from many of its neighbors in achieving a "deep integration" agreement with the European Union. This demonstrates that Indonesia can negotiate complex regulatory harmonization without sacrificing its right to develop as a nation. This success aligns with Indonesia's goal of becoming a bridge and a vital part of the global supply chain network. The ability to handle sensitive topics such as palm oil and sustainability at the negotiating table demonstrates a type of diplomacy capable of balancing national interests and fulfilling international commitments. Indonesia's position as a key representative of developing countries in the Global South is further strengthened, demonstrating that developing countries can interact with developed markets more equitably (Laksmana, 2022; Ministry of Foreign Affairs of the Republic of Indonesia, 2024).

This agreement holds profound symbolic significance for the future of North-South relations as a whole. In the past, trade between Europe and Southeast Asia was largely based on a one-way donor-recipient relationship or resource extraction. The CEPA shifts this mindset toward a more equitable way of strategic cooperation. This agreement demonstrates that rigorous sustainability standards, such as those outlined in the Trade and Sustainable Development chapter, can meet the needs of developing countries. The Indonesia-EU CEPA establishes a system in which "green" policies can be implemented through cooperation, rather than through force. This is a good starting point for how North-South economic relations will work in the future. It means that the "Green Transition" can become a shared goal, rather than simply a cause for greater conflict. (Böze! & Risse, 2021; UNCTAD, 2023).

Although the two regions share some strategic similarities, the CEPA still faces considerable political opposition in both regions. In Indonesia, a key point of contention is the "sovereignty costs" arising from regulatory harmonization efforts. Some commodity associations and nationalist interest groups still view some EU regulations, such as the EUDR, as non-tariff barriers that endanger the livelihoods of smallholder farmers. Meanwhile, civil society and environmental groups are using the Trade and Sustainable Development (TSD) commitments in the CEPA to call for stronger enforcement of rights to protect workers and forests. In Europe, the ratification process is closely watched by agricultural lobbies concerned about competition and environmental groups who feel the enforcement instruments are insufficient. To address these multiple domestic pressures, ongoing political dialogue is needed. This will enable stakeholders at the implementation level to maintain the "bridges" built at the negotiating table. (EPRS, 2023).

PROJECTED MACROECONOMIC AND SECTORAL EFFECTS

The shift from the negotiation stage to the implementation phase of the CEPA is a key moment for figuring out how much real economic benefit Indonesia and the European Union can get from it. The political and strategic aspects discussed earlier are the basis of the relationship between the two parties' relationship. However, the agreement's success will ultimately depend on its ability to improve welfare and bring about structural changes in the economy.

Before and during the negotiations, studies on the economic impacts indicated that both parties would benefit, but the magnitude of these benefits varied. The CEPA is expected to significantly increase Indonesia's real Gross Domestic Product (GDP). In a highly ambitious liberalization scenario, modeling suggests that Indonesia's GDP could grow by 0.19 to 0.25 percent per year compared to the baseline scenario. The primary reason for this increase is that bilateral exports are expected to increase by more than €5 billion per year once the agreement fully enters into force. The removal of tariff barriers makes Indonesian goods cheaper than those from other countries in the region, such as Vietnam, which has had preferential access to the EU market since 2020. This additional GDP growth is a smaller percentage for the EU, given its much larger economy. However, its benefits are seen as strategic in terms of trade efficiency. CEPA is estimated to provide the European Union with approximately 3.1 billion euros in welfare benefits annually. Most of these benefits come from lowering non-tariff barriers and providing greater market access for EU machinery, transport equipment, and other high-value services. The agreement will also help European manufacturers who rely heavily on critical raw materials by diversifying their supply chains. This will reduce their volatility costs. (Ecorys, 2020; European Commission, Directorate-General for Trade, 2024).

The overall benefits shown in the various models mask significant differences at the sector level. This is due to the degree of liberalization and the regulations businesses must comply with, which will significantly impact the bottom line in each sector. The manufacturing sector is expected to be the biggest beneficiary for Indonesia. The elimination of EU tariffs, which previously ranged between 12% and 17% on footwear and clothing, puts Indonesian exporters on par with their main Vietnamese competitors. Estimates suggest that the textile and footwear industry could see its export volumes grow by up to 30% in the medium term. Regional cumulative provisions also benefit the automotive industry by enabling Indonesia's burgeoning electric vehicle ecosystem to connect with larger production networks. The agricultural sector, on the other hand, faces a much more complex dual dynamic. While tariff removal does open up more markets for coffee, spices, and cocoa, the palm oil subsector faces stringent non-tariff barriers related to sustainability standards. The CEPA lowers import duties on biodiesel and its derivatives, but the costs of following the EU Deforestation Regulation (EUDR) could reduce tariff margin benefits, especially for small producers. So, the overall economic benefits for this sub-sector depend a lot on how well the the Trade and Sustainable Development chapter's traceability mechanisms can be put into action. (Center for Indonesian Policy Studies, 2023).

The energy and services sectors have different strategic implications than the primary goods sector. In the energy sector, the way countries cooperate is based on how well Indonesia's downstream agenda aligns with European industrial needs. The CEPA facilitates the construction of nickel and cobalt processing plants and investment in renewable energy infrastructure. This measure facilitates the restructuring of Indonesia's industry, but also places related sectors under stricter scrutiny through the use of the Carbon Border Adjustment Mechanism (CBAM). This could make production processes that remain carbon-intensive more expensive during the transition period. Trade liberalization provides the EU with a prime opportunity to invade the services sector. This agreement allows European service providers to enter several key subsectors in Indonesia, such as maritime transport, telecommunications, and environmental services. Indonesia hopes that the arrival of more efficient service providers will

lower logistics and digital infrastructure costs, making the national economy more competitive overall. (IEA, 2024; Ecorys, 2020).

The Indonesia–EU CEPA differs significantly from other EU agreements in the region. The draft Indonesia CEPA is more similar to the EU–Vietnam Free Trade Agreement (EVFTA) than to the EU–Singapore Free Trade Agreement, which places a strong emphasis on digital integration and high-standard finance suited to a service-based economy. Both agreements with Indonesia and Vietnam aim to make it easier for people to work in factories and promote long-term growth. The timeframe and depth of the accompanying green requirements are two crucial differences. The EVFTA entered into force before the European Green Deal's external instruments, such as the CBAM and the EUDR, were fully in place. Therefore, Indonesian exporters faced a greater regulatory burden initially than Vietnamese exporters in 2020. This late arrival highlights the need to accelerate institutional capacity building as mandated by the CEPA. On the other hand, the Indonesia–EU CEPA includes more advanced investment protection provisions modeled on the Investment Court System. This could provide greater certainty to investors than the Investor-State Dispute Settlement scheme still used in some older regional agreements. (Marslev & Staritz, 2024).

CHALLENGES AND RISKS

The Indonesia-EU CEPA holds many potential benefits, but the process from ratification to full implementation will be difficult due to a number of structural and external issues. If these risks are not addressed seriously, they could hinder the expected welfare gains. The main challenge lies in the disparity between the level of regulatory aspirations and existing institutional capacity. For Indonesian exporters, especially Micro, Small, and Medium Enterprises (MSMEs), the Rules of Origin (RUU) and stringent sustainability requirements in the CEPA could make it difficult for them to do business. Without adequate technical assistance, small businesses may not be able to capitalize on the opportunities offered by this agreement. Conversely, the benefits will be felt by larger companies that have the resources to handle complex compliance requirements. (UNCTAD, 2024)

The most important and specific have to do with the costs of following with environmental and social regulations. Businesses have had to deal with a "double adjustment shock" because both the European Union Deforestation Regulation (EUDR) and the Carbon Border Adjustment Mechanism (CBAM) are now in effect at the same time. To continue selling to the European Union, Indonesian palm oil, timber, and coffee producers need to spend heavily on geolocation technology and certification schemes that demonstrate they are not cutting down trees. Estimates suggest that these compliance costs could eat away at any gains from initial tariff removal. If the support schemes outlined in the Trade and Sustainable Development (TSD) chapter of the CEPA are not implemented promptly, this could lead to trade diversion. This would mean Indonesian exporters would focus on more leniently regulated markets in Asia or Africa, weakening their "bridge" function to Europe (OECD, 2024).

For the EU, the political landscape in each country presents a distinct risk. Public rejection or protectionist tendencies in a number of member states could hinder the smooth implementation of the agreement. The European agricultural lobby has historically expressed concerns about competition from lower-cost producers in Southeast Asia. Such political pressure has the potential to trigger the repeated use of safeguard instruments or the application of sanitary and phytosanitary (SPS) barriers that are not entirely based on scientific evidence, which in practice limits market access for Indonesian products. Beyond that, uncertain global economic conditions add another layer of uncertainty. Commodity price fluctuations and supply chain disruptions due to geopolitical tensions could alter the basic economic assumptions used in CEPA projection modelling. (WTO, 2023; World Bank, 2023).

CONCLUSION AND POLICY IMPLICATIONS

This study begins with the key question of whether the Indonesia-EU CEPA will function as a bridge for integration or become an arena for a battle of norms. Analysis of the final draft and projections of its impact show that this agreement does indeed provide an architectural blueprint for a 'new bridge' between the Global South and Europe, but the extent to which this bridge will actually function is largely determined by how risks are managed during the implementation phase. When linked back to the three research questions formulated at the outset, the findings of this study reveal a fairly clear pattern in terms of the expectations and adjustment strategies of the actors. First, regarding how actors view opportunities and risks, Indonesian regulators and large exporter groups generally see the CEPA as an instrument to encourage industrial upgrading and as a catalyst for accelerating the downstream agenda. However, this optimism is offset by strong concerns among commodity associations about the phenomenon of 'green protectionism'. They believe that without intensive and targeted engagement, EU sustainability standards have the potential to function as a de facto barrier to market entry.

Second, businesses are using two distinct strategies to address change. At the business level, private companies are investing more in digital traceability systems to comply with the European Union Deforestation Regulation (EUDR). On the other hand, the government wants to leverage the CEPA to secure European funding for green infrastructure that could reduce the carbon intensity of Indonesian exports.

Third, the analysis shows that strong institutions that foster cooperation are needed to reduce uncertainty. The establishment of specialized Joint Committees and the provision of binding technical assistance are not merely administrative details; they are also crucial for preventing regulatory differences from escalating into open trade disputes. Therefore, if the Indonesia-EU CEPA is to truly serve as a stable and inclusive bridge for long-term economic change, strengthening shared institutional capacity must be an undeniable policy objective. (European Commission, 2025; Indonesian Ministry of Trade, 2024).

Policy Recommendations

To ensure that the Indonesia-EU CEPA truly serves as a constructive bridge and not as a new venue for conflict, strong policy measures are needed at three interrelated levels: strengthening implementation in Indonesia, a consistent and supportive EU, and creating common institutions that can handle adjustment pressures on both sides.

- For the Indonesian government, the most important thing is to transform the CEPA from a mere legal document into a national strategy that integrates industrial policy, sustainable governance, and export support. To achieve this, the government needs to establish a CEPA Implementation Task Force, encompassing various ministries and run by the Coordinating Ministry for Economic Affairs. This task force's role is to coordinate the work of the Ministries of Trade, Foreign Affairs, Environment and Forestry, Investment, Agriculture, and Finance, as well as local governments in key export-driven provinces. This task force is responsible for developing a public implementation roadmap, ensuring that domestic laws and regulations align with CEPA obligations and European Union instruments such as the EUDR and CBAM, and holding regular consultation forums with business groups and civil society. Another crucial aspect is developing a compliance strategy for MSMEs so that the benefits of this agreement extend beyond large companies. To achieve this, SME Compliance Fund should be established to help finance certification and audits, and a digital traceability system should be implemented. Chambers of commerce, cooperatives, and other business support organizations should offer targeted technical assistance services to enhance this program. The creation of cluster-based traceability platforms for goods such as palm oil, coffee, and textiles could also lower unit compliance costs by enabling companies to share databases and infrastructure.

At the same time, national sustainability programs such as the Indonesian Sustainability Report (ISPO) need to be enhanced with a clear focus on achieving international recognition. Reforms should focus on comprehensive geolocation coverage, a robust third-party audit system, and the implementation of clear labor rights standards. Thus, these schemes can be proposed as systems that meet EU standards in terms of functionality. Finally, the industrial policy framework of the CEPA needs to be clearly linked to the technology transfer agenda. Investment facilitation tools should focus on projects that combine downstreaming with low-carbon technologies, particularly in the nickel and electric vehicle battery value chains. This is the only way to ensure that FDI flows align with Indonesia's long-term development goals.

• For the European Union: The EU's biggest problem is ensuring that high regulatory goals are met with consistent and predictable patterns of support. This way, sustainability standards will be seen as a means of cooperation, not simply as a requirement to be met by one party. To help cover the costs of adjusting to the CEPA, CBAM, and EUDR, the EU needs to use the Global Gateway and NDICI Global Europe tools in Indonesia in a more targeted manner. Funding should be prioritized to build digital traceability infrastructure, help smallholder farmers transition to supply chains that do not involve felling trees, and invest in renewable energy in CEPA focus areas.

The EU should take a phased approach to enforcing Trade and Sustainable Development (TSD) provisions. This approach should focus on partnerships, especially in the first few years after the agreement enters into force. Before imposing sanctions, the EU should utilize joint action plans and technical assistance programs with indicators of success developed with Indonesian partners. This approach can make enforcement appear more legitimate and reduce public perceptions of "green protectionism." Clear regulations are also crucial. To help Indonesian companies feel more confident, the European Union should provide clear and early instructions on how to implement the CBAM and EUDR. These instructions should include standard formats and sector-specific FAQs for businesses in specific areas. The EU could also leverage the CEPA to help Indonesia's export basket expand beyond raw materials by providing targeted support for process improvements in the manufacturing and services sectors. This step would strengthen the developmental aspects of the CEPA and put position of Indonesia more firmly within the EU's high-value-added value chain.
This set of suggestions transforms the bridge metaphor into a concrete plan for making it a reality. This approach emphasizes that a CEPA does not automatically generate inclusive benefits. Rather, it can serve as a credible model for North-South economic cooperation in a highly regulated environment if policy choices are carefully planned and coordinated.

Future Research Directions

As the agreement enters into force, the focus of future research should shift from prospective modeling to empirical impact studies. Future research should investigate the distribution of post-implementation CEPA benefits, particularly across different business scales, to assess the agreement's inclusiveness. Furthermore, examining spillover effects at the regional level will be crucial to understanding the impact of the Indonesia-EU CEPA on broader interregional trade dynamics between ASEAN and the EU.

Final Reflection

The Indonesia-EU CEPA is a crucial example of how economic diplomacy works today. The agreement seeks to find a balance between the needs of developing countries and the strict rules of wealthy economies. If it is carried out well, the CEPA can really be a "new bridge" that shows how trade agreements can be a powerful way to promote sustainable development and make North-South economic relations more equitable.

ACKNOWLEDGMENT

The authors would like to thank the anonymous reviewers and participants of the 3rd EMIDWORLD International Congress on Economics, Public Finance, and Business & Social Sciences for their helpful comments and suggestions that improved this manuscript.

This research did not receive any funding support from any funding agency, whether from the public, commercial, or non-profit sectors. In this scientific study, artificial intelligence (from GPT 5.1) support was received to improve the language structure, eliminate expression errors and make the expression fluent and consistent.

Abstract

This study examines the intersection of management accounting and food engineering disciplines, focusing on the Process Excellence 4.0 paradigm and the necessity of transitioning to Smart Quality Management (SQM). The research addresses how the integration of Artificial Intelligence (AI) and Lean production principles transforms corporate quality management from a reactive structure to a proactive model, considering both theoretical and practical dimensions. The engineering perspective highlights the deterministic role of AI-supported HACCP, blockchain-based traceability, and digital twin applications in food safety, while the financial perspective analyzes the structural transformation in the Cost of Quality (COQ) model and the shift from failure costs to strategic prevention investments. The study's key finding is that the sustainability of operational and financial performance is only possible with robust data governance frameworks and interdisciplinary integration.

Keywords: Artificial Intelligence, Lean Transformation, Smart Quality Management

Süreç Mükemmelliğinin Geleceği:

Yapay Zeka Destekli Yalın Dönüşüm ve Akıllı Kalite Yönetimi

Özet

Bu çalışma, yönetim muhasebesi ve gıda mühendisliği disiplinlerinin kesişim noktasında, Süreç Mükemmelliği 4.0 paradigmasını ve Akıllı Kalite Yönetimine (SQM) geçişin zorunluluğunu incelemektedir. Araştırmada, Yapay Zeka (YZ) ve Yalın üretim ilkelerinin entegrasyonunun, kurumsal kalite yönetimini reaktif (tepkisel) bir yapıdan önleyici (proaktif) bir modele nasıl dönüştürdüğü teorik ve pratik boyutlarıyla ele alınmıştır. Mühendislik perspektifi, Yapay Zeka destekli HACCP, blokzincir tabanlı izlenebilirlik ve dijital ikiz uygulamalarının gıda güvenliğindeki deterministik rolünü ortaya koyarken; finansal perspektif, Kalite Maliyeti (COQ) modelindeki yapısal dönüşümü ve başarısızlık maliyetlerinden stratejik önleme yatırımlarına geçişi analiz etmektedir. Çalışmanın temel bulgusu, operasyonel ve finansal performansın sürdürülebilirliğinin, ancak sağlam veri yönetişim çerçeveleri ve disiplinler arası bir entegrasyonla mümkün olabileceğidir.

Anahtar Kelimeler: Yapay Zekâ, Yalın Dönüşüm, Akıllı Kalite Yönetimi

1. GİRİŞ

Küresel tedarik zincirlerinin artan karmaşıklığı, jeopolitik belirsizlikler ve veri hacmindeki eksponansiyel büyüme, geleneksel kalite kontrol mekanizmalarının etkinliğini ciddi biçimde tartışmaya açmıştır. Özellikle gıda endüstrisi gibi raf ömrü kısıtlı ve regülasyon baskısı yüksek sektörlerde, statik denetimlere ve geçmişe dönük (ex-post) belgelendirmeye dayalı konvansiyonel yöntemler, modern operasyonların dinamik risklerini yönetmekte yetersiz kalmaktadır. Gıda mühendisliği açısından operasyonel bir aksaklık veya basit bir parametre sapması olarak görülen olaylar, yönetim muhasebesi perspektifinden bakıldığında kârlılığı, marka değerini ve nakit akışını tehdit eden sistematik birer finansal risk unsuru olarak tezahür etmektedir.

Bu bağlamda çalışma, fiziksel operasyonların kontrolünün ötesine geçerek, algoritmik güvenilirliği ve finansal risk yönetimini kapsayan bütünleşik ve disiplinler arası bir model önermektedir. **Süreç Mükemmelliği 4.0** olarak tanımlanan bu yaklaşım, teknolojiyi sadece bir verimlilik aracı olarak görmenin ötesine geçer. Yapay Zeka teknolojileri, insan faktörünü ikame eden bir unsur olarak değil; literatürdeki **"Operatör 4.0"** ve giderek önem kazanan **"Endüstri 5.0"** vizyonuyla uyumlu şekilde, insan yeteneklerini artıran bir destek mekanizması olarak konumlandırılmaktadır (Romero et al., 2023). Endüstri 4.0'ın "otomasyon" odaklı yaklaşımının aksine, Endüstri 5.0 "insan odaklılık" (human-centricity) ilkesini merkeze alır. Nitekim Xu, Lu ve Vogel-Heuser (2025), sürdürülebilir üretim sistemlerinde teknolojinin insan merkezli kullanımının, sadece verimliliği değil, aynı zamanda kriz anlarında örgütsel dayanıklılığı (resilience) da artırdığını vurgulamaktadır. Bu entegrasyonun temel amacı, gıda mühendisliğinin teknik hassasiyeti ile yönetim muhasebesinin finansal hesap verebilirliğini ortak bir stratejik düzlemde buluşturarak, işletmeleri "kırılgan" yapıdan "antifrajil" (anti-fragile) yapıya taşımaktır.

2. TEORİK ÇERÇEVE: YALIN FELSEFENİN DİJİTAL EVRİMİ

Yalın felsefenin dijital teknolojilerle bütünleştirilmesi sonucu ortaya çıkan bu teoride, kavramların isimleri değişse de özdeki felsefe değişmemektedir. Dijital tabanlı yalın dönüşümün temelinde de yalın ve çevik felsefeyle örtüşen aynı unsurlar yer alır: verimlilik, hız ve kalite. Dolayısıyla amaç sabit kalırken, değişen yalnızca bu amaca ulaşmada kullanılan yöntemdir. Bu yöntemin ayırt edici unsuru ise teknolojinin sürece dâhil edilmesidir (Apilioğulları, 2025).

2.1. Yalın 4.0 ve Kaizen'in Dönüşümü

Yalın üretim felsefesi (Lean), temelinde katma değer sağlamayan faaliyetlerin (israfın/muda) sistematik eliminasyonuna dayanır. Ancak A3 raporlama, Balık Kılçığı diyagramları veya kök neden analizleri gibi geleneksel Yalın araçların etkinliği, büyük ölçüde uygulayıcıların bilişsel kapasitesi, deneyimi ve veriye erişim hızı ile sınırlıdır. Manuel veri toplama süreçlerindeki gecikmeler, problemlerin tespit edilmesini zorlaştırmakta ve "sürekli iyileştirme" (Kaizen) faaliyetlerini kesintili hale getirmektedir.

Yapay Zeka entegrasyonu, bu sınırlılıkları aşarak **Kaizen 4.0** modelini ortaya çıkarmaktadır. Bu modelde iyileştirme faaliyetleri, aralıklı ve reaktif çabalar olmaktan çıkarak, gerçek zamanlı veri akışlarına dayalı, otonom ve sürekli bir döngüye dönüşmektedir. YZ algoritmaları, geniş veri setlerini (Big Data) tarayarak insan algısının ötesindeki örüntüleri ve korelasyonları tespit etmekte, problem çözme süreçlerine matematiksel bir disiplin getirmektedir. Cifone, Hoda ve Noll (2023) tarafından yapılan kapsamlı literatür taraması, firmaların veri analitiği yeteneklerini Yalın süreçlere entegre ettiklerinde, operasyonel çeviklikte (agility) anlamlı bir artış sağladıklarını doğrulamaktadır. Buna ek olarak, Wamba, Queiroz ve Trinchera (2024), büyük veri analitiği yetkinliğinin tedarik zinciri esnekliği üzerindeki düzenleyici etkisini kanıtlamış ve veriye dayalı karar alma kültürünün, belirsizlik ortamlarında firmalara rekabet üstünlüğü sağladığını ortaya koymuştur.

2.2. Akıllı Kalite Yönetimi (SQM) ve Kültürel Dönüşüm

Teknolojik altyapı tek başına yeterli değildir. Literatürde **Kalite 4.0** olarak adlandırılan Akıllı Kalite Yönetimi (SQM), teknolojik bir yatırımdan ziyade kültürel ve operasyonel bir dönüşüm gerektirmektedir (Sony ve Naik, 2024). Geleneksel Kalite Yönetimi (TQM), süreçlerin standartlaştırılmasına odaklanırken; SQM, verilerin demokratize edilmesine ve kalitenin herkesin sorumluluğunda olduğu, veriye dayalı bir ekosisteme odaklanır. Bu dönüşümün başarısı için ön koşul, **veri bütünlüğünün** sağlanmasıdır; zira hatalı veya kirli veriye (dirty data) dayalı tahmin modelleri, operasyonel riski azaltmak yerine artırma potansiyeli taşımaktadır. Dolayısıyla yatırım stratejileri, sadece algoritma geliştirmeye değil, veri kalitesi, veri temizliği ve yönetişim süreçlerine odaklanmalıdır.

3. GIDA MÜHENDİSLİĞİ PERSPEKTİFİ: DETERMİNİSTİK VE İZLENEBİLİR KALİTE

Gıda güvenliği yönetim sistemlerinin temelini oluşturan HACCP (Tehlike Analizi ve Kritik Kontrol Noktaları), tarihsel olarak insan beyanına, manuel kayıtlara ve periyodik kontrollere bağımlı olmuştur. Bu durum, insan hatasına açık, manipüle edilebilir ve reaktif bir yapı doğurmaktadır.

3.1. HACCP Protokollerinin Otonomizasyonu ve Blokzincir Güvencesi

Yapay Zeka destekli HACCP sistemleri, Kritik Kontrol Noktalarından (CCP) gelen sıcaklık, nem, pH gibi süreç verilerini gerçek zamanlı izleyerek potansiyel tehlikeleri kritik limitlere ulaşmadan tespit etme yeteneğine sahiptir. Ancak dijitalleşen dünyada verinin sadece toplanması yetmez, güvenliği de en az verinin kendisi kadar kritiktir.

Kumar ve Tripathi (2024), gıda güvenliğinde **"değiştirilemez kayıtlar" (immutable records)** oluşturmak için Blokzincir (Blockchain) teknolojisinin HACCP süreçlerine entegre edilmesinin önemini vurgulamaktadır. Blokzincir, tedarik zincirindeki her bir adımın şifreli ve merkeziyetsiz bir defterde tutulmasını sağlayarak, geçmişe dönük veri manipülasyonunu imkansız kılar. Bu entegrasyon, gıda sahteciliğini (food fraud) önlemede ve tüketici güvenini sağlamada günümüzün en etkili yöntemi olarak kabul edilmektedir. Böylece gıda güvenliği yönetimi, olay sonrası müdahale gerektiren reaktif bir yapıdan, riskleri kaynağında engelleyen, şeffaf ve denetlenebilir proaktif bir sisteme dönüşmektedir.

3.2. Dijital İkizler, TinyML ve Raf Ömrü Tahmini

Nesnelerin İnterneti (IoT) ve Makine Öğrenimi (ML) teknolojilerindeki gelişmeler, ürün kalitesinin izlenmesinde devrim niteliğinde imkanlar sunmaktadır. Özellikle literatürde vurgulanan **"Gıda Dijital İkizleri"** (Food Digital Twins) (Defraeye et al., 2023), fiziksel ürünün sanal bir kopyasını oluşturarak, tedarik zinciri boyunca maruz kalabileceği sıcaklık dalgalanmalarının ürün kalitesi üzerindeki etkisini simüle etmeyi sağlar.

Ray (2024) tarafından yapılan incelemede, **TinyML** (Tiny Machine Learning) modelleri kullanılarak, karmaşık bulut sistemlerine ihtiyaç duymadan, sensör üzerindeki mikroçipte (on-edge) raf ömrü tahminlerinin yapılabildiği gösterilmiştir. Çalışmalar, bu yöntemle **%91,9** gibi yüksek doğruluk oranlarına ulaşıldığını ve kalite yönetiminde subjektif "gözle kontrol" döneminin kapandığını, yerini objektif verilere bıraktığını göstermektedir. Vaganan ve Wahi (2024) ise bu tür öngörücü mikrobiyoloji modellerinin gıda güvenliği risklerini minimize etmedeki rolünü bibliyometrik analizlerle desteklemektedir.

3.3. Tedarik Zinciri Canlılığı (Viability)

Tedarik zinciri görünürlüğü, sadece "ürün nerede?" sorusuna cevap vermek değildir; "ürün hangi koşullarda ve ne kadar güvende?" sorusunu yanıtlamaktır. Ivanov ve Dolgui (2024), **"Viable Supply**

Chain" modelinde, görünürlüğün ve dijital adaptasyonun, firmaların sadece kaliteyi korumalarını değil, aynı zamanda pandemi, doğal afet veya ekonomik krizler karşısında hayatta kalma yeteneklerini (viability) korumak için elzem olduğunu savunmaktadır. Duan ve Feng (2024) de tedarik zinciri verilerine dayalı risk değerlendirmesinin, gıda güvenliği performansını doğrudan etkilediğini ortaya koyarak bu görüşü desteklemektedir.

4.YÖNETİM MUHASEBESİ PERSPEKTİFİ: FİNANSAL DEĞERLEME VE STRATEJİ

Mühendislik tabanlı teknolojik dönüşümlerin kurumsal stratejide kalıcı yer bulabilmesi, yarattıkları değerin CFO'ların ve yatırımcıların anlayacağı finansal metriklere dönüştürülmesiyle mümkündür.

4.1. Kalite Maliyeti (COQ) Modelinin Yeniden Yapılandırılması

Dijital dönüşüm, Crosby ve Juran gibi öncülerden bu yana kullanılan geleneksel Kalite Maliyeti (COQ) modelinde köklü bir değişikliği zorunlu kılmaktadır. Geleneksel modelde "optimum kalite maliyeti" bir denge noktası olarak görülürken, yeni yaklaşımda hedef "Sıfır Hata"dır. Temel strateji, yüksek maliyetli ve öngörülemez **Başarısızlık Maliyetlerini** (iade, imha, itibar kaybı) minimize etmek amacıyla, **Önleme Maliyetlerine** (teknoloji, veri altyapısı) ayrılan bütçenin artırılmasıdır.

Psarommatis, May ve Azamfirei (2023) tarafından savunulan **"Sıfır Hatalı Üretim"** (Zero Defect Manufacturing) vizyonu, dijital önlemenin en nihayetinde en ucuz kalite yönetimi yöntemi olduğunu savunur. Ayrıca, Sardanelli, Ingenito ve Vronis (2024) bu tartışmayı bir adım öteye taşıyarak **"Yeşil Kalite" (Green Quality)** kavramını ortaya atmıştır. Bu çalışmaya göre, kalite hatalarının azaltılması (daha az hurda, daha az enerji israfı, daha az iade lojistiği), firmaların **Çevresel, Sosyal ve Yönetişim (ESG)** skorlarını doğrudan iyileştirmekte; yüksek ESG skorları ise firmaların sermaye maliyetlerini düşürerek finansal piyasalarda daha ucuza borçlanmalarını sağlamaktadır.

4.2. Yatırım Getirisi (ROI) ve Risk Minimizasyonu

Yapay Zeka yatırımlarının finansal getirisi hesaplanırken, sadece doğrudan maliyet tasarrufları (azalan işçilik vb.) değil, "kaçınılan maliyetler" (avoided costs) de hesaba katılmalıdır:

- **Operasyonel Verimlilik (Dahili Başarı):** Oye, Luther ve Emerson (2024) tarafından detaylandırılan Tahmine Dayalı Bakım (PdM) stratejileri, plansız duruşların (downtime) azaltılması ve Genel Ekipman Etkinliği (OEE) oranlarının artırılması yoluyla birim üretim maliyetlerini düşürmektedir.

- **Marka Değeri ve Risk (Harici Başarı):** Gıda geri çağırma (recall) operasyonlarının ortalama maliyeti milyonlarca doları bulabilmektedir. YZ destekli izlenebilirlik, bu riskin gerçekleşme olasılığını minimize eder.

Aşağıdaki tablo, bu dönüşümün finansal ve stratejik boyutlarını, destekleyici akademik kaynaklarla birlikte özetlemektedir.

Tablo 1: Yapay Zeka Destekli Kalite Maliyeti Dönüşümü ve Kaynak Analizi

KM Kategorisi	Geleneksel Yaklaşım	Dijital Dönüşüm Yaklaşımı	Finansal ve Stratejik Çıktı	Dayanak Kaynaklar

Önleme Maliyetleri	Periyodik eğitim, manuel prosedür yazımı.	Verialtyapısı, Blokzincir, IoT sensörleri ve YZ modellerine stratejik yatırım.	Sürdürülebilir uyumluluk, **ESG uyumu**, düşük sermaye maliyeti ve sistematik risk minimizasyonu.	Psarommatis et al. (2023); Sardanelli et al. (2024); Kumar & Tripathi (2024).
Değerlendirme Maliyetleri	Örneklem bazlı (sampling) manuel laboratuvar analizleri.	Otonom, sürekli (%100) ve gerçek zamanlı doğrulama sistemleri (TinyML).	İşgücü verimliliği artışı, analiz maliyetlerinde düşüş ve kaynak optimizasyonu.	Ray (2024); Defraeye et al. (2023); Romero et al. (2023).
Başarısızlık Maliyetleri	Yüksek fire oranları, müşteri şikayetleri ve kriz yönetimi giderleri.	Tahmine dayalı analitik ve erken uyarı sistemleri ile proaktif risk engelleme.	**FAVÖK (EBITDA) artışı**, nakit akışı istikrarı ve kurumsal itibarın korunması.	Oye et al. (2024); Zhang & Chen (2024); Ivanov & Dolgui (2024).

5. UYGULAMA ZORLUKLARI VE ÇÖZÜM ÖNERİLERİ

Bu dönüşüm süreci, yalnızca teknolojik bir yatırım değil, aynı zamanda ciddi yönetimsel zorlukları da beraberinde getirmektedir.

5.1. Veri Yönetişimi ve "Kirli Veri" Sorunu

Finansal raporlamanın güvenilirliği, artık operasyonel verilerin doğruluğu ile doğrudan ilişkilidir. Yapay Zeka algoritmalarının, stok değer düşüklüğü (impairment) veya raf ömrü dolan ürünlerin karşılık ayrılması gibi finansal kararları otonom olarak tetiklediği senaryolarda, bu algoritmaların denetimi **Finansal Raporlama Üzerindeki İç Kontrollerin (ICFR)** temel bir bileşeni haline gelmektedir. Zhang ve Chen (2024), finansal risk erken uyarı mekanizmalarının başarısının, veri setlerinin temizliğine ve homojenliğine bağlı olduğunu belirtmektedir. Çözüm olarak, veri giriş noktalarında "otomatik doğrulama" (auto-validation) protokollerinin devreye alınması önerilmektedir.

5.2. Siber Güvenlik ve "Kara Kutu" Riski

Otonom sistemlerin yaygınlaşması, siber güvenlik risklerini artırmaktadır. Özellikle Blokzincir tabanlı sistemlerde verinin değiştirilemez olması bir avantajken, sisteme ilk giren verinin doğruluğu (Oracle problem) kritik bir güvenlik açığı olabilir. Ayrıca, YZ modellerinin kararlarının açıklanabilir olmaması ("Black Box" sorunu), denetçiler ve düzenleyici kurumlar nezdinde güvensizlik yaratabilir. Xu ve arkadaşları (2025), **Açıklanabilir Yapay Zeka (XAI)** tekniklerinin kullanımının, Endüstri 5.0 kapsamında insan-makine güvenini tesis etmek için zorunlu olduğunu vurgulamaktadır.

5.3. Yetkinlik Açığı ve Kültürel Direnç

Teknolojik dönüşümün önündeki en büyük engel genellikle teknik değil, beşeridir. Romero ve arkadaşları (2023), "Operatör 4.0" vizyonunun hayata geçmesi için, çalışanların sadece teknolojiyi kullanan değil, onu denetleyen ve geliştiren bir yetkinlik setine (upskilling) sahip olması gerektiğini belirtir. Bu bağlamda, organizasyonların teknoloji yatırımı kadar "dijital okuryazarlık" eğitimlerine de bütçe ayırması stratejik bir zorunluluktur.

6. SONUÇ

Bu çalışma, süreç mükemmelliğinin geleceğinin, operasyonel verilerin eş zamanlı olarak finansal veri niteliği taşıdığı, mühendislik ve finansın aynı dili konuştuğu entegre bir yönetim modelinde yattığını ortaya koymaktadır.

Yapay Zeka destekli Yalın (Kaizen 4.0) yaklaşımı operasyonel verimliliği optimize ederek israfı yok ederken; **Akıllı Kalite Yönetimi (SQM)**, kalite fonksiyonunu bir maliyet merkezi olmaktan çıkarıp stratejik bir rekabet avantajına ve ESG performans göstergesine dönüştürmektedir.

Elde edilen bulgular ışığında, geleceğin organizasyonları için şu iki temel disiplinler arası işbirliği zorunlu görülmektedir:

1)Operasyonel Yönetim için: Tamamen otonom sistemler yerine, insan sezgisi ile yapay zeka analitiğini sentezleyen, **hibrit ve insan odaklı (Endüstri 5.0)** karar alma mekanizmalarına odaklanılmalıdır.

2) Finansal Yönetim için: Veri yönetişimi bir "BT sorunu" olarak değil, stratejik bir "sermaye yatırımı" olarak değerlendirilmelidir. Zira hatalı veriye dayalı stratejiler, dijital çağın en büyük ve en sinsi finansal riskini oluşturmaktadır.

Abstract

In this study, governance sustainability, approached from the angle of the six-dimensional Worldwide Governance Indicators (control of corruption, political stability, regulatory quality, rule of law, government effectiveness, and voice and accountability) was examined vis-à-vis its relationship with green innovation (proxied by renewable energy consumption as a percent of total green energy consumption) in all the 16 West African countries between 1996 and 2024. The panel data obtained from Worldwide Governance Indicators and World Development Indicators were analysed using Pearson correlation test and Toda-Yamamoto causality technique. Findings from the Pearson correlation test indicates the existence of a positive relationship between governance sustainability and green innovation in West Africa. Furthermore, Toda-Yamamoto causality analysis reveals the existence of a unidirectional causality flowing from rule of law, and voice and accountability to green innovation in West Africa. The study therefore concludes that governance sustainability is pivotal to improving green innovation in West Africa. The study emphasizes the need for West Africa sub-region to improve its public governance structure, particularly its rule of law, and voice and accountability, in order to enhance its green innovation.

Keywords: Governance sustainability, green innovation, sustainable finance

INTRODUCTION

Green innovation is at the heart of the global goals, called Sustainable Development Goals (SDG), particularly part of goal 9 and goal 13 (...fostering innovation; and combating climate change). Greening is a global agenda considering the devastating effect of global warming and as a result, government of the world through various policies and programmes findings ways to reducing the negative effect of environmental degradation, particularly, pollution. One particular approach to improving the

environment is through greening initiative, particularly, green innovation. Fernando and Wah (2017) observed that green innovation serves as a strategic tool that allows organizations to harmonize competitiveness with environmental responsibility. This frames green innovation not merely as a corporate social responsibility effort but as a means of achieving sustained competitive advantage in increasingly environmentally aware markets. Green innovation pertains to the creation of new products, processes, services, or practices that lessen environmental impact while preserving or enhancing economic performance.

Sustainability is based on the notion of using the present resources with the future implications in mind, such that the future needs are not shortchanged. It involves the pursuit of long-term value by integrating environmental, social and governance considerations in economic, financial and other value-adding decisions making. Sustainability is multi-dimensional: economic, environmental, social, and governance. Governance as an aspect of sustainability, can be described as the operation of the governance framework in such a way that the future capacity is not jeopardized while long-term values are created. Governance sustainability could be viewed from either corporate or public governance perspectives. Corporate governance sustainability is regarded as the operation, control and direction of corporate affairs with an intention of creating long term value for the organization, the environment and the society at large. On the other hands, public governance sustainability is the operation, control and direction of public affairs with an intention of creating long term value for the people, the environment and the society at large without jeopardizing the future capacity.

Public governance, according to the World Bank is a six-dimensional concept consisting of voice and accountability, government effectiveness, regulatory quality, rule of law, control of corruption, political stability and absence of violence. Public governance can be made sustainable by operating the different dimensions of public governance in a manner to attain sustained and long-term objective. One of these objectives is green innovation, which involves creation of new products and services that is capable of improving the environment. It can also involves use of natural resources in an innovative way to improve environmental quality, for example the consumption of renewable energy consumption thereby facilitating greening of the environment.

Considering the foregoing, this study therefore aims to investigate causal relationship between governance sustainability and green innovation in West African countries between 1996 and 2024.Specifically, the study aims to:

i. Examine the causality between rule of law and green innovation in West Africa;

ii. Assess the causality between political stability and green innovation in West Africa;

iii. Investigate the causality between control of corruption and green innovation in West Africa;

iv. Determine the causality between voice and accountability and green innovation in West Africa;

v. Examine the causality between regulatory quality and green innovation in West Africa; and

vi. Evaluate the causality between government effectiveness and green innovation in West Africa.

LITERATURE REVIEW

Conceptual Review

Concept of Green Innovation

Green innovation has become a pivotal concept in sustainability studies, especially in developing nations like Nigeria and other West African countries. Green innovation, also known as eco-innovation or environmental innovation, involves the creation and application of novel products, processes, services, or organizational practices that mitigate environmental damage while providing economic and social advantages (Nwagu, 2024). Green innovation signifies the launch of new or substantially enhanced products, processes, managerial practices, or services that concurrently diminish environmental impact and improve economic outcomes (Johnson & Adebisi, 2024). In essence, green innovation transcends mere technological modifications; it includes organizational, financial, and marketing aspects that weave environmental awareness into corporate strategy. In contrast to conventional innovations, which focus on market performance and efficiency, green innovations incorporate sustainability goals such as resource efficiency, waste reduction, carbon footprint minimization, and the adoption of renewable energy sources (Onyeneke & Nnonyelu, 2025). Abubakar et al. (2022) characterized green innovation as an 'innovation process with both ecological and economic benefits,' underscoring its dual objectives.

Researchers have delineated various aspects of green innovation that companies may implement: Green product innovation, which centers on creating products that are energy-efficient, recyclable, biodegradable, or less detrimental to the environment (Chen, 2008); green process innovation, which focuses on altering production methods to minimize waste, emissions, and energy usage (Chiou et al., 2011); green organizational/management innovation, which entails the introduction of policies, strategies, and frameworks that integrate environmental accountability into corporate culture (Xie et al., 2016); and lastly, green marketing innovation, which seeks to promote products and brands with environmentally friendly characteristics to attract consumers who are environmentally aware (Dangelico & Vocalelli, 2017).\

Aside the organizational perspective to green innovation, there is also the national perspective to green innovation. This study examines green innovation from this angle by viewing green innovation from energy consumption pattern which discounts the environmental implication into it. Hence, the use of renewable energy consumption, the use of energy that promotes environmental benefits in the aspect if greening. This is considered innovative in that the use of this kind of energy source does not result in environmental degradation cause of environmental pollution, that is air, water, land pollution.

Concept of Governance Indicators

The notion of governance indicators has attracted considerable interest in modern development discussions, as they offer measurable proxies for evaluating the quality and effectiveness of Governance frameworks across countries, regions, and institutions. Governance, as broadly articulated by the World Bank, encompasses the traditions and institutions through which authority is exercised within a nation, including the processes by which governments are selected and replaced, their ability to devise and execute policies, and the respect that citizens and the state have for the institutions that regulate economic and social interactions (World Bank, 2023).

Consequently, governance indicators translate these dimensions into quantifiable metrics that facilitate comparative and longitudinal studies. The most widely acknowledged framework is the Worldwide Governance Indicators (WGI) established by Kaufmann, Kraay, and Mastruzzi, which includes six principal dimensions: voice and accountability, political stability and absence of violence, government effectiveness, regulatory quality, rule of law, and control of corruption (World Bank, 2023). Explaining each of these dimensions, Kaufmann et al. (2011), asserts that voice and accountability and political

stability and absence of violence/terrorism are involved in the process by which governments are selected, monitored, and replaced encompasses. Voice and accountability captures the perceptions of the extent to which a country's citizens can participate in selecting their government, as well as freedom of expression, freedom of association, and a free media. Political stability and absence of violence/terrorism refers to the perceptions of the likelihood that the government will be destabilized or overthrown by unconstitutional or violent means, including politically-motivated violence and terrorism.

Furthermore, government effectiveness and regulatory quality are two governance dimensions that relate to the capacity of the government to effectively formulate and implement sound policies. Government effectiveness captures the perceptions of the quality of public services, the quality of the civil service and the degree of its independence from political pressures, the quality of policy formulation and implementation, and the credibility of the government's commitment to such policies. Regulatory quality, however, captures the perceptions of the ability of the government to formulate and implement sound policies and regulations that permit and promote private sector development (Kaufmann et al., 2011).

Rule of law and control of corruption are two governance dimensions that bothers on the respect of citizens and the state for the institutions that govern economic and social interactions among them is indicated by. Rule of law is the perceptions of the extent to which agents have confidence in and abide by the rules of society, and in particular the quality of contract enforcement, property rights, the police, and the courts, as well as the likelihood of crime and violence. Control of corruption captures the perceptions of the extent to which public power is exercised for private gain, including both petty and grand forms of corruption, as well as 'capture' of the state by elites and private interests (Kaufmann et al., 2011).

Theoretical Framework

The Resource-Based View (RBV) proposed by Barney (1991) suggests that green innovation can yield unique, valuable, and inimitable resources that serve as the foundation for competitive advantage (Barney, 1991). For example, the adoption of green technologies can set firms apart in markets characterized by a strong demand for sustainability. Conversely, Institutional Theory, as articulated by DiMaggio and Powell (1983), asserts that firms are compelled to embrace green innovation due to regulatory frameworks, societal expectations, and pressures from stakeholders (DiMaggio & Powell, 1983). This is especially pertinent in situations where governments impose environmental regulations.

Empirical Review

Johnson and Adebisi (2024) performed a survey involving 151 managers from a multinational corporation located in Lagos, discovering that green innovation is a significant predictor of both environmental success and competitive advantage. The regression analysis results demonstrated that green innovation positively impacts environmental outcomes and competitive advantage, with competitive advantage serving as a mediator in the relationship between green innovation and environmental success. This finding empirically supports the notion of green innovation as a strategic resource that enhances the environmental and market performance of firms in Nigeria.

In a similar vein, Nwagu (2024) conducted a survey of 370 employees from multinational companies in South-West Nigeria, revealing that green product and marketing innovations have a positive effect on economic sustainability, whereas green process and organizational innovations exhibited negative

coefficients. These findings imply that while green innovation contributes to sustainability, not all aspects are equally advantageous in the short term, and challenges in implementation may impede the effectiveness of process and organizational innovations.

In the context of the Nigerian construction industry, Soji et al. (2024) utilized a Delphi survey targeting industry experts to identify and validate the competencies necessary for the adoption of green innovation. Their research identified four essential competency dimensions: social, environmental, economic, and technical, which practitioners deemed crucial for sustainable construction. This consensus among experts emphasizes the contextual necessity for multi-dimensional skills and competencies as facilitators of green innovation within Nigeria's built environment.

From a financial performance standpoint, Ibrahim and Ibrahim (2024) proposed a conceptual model that investigates the moderating role of environmental costs in the relationship between green innovation and firm performance within Nigerian consumer goods companies. Although the model is primarily conceptual, it highlights the significance of financial factors in assessing the effectiveness of green innovation and advocates for additional empirical research in Nigeria's manufacturing sector.

At the small and medium enterprises (SME) level, Onyeneke and Nnonyelu (2025) conducted a survey involving 325 managers of small and medium enterprises in Anambra State, revealing that the adoption of green practices was notably low. The primary obstacles identified were financial limitations, insufficient technical expertise, and inadequate regulatory enforcement. These findings suggest that, although larger firms and multinational corporations in Nigeria are embracing green innovation to enhance sustainability and competitiveness, SMEs are still confronted with considerable challenges that hinder their participation in green practices.

In a related study, Adeyokunnu et al. (2025) explored green innovation among SMEs in Lagos State, underscoring the importance of entrepreneurial initiatives, green financing, and sustainable practices in bolstering SME competitiveness. This research highlights the crucial role of GI in establishing market advantages within environments constrained by resources.

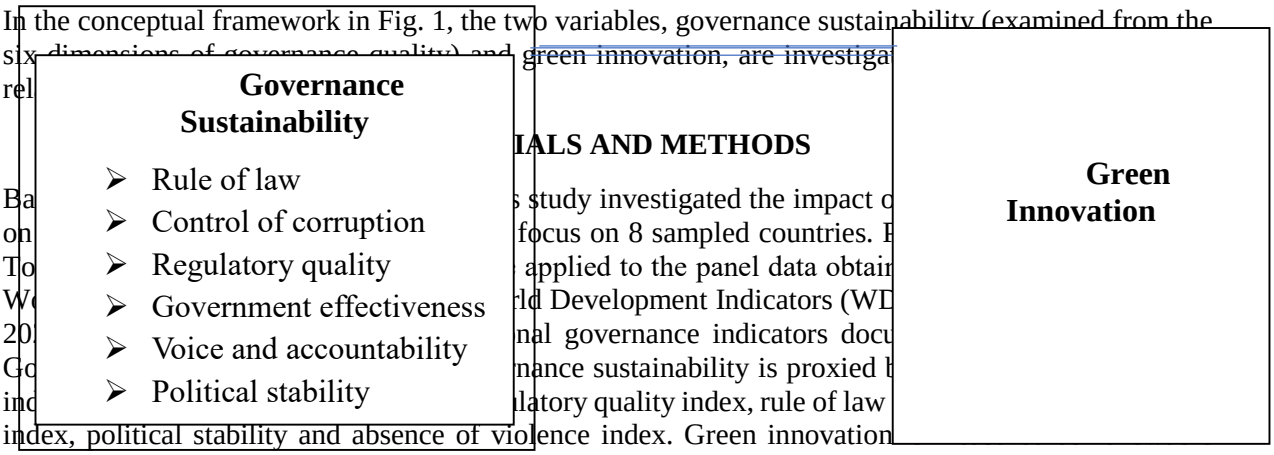
Likewise, Wilson-Oshilim and Omoye (2025) examined the relationship between green knowledge, product, process, and management innovation and SME performance. Their results indicated that while green knowledge did not have a significant impact, innovations in green products, processes, and management each positively and significantly influenced performance, thereby confirming the multifaceted nature of green innovation.

The review of literature clearly shows that most past studies evaluated green innovation from organizational perspective, relating the concept to organizational performance. There is scarcity of studies on the link between green innovation and governance sustainability, particularly the ones examined from the national or public perspective. Hence, the need for this study that focuses on national green innovation and public governance sustainability performance.

Conceptual Framework

The conceptual framework for the study is as depicted in Fig. 1.

Fig 1: Conceptual Framework on Governance Sustainability and Green Innovation



In the conceptual framework in Fig. 1, the two variables, governance sustainability (examined from the six dimensions of governance quality) and green innovation, are investiga
rel

FINDINGS

Correlation Analysis

Table 1 presents the result of the Pearson correlation test of relationship between governance sustainability and green innovation in West Africa.

Table 1: Correlation Matrix

	GRIN	COC	GEF	PST	REQ	ROL	VAC
GRIN	1.0000						

COC	0.0835	1.0000					
	0.0722	-----					

GEF	0.0334	0.7017	1.0000				
	0.4724	0.0000	-----				
PST	0.0792	0.6965	0.6197	1.0000			
	0.0882	0.0000	0.0000	-----			
REQ	0.0066	0.7874	0.5577	0.8083	1.0000		
	0.8870	0.0000	0.0000	0.0000	-----		
ROL	0.1367	0.7473	0.6215	0.6962	0.8031	1.0000	
	0.0032	0.0000	0.0000	0.0000	0.0000	-----	
VAC	0.0496	0.6305	0.6188	0.7994	0.6904	0.6292	1.0000
	0.2858	0.0000	0.0000	0.0000	0.0000	0.0000	-----

Evidence from Pearson correlation test in Table 2 indicates that all the six governance indicators (control of corruption, political stability, regulatory quality, rule of law, government effectiveness, and voice and accountability) are positively correlated with green innovation in West Africa but only regulatory quality, government effectiveness, and voice and accountability are statistically significant.

Optimal Lag Selection

As a necessary condition for Toda-Yamamot causality test to determine the optimum lag for the model, the Vector Autoregressive (VAR) lag order selection criteria test was conducted and the result reported in Table 2.

Table 2: VAR Lag Order Selection Criteria

Lag	LogL	LR	FPE	AIC	SC	HQ
0	3818.372	NA	3.31e-19	-22.68674	-22.60722	-22.65504

* indicates lag order selected by the criterion

LR: sequential modified LR test statistic (each test at 5% level)

FPE: Final prediction error

AIC: Akaike information criterion

SC: Schwarz information criterion

HQ: Hannan-Quinn information criterion

Panel Unit Root Test

To be able to ascertain the maximum lag length for the Toda-Yamamoto causality equation, unit root test (Levin, Lin & Chu t) was conducted and the result reported in Table 3.

Table 3: Levin, Lin & Chu t (LLC) Panel Unit Root Test

Variable	Test Stat. in Level		Test Stat. at 1st Difference		Integration Order
	LLC Statistics	**Prob.**	**LLC Statistics**	**Prob.**	**I(d)**
GRIN	-3.15624	0.0008			I(0)
COC	-1.80763	0.0353			I(0)
GEF	-0.14342	0.4430	-6.74954	0.0000	I(1)
PST	-3.03838	0.0012			I(0)
REQ	-3.46044	0.0003			I(0)
ROL	-2.90965	0.0018			I(0)
VAC	-4.48531	0.0000			I(0)

Table 3 reports that except government effectiveness which is integrated of order one, all other variables (green innovation, control of corruption, political stability, regulatory quality, rule of law, and voice and accountability) are integrated of order zero. Given that the maximum order of integration is one, then the maximum order of integration for the Toda-Yamamoto causality test is two (integration order plus 1).

The result of the Toda-Yamamoto causality test (otherwise called VAR Granger Causality/Block Exogeneity Wald test) as reported in Table 4 in that there is a unidirectional causality running from rule of law, and voice and accountability to green innovation in West Africa. This means that out of the six indicators of governance sustainability, only two (rule of law, and voice and accountability) were found to be drivers of green innovation in West Africa.

DISCUSSION AND CONCLUSION

In this study, governance sustainability was examined vis-à-vis its relationship with green innovation in all the 16 West African countries between 1996 and 2024 using Pearson correlation test and Toda-Yamamoto technique. The study found that there is a positive relationship between governance sustainability and green innovation in West Africa. Further, there is a unidirectional causality flowing from rule of law, and voice and accountability to green innovation in West Africa.

The study therefore concludes that governance sustainability is pivotal to improving green innovation in West Africa. This emphasizes the need for West Africa sub-region to improve its public governance structure, particularly its rule of law, and voice and accountability, in order to enhance its green innovation.

FINANCIAL INCLUSION: INTRODUCTION AND OVERVIEW

Dr. Ramzi Abdullah Ahmed Hassan
Assistant Professor - University of the Holy Quran and Islamic Sciences - Hadhramaut, Yemen
captinrmzy@uqs-ye.info

Abstract

Financial inclusion has emerged as a critical pillar for promoting inclusive economic growth, reducing poverty, and ensuring social equity. This paper examines the global initiatives undertaken by governments, international institutions, and financial regulators to bridge the financial gap and expand access to essential financial services, such as savings, credit, insurance, and digital payments, to underserved populations. Drawing on a wide range of country case studies, including Kenya, Jordan, Brazil, the Philippines, and others, the study highlights how innovative tools like mobile banking, agent banking, and digital finance platforms have helped reach remote and low-income communities. The research also underscores the role of coordinated national strategies, regulatory reforms, and financial education in advancing inclusion, particularly for women, youth, refugees, and micro-enterprises. Despite the progress made, significant barriers remain, including a lack of awareness, limited digital infrastructure, and socio-economic inequalities. The paper concludes by advocating for evidence-based policies, stronger public-private partnerships, and the integration of financial inclusion into broader sustainable development frameworks. By learning from global best practices, countries can build resilient, inclusive financial ecosystems that empower individuals and drive long-term economic prosperity.

Keywords: *Financial Inclusion, Economic Growth, Poverty Reduction, Financial Literacy, Digital Financial Services, Mobile Banking, Financial Exclusion, Sustainable Development Goals*

Introduction

The basic tenet of financial inclusion is to offer affordable banking services to low-income and underprivileged populations. For individuals who are now excluded, this includes simple access to credit, insurance, payments, and transfers via the official financial system. When everyone in society has access to formal financial services, regardless of income level, this is known as financial inclusion. It includes a variety of financial services, including insurance, equity products, and pension plans, in addition to banking services. The phrase "inclusion" highlights the need for these services to be accessible to all community members, guaranteeing equitable and reasonably priced access to financial services.

Financial exclusion, on the other hand, is a relatively recent idea that was introduced in 1994. This idea describes people's incapacity to get or utilise financial items that enable them to engage in a variety of everyday activities. Low-paid people, the unemployed, the elderly, young people not engaged in school or vocational training, and people with physical disabilities are among the social categories most at risk of financial exclusion. Concerns and perceptions of the restricted physical access to banking services brought about by bank branch closures led to the creation of the phrase "financial exclusion." The phrase started to be used more broadly in 1999 to refer to those who had little access to traditional financial institutions. Research on the barriers that some groups of people have when trying to use contemporary payment methods, other banking services, consumer credit, and insurance has also grown.

Issue Definition

Despite significant advancements in global financial systems, a large portion of the world's population, especially those in low-income, marginalised, and rural communities, remains excluded from formal financial services. This exclusion limits their ability to save, invest, manage risks, and access credit, thereby constraining economic growth, increasing poverty, and widening social inequalities. The challenge lies in designing and implementing effective frameworks, policies, and innovative solutions that ensure affordable, accessible, and sustainable financial services for all.

Research Objectives

1. To analyse the global frameworks and initiatives aimed at promoting financial inclusion in developing and developed countries.
2. To examine the socio-economic benefits of financial inclusion, including poverty reduction, empowerment of women, and economic stability.
3. To identify the barriers and challenges that hinder financial inclusion, such as infrastructural limitations, regulatory gaps, and socio-cultural factors.
4. To evaluate innovative financial tools and delivery channels, such as digital finance, mobile banking, and agent banking, in expanding access to underserved populations.
5. To propose evidence-based policy recommendations for governments, regulators, and financial institutions to foster inclusive financial ecosystems aligned with sustainable development goals.

Research Questions

1. What are the key global initiatives and national strategies implemented to advance financial inclusion?
2. How does financial inclusion contribute to poverty alleviation, economic growth, and social empowerment?
3. What are the main challenges and barriers faced by marginalised groups in accessing formal financial services?
4. How effective are digital financial services and agent banking models in increasing financial access in remote and underserved areas?
5. What policy and regulatory measures can best support the expansion and sustainability of financial inclusion initiatives?

Literature Review

Kashif Iqbal (2021) has published his work on "Modelling Relationship between Financial and Social Inclusion" in the Centre for Management Studies, Jamia Millia Islamia in 2021. Kashif aimed to investigate the connections between financial and social inclusion in India. The research employed multistage random sampling to gather data from 601 respondents through a structured questionnaire, with 300 respondents coming from Bihar and 301 from Delhi. The findings indicated a significant relationship between financial and social inclusion and identified the dimensions of this relationship. However, the small sample size of 601 may limit the generalisability of the results, and Iqbal recommends that future studies use a larger sample size to strengthen the reliability of the findings.

Naveen (2014) has published his work on "Micro-Finance and Financial Inclusion – A Case Study of Mysore and Chamarajanagar Districts" at the University of Mysore in 2014. Naveen's study examined the function of micro-finance organisations in enabling financial inclusion for the underprivileged. These institutions offer a range of products, including micro-credit, micro-savings, micro-insurance and micro-finance training to meet the diverse needs of their clients. The researcher

found that micro-finance institutions can help bridge the gap between exclusion and inclusion in access to financial services and reduce reliance on informal, costly borrowing sources. Additionally, the study found that savings can help mitigate the impact of economic shocks and absorb severe shocks. As a result, the researcher recommended that the government encourage banks to promote financial inclusion through advertising, financial assistance and awareness programs to achieve inclusive growth in India.

K. Thirumamagal (2016) has published his work on "Issues and Challenges of Financial Inclusion – A Study Concerning Rural Areas in Tamil Nadu" University of Madras in 2016. The study examined the problems faced by financial institutions in implementing financial inclusion, including stagnant banking services, technological issues, inadequate infrastructure and changing regulatory policies. The research also identified measures banks should take to promote inclusive growth and discussed linking individuals' income-generating activities to banking transactions through multiple channels. The government's decentralisation approach to financial inclusion, which involves banks and other financial institutions, was also discussed to promote financial inclusion for all individuals. Overall, the study concluded that the primary goal of financial inclusion is to ensure that all individuals have access to financial services.

Garg (2019) has published his work on "Financial Inclusion of Urban Poor in India with Special Reference to Delhi Slums" at Maharshi Dayanand University in 2019. The main objective of the study was to examine the level of financial inclusion among slum dwellers in Delhi and to identify any challenges faced by commercial banks in achieving financial inclusion in these communities. The study results showed a significant increase in commercial banks in both urban and rural areas in India over the years. However, the researchers recommend that similar studies be conducted in other states to validate the findings of this study and facilitate the generalisation of the results. This research aimed to improve the financial inclusion of marginalised communities in India, particularly in Delhi's slums.

Methodology

This study adopts a conceptual and comparative research methodology combined with case-based analysis to explore the multifaceted dimensions of financial inclusion globally. The research is primarily qualitative, drawing upon existing literature, policy documents, international reports, and empirical studies to develop a comprehensive understanding of financial inclusion frameworks, challenges, and socio-economic impacts.

Conceptual Analysis:

The study first establishes a theoretical foundation by reviewing key definitions, goals, and frameworks of financial inclusion from academic and institutional sources. It synthesises various theories and models related to financial access, inclusion policies, and economic development.

Comparative Approach:

The research compares different national and international financial inclusion initiatives, highlighting variations in strategies, implementation, and outcomes. This comparative analysis includes examples from countries such as Kenya, Mexico, Jordan, the Philippines, Nigeria, and others, illustrating diverse approaches to expanding financial access.

Case-Based Analysis:

Specific case studies are examined to illustrate the practical application of financial inclusion policies and innovations. These include Kenya's agency banking system, the UK's Post Office Current Account scheme, and Jordan's national financial inclusion strategy. The cases provide insights into effective mechanisms, challenges encountered, and lessons learned.

Data Sources:

Secondary data is collected from global databases such as the Global Findex, World Bank reports, IMF publications, and peer-reviewed articles. This data supports the evaluation of progress in financial inclusion and the identification of gaps in access.

Limitations:

While the study provides broad insights, it relies on secondary data and published case studies, which may limit the depth of localised or real-time analysis. Future research could incorporate primary data collection to enhance empirical robustness. This mixed methodological approach allows for a rich, contextual understanding of financial inclusion efforts across different socio-economic environments, providing a basis for informed policy recommendations.

Background of the Study

Financial Development and Economy

An entrepreneurial spirit can be encouraged among the populace by offering formal credit alternatives and guaranteeing sufficient and transparent credit availability through financial institutions and conventional channels, which will boost output and wealth in the nation. As a result, unbanked people will be less reliant on unofficial funding sources, including loans from friends, family, and moneylenders. In 90% of economies, the primary financial regulator is in charge of at least some components of the financial inclusion agenda, according to Financial Access's 2010 CGAP study. However, financial authorities in low- and middle-income nations are more likely to concentrate on promoting access to deposit and credit services.

Sharma (2014) asserts that, based on each nation's degree of development, different areas have varied interpretations of economic progress. Every nation prioritises economic growth and employs different strategies based on its unique situation. In order to prevent a product or program from failing, economic growth must be inclusive and beneficial to all members of society. The usage of electronic bill payment methods and digital channels may be viewed as a type of financial exclusion in industrialised nations. However, in developing countries, where the financial sector does not offer sophisticated services, this perspective may not be valid. As a result, it is difficult to compare nations based on economic development, and care should be taken. A key element of total economic growth and an important factor in an economy's development is financial development.

Promoting Global Financial Literacy

With the help of OECD/INFE, the World Bank, and G20 nations have been actively promoting financial inclusion and financial literacy among people worldwide since 2010. 515 million adults globally opened a bank account between 2014 and 2017, according to the Findex 2017 study. Nonetheless, 1.7 billion adults are still unbanked, out of the 2 billion people who lack access to banking globally. Interestingly, women make up 56% of the unbanked population.

Approximately 38% of bank accounts in India, although over 80% of people have one, are not active. Therefore, it is essential to create a comprehensive financial system that gives the underprivileged segments of society the ability to easily engage in personal financial planning activities while fostering confidence and trust. The underprivileged should have their needs met by updating and customising this system.

However, financial inclusion is not ensured by merely opening a bank account. Encouraging the underprivileged population to use the formal financial system for financial services and establishing and maintaining banking habits are the real challenges. Dhillon (2019) highlights the significance of giving

low-income households basic financial education and information. They must have access to trustworthy investment sources that can yield future returns, concentrate on building wealth through prudent saving, and comprehend the risks involved in the financial industry.

Poor people should have access to funds that are solely intended for future use as part of the financial system's contingency planning sector, which is where financial inclusion operates. It has been noted that merely enhancing one's lifestyle through financial inclusion is insufficient; people also need to have the right tools and resources to properly plan for their later years. Many impoverished people are unaware of retirement planning and lack the requisite expertise. Therefore, it is crucial to offer them reasonably priced retirement plans to guarantee they obtain beneficial returns in their later years.

Financial Inclusion

In recent years, financial inclusion has gained a lot of attention, particularly when it comes to fostering economic growth and lowering poverty. In essence, it entails making sure that a range of financial services and products, such as credit, insurance, savings accounts, and payment systems, are easily and reasonably accessible to both individuals and enterprises. Nonetheless, the notion of financial inclusion is multifaceted and subject to several interpretations. We will examine several definitions, conceptualisations, and viewpoints regarding financial inclusion in this conversation.

All societal segments must be included in the financial sector and have equitable access to banking and other financial services, according to Bhagwandas (2018).Universal access to a variety of financial services at affordable prices, including equity and insurance products, is referred to as financial inclusion. The World Bank defines financial inclusion as the availability of practical, reasonably priced financial services and products that satisfy the needs of people and enterprises, including credit, insurance, savings, payments, and transactions, and that are provided ethically and sustainably.

Established financial institutions effectively and transparently carry out the goal of providing accessible and affordable financial products and services to economically disadvantaged, underserved, underprivileged, and below-poverty vulnerable groups in compliance with the guidelines established by the RBI.

Ahmed Al-Bakle claims that a broad range of excellent public financial services and products are included in financial inclusion. Payments, current and savings accounts, transfers, credit, loans, financing, insurance, and more are all included in this category. Regulations supporting these services and goods are designed to increase their accessibility and use by all societal groups. The goal of financial inclusion is to offer these services and goods in a timely, equitable, transparent, affordable, and suitable quality manner. It should be customised to fit each person's demands and guarantee efficient use. These services must be provided responsibly, sustainably, and in accordance with the relevant legal and regulatory framework via the official financial system channels.

According to Priyanka Sharma, financial inclusion is the process of making sure that everyone in an economy can easily access, use, and utilise the official financial system. According to Lakhwinder Kaur Dhillon's research, financial inclusion is a system that provides banking services to a larger percentage of low-income and disadvantaged populations at a fair and accessible price. According to The Rangarajan Committee (2008), "the process of ensuring access to financial services and timely and adequate credit needed by vulnerable groups such as weaker segments and low-income groups at an affordable cost" is the definition of an inclusive financial system, also referred to as financial inclusion.

"A financial sector that provides credit to all bankable people and firms, as well as savings and payment services to everyone" is how the UN defines financial inclusion. While not everyone must be able to use all services for inclusive finance, they should have the option to do so if they so choose.(Raihanath & Pavithran, 2019) According to ADB (2000), financial inclusion offers low-income

and impoverished households and their microbusinesses a wide range of financial services, including deposits, loans, payment services, money transfers, and insurance.(Lin et al., 2023)

Renuka Bacharaju defines financial inclusion as giving vulnerable groups, such as those in lower-income and weaker segments, timely access to financial services and reasonably priced credit. Making banking services accessible to all people in order to satisfy their demands for credit, savings, remittances, and other financial goods and services is the main objective of financial inclusion.[i]

Reema Rabha claims that financial inclusion enables all societal groups to have access to fundamental financial services like credit, insurance, and savings opportunities.(Kumar & Manjunath, 2014)

Financial Exclusion

Lack of access to financial services and goods for both individuals and communities is known as financial exclusion. The capacity of people and enterprises to frequently and affordably use financial services is known as financial inclusion; the opposite of this is financial exclusion. Lack of access to bank accounts, credit, insurance, and payment services is just a few examples of the many ways that people might be financially excluded. Inadequate financial infrastructure, discriminatory practices, and excessive transaction costs are some further ways it may show up.

Financial exclusion, according to Guar, is the inability of large populations, particularly the less fortunate and economically disadvantaged, to obtain beneficial banking services.(Mohana et al., 2023). Financial exclusions, according to Leyshon & Thrift, are procedures used to keep members of particular social groups and individuals from having access to the official financial system. Financial exclusion, according to Sinclair, is the inability to obtain essential financial services.

Financial exclusion, according to Stephen P. Sinclair (2001), is the inability to access necessary financial services. Problems with conditions, pricing, promotion, access, or self-exclusion as a result of unfavourable experiences or opinions can all lead to exclusion. When financial exclusion impacts low-income consumers and those going through financial difficulties, it becomes a communal concern.(Priti & Aggarwal, 2019)

Table 1.1: Financial Inclusion vs Financial Exclusion

Elements	Financial Inclusion	Financial Exclusion
Product	Access to sensible, practical, and transparent goods, as well as additional financial services like micropensions, is guaranteed by the variety of offerings. They offer high-quality services and products that are adaptable and configurable, and they have access to goods that help them establish a steady income.	Exclusion may occur when products are inconvenient, rigid, uncustomisable, or of poor quality.
Price	• Their products and mechanisms are competitive and fairly priced.	When products are unaffordable, they may be excluded.

Elements	Financial Inclusion	Financial Exclusion
	• The product's effective cost is not seen as being excessively expensive or usurious. The customer is not impacted by inefficiencies.	
Awareness	•Active promotion of the product is required. • Every term and condition needs to be fully and openly defined. • Security, education, and customer service are prioritised.	When clients are unaware, they may be excluded.
Delivery	• It is accessible in remote locations, has a straightforward and practical distribution mechanism, and lowers client transaction costs.	Exclusion may occur when clients are difficult to reach and have a low transaction cost.

Source**:** (Renjith Jose & Thomas Com, 2019)

Importance and Need of Financial Inclusion

All societal sectors can access financial inclusion services thanks to the reliable and effective frameworks(Kumari et al., 2023). It is crucial to provide investments, digital payments, lending, and deposits. More resources and a wider range of financial administration solutions are made available through financial inclusion. Programs for education regarding the functions of infrastructure, bank services, and promising development prospects are also included. This feature creates a setting in which people can readily access the financial institutions' services and goods. Financial inclusion is growing and receiving attention in many contemporary nations since it is crucial to uplifting those who are financially excluded. Universal access to a variety of reasonably priced financial services is referred to as financial inclusion. It ensures that everyone, including those with modest incomes, has fair and uncomplicated access to financial goods and services at affordable rates. It also entails educating people about the use of financial goods and providing debt counselling and money management guidance.

76% of people worldwide and 71% of individuals in developing nations now own an account. For many years, the gender disparity in account ownership in developing nations was 9%, but it has since shrunk to 6%. Getting digital payments like government transfers, wage payments, or domestic transfers encourages people to use other financial services like borrowing, saving, and holding money. In developing nations, 18% of individuals, or 40% of those who paid utility bills, did so straight from their bank accounts. Only 20% of adults in other developing nations are paid using digital business payments, compared to 80% in China. The adoption of digital financial services has increased as a result of the coronavirus pandemic; 40% of adults in developing economies (apart from China) paid a digital merchant online, over the phone, or with a card, and 33% of adults in developing economies who paid a utility bill straight from their account did so for the first time since the pandemic started. Because it encourages account ownership and use through mobile payments, savings, and borrowing, mobile money has emerged as a crucial facilitator of financial inclusion in sub-Saharan Africa, especially for women. In developing economies, over 50% of adults can get more money within 30 days if they have unforeseen expenses.(Demirguc-Kunt et al., 2018)**.**

The main aims of inclusive finance, according to the United Nations, are:

1) Market monitoring, industry performance values, and an appropriate management system can all help create sound financial institutions.

2) It should be possible to use financial services appropriately by ensuring institutional and financial sustainability.

3) Where necessary, more financial service providers should be present to give clients a wide range of choices.

The policymakers have been emphasising financial inclusion of the country's rural and semi-rural areas primarily for the three most critical imperative needs:

1) Developing saving habits: People in poverty are more susceptible when they don't have any savings. Due to a lack of protection, this low-income group has always been under financial strain. The goal of banking services and products is to offer a valuable instrument to promote saving. People will shift away from traditional savings strategies, including investing in real estate, buildings, and bullion, as a result of financial inclusion. This action will raise the nation's capital formation and, after financial inclusion policies are implemented, should strengthen the economy.

Offering formal credit options: By making sure that sufficient and transparent financing is available through financial institutions and conventional channels, people will be more inclined to start their businesses, which will boost national output and wealth. Consequently, it will lessen the reliance of unbanked people on unofficial funding sources, including loans from friends, relatives, and moneylenders. One of the best instances of offering credit at a convenient and reasonable cost is microfinance.

Resolving public subsidy and welfare program leaks: The development and well-being of the impoverished are the goals of government programs and initiatives. But a sizable portion of funds intended for the impoverished do not make it to them. On the other hand, a large portion of the funds is leaked and fails to reach the intended recipients due to a complex system of government administration. By allowing the government to send benefits straight to the recipients' bank accounts rather than through cash payments, subsidies, or concessions, financial inclusion has assisted in resolving this problem. The real beneficiaries have benefited from this admirable endeavour, which has also decreased the government's subsidy expense and stopped money from leaking before it reaches its intended users. Establishing a transaction system where the impoverished can directly profit from an economical and effective financial system is crucial to achieving this. Consequently, financial inclusion must be given top priority. The official financial system must address two issues: Using financial counsellors to raise farmers' financial literacy and emphasising their financial inclusion. Indian banks and other financial market participants should aggressively promote initiatives that raise understanding of loan consequences, interest computations, and other unique banking aspects so that consumers can make educated decisions as part of their CSR. Small borrowers, particularly farmers, should have access to full-day counselling sessions offered by banks. It takes a lot of work and engagement in this area.

Establishing a bank account is not the end goal of financial inclusion; it is only the first step. Accounts must be actively used; simply establishing an account is not enough. Understanding the lives, needs, production, and vulnerabilities of the impoverished is essential to inclusion. They can gradually stabilise, reduce risk, boost earnings, acquire assets, and eventually become self-sufficient when banks step in and open accounts. By meeting their financial needs, fostering savings, and advancing financial awareness, financial inclusion is viewed as a way to empower the targeted group. Treating account holders as clients rather than as beneficiaries is essential.

A larger portion of the economy is encouraged to interact with the official financial system through financial inclusion. It facilitates the shift to bank accounts, which are easily monitored, from a

cash-based economy. Additionally, it makes it easier to monitor suspicious transactions by facilitating the application of Anti-Money Laundering and Combating the Financing of Terrorism (AML/CFT) rules.

Advantages of Financial Inclusion

First, financial inclusion contributes to economic growth to a certain extent. Research suggests that when credit is issued without adequate management, the dangers to financial stability increase. Financial stability is unaffected by expanding access to other forms of financial services, in contrast to credit. Financial independence can only be attained by people who have investments, insurance, and retirement plans. Only until impoverished households and isolated regions are financially included will all of this be feasible.

Another benefit of financial inclusion is that it opens up new avenues for private-sector company models that put social service first and offer a fresh approach to growth. For instance, M-PESA and other mobile money services have reached around 80% of Kenyans, and innovative use cases and business models are finding their way into the infrastructure. Additionally, M-KOPA and Mobisol have created microleasing for community-based, off-grid solar electricity in Tanzania, which is a great illustration of innovation in the context of climate change adaptation. The effect on household wellbeing has not yet been confirmed.

Global poverty can be reduced with the help of financial inclusion, especially in developing and impoverished nations. It accomplishes this by giving those in need prompt, affordable access to better credit and thrift savings. Because many individuals lack access to financial services and are forced to rely on their own resources or unofficial sources of financial services, financial inclusion has become a global concern. All nations are working together to get a sizable portion of the population, especially the disadvantaged groups in both rural and urban areas, into the banking industry.

Financial empowerment is also a set of results proven to improve the economic well-being of impoverished people. It offers many advantages, including:

1) Financial literacy education and counselling

2) Assistance with receiving government benefits and tax credits

3) Access to safe and affordable financial products and services

4) Opportunities for savings, asset building, and investment

5) Consumer education and safety

6) The removal of financial barriers and connection to opportunities to increase incomes quickly and begin saving and building assets for a secure future will enable people with low incomes to improve their financial outcomes.

In recent years, financial inclusion has also been seen as a growth factor. Financial inclusion expands the total amount of savings and investment options available to society at large. The literature claims that many European nations adopted universal banking systems because of the concern that market-based competitive banking would fail to deliver the social advantages of full financial inclusion.

Indicators of Financial Inclusion

Three factors—access to financial services, use of financial services, product quality, and service delivery—can be used to gauge financial inclusion. The indicators are set by the G20. Point of sale services, ATMs, opening accounts, department cards, and complaints are some of the signs. Three

factors—access to financial services, use of financial services, product quality, and service delivery—can be used to gauge financial inclusion. The indicators are set by the G20. Point of sale services, ATMs, opening accounts, department cards, and complaints are some of the signs.

Each definition has key terms that distinguish it from the others. The following are the key terms identified and described in the definitions:

1) **ACCESS**: Permission to utilise a product or service is known as access. Financial products and services are referred to as financial inclusion services in terms of accessibility.

2) **USE**: Utilising is the act of carrying out a plan. Usage refers to the usage of financial services and products that have been approved by official authorities in order to access financial institutions in the context of financial inclusion.

3) **Financial Products**: Financial products include small savings accounts. Examples of schemes include savings accounts, public provident funds, and national savings.

Data plays a crucial part in the policymaking process, from design and execution to monitoring and assessment, and policymakers are becoming more aware of the significance of evidence-based policymaking. With rigorous, unbiased, and trustworthy data, policymakers can precisely diagnose the state of financial inclusion, set reasonable goals, pinpoint current obstacles, create efficient policies, and track and evaluate the effects of those policies.

Although the need to gather statistics on financial inclusion is widely acknowledged, there is no consensus on what should be measured or how. At the moment, several nations employ various metrics and approaches to accomplish comparable objectives. While some nations have advanced systems for gathering data, others do not.

To meet the requirement for a minimum collection of financial inclusion data that is uniform across nations and a shared concept of financial inclusion, the Financial Inclusion Data Working Group (FIDWG) has created a Core collection of financial inclusion indicators. The first step in reaching a common understanding of financial inclusion in terms of measurement and data is the Core Set of Financial Inclusion Indicators, or "the Core Set."The FIDWG will create a broader, more thorough framework for financial inclusion, of which the Core Set will be a component. The framework will incorporate recommendations for evaluating financial inclusion, including guiding comments on measuring quality and a more comprehensive catalogue of indicators spanning the access and usage components of financial inclusion.

The Core Set is a condensed collection of numerical metrics that represent the degree of financial inclusion in a nation. The indicators are intended to evaluate the most basic facets of financial inclusion, which are as follows, per AFI (2011):

- Deposit accounts
- Credit arrangements
- Insurance contracts
- Securities
- Foreign currency contracts

Goals of Financial Inclusion

The economic (financial and banking) as well as social and political contexts would benefit from rising levels of financial inclusion, which aims to include societal sectors in the formal financial system and attain financial stability and economic progress. Before defining goals, it is essential to comprehend the governmental, regulatory, and economic settings because of their significance in attaining financial inclusion. These situations feature certain elements that need to be taken into account when establishing objectives. Among the objectives of financial inclusion are the following:

1) It offers a program to help people save more money, especially those in low-income groups who are constantly under financial pressure, which puts them in danger because they don't save enough. Therefore, instead of depending on unofficial credit channels like friends, family, and moneylenders, the provision of banking products and services that combine savings results in higher savings and the development of formal credit channels that draw in the unbanked population.(Pradhan et al., 2021)

2) Financial inclusion has the potential to generate positive factors that increase savings and investment, thereby stimulating economic growth processes and increasing societal welfare and economic prosperity.

3) By controlling the payments infrastructure and cash flows that lessen shocks, financial inclusion promotes regular usage of financial services, which are provided with integrity by a collection of official service providers. Additionally, it tackles the problem of social and geographic inequality in financial services and works to provide alternative, well-being-directed banking and financial services that are affordable and available to all societal groups.

4) In order to boost production outputs and attain economic prosperity, it promotes the growth of mass entrepreneurship in rural areas by offering timely and sufficient credit as well as transparency through formal banking channels. Additionally, it makes it possible for low-income individuals who do not deal with banks to receive legitimate transfers instead of transferring money between locations through unofficial means, which are typically costly and dangerous.

5) Financial inclusion is currently seen as a remedy to fill the gaps in distributing government benefits and financial subsidies through transfers, interest, and subsidies directly to the beneficiaries (with a bank account) and not through product support and cash payments.

6) Disparities in income and savings are lessened when all facets of society experience equitable growth. Financial inclusion can help achieve equitable growth, which will benefit developing nations by mobilising savings and effectively using them for capital production and growth. It results in the establishment of sizable financial markets that satisfy the demand for financial services from a broad swath of the population. As a result, it creates a deep and wide financial system that makes it possible for new financial and banking institutions to join it, which boosts the banking industry.

7) "The eradication of poverty" and the establishment of sustainable livelihoods are two of the social objectives. Since financial inclusion is characterised as the link between the weaker segments of society and the sources of income, and because it provides a source of income for vulnerable groups through loans and advances, its primary goal is the eradication of poverty. Regarding sustainable livelihoods, after receiving a loan, the most vulnerable members of society can launch their own companies and pursue education that would enable them to manage their income. According to financial studies, financial inclusion may directly affect poverty by promoting economic growth and the well-being of the impoverished by facilitating their access to official financial institutions. In order to improve low-income families' access to financial services from all financial institutions and, consequently, their well-being, financial and economic authorities must reform the financial sector during the decision-making process.(Kthirumamagal & Professor, 2016)

8) Other political objectives that focus on the poorest groups can be accomplished through financial inclusion, and it can also act as a guide for government programs. For example, some governments have policies that aim to reduce unemployment, alleviate poverty, and achieve sustainable development.

9) In addition to offering banks a vast database that can be used for analysis and exploration in a way that influences the possibility of introducing new products that satisfy the needs of these segments and building models for credit assessment to facilitate financing, it also helps the banking industry by diversifying banking assets, luring banks to new clients, stabilising deposits, and lowering liquidity risks.

10) How to access and utilise financial services to get advantages, enhance social and economic circumstances, and attain financial and social stability is what makes them important. Through the creation of guidelines and policies, it also seeks to uphold and defend the rights of financial services consumers, especially by educating present and prospective customers about their obligations and rights.

11) When a woman is financially independent, she makes investments in the education, health care, and nutrition of her family—investments that have a beneficial intergenerational influence on the society in which she lives. The extension of universal financial services for women has a significant macroeconomic impact on both economic growth and the advancement of society.(Pradhan et al., 2021)

Global Framework for Financial Inclusion

During Mexico's 2012 presidency, the G-20 nations demanded an action plan to boost financial inclusion in their nations with World Bank assistance. The goal was to safeguard citizens from economic uncertainty and close the "financial gap" to bring them out of poverty. For people in the UK who are unable to access basic bank accounts, the government established the Post Office Current Account (POCA). For low-income employed people, they also launched the "Savings Gateway," which offers £1 for every £1 invested in the scheme, up to a monthly limit of £25. In order to provide clients with affordable banking services, the State of New York Banking Department has mandated that financial institutions offer basic banking accounts.(HASANOV, 2022)

Global partners in the public and private sectors pledged to advance financial inclusion and declared a new global development objective of attaining universal financial access by 2020, according to the 2015 IMF World Bank Group meeting report. Established in 2002, the USA Treasury's Office of Financial Education, which is supported by the Federal Deposit Insurance Corporation (FDIC), organises the work of other federal agencies to provide financial education.

Approximately 515 million adults globally opened bank accounts or accounts with mobile money providers between fiscal years 2014 and 2017, according to the Global Findex 2017 database. This means that, compared to 51% in 2011 and 62% in 2014, 69% of adults globally now have accounts. In order to unite different financial institutions and give adult members throughout the county access to financial knowledge and efficient financial service utilisation, the "Money Smart Alliances" initiative was established.

Significant action has been taken by a number of nations to advance financial inclusion. For example, Tanzania sought to expand financial access to 50% of its people in 2015 through programs like mobile banking, while Brazil launched the National Partnerships for Financial Inclusion. By 2014, it was agreed that all municipalities in Mexico would have banking agents and branches. In 2020, Nigeria was able to cut the number of unbanked areas by half. Malawi planned to introduce agent banking in 2012, while Zambia sought to increase financial inclusion by 50% in two years. By 2017, Rwanda aimed to reach 80% of its people, and Peru promised to enact a new legislation governing electronic money the following year. In November 2009, the Central Bank of Kenya added agents to the financial banking system. These agents are allowed to perform a variety of financial services, including cash transactions, loan disbursement, bill payments, fund transfers, and mobile banking. These agents may be LLPs, Proprietorship Firms, Partnership Firms, Co-operative Societies, and Trust Corporations. However, they are prohibited from initiating electronic transactions during system failures, charging fees directly from customers, guaranteeing transactions, or continuing to serve customers if prohibited by law or due to criminal records or integrity issues. These agents operate on a commercially viable basis to ensure their financial sustainability (Cámara et al., 2014)

Other nations have pledged to extend banking services to underserved areas, including the Philippines, Burundi, Ethiopia, Uganda, Pakistan, and Fiji. In the Philippines, banks contract with mobile operators that employ prepaid account systems to handle a sizable amount of their banking operations. A mobile operator's subsidiary, Globe Telecom, offers virtual stored value accounts that let users send and receive money using their smartphones. G-Xchange, Inc. (GXI), another subsidiary of Globe, allows non-bank agents to use prepaid accounts. Smart Money and G Cash are required to provide the BangkoSentral ng Pilipinas (BSP) with detailed operational data. In addition to traditional branch facilities, banking institutions in South Africa may appoint non-bank third parties as agencies or outsourcing arrangements to provide banking services. Contract agents are authorised to offer basic banking services to customers on behalf of the banks.

To ascertain the effects of financial access via agency banking on Kenya's low-income population, a study was carried out. Descriptive, qualitative, and quantitative research approaches were used in the study. The results showed that expanding the number of agency banking services will improve access points and increase vulnerable groups' ability to obtain financial services. According to the study, authorities should push banks to maximise financial access and implement agency banking.

Sriram concentrated on investigating the availability of financial services for rural women. It was recommended that financial product designs be tailored to women's unique demands in areas including borrowing, insurance, and savings. Ensuring married women have direct access to financial services instead of depending on their spouses as middlemen is also crucial. Giving women financial autonomy gives them more authority and allows them to effectively manage resources to enhance their long-term production, education, and nutrition, among other areas of their lives.. The authors have also proposed a model that addresses the constraints posed by limited technological access and suggests tailoring financial products to women's preferences to enhance their access.

In terms of Jordan's financial inclusion experience, the government has shown a significant dedication to this cause for a number of years. An integrated financial ecosystem has been developed in Jordan via the joint efforts of numerous national and international organisations. After taking the lead in 2013, the Central Bank of Jordan concentrated on creating a strong regulatory framework and a favourable atmosphere for digital finance. The goal of these initiatives was to make all Jordanians financially included. The Jordanian Central Bank presented its national financial inclusion strategy in 2016, which covered the years 2018–2020. With an emphasis on addressing women, refugees, young people, and small and medium-sized businesses, this vision highlights the significance of improved financial education, customer safety, and electronic payments. To carry out this plan, the Central Bank of Jordan has successfully collaborated with a number of public and commercial sector players as well as members of civil society. The strategy's six main components served as the basis for the formation of working groups that worked with the Technical Committee and the Steering Committee. Six working groups were established in September 2016 after it was decided to start working on the national financial inclusion strategy. These groups concentrated on data collecting and analysis, consumer protection, microfinance, financing for small and medium-sized businesses, electronic payment systems, and financial literacy. The second regional conference, which was organised in collaboration with the Central Bank of Jordan, the Arab Monetary Fund, the German Agency for International Cooperation (GIZ), and the Kingdom's national agenda and strategic directions, saw the introduction of the strategic vision document for financial inclusion in Jordan. Jordan's comparatively low adult financial inclusion rate of 60.24% necessitated the development of a national financial inclusion policy. Even while this number is higher than that of other Middle Eastern and North African nations, it is still low when compared to nations with comparable income levels across the globe. The financial exclusion of underprivileged individuals, low-income and marginalised groups, micro, small, and medium-sized businesses, youth, women, non-Jordanians, and refugees will therefore be the primary focus of the upcoming three-year strategy (2018-2020). By strengthening the link between financial inclusion and the 2030 Sustainable Social Development Goals set forth by the UN General Assembly, this plan seeks to.(Bayram et al., 2021)

Conclusion

Global experiences with financial inclusion show that there's no single solution—successful efforts depend on tailoring approaches to local needs, like Kenya's agency banking or the UK's use of post offices to reach the unbanked. Technology, especially mobile banking, has been a powerful tool in expanding access, particularly in remote areas. But access alone isn't enough; financial literacy and

consumer protection are crucial so people can use these services wisely. Strong government commitment and clear regulations, as seen in Jordan, play a vital role, while partnerships between the public and private sectors help scale solutions effectively. Special attention to marginalized groups such as women, refugees, and small businesses boosts overall social and economic benefits. Despite progress, ongoing challenges like infrastructure gaps and cultural barriers mean that financial inclusion requires continuous effort and innovation to truly succeed.

NAXÇIVAN MUXTAR RESPUBLIKASININ TURIZM POTENSIALININ QIYMƏTLƏNDIRILMƏSI

Açar sözlər - müasir turizm kompleksi, müalicə turizmi, kənd-yaşıl turizmi, tarixi-mədəni turizm, turizm sahibkarlığı.

Naxçıvan Muxtar Respublikasında çox güclü turizm potensialı mövcuddur. Bu turizm potensialı düzgün qiymətləndirilməli və səmərəli istifadə edilməlidir. Hər bir turizm növünün özünəməxsus spesifik xüsusiyyəti olduğuna görə də inkişafı üçün görülən işlər də ona uyğun olmalıdır. Bu spesifik xüsusiyyətlər nəzərə alınmaqla turizmin inkişafını şərtləndirən əsas amillərdən biri ixtisaslı kadrların hazırlanmasıdır. Naxçıvan Muxtar Respublikasında turizm sahəsinin peşəkar kadrlarla təmin edilməsi məqsədilə mütəmadi (NDU-də turizm ixtisası üzrə kadrlar hazırlanır) tədbirlər görülür.

Naxçıvan Muxtar Respublikası tarixi baxımdan çox qədimdir. Bura Midiya, Albaniya, Atropatena, Sasanilər, Atabəylər və s. qədim dövlətlərin tərkibində olmuş, buna görə də bir çox tarixi mədəni abidələri yaranmışdır. Regionda olan tarixi mədəni abidələrdən biri Mömünə xatun türbəsidir ki, bura tarixi-mədəni turizmin əsas obyektlərindən hesab olunur. Regionda olan mühüm obyektlərdən biri də Əlincə qalasıdır ki, bu qalanı Orta Asiya və Qafqazda ən güclü ordusu olan Teymurləng ordusu bu qalanı 14 il ala bilməmişdir. Bu qalanın möhtəşəmliyi və əzəməti görənləri heyran edir və turistləri özünə cəlb edir. Bu regionun qədim dövlətlərin tərkibində olması həmin dövlətlərə məxsus qədim tarixi abidələrin (kilsələrin, türbələrin və s.) mövcud olmasına gətirib çıxarmışdır. Bu tarixi mədəni abidələr (kilsələr,türbələr və s.) əsasən Naxçıvan şəhəri, Şahbuz və Ordubad rayonlarının (Buzxana, Came məscidi, Mədrəsə və s.) ərazilərindədir. Tarixi abidələr aşınaraq sıradan çıxsa da qalıqları bir çox qərb ölkələrindən gələn turistlərin marağını cəlb edir. Belə obyektlərə Yusif ibn Küseyr türbəsi, İsmayılxan hamamı, Gülüstan türbəsi, Xanəgah memarlıq kompleksi, Qarabağlar memarlıq kompleksi və s. tarixi-mədəni abidələri və qədim kilsələri misal göstərmək olar. Regionda və ölkəmizdə yaşayan əhalinin əksəriyyətini müsəlmanlar təşkil etsə də, region əhalisi tarixi-mədəni abidələrə hörmətlə yanaşır və qorunmasını təmin edirlər.

Naxçıvan Muxtar Respublikasında 250-dən çox müalicəvi əhəmiyyətli mineral bulaqlar mövcuddur ki, bunlar regionun müalicə-sağlamlıq turizminin inkişafında mühüm rol oynayır. Azərbaycan ərazisində olan mineral su ehtiyatlarının 60 faizindən çoxu Naxçıvan Muxtar Respublikasının payına düşür. Naxçıvanın zəngin mətbəxi, qədim tarixi və mədəniyyəti turizmin inkişafında önəmli yer tutur. Süfrələrin bəzəyi olan "Badamlı" və "Sirab" uzun müddətdir (SSRİ dövründən hazırkı dövrə qədər) ki, ölkəmizdən kənarda Azərbaycanın təbii sərvəti (şəfalı mineral su) kimi bir neçə ölkədə şöhrət qazanmışdır. Şahbuz rayonunun Badamlı kəndində (Şahbuz rayonunun mərkəzindən 14 km qərbdə yerləşir) 1980-ci ildən mineral bulağın bazası əsasında balneoloji müalicəxana fəaliyyət göstərir ki, bu da müalicə-sağlamlıq turizminin inkişafında mühüm rol oynayır. [1, s.58]

Naxçıvan regionunda müalicə sağlamlıq turizminin inkişafı üçün mineral bulaqlardan əlavə başqa (Fizioterapiya mərkəzləri) imkanlar da mövcuddur. Buna misal olaraq Duzdağ Fizioterapiya Mərkəzini və Darıdağ Balneoloji Mərkəzini göstərmək olar. Duzdağ Fizioterpiya Mərkəzində tənəffüs yolları

xəstəliklərindən əziyyət çəkənlərin müalicəsi məqsədi ilə müasir standartlara cavab verən şərait yaradılmışdır ki, bu da regiona gələn turistlərin axınına müsbət təsir edir.

Darıdağ Balneoloji Arsenli Su Müalicəxanası regionun müalicə-sağlamlıq turizmində əhəmiyyətli mövqeyə malikdir. Bu Balneoloji Mərkəzə müalicə məqsədilə gələn turistlərin sayı gündən-günə artmaqdadır. Bu mərkəzlə yanaşı Naxçıvan regionunda belə müalicəvi əhəmiyyətli turizm obyektləri də mövcuddur ki, bunlar da regionun müalicə-sağlamlıq turizminin inkişafında əsas yerlərdən birini tutur. Naxçıvan Muxtar Respublikasının saf və təmiz havasının olması bura gələn turistlərin daha çox marağına səbəb olur. Belə təmiz havanın və gözəl təbiətin mövcudluğu turistlərin burada yaxşı vaxt keçirməsi ilə yanaşı sağlamlığına da müsbət təsir göstərir. Məsələn Batabat yaylağının iqlimi bura gələn insanlara xoş təəssüratla yanaşı, bir çox xəstəliklərin (ciyər, ürək, əsəb və s.) müalicəsi üçün də münasib yer hesab olunur.

Turistlərin diqqətini daha çox cəlb edən və marağına səbəb olan sahələrdən biri səfər etdikləri yerə məxsus xalq sənətkarlığı əsərləri və əl işlərinin mövcud olmasıdır. Naxçıvan regionunda xalq sənətkarlığının müxtəlif sahələri inkişaf etdirilmiş, sənətkarlar üçün lazımi şərait yaradılmışdır. Ağacişləmə, misgərlik, papaqçılıq, dulusçuluq, xəttatlıq və digər sənət sahələri tarixən bu torpaqda inkişaf edən və böyük inkişaf yolu keçən sahələrdən hesab olunur. Naxçıvan Muxtar Respublikası Turizm Departamenti regionda olan sənətkarlarla müqavilələr bağlamış, onların hazırladıqları suvenirlərin və hədiyyəlik xatirə əşyalarının satışını təşkil etməkdədir. Belə sənətkarlıq əşyalarının satışı üçün mütəmadi sərgilər və yarmarkalar təşkil edilmiş, bu istiqamətdə bir neçə tədbir həyata keçirilmişdir. Belə tədbirlərin təşkilati məsələlərinin əsas iştirakçısı "Naxçıvan Biznes Mərkəzi" MMC hesab olunur ona görə ki, burada satış məqsədilə çoxlu əl işi və sənət əsəri qəbul edilmiş, on minlərlə manat dəyərində əl işlərinin satışı həyata keçirilmişdir.

Turizm sahibkarlığının inkişaf etdirilməsi, turizmlə məşğul olan sahibkarlara müvafiq tövsiyələrin verilməsi, biznes-planların işlənilməsi və onların tətbiqi haqqında Naxçıvan Muxtar Respublikası İqtisadiyyat Nazirliyi tərəfindən "Naxçıvan Biznes Mərkəzi" MMC-də sahibkarlarla mütəmadi görüşlər keçirilir, onlara məruzələr verilir. Burada turizm obyektlərində göstərilən xidmətlərin keyfiyyətinin artırılması istiqamətində maarifləndirici monitorinqlər aparılmış, müvafiq tövsiyələr verilmişdir.

Naxçıvan Muxtar Respublikasında turizmin inkişafı ilə bağlı öhdəliklərin icrası aidiyyatı qurumlar tərəfindən davam etdirilir, bu da onu göstərir ki, Naxçıvan Muxtar Respublikasında turizmin inkişafı ilə bağlı tədbirlər görülməkdədir. Naxçıvan regionun turizm potensialının bol olması hər il çoxlu turist qəbul etmək imkanı yaradır. Naxçıvanın zəngin turizm potensialının təbliği və tanıdılması istiqamətində ardıcıl tədbirlər görülür, müasir turizm infrastrukturu yaradılır. Naxçıvan Muxtar Respublikasının turizm potensialının təbliğində elektron resursların internetdə yerləşdirilməsi, internet səhifələrində regionun turizm potensialı ilə bağlı bölmələrin yaradılması və gənclərin bu sahədə fəallığının artırılması qarşıya qoyulmuş əsas prioritet məsələ hesab edilir.

Dünyada baş verən iqtisadi hadisələr – neftin qiymətinin kəskin surətdə aşağı düşməsi, onun Azərbaycan iqtisadiyyatına təsiri və devalvasiyanın baş verməsi bir daha onu göstərdi ki, bir ölkənin iqtisadiyyatının təkcə bir sahədən - neftdən asılı olması həmin ölkənin iqtisadiyyatını birtərəfli inkişaf etməsinə gətirib çıxarır. Bunun baş verməməsi üçün başqa sahələrin də inkişafı üçün müəyyən tədbirlər görülməlidir. Yəni qeyri-neft sektorunun inkişafı qarşıya qoyulan əsas hədəflərdən biridir. Qeyri-neft (xidmət) sektorunda turizm sahəsi aparıcı mövqeyə malikdir. Azərbaycanda, xüsusilə də Naxçıvan Muxtar Respublikasında turizm potensialı bu sahənin inkişafını labüd edir.

Qədim diyarda tarixi-mədəni turizmlə yanaşı, turizmin ekoloji, ziyarət, müalicə, dağçılıq, kənd və digər növlərinin inkişaf etdirilməsi üçün geniş imkanlar vardır. Muxtar respublika kəndlərinin əksəriyyəti

coğrafi baxımdan dağlıq ərazilərdə və çay vadilərində yerləşir. Bu xüsusiyyətlər regionda turizmin inkişafına müsbət təsir edir. Muxtar respublikada hal hazırda 3 yasaqlıq, 1 milli park, 1 qoruq fəaliyyət göstərir ki, bu da turizmin inkişafına müsbət təsir göstərir. Şahbuz rayonunun ərazisində yerləşən füsunkar gözəlliyə malik olan Batabat gölü və Ordubad rayonunda yerləşən insanları özünə valeh edən Göygöl gölü təbiəti sevənləri özünə cəlb edir və istirahət turizminin inkişafı üçün mühüm arqumentlər hesab olunur.

Hazırda muxtar respublikada 21 mehmanxana və mehmanxana tipli müəssisə vardır. Bu da muxtar respublikaya gələn turistlərə vaxtlarının səmərəli keçirmələrinə şərait yaradır. Bura gələn turistlər bir neçə turizm marşrutundan istifadə etməklə Naxçıvan Muxtar Respublikasının müəyyən bir ərazisini gəzə bilərlər və görməli yerləri ilə tanış ola bilərlər. Bura gələn turistlər Naxçıvan-Qarabağlar, Naxçıvan-Əshabi-Kəhf, Naxçıvan-Əlincə qalası, Naxçıvan-Ordubad, Naxçıvan-Batabat, Naxçıvan-Gülüstan turizm marşrutları regionun füsunkar gözəlliklərini görməyə, xoş vaxt keçirmələrinə şərait yaradır. Hal hazırda Naxçıvan regionunda yerləşən kəndlər təmiz havası, saf suyu və ekoloji təmiz məhsulları, əlverişli iqlim şəraiti, abad yol və müasir rabitə xidməti ilə turizmin inkişafı üçün böyük imkanlara malikdir. Bu imkanlardan səmərəli istifadə regionu "turizm regionu"-na çevirə bilər. 2013-cü ildə Şahbuz rayonunda yerləşən Ağbulaq kəndində Ağbulaq İstirahət Mərkəzinin istifadəyə verilməsi bu sahədə həyata keçirilən tədbirlərin davamlı fəaliyyətinin nəticəsidir. Muxtar respublikada müasir turizm komleksi ilə yanaşı, turizm cəhətdən ən çox cəlbedici edən amillərdən biri burada mövcud olan minlərlə tarixi-mədəni abidələrin olmasıdır. Bu abidələri görmək məqsədi ilə hər il yüzlərlə turist Naxçıvan iqtisadi rayonuna səfər edir. Təbii ki, abidələrin qorunması, bərpası və təbliği sahəsində görülən işlər turizmin gələcək inkişafından xəbər verir. Novruz bayramı ərəfəsində Naxçıvan regionuna qonşu Türkiyə və İrandan turistlər gəlir. Bunun da səbəbi gələn turistlərin əksəriyyətinin keçirilən Novruz şənliklərində yaxından iştirak etmək niyyətinin olmasıdır. Naxçıvana qonşu ölkələrdən gələn turistlər Əshabi-Kəhf deyilən dini (müqəddəs kitab olan Quran-i Kərimdə surə də vardır və sıralamada 18-ci surə Kəhf surəsidir) məkanı görməyi daha çox meyl edir. Bu dini ocaqla yanaşı başqa dini obyektlərin (Nuh peyğəmbərin türbəsi və s.) olması Türkiyə və İrandan gələn turistlərin daha çox diqqətini cəlb edir ki, bu da regionda dini turizmin inkişafına şərait yaradır.

Naxçıvanda turizm növlərinin içərisində güclü potensial olanlardan biri də kənd yaşıl turizmidir. Naxçıvan Muxtar Respublikası Turizm Departamenti tərəfindən kənd yaşıl turizmin inkişafı ilə bağlı muxtar respublikanın 5 rayonunun 19 kəndində kənd sakinləri ilə maarifləndirici görüşlər keçirilmişdir. Regionda mövcud olan hər bir kəndin, hətta ən ucqar dağ kəndlərinin kənd yaşıl turizminin inkişafı üçün potensialı mövcuddur ki, buna Biçənək, Kükü, Nəsirvaz, Bist, Tivi, Şahbulaq, Ərəfsə, Gümüşlü və başqa onlarla yaşayış məntəqəsini misal göstərmək olar.

Turizmin müasir inkişaf səviyyəsində Naxçıvan Muxtar Respublikasında qış turizmi üçün geniş imkanlar mövcuddur. Ona görə də qışda istirahətini mənalı keçirmək istəyənlər Naxçıvan şəhərindən çox da uzaqda olmayan məkanları seçirlər. Şahbuz, Culfa, Ordubad rayonlarının dağlıq və dağətəyi yerlərindəki ecazkar qış mənzərələri qış turizminin keçirilməsi üçün əla fürsətdir. Qışda Şahbuz rayonundakı Ağbulaq İstirahət Mərkəzinə çox sayda turist gəlir. Şahbuz şəhərindən təqribən, 20 kilometrlik (Naxçıvan şəhərindən 45 km məsafədə yerləşir) məsafədə, dəniz səviyyəsindən 2000 metr yüksəklikdə yerləşən bu turistik mərkəz yerləşdiyi relyefə, təbii iqlim xüsusiyyətlərinə və şəraitinə görə regionun, eləcə də Azərbaycanın qış turizminin əsas mərkəzlərindən birinə çevirmişdir. Ağbulaq Turizm İstirahət Mərkəzinə səyahət edən turistlər buranın gözəl təbiəti, təmiz havası və suyu ilə yanaşı, bölgəyə məxsus milli mətbəxi ilə də tanış olurlar. Yayda olduğu kimi, qışda da Ağbulaqda istirahət edən turistlərdə bu istirahət kompleksi gözəl təəssüratlar yaradır.

İstirahətini xoş keçirmək istəyən turistlər üçün digər bir maraqlı və cəlbedici yer – Batabat yaylağıdır. Batabat gölünün gözəlliyi ilə yanaşı burada olan "üzən ada" turistləri daha çox özünə cəlb edir. Batabat yaylağının yay aylarında qışdan da daha cazibədar və ürəkaçan mənzərəsi olur. Burada gül-çiçəkli

çəmənlikləri, gölü, saf və təmiz dağ havası, təbii meşələri, Zorbulaq, Südlübulaq kimi şirin suları turistlərin diqqətini cəlb edir. [1, s.63]

Turizm iqtisadiyyatın mühüm bir sahəsi, beynəlxalq turizmin gəlmə tipi ölkə ixracatının mühüm bir növüdür. Naxçıvan Muxtar Respublikasında daxili və gəlmə turizmin inkişafından regional inkişaf, yeni iş yerlərinin yaradılması və valyutanın ölkəyə axını kimi mühüm iqtisadi nəticələr əldə edilir.

Naxçıvan Muxtar Respublikasına çoxlu yerli və əcnəbi turist səyahət edir ki, bu da turizmin çoxçeşidli növlərinin inkişafı nəticəsində mümkün olmuşdur. Naxçıvan Beynəlxalq Hava Limanı vasitəsilə Bakı, İstanbul, Moskva və Gəncə şəhərlərindən, habelə qonşu ölkələrlə 24 saat iş rejimində olan gömrük-keçid məntəqələri ilə dünyanın hər yerindən bu regiona turistlər gələ bilirlər. Naxçıvanda yaradılmış sabitlik və təhlükəsiz həyat şəraiti turistlərin burda özünü rahat hiss etməsinə imkan yaradır. Naxçıvana gələn turistlər, əsasən, VFR ("Visiting Friends and Relatives"- VFR turizmi yaxud da etnik turizm) müalicə, ziyarət, əyləncə, gəzinti və işgüzar görüşlər məqsədilə buraya səyahət edirlər. Gələn turistlərin ölkə və sosial mənşəyi isə dövlət başçılarından (işgüzar görüşlər keçirmək məqsədi ilə) tutmuş sadə vətəndaşlara qədər genişdir.

Muxtar respublikanın əlverişli coğrafi-siyasi mövqeyi, müxtəlif iqlim qurşaqları və təbiəti, zəngin və çeşidli heyvanat aləmi, tarixi-mədəni irsi, özünəməxsus və zəngin mətbəxi, yüksək qonaqpərvərlik ənənələri Naxçıvan regionunda turizmin hərtərəfli inkişafına şərait yaradır.

Hər hansı bir ölkənin turizm potensialından danışdıqda oranın tarixi-mədəni irsi ön plana çəkilir. Mömінə xatın, Yusif ibn Küseyir türbələri, Qarabağlar Memarlıq Kompleksi, Xanəgah Abidə Kompleksi, adı Nuh Peyğəmbərin gəmisi ilə bağlanan Gəmiqaya daşüstü yazıları, əfsanəvi İlanlı dağ, abidələrlə zəngin olan qoruq-şəhər Ordubad, haqqında müqəddəs "Qurani-Kərim"də bəhs edilən Əshabi-Kəhf ziyarətgahı, 5000 ildən çox yaşı olan Naxçıvan şəhəri, qədim tikililər, qalalar, yaşayış yerləri və nekropollar, günümüzə qədər qorunub saxlanılmış xalq sənəti nümunələri turistlərin diqqətini daha çox cəlb edir.

Bütün bunlara əsasən demək olar ki, Naxçıvan Muxtar Respublikasında çox böyük turizm potensialı mövcuddur və bundan düzgün istifadə regionun turizminin inkişafına şərait yaradacaq, regionu "turizm regionu"-na çevirəcəkdir.

Mammadov Tural Vatan

The assessment of tourism potential of Nakhchivan Autonomous Republic

Resume

Key words - modern tourist complexes, medical tourism, rural and green tourism, historical and cultural tourism, tourism and entrepreneurship.

Among the indicators of social-cultural development of the community's growing interest in tourism occupies an important place. The attention to the development of tourism for the first time in this area to benefit every citizen of our country's beauty and historical and cultural wealth, is aimed at introducing the world. Colorful tourism resources in the autonomous republic and a modern tourist infrastructure creates favorable conditions for the development of this important sector.

Мамедов Турал Ватан

Оценка туристического потенциала Нахчыванской Автономной Республики

Резюме

Ключевые слова - современные туристические комплексы, медицинский туризм, сельский и зеленый туризм, исторический и культурный туризм, туризм и предпринимательство.

Среди показателей социально-культурного развития растущего интереса сообщества в сфере туризма занимает важное место. Внимание развитию туризма в первый раз в этой области, чтобы принести пользу каждому гражданину красоты нашей страны и исторического и культурного богатства, направлена на внедрение мира. Красочные туристические ресурсы в автономной республике и современной туристической инфраструктуре создают благоприятные условия для развития этого важного сектора.

ÖZET

Bu çalışmanın amacı, dijital dönüşüm sürecinde örgütlerin sürdürülebilir rekabet elde etmesinde rol oynayan üç kültürel yaklaşımı (veri odaklılık, çeviklik ve inovasyon) kavramsal olarak incelemek ve aralarındaki ilişkiyi ortaya koymaktır. Çalışma, dijitalleşmenin yalnızca teknolojik bir yatırım değil, aynı zamanda örgüt kültüründe de bir dönüşüm gerektirdiği düşüncesinden yola çıkmaktadır. Yapılan incelemeler, bu üç kültürün birbirinden bağımsız olmadığını; veri odaklı karar almanın çevikliği beslediğini, çevik yapıların da inovasyonu hızlandırdığını göstermektedir. Sonuç olarak, işletmelerin dijital başarısının, teknolojik altyapı kadar, kültürel zemine de bağlı olduğu düşünülmektedir.

Anahtar Kelimeler: Veri Odaklı Kültür, İnovatif Kültür, Çevik Kültür

ORGANIZATIONAL CULTURE IN DIGITAL ENTERPRISES: A CONCEPTUAL STUDY ON THE EXAMINATION OF DATA-DRIVEN, INNOVATIVE, AND AGILE ORGANIZATIONS

ABSTRACT

The aim of this study is to conceptually examine three cultural approaches (data-driven, agile, and innovative) that play a role in achieving sustainable competitiveness during the digital transformation process, and to reveal the relationship among them. The study is based on the idea that digitalization is not merely a technological investment but also requires a transformation in organizational culture. The analyses indicate that these three cultures are not independent of one another; data-driven decision-making fosters agility, and agile structures, in turn, accelerate innovation. Consequently, it is considered that the digital success of enterprises depends as much on their cultural foundation as on their technological infrastructure.

Keywords: Data-Driven Culture, Innovative Culture, Agile Culture

GİRİŞ

Dijital teknolojilerin gelişimi, endüstriyel alanda köklü dönüşümlere yol açan yeni bir devrim sürecini beraberinde getirmektedir. Bu gelişmeler, hem şirketler hem de toplumlar üzerinde derin etkiler yaratmakta ve değişen koşullara uyum sağlamak için yeni gereksinimler ortaya çıkarmaktadır. Dijital dönüşüm olarak da adlandırılan bu evrim, birbirine bağlı ve sürekli etkileşim içinde olan karmaşık yapılar ve sistemler oluşturmaktadır (Herve vd., 2021). Bu köklü değişim, örgütler için kaçınılmaz olarak zorlu bir uyum sürecini tetiklemektedir. Ancak sadece teknolojik bir uyum ile değil, aynı zamanda çalışanların becerilerini, takım dinamiklerini ve hatta kurum içi iletişim kanallarını dönüştüren kapsamlı bir uyarlanma çabasını gerektirir. Bu süreç, örgütün hayatta kalması ve rekabet gücünü sürdürebilmesi için

atması gereken kaçınılmaz bir adımdır (Nalbantoğlu, 2021).

Henriette vd., (2016) belirttiği gibi şirketlerin dijital dönüşümü yalnızca iş modeli olarak düşünmesi sığ bir düşünce olarak kalacaktır. Bu nedenle dijitalleşen işletmelerin, sürdürülebilir rekabet avantajı elde edebilmeleri için yeniliklere uyum sağlayarak organizasyonlarını da bu yönde geliştirmeleri beklenmektedir (Güleryüz vd., 2023).

Bu çalışmanın amacı, dijital işletmelerde veri odaklı, çevik ve inovatif kültürü, kavramsal olarak incelemek ve aralarındaki ilişikiyi ortaya koymaktır. Konu olan üç kavramın işletmelerin sürdürülebilir rekabet avatantajında bütün olarak ele alınması gerektiği düşünülmektedir. Çalışma, kavramların tanımlanması, ilgili çalışmaların incelenmesi ve sonuç bölümlerinden oluşmaktadır.

1.KAVRAMSAL ÇERÇEVE

1.1 Dijitalleşme ve Dijital İşletmelerde Örgütler

Dijitalleşme, kökeni Latince "digitus" (parmak) sözcüğüne dayanan ve verilerin sayısal biçime dönüştürülerek bilgisayarlar tarafından işlenebilir hale getirilmesi sürecini ifade eden bir kavramdır. İş dünyasında bu süreç ilk olarak iş operasyonlarının otomasyonu şeklinde başlamış, ardından internet ve çeşitli dijital teknolojilerin gelişimiyle birlikte iş modellerinde köklü dönüşümlere yol açmıştır (Klein, 2020). Kavramın günümüzdeki anlamına yakın ilk kullanımı ise 1971 yılında Robert Wachal tarafından North American Review dergisinde yapılmış, Wachal bu süreci özellikle beşerî bilimlerde bilgisayar kullanımının toplumsal etkileri üzerinden ele almıştır (Brennen & Kreiss, 2016). 1990'lı yıllarda teknolojik gelişmelerin hız kazanmasıyla birlikte dijitalleşme; işletmelere yeni pazarlara erişim, artan müşteri portföyü, farklı liderlik yaklaşımları ve örgütsel çeviklik gibi avantajlar sunmuştur. Bu dönemde sadece teknik sistemlerde değil, aynı zamanda örgütlerin yapısal ve kültürel yapılarında da önemli değişiklikler yaşanmıştır. Dijital başarı, değişen koşullara hızla uyum sağlayabilen, öğrenmeye açık, esnek ve rekabetçi yapılarla mümkün hale gelmiştir (Mert, 2024). Geleneksel kültür yapısı daha çok analog özelliklerle tanımlanırken, günümüz kültürü dijital dinamiklerle şekillenmektedir. Dijital kültürde müşteri talepleri ürün ve hizmetlerin oluşumunda belirleyici bir unsur haline gelirken, örgütsel yapılar daha yatay, hızlı karar alabilen ve sonuç odaklı bir yapıya evrilmektedir. Esneklik, yenilikçilik, iş birliği ve hız ise yeni çalışma düzenlerinin temelini oluşturmaktadır. Bu dönüşüm yalnızca teknik değil, aynı zamanda kültürel bir değişimi de beraberinde getirmektedir. Pandemi süreciyle birlikte hız kazanan dijitalleşme, örgüt kültürünü derinden etkileyerek, önümüzdeki dönemde daha büyük değişimlerin temelini atmaktadır (Nalbantoğlu, 2021).

Dijital işletmelerin sürdürülebilir rekabet elde etmesi için kurum içi örgütlerin de dönüşmesi önemlidir. Örgüt kültürünün veri odaklı, çevik ve inovatif olması işletmelerin dijital dönüşümünü hızlandırıp yeniliklere kolay adapte olacağı düşünülmektedir. Aynı zamanda oluşabilecek hataların da örgüt tarafından hızlı bir şekilde çözüme kavuşması işletmeler için avantaj sağlayacağı ön görülmektedir.

1.2 Dijital İşletmelerde Veri Odaklı Örgüt

Veriye dayalı kültür, işletmelerde karar alma süreçlerinin kişisel yargılar veya sezgiler yerine somut verilere ve analitik değerlendirmelere dayanmasını teşvik eden bir yaklaşımdır. Bu kültür, çalışanların veriye güven duymasını sağlayarak karar mekanizmalarının daha rasyonel ve sistematik bir şekilde işlemesine katkıda bulunur. Aynı zamanda, büyük veri analitiği yetkinliğinin gelişmesine uygun bir zemin hazırlar. Veriye dayalı düşünme biçiminin organizasyonun tüm kademelerinde benimsenmesi, stratejik avantaj elde etme

potansiyelini önemli ölçüde artırır (Gupta & George, 2016). Bu bağlamda, gelişmiş analitik araçlardan en yüksek düzeyde fayda sağlanabilmesi için, işletme genelinde veri odaklı bir zihniyetin yerleşmesi gerektiği genel kabul görmektedir. Berndtsson vd. (2018) da vurguladığı üzere, karar süreçlerinin merkezine veriyi yerleştiren işletmeler, hem operasyonel süreçlerini iyileştirme hem de rakiplerine kıyasla daha üstün bir performans sergileyerek sürdürülebilir rekabet avantajı elde etme konusunda önemli fırsatlar yakalayabilmektedir.

Veri odaklı kültürün, büyük veri stratejilerinin hem dış çevresel faktörlerle hem de iç organizasyonel süreçlerle uyum içerisinde şekillendirilmesi gerektiğini bildiren Karaboğa ve Zehir (2020), işletmelerdeki bu kültürün yerleşmesi, yalnızca teknolojik altyapının değil, aynı zamanda iş yapma biçimlerinin ve karar mekanizmalarının da dönüşmesinin zorunlu olduğunu ifade etmektedir. Öznel yargılardan çok, veriye dayalı öngörülere dayanan karar süreçleri ön plana çıkar. Bu nedenle, veri odaklı bir kültürün benimsenmesi, büyük veri projelerinin başarısı kadar, genel işletme performansının artmasında da belirleyici bir faktör haline gelmektedir. Benzer şekilde, Anton vd. (2023) göre , veri odaklı kültür, yalnızca veriye dayalı karar almayı değil, aynı zamanda bu karar süreçlerinin insan kaynağı, teknolojik yetkinlikler ve örgütsel yapı ile nasıl bütünleştiğini de kapsar. Bu doğrultuda, işletmelerin sürdürülebilir rekabet avantajı elde edebilmeleri için sadece veri toplamakla yetinmeyip, bu veriyi kurumsal karar alma ve değer yaratma süreçlerinin merkezine yerleştirmeleri gerekmektedir. Bu yaklaşımı destekleyen Chatterjee ve arkadaşları (2021), veri odaklı kültürün yalnızca karar alma süreçlerini değil, aynı zamanda ürün ve süreç inovasyonu aracılığıyla firma performansını doğrudan etkilediğini göstermektedir. Çalışmalarında, iş analitiği araçlarının etkin kullanımıyla desteklenen veri odaklı bir yapının, firmaların yenilikçilik kapasitelerini artırarak rekabet avantajı sağladığını ortaya koymuşlardır.

Literatürde veri odaklı kültürün örgütsel çıktılar üzerindeki rolünü inceleyen araştırmalar, bağlama ve modele göre değişen bulgular sunmaktadır. Türkiye'deki orta ve büyük ölçekli işletmeler üzerine yapılan bir araştırma (Düzcan & Fidan, 2023), veri odaklı kültürün dijital olgunluk ile yenilik performansı arasında anlamlı bir düzenleyici etki göstermediğini, ancak büyük veri analitiği yeteneğinin bu ilişkide güçlü bir aracı rol üstlendiğini ortaya koymuştur. Bu bulgu, Gupta vd. (2024) tarafından yapılan ve örgütsel kültürün veri odaklı dijital dönüşümü doğrudan ve pozitif olarak etkilediğini, bunun da operasyonel performansı artırdığını gösteren çalışmanın sonuçlarıyla kısmen bir tezat oluşturmaktadır. Öte yandan, Chatterjee vd. (2021)'nin çalışması, veri odaklı kültürün hem ürün hem de süreç inovasyonu üzerinde doğrudan ve anlamlı bir pozitif etkisi olduğunu doğrulamaktadır.

1.3 Dijital İşletmelerde Çevik Örgüt

Örgütsel çeviklik, işletmelerin değişen çevresel koşullara karşı hızlı ve etkili biçimde tepki verebilme, stratejik yönelimlerini sürekli olarak güncelleyebilme ve yenilikçi yaklaşımlar

geliştirerek sürdürülebilir değer yaratma yetkinliğidir. Bu yetkinlik, firmaların pazar fırsatlarını erkenden öngörebilmelerine, yeni iş modellerini hızla hayata geçirebilmelerine ve mevcut kaynak yapılarını çevresel gerekliliklere uygun şekilde yeniden düzenleyebilmelerine olanak tanımaktadır (Theyel ve Hofmann, 2021). Günümüzün dijitalleşme odaklı ve yoğun rekabet içeren piyasa koşulları, işletmeleri çevik bir yapıya sahip olmaya zorlamaktadır. Ancak dijital dönüşümün başarısı yalnızca teknolojik yatırımlara bağlı değildir; aynı zamanda kurum kültüründe dönüşümün sağlanması ve dijital teknolojilerin tüm organizasyonel süreçlerle bütünleştirilmesi gerekmektedir. Bu bağlamda çeviklik, dijital dönüşüm süreçlerinin merkezinde yer almakta; organizasyonların değişen

pazar dinamiklerine hızlı biçimde adapte olmasını ve daha etkili sonuçlara ulaşmasını mümkün kılmaktadır (Oğan, 2023).

Dijital dönüşümün beraberinde getirdiği yüksek hız ve belirsizlik, örgütlerde hata yapma riskini artırabilir. Ancak bu hataların birer öğrenme süreci olarak değerlendirilmesi ve cezalandırılmaması, risk almaya açık, çevik ve yenilikçi bir örgüt kültürünün gelişmesini destekler. Böyle bir kültür içerisinde, işletmeler değişen dijital koşullara karşı daha esnek yaklaşabilir, yeni stratejileri denemeye daha istekli olur ve bu sayede rekabet avantajı elde etme şanslarını artırabilirler (Mert, 2024).

İmamoğlu vd. (2024)'e göre, dijital örgütlerde çeviklik, hızlı değişen teknoloji ve pazar koşullarına uyum sağlayabilme yeteneğini ifade eder. Bu çeviklik, dijital araçların etkin kullanımıyla birlikte karar alma süreçlerinin hızlanmasını, esnek iş yapılarının benimsenmesini ve yenilikçi çözümlerin hızlıca hayata geçirilmesini sağlar. Dijital örgütler için çeviklik, rekabet avantajı elde etmede ve sürekli değişen dijital ortamda sürdürülebilirliği sağlamada temel bir unsurdur. Dijital teknolojiler sayesinde firmalar, çevresel değişimleri daha hızlı fark edebilmekte, kaynaklarını etkin biçimde yönetebilmekte ve fırsatlara hızlı tepki verebilmektedir. Bu da örgütsel çevikliğin güçlenmesini sağlayarak, firmaların değişken ve belirsiz piyasa koşullarında ayakta kalma ve rekabet etme yeteneğini artırmaktadır.

Farklı sektör ve bağlamlarda yapılan araştırmalar, örgütsel çevikliğin etkinlik ve dijital dönüşümün başarısındaki kritik rolünü ortaya koymaktadır. Holotiuk vd'nin (2018) profesyonel hizmet sektöründe yaptığı nicel çalışma, çevikliği algılama ve tepki verme olarak ikiye ayırarak bunun örgütsel etkinliğin temel bir unsuru olduğunu ve örgütsel tasarımın bu iki boyutu farklı şekilde etkilediğini göstermiştir. Kamu sektörüne odaklanan Zhang vd.'nin (2023) bulguları ise, örgütsel çevikliğin kurumların değişimleri algılamasını, strateji geliştirmesini, hizmet kalitesini ve dijital dönüşüm süreçlerindeki koordinasyonu doğrudan destekleyen bir yetkinlik olduğunu vurgulamaktadır. Benzer şekilde, Özdemir'in (2023) Türkiye'deki büyük ölçekli işletmeler üzerine yaptığı doktora tezinde, yapısal eşitlik modeli analizleri dijital dönüşüm olgunluğunun örgütsel çeviklik üzerinde anlamlı ve güçlü bir pozitif etkisi olduğunu kanıtlamış; bu da dijitalleşmenin çeviklik kapasitesini artırdığı yönündeki bulguları desteklemiştir. Özetle, örgütsel çeviklik hem özel hem de kamu sektöründe değişime uyum sağlama ve dijital dönüşümü yönetmede kilit bir özellik olarak öne çıkmaktadır.

1.4 Dijital İşletmelerde İnovatif Örgüt

İnovasyon, yalnızca ürün, süreç, pazarlama ya da yönetim alanlarında yapılan yenilikler veya iyileştirmelerden ibaret değildir; aynı zamanda teknik ve ekonomik yönlerinin ötesinde, toplumsal etkileri de olan çok boyutlu bir süreçtir. Bu sürecin gelişip sürdürülebilir hale gelmesi, farklı bakış açıları ve motivasyonlara sahip yapıların sürekli ve dinamik etkileşimine bağlıdır (Karaata, 2021). Çellek'in (2003) değerlendirmesi ise inovasyonu, farklı alanlarda özgün ve bilinmeyen çözümler üretme süreci olarak tanımlar. Bu süreç, yaratıcı düşünce, hayal gücü, sezgi, ilişkilendirme ve bireysel ifade gibi unsurları içerir. Daha önce ilişkisiz gibi görünen kavramların bir araya getirilerek özgün sonuçlara ulaşılması, inovasyonun temelini oluşturur. Aynı zamanda sistemli bir düşünme biçimi olan inovasyon, bireyler tarafından geliştirilebilir ve eğitilebilir bir yeti olarak da öne çıkar.

Siebel'e göre (2019), dijital örgütlerde inovasyon, teknolojiyle sınırlı olmayan; kültürel dönüşüm, liderlik, esneklik ve müşteri odaklılıkla beslenen bir süreç olarak anlatılır. İnovasyon; bulut, yapay zeka, IoT gibi teknolojilerle desteklenir, ancak esas başarı, örgütün değişime açık ve deneyime izin veren bir yapıya sahip olmasındadır.

Dyer vd.'ne (2011) göre, sorgulama, gözlemleme, ağ kurma, deney yapma ve ilişkilendirme gibi beş temel beceri, dijital dönüşüm süreçlerinin temelini oluşturan inovatif düşünme biçimini yansıtır. Dijital dönüşüm yalnızca teknolojiyi kullanmakla sınırlı olmayıp; yerleşik iş modellerini sorgulayan, kullanıcı deneyimini merkeze alan, denemeye açık ve farklı fikirleri bir araya getirebilen bir zihniyet gerektirir. Benzer şekilde, Westerman vd.'nin (2014)çalışmasında da inovasyon, teknolojiyi yalnızca destekleyici bir unsur olarak değil, iş stratejisinin odağına yerleştiren bir dönüşüm süreci olarak ele alınır. Dijital inovasyon; yeni ürünlerin geliştirilmesinin ötesinde, iş süreçlerinin yeniden tasarlanması, veri temelli karar alma sistemlerinin oluşturulması ve müşteri deneyiminin dijital olarak yeniden yapılandırılmasıyla sağlanır.

Farklı araştırmalar, dijital çağda inovatif bir örgüt yapısının ürün odaklı değil, bütünleşik ve kültürel bir dönüşüm gerektirdiğini ortaya koymaktadır. Porter ve Heppelmann'ın (2015) sektör öncüsü şirketler üzerine yaptığı kavramsal analiz, inovasyonun artık yalnızca fiziksel ürünle sınırlı olmadığını; yazılım, veri analitiği ve bağlantı özellikleriyle desteklenen, sürekli ve hizmet odaklı bir modele evrildiğini göstermiştir. Bu yaklaşım, Bughin vd.'nin (2017) 2.000'den fazla şirketle yaptığı geniş ölçekli çalışmada desteklenmiş; inovasyon kültürünün sürekli öğrenme, risk alma ve deney yapmaya dayalı çevik bir yapı olduğu, bunun sürdürülebilirliği için ise liderlik desteği ve çalışanların yetkilendirilmesinin kritik önemi vurgulanmıştır. Nihayet, Vial'ın (2019) literatür taraması da bu bulgularla uyumlu olarak, dijital dönüşümle rekabet avantajı elde etmenin, esnek, öğrenmeye açık ve yenilikçi bir örgütsel kültür geliştirmekten geçtiğini teyit etmektedir. Tüm bu çalışmalar, teknolojik değişime uyum sağlayan ve yeni iş modelleri geliştiren inovatif örgütlerin, inovasyonu yalnızca bir sonuç değil, aynı zamanda sürekli bir organizasyonel süreç olarak benimsemesi gerektiğine işaret etmektedir.

2. Dijital İşletmelerde Örgüt Kültürü: Veri Odaklı, İnovatif ve Çevik Örgütlerin Kavramsal Olarak İncelenmesi

Araştırmanın veri kaynağını, konuyla ilgili hakemli akademik dergilerde yayımlanmış makaleler, kitaplar ve lisansüstü tezler oluşturmaktadır. Yapılan kavramsal inceleme Google Scholar, Web of Science (WoS), Scopus ve YÖK Ulusal Tez Merkezi akademik veri tabanlarında gerçekleştirilmiştir. İncelemede, ilgili kavramları kapsamak üzere İngilizce ve Türkçe anahtar kelimeler kullanılmıştır. Ana odağı veri odaklı, çevik veya inovasyon kültür olan ve dijital işletmeler bağlamını ele alan çalışmalar araştırmaya dahil edilirken teknik/teknolojik odaklı olup, örgütsel/kültürel boyutu yeterince ele almayan çalışmalar hariç tutulmuştur. Seçilen çalışmalar, kavramsal olarak ele alınmıştır. Bu kapsamda, her bir çalışmada yazar, yıl, amaç, yöntem, örneklem ve sonuçlar incelenmiştir.

Tablo 1: Veri Odaklı, Çevik ve İnovatif Kültür Çerçevesinde İncelenen Çalışmalar

Çalışma Adı, Yazarı (Yazarları), Yılı	Amacı	Veri Toplama Yöntemi	Örneklemi	Analiz Yöntemi	Sonucu
Dijital Dönüşümün Örgütsel Çevikliğe Etkisi (Doktora Tezi) Özdemir, A. (2023	Dijital dönüşüm uygulamalarının örgütlerin çeviklik düzeyi üzerindeki etkisini incelemek	Anket tekniği kullanılmıştır.	Türkiye'de faaliyet gösteren büyük ölçekli işletmeler.	Veriler, nicel analiz yöntemiyle incelenmiştir. Korelasyon analiz ve regresyon analiz ile raporlanmıştır.	Dijital dönüşüm sürecinin örgütün çevikliğini artırma potansiyeline sahip olduğunu; çevikliğin ise dijitalleşme başarısında kritik bir rol oynadığını göstermektedir.
How organizational agility promotes digital transformation: An empirical study Zhang, H., Ding, H., & Xiao, J. (2023)	Örgütsel çevikliğin dijital dönüşümü nasıl teşvik ettiğini ampirik olarak incelemek.	Anket tekniği kullanılmıştır.	Veriler Çin'de kamu sektörü kurumlarında çalışan 313 kişiden toplanmıştır.	Veri analizi için yapısal eşitlik modeli (SEM) kullanılmıştır.	Çalışma bulgularına göre, örgütsel çevikliğin (hem operasyonel ayarlama hem stratejik) dijital dönüşüm performansını anlamlı ve pozitif etkilediği bulunmuştur. özellikle kamu sektörü bağlamında çevikliğin ve dinamik kabiliyetlerin dijital dönüşüm başarısı için kritik olduğu vurgulanmıştır.
The Determinants and Role of Agility in Digital Organizations Holotiuk, F., Beimborn, D., & Jentsch, C. (2018)	Dijital çağda örgütlerin çevik olabilmesi için hangi tasarım unsurlarının önemli olduğunu belirlemek ve çevikliğin örgütsel başarıya katkısını göstermeyi amaçlamak	Anket tekniği kullanılmıştır.	Profesyonel hizmet odaklı sektörlerde çalışanların 217 geçerli yanıtı üzerinden yürütülmüştür.	Veriler istatistiksel olarak analiz edilmiştir	Çalışma bulgularına göre; örgütsel tasarımın (örneğin esneklik, düşük formalizasyon, süreçlerin modülerliği gibi) çevikliği etkilediği ve çevikliğin de örgütsel etkinlik üzerinde anlamlı bir belirleyici olduğu görülmüştür. Özellikle "detecting agility" ve "reacting agility" her ikisi de dijitalleşen ortamda organizasyonların uyum ve tepki yeteneklerini artıran önemli boyutlar olarak bulunmuştur.
İşletmelerde dijital olgunluk	Dijital olgunluk yüksek olan	Nicel anket çalışması	Türkiye'de faaliyet gösteren	Korelasyon analizi,	Büyük veri analitik yeteneği,

düzeyinin yenilik performansı üzerindeki etkisinde büyük veri analitik yeteneğinin aracı ve veri odaklı kültürün düzenleyici rolü Düzcan, A., & Fidan, Y. (2023).	işletmelerde büyük veri analitik yeteneği ve veri odaklı kültürün birlikte nasıl işlediğini ve bu sayede yenilik performansına nasıl etkide bulunduğunu" kavramsal ve ampirik olarak ortaya koymak	yöntemi kullanılmıştır. Anketler çevrimiçi yayınlanmıştır.	orta ve büyük ölçekli işletmelerin yöneticileri veya kıdemli personelleri. 411 geçerli anket üzerinden değerlendirme yapılmıştır.	regresyon ve hiyerarşik regresyon analizleri yapılmıştır.	dijital olgunluk ile yenilik performansı ilişkisi içerisinde aracı rol oynamaktadır.
Toward the development of a big data analytics capability. Gupta, M., & George, J. F. (2016)	İşletmelerde büyük veri analitiği yeteneği kavramını teorik ve yapısal olarak tanımlamak ve bu yeteneğin örgütsel performans üzerindeki etkilerini açıklayan bir çerçeve geliştirmek.	Büyük veri analitiği yeteneğini ölçmek amacıyla literatüre dayalı yeni bir ölçek geliştirilmiştir. Yapılandırılmış bir anket formu kullanılmıştır.	ABD merkezli firmalarda, pilot çalışmada 232, ana çalışmada 108 yöneticiye ulaşılmış ve toplam 340 geçerli anket değerlendirmeye alınmıştır.	İlk aşamada doğrulayıcı faktör analizi, ikinci aşamada ise yapısal eşitlik modellemesi kullanılmıştır.	Bulgular, büyük veri analitiği yeteneğinin geliştirilmesinin firma performansını anlamlı biçimde artırdığını göstermiştir. Organizasyonların, rekabet avantajı elde edebilmesi için büyük veri analitiği yeteneğini çok boyutlu bir kaynak olarak ele alması gerektiği bildirilmiştir.
Does data-driven culture impact innovation and performance of a firm? An empirical examination. Chatterjee, S., Chaudhuri, R., & Vrontis, D. Dijital dönüşümde yalnızca teknoloji yatırımı yapan firmaların kalıcı başarı sağlayamadığını; kurum kültüründe inovasyonu teşvik eden bir zihniyet dönüşümünün asıl fark yaratan unsur olduğu bildirilmektedir.
Understanding digital transformation: A review and a research agenda Vial, G. (2021)	dijital dönüşümün tanımı, bileşenleri, etkileri ve örgütsel sonuçlarıyla ilgili literatürdeki kavramsal dağınıklığı gidererek bütüncül bir çerçeve oluşturmak	2000-2020 arasında yayımlanan akademik yayınların literatür taraması yapılmıştır. İkincil veri analiziyle hazırlanmıştır.	Örneklem, seçilen literatürdeki 100'den fazla nitel ve nicel makaleden oluşmaktadır.	Çalışmada içerik analizi (content analysis) ve tematik sentez (thematic synthesis) yöntemleri uygulanmıştır.	İnovasyon kültürünü oluşturan "deneme-yanılma", "veriye ve teknolojiye açıklık", "süreç ve yapıların yeniden yapılandırılması" gibi unsurlar, çalışmada kültürel dönüşümün bir parçası olarak yer almaktadır.

Bu çalışmalar bütüncül olarak değerlendiğinde, işletmelerin başarısının, teknolojik alt yapıdan çok kültürel alt yapıya dayandığı söylenebilir. Çalışmalar, işletmelerin kararlarını veriye dayalı almasının inovasyon ve performansı artırdığını gösterirken (Gupta & George 2016; Chatterjee vd., 2024), Düzcan & Fidan (2023) ise veri odaklı kültürün bu etkiyi düzenlediğini sunmuştur. Bughin vd. (2017) ve Vial (2021), dijital dönüşümün bir yeniden icat süreci olduğunu, bunun yalnızca teknolojik değil, zihinsel ve kültürel bir yeniden yapılanma olduğunu vurgulamaktadır. İnovasyon burada hem bir zihniyet dönüşümü, hem de dijitalleşmenin sürdürülebilirliğini sağlayan kültürel bir kavram olarak bildirilmektedir. Zhang vd. (2023), Holotiuk vd. (2018) ve Özdemir (2023), çevikliğin dijital dönüşümün etkinliğini artıran kültürel unsur olduğunu gösterirken çevikliğin, yalnızca hızlı tepki verme yetisi değil, aynı zamanda öğrenme, uyum sağlama ve değer yaratma kapasitesi olduğunu vurgulamaktadır.

Sonuç

Bu çalışmanın amacı, işletmelerde veri odaklı, inovatif ve çevik kültürü kavramsal çerçevede incelemek ve aralarındaki ilişkiyi ortaya koymaktır. İncelenen çalışmalar, bu üç kavramın birbirinden bağımsız olmadığını göstermektedir. Veri odaklı kültür, işletmelerin veriye dayalı karar almasını sağlayarak değişimlere daha hızlı ve doğru karar vermesine zemin hazırlayabilir. Dolayısıyla veri odaklı kültürün çevikliği güçlendirdiği söylenebilir. Çeviklik ise örgüt içinde yenilik fikirlerinin daha hızlı ortaya çıkmasını ve uygulanmasını kolaylaştırır. Böylelikle, örgütlerin hızlı karar alabilmesi, deneme-yanılmaya açık bir ortamın oluşmasını sağlayarak inovasyon kültürünü de oluşturabilir. Sonuç olarak, veri odaklılığın çevikliği beslediğini, çevikliğin, inovasyonu hızlandırdığını ve bu döğünün de işetmelerin dijital ortamda sürdürülebilir rekabet avantajı elde edebileceği söylenebilir.

Bu çalışmada veri odaklı, inovatif ve çevik kültür kavramları kavramsal düzeyde ele alınmıştır. Ancak bu üç kültür, henüz gelişmekte olan kavramlardır. Bu nedenle gelecekte yapılacak nicel araştırmaların, bu kavramlar arasındaki ilişikiyi ortaya çıkarmada önemli olacaktır. Özellikle farklı sektörlerde yürütülecek çalışmalar, veri odaklılık, çeviklik ve inovasyon kültürlerinin sektörlere göre nasıl farklılaştığını ya da birbirini nasıl etkilediğini ortaya koyabilir.

Öz

Küresel ısınmanın, insan kaynaklı olmasının sonucunun Dünyadaki ortalama yüzey sıcaklığının uzun süreli artışının olduğunu ve bu artışın sanayi öncesindeki sıcaklıkların yaklaşık 1,1°C üzerinde artırdığını vurgulamaktadır. Bu durum, iklim sisteminin dengesizleştirebileceği bir durumu getirebilecek bir tehdit olarak görülmektedir. Öte yandan 1970'lerde başlayan literatürdeki bir dizinin aerosollerin etkisi nedeniyle küresel soğumanın yaşanacağı iddiasında yer aldığı görülmektedir. Bu, her iki görüşmede de salgınları değerlendirilerek, iklim koşullarının değişime karşı direncinin yüksek değişimi için neler yapılması gerektiği konusunda eğilmektedir. Mevcut iklimlere ve önde gelen uluslararası ekonomi ve iklim iklimlerinin projeksiyonlarına dayanarak, küresel ekonomilerin şu etkileri üzerinde beklemeliyiz: Azalan verimlilik ve büyüme, tedarik zincirinde aksama ve varlıklar için fiziksel risklerde artış. Ancak diğer yandan ülkelere açıdan yeni fırsatlar ortaya çıkıyor. Yeşil sanayi devrimi diyebileceğimiz bir süreç yaşanmakta, küresel güce sahip fosil yakıtlara sahip ülkeler aleyhine jeopolitik güç dengeleri değişmeye başlamaktadır. Yeşil krediler ve sürdürülebilir piyasa finansları ile ilgili çok hızlı bir dönüşüm yaşanmaktadır. Uzun vadeli ekonomik gidişat, büyük ölçüde bugün yapılan politika tercihlerine bağlıdır. Hataların gecikmeli ve ardından ani değiştirilmiş bir geçiş, ekonomik açıdan en yıkıcı geçiş olacaktır. Önemli miktarda ön yatırım gerektirse de, proaktif ve düzenli bir geçişin, kontrolsüz iklim sıcaklıklarının yol açtığı zararlardan çok daha az iyileşmenin ve daha birleştirilmiş, dayanıklı ve dirençli bir ekonomik esnek giden yolun açılması öngörülmektedir.

GLOBAL WARMING? GLOBAL COOLING? HOW SHOULD COUNTRIES PREPARE FOR THIS PROCESS?

Abstract

The paper emphasizes that the human-caused nature of global warming results in a long-term increase in the average surface temperature of the Earth, approximately 1.1°C above pre-industrial levels. This situation seen as a threat that could lead to a situation where the climate system becomes unstable. On the other hand, a series of claims in the literature, beginning in the 1970s, suggest that global cooling will occur due to the effects of aerosols. This, along with the assessment of pandemics in both discussions, focuses on what needs to increase the resilience of climate conditions to change. Based on current climates and projections from leading international economic and climate agencies, we should expect the following impacts on global economies: decreased productivity and growth, disruptions in supply chains, and increased physical risks to assets. However, new opportunities are emerging for countries. A process that we can call a green industrial revolution is underway, and geopolitical power balances are beginning to shift against fossil fuel-rich countries with global power. A very rapid transformation is taking place regarding green credits and sustainable market finances. The long-term economic trajectory largely depends on the policy choices made today. A delayed and then abruptly altered transition due to

mistakes would be the most economically devastating. While requiring significant upfront investment, a proactive and orderly transition projected to yield far less recovery from the damage caused by uncontrolled climate temperatures and pave the way for a more unified, resilient, and economically flexible path forward.

Keywords: Global Warming, Global Cooling, Earth

GİRİŞ

İklim değişikliği günümüzde artık sadece çevre problemi değil, aynı zamanda ulusal güvenlik, ekonomi, enerji stratejileri ve sosyal yaşam üzerinde etkileri olan karmaşık bir durumdur. Bu nedenle, ülkelerin iklim değişikliği ile ilgili hazırlık aşamalarını değerlendirirken "küresel ısınma mı yoksa soğuma mı olacak?" sorusu büyük bir önem taşımaktadır (IPCC, 2021: 3). Son yüzyılda yapılan bir dizi çalışma sıcaklık artışının belirgin bir şekilde hızlandığına işaret ederken, bazı çalışmalar ise güneş döngüleri ve volkanik etkinlik gibi doğal unsurların gelecekte soğuma senaryolarını oluşturabileceğine dikkat çekmektedir (Lockwood, 2010: 206).

İklim sisteminin karmaşık yapısı, atmosfer, okyanuslar, buzullar ve güneş etkinlikleri gibi pek çok bileşenin birbiriyle ilişkili olmasından dolayı, tek bir açıdan açıklama getirilmesini zorlaştırmaktadır. Bazı araştırmalar, son bir asırda görülen ortalama sıcaklık artışlarının küresel ısınmanın ana eğilimi olduğunu göstermekteyken (NASA, 2020: 12), diğer bazı çalışmalar belirli dönemlerde bölgesel soğuma eğilimlerinin, doğal döngülerin ya da okyanus akıntılarının sıcaklık artışının hızını yavaşlatabileceğine dair bulgular sunmaktadır (Soon ve Yaskell, 2003: 272). Bu durum, farklı yöntemler ve zaman ölçekleri kullanıldığında tartışmaların yönünün değişebileceğini ortaya koymaktadır. Bu nedenle mesele tek boyutlu bir eğilimle sınırlı tutulmamalıdır; hem ısınma hem de soğuma olasılıklarının birlikte ele alındığı daha geniş bir bakış açısı benimsenmelidir.

KÜRESEL ISINMA EĞİLİMİ VE BULGULAR

Son yüz yıl içerisinde dünya genelindeki ortalama sıcaklık yaklaşık 1,1°C artış göstermiştir (IPCC, 2021: 5). Atmosfere salınan sera gazlarının, özellikle karbondioksit (CO_2) ve metan (CH_4), bu gelişmenin temel etkenleri olduğu bilimsel verilerle kanıtlanmıştır (NASA, 2020: 3). Okyanus sıcaklığı, kutupsal buzulların durumu ve deniz seviyesindeki değişiklikler de küresel ısınmanın fiziksel belirtileri arasında sayılmaktadır. Okyanuslar, atmosferdeki ısının yaklaşık %90'ını emmektedir. 1993 yılından itibaren ortalama deniz seviyesi her yıl 3,3 mm artış göstermiştir (NOAA, 2019: 15). Bu bilgiler, küresel ısınmanın sadece sıcaklık artışlarıyla sınırlı olmadığını ve sistematik bir ısınma modeli sergilediğini ortaya koymaktadır. Bu eğilim, birçok bölgede sıcak hava dalgaları, kuraklıklar, aşırı yağışlar ve orman yangınlarının daha sık ve şiddetli hale gelmesine yol açmıştır. Grönland ve Antarktika'nın buz alanlarında önemli bir erime meydana gelmektedir; yıllık kayıplar 20. yüzyılın ortalama seviyelerinin oldukça üzerindedir (IPCC, 2021: 17-8). Bunun neticesinde:

- Arktik deniz buzları hızla azalmakta,
- Kutup ekosistemleri etkilenmekte,
- Okyanus akıntılarında değişiklik olasılığı artmaktadır.

Bu sonuçlar, küresel ısınmanın sistematik olarak doğrulanmış bir bilimsel gerçeklik olduğunu göstermektedir.

3. KÜRESEL SOĞUMA OLASILIĞI VE DOĞAL DÖNGÜLERİN ROLÜ

İklim sistemi, sadece insan kaynaklı etkenlerden değil, aynı zamanda doğal olaylardan da etkilenmektedir. Güneş lekesi döngüleri, Dünya'nın yörünge değişiklikleri ve büyük ölçekli volkanik patlamalar, daha serin dönemlerin yaşanmasına yol açabilir (Lean ve Rind, 2008: 1104). Küresel soğuma ihtimali, iklim sisteminin doğal döngülerin etkisi altında şekillenen yapısı göz önünde bulundurularak incelenmelidir. Dünya üzerindeki uzun vadeli iklim değişiklikleri, Milankovitch döngüleri olarak adlandırılan yörünge değişiklikleri ile yakından ilişkilidir; bu döngüler, buzul dönemleri ve sıcak fazların başlıca belirleyicileridir. Benzer şekilde, güneş aktivitesindeki azalma dönemleri — örneğin

Maunder Minimum — tarihi verilerle bağlantılı olan bölgesel soğuma eğilimlerinin sebebi olarak değerlendirilmektedir (Eddy, 1976: 1183).

Orta ve kısa vadede okyanus döngüleri de sıcaklık değişimlerinde etkili olabilir. PDO ve AMO'nun soğuk dönemlerinin 20. yüzyılda küresel sıcaklık artışını yavaşlattığı birçok çalışma ile kanıtlanmıştır (Trenberth ve Hurrell, 1994: 263). Güneş'in her on bir yılda bir tekrarlayan döngüleri, Dünyaya ulaşan radyasyon miktarını etkileyebilir. 2008 ile 2010 yılları arasındaki "minimum güneş aktivitesi" durumu gibi, azalmış güneş lekesi dönemleri geçici soğuma etkileri yaratabilir (Lockwood, 2010: 209). Büyük volkanik patlamalar, havaya yayılan sülfat aerosolleri dolayısıyla geçici soğuma etkileri meydana getirebilir. Örneğin: Tambora (1815) volkanik patlamasından sonra 1816 yılı "yazsız yıl" olarak tarihe geçmiştir (Crowley, 2000: 274).

Tarihsel belgelerde yer alan Küçük Buz Çağı (Little Ice Age, 1450–1850), belirli zaman dilimlerinde doğal süreçlerin küresel soğuma etkisi yaratabileceğini gösteren önemli bir örnek teşkil etmektedir (Mann, 2002: 758). Bu bağlamda, bazı araştırmacılar kısa süreli veya bölgesel soğuma eğilimlerinin hâlâ mümkün olabileceğini belirtmektedir (Lockwood, 2010: 205).

ÜLKELERİN HAZIRLIK İHTİYACI

Bu araştırmanın kapsamı gereği, ülkelerin hangi iklim yönüne doğru hareket edildiğini belirlemekten ziyade, ısınma veya soğuma fark etmeksizin nasıl hazırlanması gerektiğini incelemek önemlidir.

Küresel iklim sisteminin doğal döngüleri, insan kaynaklı etkileri ve yerel geri bildirimler yüzünden giderek daha belirsiz hale gelmesi, ülkelerin kapsamlı bir iklim hazırlık yeteneği oluşturmasını zorunlu kılmaktadır. Bu hazırlık, öncelikle iklim değişikliğinin çeşitli etkilerini (enerji temininde güvenlik, tarım verimliliği, su sıkıntısı, altyapı dayanıklılığı, sağlık tehditleri ve ekonomik kırılganlıklar) dikkate alan kapsamlı bir ulusal uyum yapısını gerektirir.

Özellikle iklim risk analizi, erken uyarı sistemleri, uluslararası veri paylaşımı, iklimle ilgili felaketlere dayanıklı altyapı planlamaları, enerji dönüşüm planları ve iklim finansman yöntemleri, ülkelerin dayanıklılığını belirleyen anahtar unsurlarıdır. IPCC verilerine göre, iklim değişikliği etkilerine karşı savunmasız durumda olan ülkeler, sadece fiziksel olarak değil, ekonomik ve yönetimsel olarak da risk altındadır; bu nedenle hazırlık, teknik uyumluluğun yanı sıra kurumsal kapasiteyi de kapsamalıdır (IPCC, 2022: 12–15).

Ayrıca şu politikalar izlenerek de ülkeler hazırlıklı olabilir:

Yeşil Sanayi Devrimi: Düşük karbonlu bir ekonomiye geçiş, devasa yeni pazarlar ve yatırım fırsatları yaratır. Bunlara yenilenebilir enerji (güneş, rüzgar, hidrojen), elektrikli araçlar, enerji depolama, yeşil binalar ve döngüsel ekonomi teknolojileri dahildir.

Jeopolitik Değişimler: Enerji dönüşümü, küresel güç dinamiklerini yeniden şekillendirecektir. Yenilenebilir enerji ve piller için kritik mineraller (örneğin lityum, kobalt, nadir toprak elementleri) açısından zengin ülkeler stratejik önem kazanırken, geleneksel fosil yakıt ihracatçıları ekonomilerini çeşitlendirme ihtiyacıyla karşı karşıya kalacaktır.

Riskin Yeniden Fiyatlandırılması ve Yeni Finansal Araçlar: Yeşil tahviller, sürdürülebilirliğe bağlı krediler ve karbon piyasaları dahil olmak üzere sürdürülebilir finans alanında hızlı bir büyüme yaşanmaktadır. Merkez bankaları ve finansal düzenleyiciler, iklim riskini stres testlerine ve denetim çerçevelerine giderek daha fazla dahil edilmelidirler.

Kısa ve orta vadede, iklim değişikliğinin maliyetleri (artan afet müdahalesi, altyapı hasarı, tarımsal kayıplar) küresel ekonomik büyümeyi yavaşlatacak ve enflasyonu artıracaktır. Uzun vadede ise ekonomik gidişat, büyük ölçüde bugün yapılan politika tercihlerine bağlıdır. Politika eylemlerinin gecikmeli ve ardından ani olduğu düzensiz bir geçiş, ekonomik açıdan en yıkıcı geçiş olacaktır. Önemli miktarda ön yatırım gerektirse de, proaktif ve düzenli bir geçişin, kontrolsüz iklim değişikliğinin yol

açtığı zararlardan çok daha az maliyetli olacağı ve daha istikrarlı, sürdürülebilir ve dirençli bir ekonomik geleceğe giden yolu açacağı öngörülmektedir.

Küresel ısınma durumunda olası problemler:

- Tarımda ürün azalması,
- Su kaynaklarının azalması,
- Enerji ihtiyacında yükseliş gibi etkiler meydana getirmesi.

Küresel ısınma durumunda olası problemler:

- Tarım sezonlarının kısalması,
- Isınmak için enerji talebinde artış,
- Taşımacılık ve ulaştırma işlerinin güçleşmesi.

Beklenen temel sorunlar olacaktır ve gerekli hazırlıkların yapılması şarttır. Her iki durumun da değişik ama önemli etkileri olabileceğinden, ülkelerin iklim değişikliğinden kaynaklanan belirsizlikleri dikkate alan detaylı bir uyum stratejisine ihtiyaç duyduğu anlaşılmaktadır (UNFCCC, 2015: 22):

Her iki durumda da:

- Dayanıklı altyapı,
- Aşırı hava olaylarına yönelik hazırlık,
- Kıyı alanlarında koruyucu tedbirler,
- Enerji tedarik güvenliği gerekmektedir

Belirsizlikleri azaltmak adına ülkelerin:

- İklime dair uzun dönemli verileri takip etmesi,
- Modellemeleri yenilemesi,
- Bilimsel kuruluşlarla işbirliği içinde çalışması çok önemlidir.

Ayrıca, eğer bir bölgesel soğuma, aşırı hava koşulları ya da iklim düzeninde bir değişiklik olursa, ülkelerin tarım, enerji kullanımı, gıda bulundurma planları, su altyapıları ve acil durum hazırlıkları gibi alanları sürekli güncellemeleri gerekecek. Bu bağlamda, iklim tahminlerinin sürekli takibi, bilimsel kurumlarla iş birliği yapılması ve çeşitli sektörleri kapsayan uyum politikalarının hayata geçirilmesi, ulusal dayanıklılığın temel unsurlarıdır.

SONUÇ VE DEĞERLENDİRME

Küresel ısınma veya küresel soğuma üzerine yapılan tartışma, çağdaş iklim bilimlerinin önemli yöntemsel problemlerini de gözler önüne sermektedir. Tartışmanın odak noktası, atmosfer ve okyanus sistemlerinin uzun vadeli davranışlarını açıklamaya yönelik veriler, modeller ve yorumlar arasındaki farklılıklardır. Bu yüzden mesele yalnızca sıcaklık dalgalarının tespit edilmesiyle sınırlı kalmamaktadır; ayrıca hangi indislerin daha etkili olduğu, hangi zaman diliminin iklim eğilimi için temel alınacağı ve kullanılan modellerin ne derece güvenilir olduğu gibi konular da tartışmanın ayrılmaz bir parçasını oluşturmaktadır.

Bilim dünyasında son yüzyıldaki eğilimler genel olarak dünya genelindeki sıcaklıkların yükseldiğine işaret etse de, iklimin doğal döngüler, güneşin etkileri, volkanik etkinlikler, okyanus akıntıları ve atmosfer bileşenleri gibi pek çok farklı faktörden etkilendiği kabul edilmektedir. Bu yüzden bazı araştırmalar, bazı dönemlerde sıcaklık artış hızının azaldığını veya bazı dönemlerdeyse bölgesel soğuma işaretlerinin güçlendiğini göstermektedir. Bu durum, tartışmaların yalnızca "ısınma" ve "soğuma" üzerine kurgulanmasının yetersiz olduğunu ortaya koymaktadır.

Ayrıca, iklim sistemi oldukça karmaşık olduğundan, çeşitli veri setlerinin analizi ve modellere eklenen değişkenlerin çeşitliliği araştırmacılar arasında farklı sonuçların ortaya çıkmasına neden olmaktadır.

Örneğin, buz çekirdekleri, ağaç halkaları ve tortul kayıtlar gibi paleoiklim verileri uzun dönemli döngüsel değişimleri ortaya koyarken, güncel ölçümler daha kısa zaman dilimindeki eğilimlere odaklanmaktadır. Bu durum, hangi zaman diliminin "temel eğilim" olarak kabul edileceği konusunda farklı bakış açılarına yol açar.

Bu bağlamda, tartışma bile iklim araştırmalarının dinamik yapısını, veri yorumlamanın çok katmanlı biçimini ve bilimsel toplulukta yer alan metodolojik çeşitliliği göstermektedir. Ne küresel ısınma ne de küresel soğuma tek başına bir veri seti ile açıklanabilecek bir durumda değildir; bunun yerine, iklim sisteminin etkileşim halindeki bileşenleri hakkında geniş bir bilimsel çalışma alanını temsil eder. Bu nedenle, konu tek bir sonuca dayanmaz; aksine, çok boyutlu bir bilimsel sürecin anlaşılması gereklidir.

Sonuç olarak, gelecekte küresel sıcaklık eğilimlerinin nasıl şekilleneceği sadece mevcut verilere değil, bu verilerin nasıl değerlendirildiğine, hangi parametrelerin modellere dahil edildiğine ve hangi zaman dilimlerinin iklim tanımı için seçildiğine bağlı olarak ortaya çıkmaktadır. Bu nedenlerle tartışma, iklim sisteminin karmaşıklığı dikkate alındığında, bilimsel topluluk içinde sürekli olarak açık bir araştırma alanı olarak devam etmektedir.

Öz

Özel gereksinimli bireylerin doğal veya insan kaynaklı felaket ve afetlere karşı dirençliliğini artırmak için uygulanacak olan politikalar sadece insan hakları açısından değil aynı zamanda da stratejik bir ekonomik karar olması açısından önem arz etmektedir. Özel gereksinimli bireyler ile ilgili, afetler öncesi alınması gereken tedbirler alınıp gerekli düzenlemeler yapılmaması durumunda hem afet kaynaklı ölüm oranları yükselmekte hem de ekonomik kayıplar ve sağlık sistemi üzerine binen yük artmaktadır. Özel gereksinimli bireylerin acil durumlara dirençliliğini artırmak için yapılan yatırımlar ise daha düşük acil durum mübadele maliyetleri, sağlık sistemi üzerindeki yükün azaltılması, insan sermayesinin korunması ve afet sonrası daha hızlı ekonomik toparlanmanın sağlanması gibi temel etkiler yaratır. Ayrıca özel gereksinimli bireylerin ihtiyaç duyacağı taşınabilir güç kaynakları, erişilebilir iletişim cihazları gibi teknolojilerin acil durumlara özel olarak tasarlanacak olması teknolojik gelişmeyi hızlandıracak bir unsur olarak karşımıza çıkmaktadır. Bu sayede Ar-Ge yatırımları ve dolayısıyla teknolojik ilerleme sağlanmasına olumlu katkısı olacaktır. Bu da büyüyen bir pazar yaratarak yeni iş ve ihracat imkanları doğuracaktır. Ayrıca acil durum uyarıları, ulaşım ağlarının ve toplanma alanlarının düzenlenmesi herkes için tasarım ilkesi temel alınarak yapılacağı için bu sayede tüm toplum için daha iyi hizmetlerin oluşması sağlanacaktır.

HUMANITARIAN AND ECONOMIC ASPECTS OF ENHANCING THE RESILIENCE OF INDIVIDUALS WITH SPECIAL NEEDS TO DISASTERS

Abstract

Policies aimed at increasing the resilience of individuals with special needs to natural or man-made disasters and calamities are important not only from a human rights perspective but also as a strategic economic decision. Failure to take necessary precautions and make the required arrangements before disasters affecting individuals with special needs leads to increased mortality rates, economic losses, and a greater burden on the healthcare system. Investments in increasing the resilience of individuals with special needs to emergencies have key effects such as lower emergency response costs, reduced burden on the healthcare system, protection of human capital, and faster economic recovery after disasters. Furthermore, the design of technologies such as portable power sources and accessible communication devices specifically for emergencies will accelerate technological development. This will positively contribute to R&D investments and consequently technological progress, creating a growing market and generating new jobs and export opportunities. Furthermore, emergency alerts,

transportation networks, and assembly areas designed based on the principle of design for all, thus ensuring better services for the entire community.

Keywords: Disasters, Individuals with Special Needs, Economic

GIRIŞ

Literatürde farklı sınıflamaları olmakla birlikte özel gereksinimli bireyler şu şekilde tanımlanır:

"Özel gereksinimli birey; doğum öncesi, doğum sırası ve doğum sonrasında, gelişim sürecinde oluşan çeşitli nedenlere bağlı olarak; bilişsel, dil, hareket, fizik, sosyal ve duygusal gelişimlerinde ölçme araçlarıyla ölçülebilen düzeyde yetersizlik, yavaşlama, gerileme veya ileride olma sonucunda yaşıtlarına göre farklı özellikler gösteren ve normal eğitim programlarından yararlanamayan, kısmen yararlanan veya yararlandığı halde destek programları ile eğitimlerini devam ettirebilen bireylerdir" (Baykoç, 2015:20).

Özel gereksinimli bireyler afetler sırasında önemli zorluklarla karşılaşırlar. Bu zorluklara karşılıklı hazırlıklı olunması büyük önem taşımaktadır. Bu sadece özel gereksinimli bireyler ve ailelerinin değil aynı zamanda devletin sorumluluğundadır. Bu zorluklar en temel şekilde (United Nations, 2015):

Hareketlilik Sorunları: Yardım olmadan tahliye zorluğu.

Duyusal Aşırı Yüklenme: Kalabalık, gürültülü ve hijyen bakımından sıkıntılı sığınaklar otizm veya travma sonrası stres bozukluğu olanlar için dayanması çok zor olabilir.

İletişim Engelleri: Standart uyarılar işitme engelli, işitme güçlüğü çeken veya görme engelli kişiler için erişilemezdir.

Tıbbi Bağımlılık: Elektrik kesintileri yaşam destek ekipmanlarını devre dışı bırakabilir; ilaç veya tıbbi malzeme olmadan tahliye hayati tehlike oluşturabilir (FEMA, 2010).

Anlama Engelleri: Standart talimatlar zihinsel engelli kişiler, down sendromlular veya otizmliler tarafından anlaşılamayabilir.

Özel gereksinimli bireylerin koşullarını nasıl iyileştirebiliriz? Bu sorunun cevabını verebilmek için atılması gereken politikalar hem insan hakları açısından hem de makroekonomik dengeler açısından önem arz etmektedir (Jensen ve Chavet, 2014). Bu politikalar şu şekilde özetlenebilir:

İyileştirme, afet yönetiminin tüm aşamalarına entegre edilmelidir (United Nations, 2025). Acil durum planlarının oluşturulmasında özel gereksinimli bireyler ve onlarla ilgili çalışan kuruluşlar dahil edilmelidir. Çünkü yaşadıkları deneyimler ve temel ihtiyaçlarını bilmek önemlidir. Tahliye sırasında yardıma ihtiyaç duyabilecek kişileri belirlemek için yerel acil servislerle gönüllü kayıtlar oluşturulmasını teşvik edilmelidir (Dynes, 1994). "Acil Durum Çantaları": (Ek ilaçlar, tıbbi cihaz pilleri (güç bankası ile), reçete kopyaları, duyusal araçlar ve iletişim kartları içeren acil durum kitleri) mutlaka hazırlanmalıdır. Erişilebilir kamu uyarı sistemleri oluşturulmalı, uyarıların herkese ulaşmasını sağlamak için birden fazla kanal kullanılmalıdır. Metin uyarıları, görsel sirenler, sözlü mesajlar ve sosyal medya.

Afet sırası ve sonrası için yapılacaklar ise şu şekilde özetlenebilir: Tahliye araçlarının tekerlekli sandalyeleri taşıyabilecek kapasitede olduğundan emin olunmalı. Fiziksel olarak erişilebilir barınaklar belirlenmelidir. Engellilik farkındalığı konusunda eğitimli personel yetiştirilmelidir. Duyusal hassasiyeti olan bireyler için sessiz bölgeler yaratılmalı, tıbbi cihazları şarj etmek için yedek güç sağlayıcıları hazır bulundurulmalı, erişilebilir tuvaletler ve yıkama tesisleri yapılmalıdır. Acil durum personeli, çok çeşitli engellere sahip insanlarla saygılı ve etkili bir şekilde iletişim kurma ve onlara yardımcı olma becerileriyle donatılmalıdır. Gıda, su ve malzeme dağıtım noktalarının fiziksel olarak erişilebilir olduğundan ve personelin çeşitli ihtiyaçları olan insanlara yardımcı olabileceğinden emin olunmalıdır. Zihinsel veya psikososyal engelli kişilere erişilebilir travma odaklı danışmanlık hizmeti sağlanmalıdır.

Özel gereksinimli bireyleri de kapsayan, afetlere karşı dayanıklılık politikalarını bir maliyet olarak görmek, dar görüşlü bir yaklaşımdır. Gerçekte dayanıklılığı artıran yatırımların getirisi oldukça yüksektir. İzleyen bölümde bunun nedenler açıklanmaktadır. Çünkü temelde, bir ülkenin insan sermayesini korumakta, gelecekteki mali yükümlülükleri en aza indirmekte, yenilikçi pazarları teşvik etmekte ve dayanıklı bir ekonominin temelini oluşturan sosyal güveni inşa etmektedir (Kreps ve Drabek, 1996). En savunmasız kesimlerin korunmasını sağlayarak, bir ulus nihayetinde tüm ekonomik temelini güvence altına almaktadır.

VERIMLILIĞIN VE EKONOMIK KATILIMIN ARTIRILMASI İÇIN DAYANIKLI TOPLUMLARIN İNŞASININ ÖNEMI

Dayanıklılık politikaları, afet sonrası daha hızlı ekonomik iyileşme sağlamaktadır (Gillespie, 1991). Hızlı bir şekilde tahliye ve iyileşme sağlayabilen topluluklar, ekonomik faaliyetlerine daha hızlı bir şekilde geri dönerler. Engelli çalışanlar veya bakıcıları bir felaket nedeniyle iş göremez hale gelmezlerse, daha erken işe dönebilir ve verimliliği koruyabilirler.

Özel gereksinimli bireyler için yapılması gereken bir diğer politika ise bu kişilere bakım sağlayan kişiler ile ilgilidir. Özel gereksinimleri olan birçok kişinin bakıcıları (aile üyeleri veya profesyoneller) vardır. Dayanıklı bir destek sistemi, bu bakıcıların acil bakım sağlamak için uzun süre işgücünden uzaklaştırılmasını önleyerek ekonomik katkı yapmaya devam etmelerini sağlamış olur.

Erişilebilirliği zorunlu kılmak ve buna yatırım yapmak, inovasyonu teşvik eder ve ticari fırsatlar yaratır (Kouzmin, vd., 1995). Özellikle taşınabilir güç kaynaklarına, erişilebilir iletişim cihazlarına ve acil durumlar için uyarlanabilir ekipmanlara olan talep, teknoloji şirketleri için büyüyen bir pazar oluşturarak iş imkanları ve ihracat potansiyeli yaratacaktır.

Acil durum uyarılarından, ulaşım ve barınaklara uygulanan "herkes için tasarım" ilkesi, genellikle herkes için daha iyi olan ürün ve hizmetlere yol açar. Yani aslında özel gereksinimli bireyler için tasarlanmış olan ürünler tüm toplum için kolaylaştırıcı hizmetleri beraberinde getiri. Bu inovasyon diğer sektörlere de yayılabilir ve rekabet gücünü artırabilir.

Ekonomik refah, sosyal istikrar temeli üzerine kuruludur. Bir hükümet tüm vatandaşlarına değer verdiğini gösterdiğinde güveni güçlendirir (May ve Williams, 1986). Bu güven, acil durum direktiflerine uyum için çok önemlidir ve uzun vadeli yatırım ve ekonomik büyüme için kilit bir unsur olan daha istikrarlı ve işbirlikçi bir toplumu teşvik eder. Ayrıca eşitsiz afet müdahalesi, sosyal bölünmeleri şiddetlendirir ve huzursuzluğa yol açabilir. Herkese adil muamele sağlayan kapsayıcı politikalar, bu riski en aza indirir ve ekonomik faaliyet için gerekli olan sosyal düzeni korur.

Küresel finans sistemleri, iklim ve afet riskini giderek daha fazla fiyatlandırmaktadır. Sağlam, kapsayıcı afet risk azaltma planlarına sahip ülkeler ve belediyeler genellikle daha düşük riske sahip görülür ve bu da afet sigortası ve yeniden yapılanma borçlanmasının maliyetini potansiyel olarak düşürür. Çevresel, sosyal ve yönetişim kriterleri, sosyal kapsayıcılık ve dayanıklılığa büyük önem vermektedir. Hassas nüfus gruplarını korumaya yönelik bir taahhüt göstermek, bir ülkeyi yabancı doğrudan yatırımlar için daha çekici hale getirir.

SONUÇ VE DEĞERLENDIRME

Özel gereksinimli bireyler için afetler gerçekleşmeden yapılan tüm düzenlemeler ve alınan önlemler birçok olumlu etkiyi beraberinde getirir. Bu etkiler aşağıdaki şekilde özetlenebilir:

Daha Düşük Acil Durum Müdahale Maliyetleri: Yönetilen kayıtlar ve erişilebilir tahliye planları gibi etkili ön planlama, son dakika, yüksek riskli ve pahalı acil kurtarma operasyonlarına olan ihtiyacı azaltır.

Azaltılmış Sağlık Hizmeti Yükü: Bir afet sırasında yaralanmaları, travmaları ve kronik rahatsızlıkların kötüleşmesini önlemek, kamu sağlık sistemleri üzerindeki uzun vadeli yükü

hafifletir. Bu, acil tıbbi bakım, rehabilitasyon ve uzun vadeli desteğe harcanacak önemli miktarda kamu fonundan tasarruf sağlar.

İnsan Sermayesinin Korunması: Engelli bireyler, iş gücünün, tüketicilerin ve vergi mükelleflerinin bir parçasıdır. Onları koruyan politikalar, bu nüfus kesiminin sosyal güvenlik ağına daha fazla maliyet getirmek yerine ekonomik olarak katkıda bulunmaya devam etmesini sağlar.

Daha hızlı ekonomik toparlanma: Dayanıklılığı artırılmış bir toplumda afet sonrası hızla bireyler ekonomik faaliyetlere geri dönebilmektedir.

Yeni teknolojilerin gelişimini zorunlu kılma: Özel gereksinimli bireyler için belirli yasal standartları zorunlu kılarak erişilebilirliği artırıcı politikalar uygulamak firmaları teknoloji geliştirmeye iter. Yeni iş ve pazar imkanları yaratır.

Sosyal uyum ve dayanışmada artış: Tüm halkın özel gereksinimli bireyler hakkında bilinçlendirilmesi ve dayanıklılık politikalarının bir parçası olarak düşünülmesi toplumda uyum ve dayanışmanın artmasına neden olur.

Toplumda güven inşası: Devletin uyguladığı kapsayıcı politikalar ülke içinde eşitsizlikleri azaltarak güveni artırır.

Uluslararası risk puanının düşmesi: Dayanıklı toplumlar daha az finansal riske sahiptir. Özetlenen tüm bu etkiler değerlendirildiğinde özel gereksinimli bireyler için geliştirilen politikaların sadece onların güvenliği için değil toplumun tüm kesimleri için önemli olduğu göstermektedir. Bu başlıklar tek tek değerlendirilerek her biri için gerekli politikalar geliştirilmelidir.

Afetler sırasında ve sonrasında özel gereksinimleri olan kişileri korumak ayrı bir faaliyet değil, tüm acil durum planlaması ve müdahalesinin dokusuna entegre edilmesi gereken bir konudur. Bu, proaktif iş birliğini, erişilebilir iletişimi ve gerçekten hiç kimseyi geride bırakmamaya yönelik sarsılmaz bir bağlılığı gerektirir.
